d. Code AN-R - Approved as Noted - Resubmit: Do not deliver or install the related work until the resubmittal has received Code AP or AN. However, fabrication and other off-site work covered by the submittal item may proceed, at the Contractor's risk, provided it complies with the Architect's notations and Contract Document requirements.

2. Action Code Prohibiting Use:
   a. Action Code REJ - Not Approved: The Work covered by the submittal item, including purchasing, fabrication, delivery, and other activity, shall not proceed. Revise the submittal item or prepare a new item in accordance with the Architect's notations. Resubmit the corrected or new item without delay; do not permit submittal items marked "Not Approved" to be used. Work incorporating such items will be rejected.

3. Action Code for Items Not Required:
   a. Action Code X - Not Requested by Contract Documents: The submittal item is not called for by the Contract Documents and is being returned unreviewed by the Architect except to the extent necessary to determine its status.

F. Informational Submittals: For Architect's information only. Architect will review each submittal and will not return it, or will return it if it does not comply with requirements. Architect will forward each submittal to appropriate party.

1. Action Code for Information Only:
   a. Action Code INF - Information Only - Received: The submittal item is not called for a return with a reviewed action code by the Contract Documents and is being returned unreviewed by the Architect except to the extent necessary to determine its status.

G. Partial submittals prepared for a portion of the Work will be reviewed when use of partial submittals has received prior approval from Architect.

H. Incomplete submittals are not acceptable, will be considered non-responsive, and will be returned without review.

I. Architect will return without review or discard submittals received from sources other than the Contractor.

J. Submittals not required by the Contract Documents may be returned by the Architect without action.

1. Do not submit Material Safety Data Sheets. They will be returned without review or discarded.

3.3 SUBMITTAL TRANSMITTAL REQUIREMENTS

A. Submittal Transmittal shall be a PDF file in electronic format. It is recommended, to expedite the submittal review, the electronic form be emailed for review to the Architect as early as possible.

   1. Submittal Numbering: See below.
   2. Contact Information: Full Name, Phone Number and Email Address.

B. Submittal Definition

   1. Each submittal consists of items from only ONE Specifications section.
2. Complete Submittal: If ALL the items required by the Specifications section are listed on one Submittal Form (including continuation sheet), it is a complete submittal.
3. Partial Submittals: If it is necessary to divide the required items of a given Specifications section into two or more submittals to meet schedule or handling requirements, the separate submittals are partial submittals. All partial submittals have the same submittal number, and are differentiated by sequential P-numbers (see below).
4. All items in each submittal, whether complete or partial, will be processed together: Individual items will not be 'broken out' for special handling. Arrange submittals accordingly.

C. Submittal Numbering
1. Number submittals as described below to assist tracking.
2. Number each submittal in the format nnnnnn-nn.
   a. The 6-digit number is the number of the section that requires the submittal. For example, 044200.
   b. The 2-digit number is based on the numerical sequence of submittals from that section. In other words, for each section, the first submittal is 01, the second is 02, and so on. The 2-digit number does not change for partial or re-submittals, so that the submittal can be tracked.
   c. P-Number for Partial Submittals: Number each partial submittal in the pee space, beginning with P1, and increasing by one for each partial submittal of that submittal. If the submittal is a complete submittal, leave the P space blank.
   d. R-Number for Re-submittals: Number each re-submittal in the arr space, beginning with R1, and increasing by one for each re-submittal of that submittal. Do not include an R-Number for the initial submittal.
   e. Examples:

3.4 SUBMITTAL REVIEW SHEET REQUIREMENTS
A. Provide Submittal Review Sheet in PDF format. Submit as the page after the Submittal Transmittal.
B. When attached, the Submittal Review Sheet shall not obscure information contained in the submittal.
C. Do not edit any of the information contained within the Submittal Review Sheet except as follows:
   1. Submittal Number: See Submittal Numbering in Submittal Transmittal Requirements paragraph.
D. The Contractor shall submit the PDF file in a manner that will allow editing of the Submittal Review Sheet fields by SmithGroup and its consultants.

END OF SECTION
SECTION 132300 - PLANETARIUM DOME

PART 1 – GENERAL

1.1 PROJECT DESCRIPTION/WORK INCLUDED

A. The selected contractor shall provide and install a 30’ DIAMETER DOME PROJECTION SCREEN TO SUPPORT A FULLDOME PLANETARIUM PROJECTION SYSTEM (FPPS) and LED LIGHTING SYSTEM for the CCC Planetarium.

B. The dome projection screen design is based on an Astro-Tec Manufacturing Co. 30-foot diameter dome.

Contact: Astro-Tec Manufacturing, Inc.
550 Elm Ridge Avenue, P.O. Box 608, Canal Fulton, Ohio 44614-0608
Phone: (330) 854-2209 | Fax: (330) 854-5376
http://astro-tec.com/contact/

1. Unless otherwise noted, a substituted manufacturer may be proposed and included, but only if Alternate manufacturer meets specifications outlined in PART 2 – 30’ DOME PROJECTION SCREEN and approved in advance by the Architect and the Planetarium Design Consultant.

D. This specification shall apply to all phases of Work hereinafter specified, shown on drawing PL.EQ1 DOME, or as required to provide a complete installation.

1. The Dome details, including vertical suspensions, lateral bracings, locations, mounting details shall be designed to comply with the requirements and details indicated in Architectural and Structural Drawings.

1.2 GENERAL REQUIREMENTS

A. Warranty: Furnish a written guarantee for a period of FIVE years from date of acceptance.

B. The dome projection screen described in this specification shall be furnished and installed by the manufacturer.

C. Before manufacturing, dome provider to provide a certified engineering design study documents showing that the dome meets State of California Seismic requirements. Fabrication and installation of deferred submittal items shall not be started until contractor’s drawings, specifications, and engineering calculations for the actual systems to be installed have been accepted and signed by the architect or structural engineer and approved by the DSA.

1. Verifying Drawings and Job Conditions:
2. Examine all project drawings and specifications to ensure full awareness of all work required under this Section.
3. Visit the site and verify existing conditions. Where existing conditions differ from drawings, report differences to architect and where possible without re-manufacture of dome components, make adjustments and allowances for all necessary equipment to complete all parts of the work. Verify actual dimensions of construction contiguous with Planetarium equipment by field measurements before fabrication.
4. Pre-installation Conferences: Conduct a minimum of one conference at the project site prior to the start of installation work. Where existing conditions differ from drawings, report differences to architect and, where possible without re-manufacture of dome components, make adjustment and allowances for all necessary equipment to complete all parts of the work.

1.3 FINAL INSPECTION AND ACCEPTANCE

A. After all requirements of the specifications and/or the drawings have been fully completed, representatives of the Owner will inspect the work.

B. Final acceptance of the work will be made by the Architect, Owner, and the Planetarium Design Consultant.

1.4 RECORD DRAWINGS

A. Drawings of Record: Provide and keep up-to-date, a complete record set of drawings. Keep these corrected daily and show every change from the original drawings. Keep this set of prints on the job site for use only as a record set. This shall not be construed as authorization for your firm to make changes in the layout without Owner approval in each case.

B. Upon completion of the work, obtain a set of Contract Drawings from the General Contractor and create a record set professionally using a PDF editor. Deliver this set in PDF format as indicated in Submittals – Close-Out, below.

1.5 APPROVALS, EQUALS, SUBSTITUTIONS, ALTERNATIVES, NO KNOW EQUAL

A. Approvals: Where the words (or similar terms) “approved”, “approval”, “acceptable”, and “acceptance” are used, these refer to the requirement that acceptance by the Owner, Architect, Planetarium Design Consultant, and Engineer is required.

B. Equal: Where the words (or similar terms) “equal”, “approved equal”, “equal to”, “or equal by”, “or equal” and “equivalent” are used, it shall be understood that these words are followed by the expression “in the opinion of the Owner, Architect, and Engineer.” For the purposes of specifying products, the above words shall indicate the same size, made of the same construction materials, manufactured with equivalent life expectancy, having the same aesthetic appearance/style (includes craftsmanship, physical attributes, color and finish), and the same performance.

C. Substitution: For the purposes of specifying products “substitution” shall refer to the submittal of a product not explicitly approved by the construction documents/specifications.

1. Substitutions of specified equipment shall be submitted and received by the Architect ten days prior to the bid date for review and written approval. Regulatory Agency approval for all substitutions will be the sole responsibility of the Contractor. To receive consideration, requests for substitutions must be accompanied by documentary proof of its equality with the specified material. Documentary proof shall be in letterform and identify the specified values/materials alongside proposed equal values/materials. In addition, catalog brochures and samples, if requested, must be included in the submittal.
2. SUBSTITUTIONS MUST BE PRE-APPROVED BY THE ARCHITECT AND THE PLANETARIUM DESIGN CONSULTANT. ALL BIDS SHALL BE BASED ON THE PRODUCTS EXACTLY AS SPECIFIED. PRICING FOR EACH APPROVED SUBSTITUTION SHALL BE INCLUDED IN THE BID SUBMITTAL AS A SEPARATE LINE ITEM.

3. The Contractor warrants that substitutions proposed for specified items will fully perform the functions as specified herein.

D. Alternates/Alternatives: For the purposes of specifying products, “alternatives/alternates” may be established to enable the Owner/Architect/Engineer to compare costs where alternative materials or methods might be used. An alternate price shall be submitted in addition to the base bid for consideration. If the alternate is deemed acceptable, written authorization will be issued.

1.6 SUBMITTALS – PRE-CONSTRUCTION

A. Submit the shop drawing submittal as PDF files accompanied by Letter of Transmittal, which shall give a list of the number and dates of the drawings submitted.

B. Provide consecutively numbered drawings featuring the name of the project that indicate the name of the specific staff that checked and approved each drawing. Any drawings submitted without this approval will be rejected.

C. If the shop drawings show variations from the requirements of the Contract because of standard shop practice or other reasons, make specific mention of such variations in the Contractor’s letter of transmittal.

D. Projection Dome vendor/supplier shall not proceed with manufacture of dome without written (via letter, fax or email) acceptance of final submittals by GC, Architect, Planetarium Consultant, and DSA approval of the deferred submittal.

1.7 SUBMITTALS – CLOSE-OUT

A. Subsequent to completing preliminary testing, provide to the Construction Manager, Owner, and Planetarium consultant, a letter/report documenting the results of the preliminary tests and the documentation detailed below. The receipt of this documentation will constitute the acknowledgment that the installation is complete, that it conforms to this specification, and that it is ready to be reviewed and tested.

B. Operation and Maintenance Manuals: Provide all manuals as PDF files on three duplicate CD-ROM disks or USB drives, named consistently with the manufacturer’s name and the model number in separate folders for the planetarium and exhibit hall. Copy the same file and folder organization to the Owner.

   1. Spare materials such as spare dome panels. Include method/conditions of storage.
   2. Dome maintenance and cleaning instructions

C. As-built drawings: Provide all as-built documentation as PDF files on the disks and online service mentioned above. In addition, provide a single copy each of the functional drawings, floor plans, and ceiling plans as laminated full-size drawing sets.
PART 2 - PRODUCTS

2.1 30' DOME PROJECTION SCREEN

A. OVERVIEW: The support of the 30’ diameter dome structure, suspended from roof truss at not less than 12 points and not more than 14 equidistant measured from dome center. Rigid horizontal restraints are also required. Nature of, number of, and location of vertical supports and horizontal restraints must meet California seismic requirements. The weight of the dome without cove trough shall not exceed 3600 pounds. Weight with cove trough, ladders, attached audio speakers, projectors, and cove-lighting shall not exceed 5100 pounds. Refer to schematic level drawing A1.PL DOME.

2.2 SCOPE:

A. The work covered by the specifications consists of furnishing materials, plant labor, equipment necessary to the fabrication, manufacture, delivery, and complete installation of a tilted 30 Ft. (180 degree) hemispherical planetarium projection dome. Target reflectivity: 44% (to be confirmed by planetarium system provider). Dome tilt angle will not exceed 2.5 degrees.

B. Projection surface: Perforated overlapping aluminum sheets with factory prime coat, followed by a final coat of water-based non-bridging flat paint on-site after panel installation.

2.3 WORK INCLUDED

A. STAMPED ENGINEERING STUDY THAT SHOWS THAT DOME MEETS CALIFORNIA STATE SEISMIC REQUIREMENTS AND ENGINEERING CRITERIA/REQUIREMENTS SET BY DSA.

B. Supply of all materials and labor required for the design and manufacture of a hemispherical projection dome with a perforated projection surface of painted aluminum.

C. Preparation of complete shop, assembly and erection drawings, which shall be subject to approval by the owner with respect to general design.

D. Preparation of a list of installation requirements, such as storage of materials, installation conditions (heat, light, power, ventilation, etc.) as well as an estimate of erection time.

E. Attendance of at one job-site co-ordination and scheduling meeting at time of dome delivery or prior to dome installation.

F. Manufacturer's personnel shall install the dome screen.

G. Prior to any manufacturing, provide all samples, procedures and demonstrations as specified for approval by owner.

H. Design and supply of the base tension ring of the dome, including the interface with the structural support ring and anchor bolts/eye bolts provided in the building by the owner.

I. Delivery of all materials, special tools and accessories for the dome projection screen to the site in manufacturer's protective packaging.

J. Provisions of a skilled painter, experienced in on-site painting of dome screens, for the final painting of the dome projection surface.

2.4 REQUIRED SITE PREP WORK BY THE GC

A. Scaffolding and scaffolding platforms are to be provided by the owner/general contractor.
Because the finished floor consists of a number of 4" high risers, the General Contractor will provide a TEMPORARY wooden raised level floor as part of the site preparation. The level platform is required for the rolling towers during installation. The platform must be flat and smooth with a load-bearing surface of at least 80-lbs./sq. ft. Platform material must be 3/4" T&G plywood and screwed in place.

B. Suspension attachment points per shop drawings supplied by dome manufacturer.

2.5 STRUCTURAL INTEGRITY

A. The manufacturer shall provide the owner with a certified drawing or statement of the total weight of the dome and its distribution around the dome base ring which rests on the structural support ring, columns or eyebolts provided by the owner.

B. The manufacturer shall be responsible for the structural design of the complete dome screen systems including the structural frame and panels, sizing of all members and detailing of connections to support structure or eyebolts as supplied by owner.

C. Prior to commencing fabrication, the manufacturer shall provide to the owner design drawings for approval.

2.6 DESIGN AND MANUFACTURE

A. The projection dome shall be self-supporting and capable of maintaining its hemispherical characteristics when supported by its tension ring as required by the design of the theater.

B. The hemispheric shell consists, in part, of an aluminum structural rib network system of twenty-eight (28) evenly spaced ribs, with a depth of not less than 2" and not more than 7" and sufficient number of cross-members to maintain its correct shape. The inside diameter of the dome screen shall be 30’ or 9144 mm, departing not more than plus or minus 12.7mm from the nominal radius.

C. The ribs shall be accurately formed and reinforced in accordance with the manufacturer's drawings. The ribs shall be fabricated from aluminum alloy 6061-T6 and 6063-T5, or other suitable material.

D. A girt system shall be incorporated to maintain proper rib spacing. Sizing and spacing shall be as indicated on manufacturer's drawings as approved by the owner.

E. The structural gage of the dome shall be sufficiently stiff so that deflection and settlement of the structure will not lead to deformation of the screen panels, based on the stiffness of the support system provided by the owner.

F. A circular compression ring shall be provided and located at the zenith or apex of the dome, to accommodate the terminal points for the main ribs and the perforated top circle. The compression ring shall be fabricated from aluminum alloy 6061-T6, or other suitable material acceptable to the owner.

G. An aluminum base tension ring shall be provided at the base of the hemisphere, which shall be so constructed that the ring will support the dome and provide the necessary connection points around its periphery. The base tension ring shall be aluminum alloy 6061-T6 or other suitable material, sized and reinforced in accordance with the manufacturer's drawings.

H. The projection surface shall consist of no more than 57 perforated panels which shall be 0.040 (1mm) gauge aluminum alloy type 5052-H32 containing 0.062 in. (1.6mm) diameter holes on 0.125 in. (3.2mm) staggered centers, to provide approximately 22% void area with a minimum of a 20% void after final painting.
I. The perforated panels shall be formed or stretch-formed over a compound die to correspond to the required section of a sphere. Trimming of the panels to their final configuration shall be accomplished in compound fixtures at manufacturer's factory.

2.7 SEAMS AND JOINTS
A. Seams between adjacent panels will be overlapped jointed.
B. The seams, where the panels join, shall be overlapped by no more than 29mm and shall have an opaque flat black material of minimum thickness between the layers to insure that the reflectivity of the seams matches the rest of the dome screen surface. The panels shall be secured to the ribs using low profile aluminum rivets. Vertical and horizontal seams shall not be located where there are no structural elements available for support. After final painting the dome shall appear nearly seamless under projection from the center of the dome.

2.8 QUALITY ASSURANCE
A. Uniformity of the color and the reflectivity of the dome surface over the entire area of the dome screen are of vital importance. Variation of reflectivity or color from panel to panel shall not be accepted. To this end the dome manufacturer shall include a quality assurance program as an integral part of his proposal. This program shall clearly address the points which follow, as well as any others which the manufacturer considers pertinent.
B. Dome images projected from center of dome shall appear nearly seamless as seen from near the center of the dome.
C. The dome manufacturer shall provide a description of the methodology and equipment to be used to ensure uniformity of color and reflectivity of surface.
D. If any corrective measures are needed, due to color variation or reflectivity they will be made in the final painting of the screen. Any other corrective work needed shall be performed prior to any finish work in the dome room.
E. If for any reasons, satisfactory repairs or touch-up cannot be made to bring the dome screen within the required uniformity, repainting will be performed by the dome manufacturer.

2.9 PREPARATION AND FINISH OF DOME STRUCTURE
A. The structural rib network, girts and pipe-members shall be thoroughly degreased to provide a clean, adhesive surface prior to painting. All structural elements shall be given a factory-applied coat of flat black paint.
B. Any damaged paint on surfaces (caused by shipping) shall be touched up with matching flat black paint before panel installation is started.

2.10 PROJECTION SURFACE OF THE COMPLETED DOME
A. The inside surface of the dome screen is to be painted with the overall reflectivity of 0.44. The seams are to be virtually unnoticeable and the panel-to-panel differences invisible during projection.
B. The screen surface shall diffuse incident light with no spectral component while retaining the specified reflectance, with absence of gloss at all incident angles under projection from the center of the dome.
C. The seam backing material between the panels supplied by the manufacturer must be such that reflectance of the seam areas does not change over a period of at least five (5) years from acceptance.

D. The projection surface is to be factory primed then painted-in-place, by a factory technician with a non-bridging flat coating, with the target reflectivity of 44% (to be confirmed).

2.11 COVE LIGHT TROUGH
A. Per detail shown in shown on drawing E1.PL LIGHTING, Dome manufacturer shall provide a self-supporting cove trough app. 6” deep with a 3” high façade. This trough shall be of sufficient strength to support with no distortion an LED cove light system. This trough shall be bolted to or supported by the dome tension ring.

2.12 EXTENDED COVE TROUGH FOR TRACK LIGHTING
A. Per detail shown in shown on drawing sheet E1.PL LIGHTING, Dome manufacturer shall provide self-supporting cove trough pan or base that extends 2” beyond the tension ring at base of dome to support track fixtures and track lighting. This makes the dome trough Pan app. 15” deep from front to back. This dome trough pan extension shall be of sufficient strength to support with no distortion a track lighting wall-wash system that runs around the theater along the dome tension ring.

2.13 DOME LADDERS
A. Manufacturer shall provide three (3) ladders that conform to the outer ribs of the dome. One ladder shall run from the bottom tension ring to dome zenith compression ring. The other two ladders shall be run from bottom tension ring up to 40 degrees up the dome. Location in dome azimuth of ladders are shown in A1.PL DOME. Final locations shall be confirmed/approved by owner, architect, planetarium consultant before installation.

2.14 ATTACHMENTS TO DOME BY OTHERS
A. All submitted mounts and methods provided by others for lighting equipment, projector, and audio speakers attached to dome structure must be reviewed/approved by the dome manufacturer before manufacture by others. See drawing sheets TE1 SOUND and E1.PL LIGHTING showing desired methods for mounting/attaching equipment by others to dome. ESTIMATED WEIGHT OF DOME LADDERS, EQUIPMENT, EQUIPMENT MOUNTING HARDWARE, LED POWER SUPPLIES, TRACK LIGHTING, CABLING AND THE WEIGHT OF ONE PERSON ON DOME LADDER WILL NOT EXCEED 1500 POUNDS. THIS WEIGHT SHALL BE THE DESIGN CRITERIA FOR SEISMIC ENGINEERING STUDY.

2.15 ACCEPTANCE OF WORK BY OTHERS
A. The architect will provide the dome screen manufacturer complete design information concerning the architectural support for the base tension ring of the dome.

B. The dome manufacturer shall provide a list of site conditions required for installation and conduct a pre-installation site inspection before scheduling the installation.
PART 3 - EXECUTION – NOT USED

END OF SECTION.
SECTION 132310 - PLANETARIUM PROJECTION SYSTEM

PART 1 - GENERAL

1.1 PROJECT DESCRIPTION/WORK INCLUDED

A. The project shall provide, install, train for and support a FULLDOME PLANETARIUM PROJECTION SYSTEM (FPPS) for the CCC Planetarium as shown in schematic and diagrammatic drawings A.1 PL, AV1. BLOCK DRAWING, A1.CONSOLE, and TE1.PL.

B. The Planetarium takes the form of multi-use domed theater and, in addition to astronomy, is also used for general instruction/lecture and visualization by various College Departments including: Science, Engineering, and Math.

C. The design is based on MEDIAGLOBE Σ 2K by Konica Minolta Planetarium Co. and SciDome IQ 2400 by Spitz, Inc.

Contact: Steve Hatfield

URL: https://www.spitzinc.com

D. Unless otherwise noted, a substituted component may be proposed and included, but only if approved in advance by the Planetarium Design Consultant and/or the Contra Costa College.

E. This specification shall apply to all phases of Work hereinafter specified, shown on drawing, or as required to provide a complete installation. Work required under this specification, is not limited to just the FPPS - refer to Architectural, Electrical, Structural, and Raceway/Structural Cabling, as well as all other drawing applicable to this project, which designate the scope of work to be accomplished. The intent of the drawings and Specifications is to provide a complete and operable planetarium system that includes all documents that are a part of the Contract.

1. Work Included. Furnish labor, material, services and skilled supervision necessary for the construction, erection, installation, connections, testing, and adjustment of all FPPS equipment specified herein, or shown or noted on drawings, and its delivery to the Owner complete in all respects ready for use.

2. The FPPS work includes installation or connection of certain materials and equipment furnished by others. Verify installation details, installation and rough-in locations from the actual equipment or from the equipment shop drawings.

F. The associated system drawings are diagrammatic and are intended to convey the scope of work, indicating intended general arrangement of equipment. Follow drawings in laying out work and verify spaces for installation of materials and equipment based on actual dimensions of equipment furnished.
1.2 RELATED DOCUMENTS AND SECTIONS

A. Refer to drawings A.1 PL, AV1. BLOCK DRAWING, A1.CONSOLE, and TE1.PL.

1.3 GENERAL REQUIREMENTS

A. Warranty: Furnish a written guarantee for a period of two years from date of acceptance.

B. Documents that your firm is a factory-authorized installer and warrantee station for the brand of equipment offered and maintain a fully-equipped service organization capable of furnishing adequate repair service to the equipment. Maintain a spare set of all major parts for the system at all times. All circuit boards, amplifiers and control sub systems shall be 100% backed up with stock at your firm’s shop.

C. All of the equipment in this specification shall be furnished and installed by the Authorized Factory Installer of the equipment. Furnish a letter from the manufacturer of all major equipment, certifying that your firm is the Authorized Installer and that the equipment has been installed according to factory intended practices.

D. All of the equipment in this specification shall be furnished and installed by the Authorized Factory Installer of the equipment with the most current software and firmware package available at the time of installation. At the time of Owner Acceptance of the installation, all equipment shall include any and all updated software or hardware revisions. In addition, when the software is available in disk format, a backup copy of the most up to date revision, in disk format, shall be handed to Owner at the completion of the project.

E. Verifying Drawings and Job Conditions:
   1. Examine all project drawings and specifications to ensure full awareness of all work required under this Section.
   2. Visit the site and verify existing conditions. Where existing conditions differ from drawings, make adjustments and allowances for all necessary equipment to complete all parts of the work. Verify actual dimensions of construction contiguous with Planetarium equipment by field measurements before fabrication.
   3. Pre-installation Conferences: Conduct a minimum of one conference at the project site prior to the start of installation work. Where existing conditions differ from drawings, make adjustment and allowances for all necessary equipment to complete all parts of the work.

1.4 WORK IN COOPERATION WITH OTHER TRADES

A. Examine the drawings and specifications and determine the work to be performed by the electrical and other trades. Provide the type and amount of audiovisual systems materials and equipment necessary to place this work in proper operation, completely wired, tested and ready for use.

B. Confirm Low voltage conduit, boxes and power have been provided by the division 26 00 00 contractor.
1.5 TESTING AND ADJUSTMENT

A. Upon completion of all audiovisual systems work, provide testing and demonstrating in the presence of the owner’s inspector that the all audio, digital video and control parameters are as stated in the factory data sheets.

B. Promptly repair or replace all equipment and parts discovered to be in need of correction. Then retest that part of the system and all associated components to correct the error. Perform all such replacement or repair at no additional cost to the Owner.

1.6 FINAL INSPECTION AND ACCEPTANCE

A. After all requirements of the specifications and/or the drawings have been fully completed, representatives of the Owner will inspect the work. Provide competent personnel to demonstrate the operation of any item or system to the full satisfaction of each representative.

B. Final acceptance of the work will be made by the Owner after receipt of approval and recommendation of acceptance from each representative.

1.7 RECORD DRAWINGS

A. Drawings of Record: Provide and keep up-to-date, a complete record set of drawings. Keep these corrected daily and show every change from the original drawings. Keep this set of prints on the job site for use only as a record set. This shall not be construed as authorization for your firm to make changes in the layout without Owner approval in each case.

B. Upon completion of the work, obtain a set of Contract Drawings from the General Contractor and create a record set professionally using a PDF editor. Deliver this set in PDF format as indicated in Submittals – Close-Out, below.

1.8 APPROVALS, EQUALS, SUBSTITUTIONS, ALTERNATIVES, NO KNOW EQUAL

A. Approvals: Where the words (or similar terms) “approved”, “approval”, “acceptable”, and “acceptance” are used, these refer to the requirement that acceptance by the Owner, Architect, Planetarium Design Consultant, and Engineer is required.

B. Equal: Where the words (or similar terms) “equal”, “approved equal”, “equal to”, “or equal by”, “or equal” and “equivalent” are used, it shall be understood that these words are followed by the expression “in the opinion of the Owner, Architect, and Engineer.” For the purposes of specifying products, the above words shall indicate the same size, made of the same construction materials, manufactured with equivalent life expectancy, having the same aesthetic appearance/style (includes craftsmanship, physical attributes, color and finish), and the same performance.

C. Substitution: For the purposes of specifying products “substitution” shall refer to the submittal of a product not explicitly approved by the construction documents/specifications.

   1. Substitutions of specified equipment shall be submitted and received by the Architect ten days prior to the bid date for review and written approval. Regulatory Agency approval for all substitutions will be the sole responsibility of the Contractor. To receive consideration, requests for substitutions must be accompanied by documentary proof of its equality with the specified material. Documentary proof shall be in letterform and identify the specified
values/materials alongside proposed equal values/materials. In addition, catalog brochures and samples, if requested, must be included in the submittal.

2. SUBSTITUTIONS MUST BE PRE-APPROVED BY THE ARCHITECT AND THE PLANETARIUM DESIGN CONSULTANT. ALL BIDS SHALL BE BASED ON THE PRODUCTS EXACTLY AS SPECIFIED. PRICING FOR EACH APPROVED SUBSTITUTION SHALL BE INCLUDED IN THE BID SUBMITTAL AS A SEPARATE LINE ITEM.

3. The Contractor warrants that substitutions proposed for specified items will fully perform the functions as specified herein.

D. Alternates/Alternatives: For the purposes of specifying products, “alternatives/alternates” may be established to enable the Owner/Architect/Engineer to compare costs where alternative materials or methods might be used. An alternate price shall be submitted in addition to the base bid for consideration. If the alternate is deemed acceptable, written authorization will be issued.

1.9 SUBMITTALS – PRE-CONSTRUCTION

A. Submit the shop drawing submittal as PDF files accompanied by Letter of Transmittal, which shall give a list of the number and dates of the drawings submitted.

B. Provide consecutively numbered drawings featuring the name of the project that indicate the name of the specific staff that checked and approved each drawing. Any drawings submitted without this approval will be rejected.

C. If the shop drawings show variations from the requirements of the Contract because of standard shop practice or other reasons, make specific mention of such variations in the Contractor’s letter of transmittal. If the substitution is accepted, the Contractor shall be responsible for proper adjustment that may be caused by the substitution. Submit samples upon request.

D. Only products listed as “Equal” within the contract documents, along with formally approved “Substitutions” will be reviewed. Products not conforming to these items will be rejected.

E. Shop drawings shall be submitted on the following but not limited to:
   1. System functional diagrams, including control system wiring and audio signal diagrams
   2. Equipment rack elevations
   3. Console design, layout, equipment placement, etc.
   4. Protective Barrier for Central Projector
   5. Column Lifter
   6. All other products called out on drawings that call for shop drawing submittal

1.10 SUBMITTALS – CLOSE-OUT

A. Subsequent to completing preliminary testing, provide to the Construction Manager, Owner, and Planetarium consultant, a letter/report documenting the results of the preliminary tests and the documentation detailed below. The receipt of this documentation will constitute the acknowledgment that the installation is complete, that it conforms to this specification, and that it is ready to be reviewed and tested.
B. Operation and Maintenance Manuals: Provide all manuals as PDF files on three duplicate CD-ROM disks or USB drives, named consistently with the manufacturer’s name and the model number in separate folders for the planetarium and exhibit hall. Copy the same file and folder organization to the Owner.

1. Provide step-by-step operating instructions for the day-to-day use of the system including power activation, connection of source devices, adjustment of volume levels, selection of sources, etc. Include illustrations and references to individual equipment manuals as necessary.
2. Equipment List: Include an Excel or other spreadsheet file listing all equipment including connectors and specialty hardware. Include columns for manufacturer, model, physical location, MAC address, IP address, if fixed or DHCP, VLAN, serial number, and cable label identification.

C. As-built drawings: Provide all as-built documentation as PDF files on the disks and online service mentioned above. In addition, provide a single copy each of the functional drawings, floor plans, and ceiling plans as laminated full-size drawing sets.

PART 2 - PRODUCTS

2.1 PLANETARIUM FULLDOME DIGITAL PROJECTION SYSTEM

A. General Characteristics:

1. The system shall be a single projector/single lens digital planetarium projector, located along the optical axis of the projection dome as shown in drawing A1.PL. System will include a column LIFTER to raise the Fulldome Projector when in use and lower it into a barrier when not in use. Supplier shall include Control Console and Projector Barrier casework as shown in drawing: A1.CONSOLE.

2. There shall be no apparent image seams or blending artifacts, variation in color, and variation in brightness across the dome over the entire life of the Planetarium projector system. Minimum White-light Dome Image brightness on a 30’ diameter dome with reflectivity of 44% is one (1) Foot Lambert (F.L.). Brighter is acceptable.

3. The projector system shall be capable of playing all formats of fulldome movies.

4. The system shall have an extensive set of astronomical databases.

5. The system shall have both manual and wireless controls. The manual controls shall be located at a fixed console (see). The wireless touch-screen remote control shall operate anywhere in the planetarium theater.

6. The proposed System shall allow for maintenance/repair by planetarium staff with no projector/pixel alignments (electronic or mechanical) required during life of system.

7. The Minimum Effective Dome Master Resolution of the projector image shall be: 2160 pixels (higher acceptable) or 3.664,354 total dome pixels (higher is acceptable).

8. The projection system shall use an azimuthal equidistant projection (circular fisheye) method to insure the accuracy of the fulldome master. Projection angle is 160°±2.

9. LIFTER shall be secured to floor of projector pit and controlled via a wired paddle at the Console. Exact height and travel distance to be determined by the FPPS provider as shown in drawing A1.PL. Current design is based upon 700mm travel distance. Lifter is to lower projector out of slight-lines for whiteboard instructions as shown in A1.PL

B. Technical Specifications:

1. Required Projector Features

   a. Main Configuration: Single-projector system inclusive of lens/chassis/outer cover

   b. Projection technology: LCOS
c. Minimum projector characteristics
   1) Minimum chipset resolution: 4096 x 2160 pixels x 3 chip (can be higher)
   2) Minimum number of colors: 16,770,000 colors (10 bit color depth)
   3) Minimum rated light output: 4000 Lumens at 100%
   4) Minimum native on/off contrast ratio: 15,000:1
   5) Be capable of displaying 60 fps movies.

d. Projection Lens: 160 degree ± 2° projection angle. All lens elements shall be fully multi-coated

e. Electrical Power: Projector shall be able to operate with AC100～240V at 50/60Hz
   and electrical load less than 15 amps.

2. Computer Features
   a. Graphics Card output shall be capable of 24 fps, 30 fps, and 60 fps (frames per second) at the required projected resolution with enough built-in buffer memory to provide smooth display of both real-time generated planetarium imagery and pre-rendered content. The card shall be capable of displaying imagery at 10-bit color depth.
   b. The server shall meet the following minimum specifications: CPUs: 6 core Xeon 3.5GHz or faster, OS: Windows 10 - 64bit or later, Memory per CPU: 8GB or more, Solid State OS Drive (256GB or larger), HDD for Program/Content: 1TB or larger. The vendor shall supply the latest model available of hardware and software version at time of installation. The vendor shall provide cut sheets and shop drawings of the computer system for approval by CCC, prior to installation.
   c. Audio output: The system shall be capable of two-channel, and 5.1-channel source content and shall provide audio over digital output.
   d. Power: AC100～240V, 50/60Hz, Maximum load per computer/server – 1000 Watts or 8.5 amps.
   e. All computer components, switchers, and image/audio processors are to be rack mounted in the Control Console.

3. Live Capture Capability and External Switcher System
   a. The server system shall include a 2K 60 fps HDMI 2.0 “Live Capture” board, allowing the Digital Fulldome Planetarium system to display real-time streaming images from external computers/laptops, IP cameras, observatory cameras, etc.
   b. Vendor shall include a real-time switcher unit that will allow the operator to switch the image/computer source of the Digital Fulldome Projection System. This switcher shall support seamless switching frame-to-frame video (no transition time) and shall not send a blue screen or any image to the Digital Fulldome Projectors during the switching process. Image overlap and warp must match that of the Digital Fulldome Projection System.

4. Signal Distribution:
   a. The vendor shall supply of all signal switching and cabling systems associated with the Fulldome Planetarium system from all image sources including the secondary image generator. Please refer to AV1. BLOCK DRAWING.
   b. Vendor is to include all control and switching equipment, cabling, etc. in the system, capable of displaying signals from both vendor supplied systems and alternate owner furnished fulldome systems as well as presentation PC, laptop presentations and the remote telescope cameras. Digital video signals shall be utilized throughout the system to achieve a truly digital system throughout.
   c. Signal distribution equipment shall include, but is not limited to, boosters, transmitters and receivers shall be all digital in terms of signal path and provided as required to ensure all signal distribution runs are within the specification of the maximum run for the signal type. All digital picture continuous signal runs of more than 20 meters shall
be done via optical fiber.

C. Digital Planetarium Functions:

1. At the planetarium control console, the planetarium system shall provide a simple-to-use GUI that allows the operator to display the following functions in real-time or through pre-recorded macro functions:

2. Fixed Stars:
   a. Stellar Data Base shall include the Hipparcos Catalogue and the Bright Star Catalogue down to 13.1 magnitude (more than 110,000 fixed stars).
   b. The system shall be able to adjust brightness of stars (0-100%).
   c. The Limiting Magnitude shall be adjustable in 0.1 magnitude increments.
   d. Display of the datasets shall be adjustable by distance from Earth in light-year increments.
   e. Display of the datasets shall be adjustable by spectral class and luminosity class.
   f. The system shall be able to change the texture/artwork/color of stars.
   g. The system shall be able simulate scintillation/twinkling of stars (with the characteristics of scintillation adjustable by the user)
   h. The System shall be able simulate major supernovae and the light curves of variable stars with apparent magnitude 6.5 or brighter.
   i. The system shall be able to display telescopic photos of Supernova. The user shall be able to add images, as needed.
   j. The system shall be able simulate representation of proper motion over a period ±1,000,000 years.
   k. System shall be able trace the path of stellar objects.
   l. User shall have the ability to customize the visual size (angular size or diameter) of fixed stars according to their magnitude.
   m. The User shall have the ability to customize the visual color of fixed stars according to their interpretation of the color index/spectral class.
   n. In displaying the sky as seen from the surface of the Earth, the center of individual stars shall have a positional accuracy as measured at any or every location of the 30’ diameter dome screen of less than ±10 arc minutes as measured from the center of the dome.
   o. The user shall have the ability to turn ON/OFF the aureole of Sun.
   p. The user shall have the ability to turn ON/OFF daylight, moonlight, and light pollution.

3. Galaxies, Nebulae and Star Clusters:
   a. The system shall show the Milky Way with individual selection for Visible/Infrared/X-ray/Gamma-ray/Radio Continuum, Hydrogen Alpha, Atomic Hydrogen, and Molecular Hydrogen. Brightness adjustment shall be from 0-100%, independent of fixed stars, using a slide bar control.
   b. The system shall show all Messier objects including selectable display of location marker, label (English), and display of enlarged telescopic image (picture). Images should be mapped to celestial sphere in the proper orientation and shall participate in Earth motions.
   c. The system shall allow the ability to add close-up photos of main Galaxies, cluster of galaxies, nebulae, planetary nebulae, dark nebulae, globular clusters, open clusters, etc. The system shall Display galaxies, nebulae, star clusters from any location in known universe.
   d. The system shall display Asteroid belt objects, Kuiper belt objects, Oort cloud, globular clusters, Local Group, regional galaxies, SDSS, quasar survey, WMAP and Planck Map of early universe. The system shall display labels of objects.

4. Solar System:
   a. The system shall display:
1) The Sun: Enlarged display and shall display Total, Annular, and Partial Solar Eclipses, including the Diamond Ring effect and the Solar Corona.
2) The Moon: Enlarged display including representation of Moon phases and Earthshine and shall display Total and Partial Lunar Eclipses, including the reddening of the Moon during eclipse.
3) Be able to scale up or down the Sun, the Moon, planets and etc. individually or in synchronization.
4) All planets and Pluto: Enlarged display, display of label, display of orbit.
5) All named dwarf planets: Enlarged display, display of label, display of orbit.
6) Major Trans-Neptunian objects: Display of label, display of orbit.
7) Minor Planetary Satellites: Enlarged display, display of label display of orbit.
8) Minor objects (minor planets, asteroids and comets): Display as a dot, display of label, display of orbit. Ability to add artwork, close-up photos of Asteroids, Comets.
9) Spacecraft: Display of Pioneer 10 and 11, Voyager 1 and 2, Cassini, New Horizons, etc. and their orbits.
10) Project the paths of seasonal Suns and trace the Analemma.

5. Simulation Range, Time, and Viewpoints:
   a. Time:
      1) Display proper motion of fixed stars over ± 1,000,000 years.
      2) Display all Solar System Objects motion over ±100,000 years.
   b. Space: to distant objects formed in early universe.
   c. Time Setting:
      1) Any time within the simulation range
      2) System shall have the ability to be customize time settings at startup by the user.
   d. View point (in the solar system):
      1) On any object at any latitude, longitude and planet-centric distance.
      2) Able to select and move solar system objects.
      3) Ability to move forward to/backward from/around solar system objects. (moving speed can be selected or automatically preset.)
      4) View point (outer space):
      5) Able to display the day or night sky viewed from a given target or location. Ability to automate, record, and store space travel from take-off to arrival point by setting up objects to seen en route, final target object, duration time of travel, etc.

6. Meteors and Meteor Showers:
   a. Sporadic Meteors: Real time simulation. Meteors can be displayed out of synchronization with time.
   b. Meteor Streams: Real time simulation with accurate peak/radiant points. User can set the meteor rate.

7. Coordinate Systems:
   a. Display of horizontal coordinates, equator, right ascension and declination, ecliptic, ecliptic latitude and longitude, galactic coordinates, super galactic coordinates, galactic longitude and latitude, meridian, azimuth, precession circle, poles, ecliptic pole, and zenith point.
   b. Able to Display distance circles or spheres from the sun (scale) in off-Earth simulations.

8. Constellations:
a. Display Artworks: Display of 88 constellation artworks individually or in any combination.
b. Display Lines: Display of 88 constellation lines individually or in any combination. The lines shall display in 3-dimensional location when viewed off of Earth's surface.
c. Display Boundaries: Display of boundaries of 88 constellations individually or in any combination.
d. Display Labels: Display of labels for 88 constellations individually or in any combination.
e. Display Animation Constellation Artworks. Operator will have the ability to add alternate constellation artwork and additional animated constellations.
f. Lines, Boundaries, Labels shall be adjustable by color/line width/size, font etc.

9. Asterisms:
   a. Major Asterisms: Great Spring Triangle, Great Spring Arc, Spring Diamond, the Big Dipper, Finding Polaris by using the Big Dipper, Leo’s Scythe, Summer Triangle, Northern Cross, Tea Pot, The Milk Dipper, Great Square of Pegasus, Finding Polaris by using Cassiopeia, Winter Triangle, Great Diamond or Hexagon of Winter, Winter circle, the False Cross, Winter "W", How to find the South Pole, etc.

10. Pointers, lines, circles, etc.:
    a. Able to display multiple pointers at a time including arrow, circle, cross and others anyplace on the dome. Display lines or letters connecting given points on the screen. Able to display lines that follows mouse/pointer movement.

11. Natural Sky Phenomena:
    a. Morning/evening twilight - real time simulation (automatic brightness control based on the location of the Sun)
    b. Sunset/Sunrise clouds
    c. Representation of natural phenomena including lighting, clouds, rain, snow, aurorae, fireball, zodiacal light, gegenschein and etc.
    d. Daylight and Blue Light: The brightness is automatically adjusted in relation to the location of the Sun.

12. Panorama (Landscapes):
    a. Able to display day/night landscapes (panoramas). Easily change to other layers or landscapes. Vendor shall supply a minimum of 10 panoramas in the database as well as one local photographic panorama of local campus area to be determined by CCC. Synchronized brightness control based on the altitude of the Sun.
    b. Able to display scenes (day view and night views) created by CCC staff.

13. High Resolution Surface Mapping:
    a. Able to display high-resolution surface map images for Mercury, Venus, Earth, Moon and Mars in real-time simulation. Still images can be pasted at a specified longitude and latitude, in proper orientation, and displayed on the surface.

14. Data2Dome:
    a. Vendor is to provide a pathway to import and display astronomical data through the Data2Dome project as proposed by ESO. CCC recognizes that this is a work in progress, but the vendor, through the warranty period, must update its software to import these datasets as they become available.

15. Multimedia Functions:
    a. The system shall provide the following functions:
1) Fulldome Projection:
   a) Fulldome projection of stills or movies.
   b) Fulldome projection can be performed with the planetarium functions or other multimedia functions.

2) Still Images:
   a) Multiple still images can be projected simultaneously and can be switched automatically in specified intervals. Operator can move, zoom, fade and special effects (rotation, wiping, etc.) still images.
   b) Able to display these file formats: BMP, JPEG, PNG, TIFF, TGA, GIF and PICT.

3) Movies:
   a) Multiple movies can be projected simultaneously. Operator can Play / Stop / Pause / Repeat / Move / Zoom / Fade any or all movies as well as Search and Load new movies in real time.
   b) Able to display these formats: MPEG, AVI, WMV, MP4, MOV, FLV

4) Sounds
   a) Multiple sound files can be played simultaneously. Operator can Play / Stop / Pause / Repeat / Fade any or all sounds as well as Search and Load new sounds in real time. Able to play these formats: WAV (2 ch. to 5.1), MP3, AC3, WMA, and OGG.

5) 3D Object:
   a) Multiple 3D objects can be projected simultaneously.
   b) Able to display these formats: Lightwave Object (.lwo), 3D Studio Max (.3ds)

6) Text and Others:
   a) Letters can be projected as text data. 2-dimensional objects such as dots, lines, circles, arrows and freely drawn lines and can be projected in real-time.

7) Slide show:
   a) Place audio, still images, and/or video on a timeline, and play/record automatically.

8) Live Capture:
   a) Project the HDMI output image of an external device. Automatic distortion correction of live action or real-time images on any part of the dome.

9) Cursor:
   a) Display a dome-view cursor, size/type/artwork of cursor can be customized by users.

10) Macro Function:
    a) Operator can record, reproduce, and edit the contents of all manually operated planetarium and multimedia functions to create programs.
    a) Recorded macros can be edited along a time-line or converted to a script program for even more precise editing and show production.
11) Other:
   a) Ability to render out dome master frames
   b) Ability to re-render and encode fulldome movies from dome master frames

D. Requirements and Considerations:

1. Additional Spare Parts: Bidder should provide a list of spare parts provided to maintain continued operation of the system.
2. As a minimum, the following items shall be supplied:
   a. Two complete sets of spare lamps.
   b. Spare hard drives for all computers in system. These hard drives shall be true backups of all provided software at the time of acceptance.
3. The RFP response should provide service spare equipment location and the location of service technicians.
4. Selected vendor is to provide drive cloning device(s) as part of the provided technology. As part of the training, vendor and owner’s representative will jointly develop a schedule/procedure for updating and cycling of back-up and master hard drives.
5. Coordination with GC and other Trades
   a. The selected vendor shall be flexible in the approach to the installation; there will be coordination with other specialists working on site in the same areas. Agreements will be established for allowing sufficient ‘dark time’ to enable proper projection alignment; this may involve working outside normal daytime working hours.
6. Pre-response Site Visit
   a. There will be a job walk to visit the new planetarium site for inspection before responding to this RFP. CCC will facilitate such a visit, however, the cost of the visit will be at the expense of the bidder and technical questions will not be answered on site. All questions shall be presented during the question period as detailed in the RFP.
7. Cabling Considerations
   a. All cabling within the rack housings will be identified, secured and correctly terminated in accordance with manufactures recommendations.
   b. No cable will be stressed and will be installed in such a way that any piece of hardware can be removed from the rack without removing any cable fixings.
   c. All site cables will be neatly installed and secured and enclosed in the containment provided unless stated otherwise.
   d. Any cable splicing or joining will not be accepted. All cable runs to be a single length of cable.
   e. All cables will be identified at both ends in accordance with the delivered Operational and Maintenance (O&M) Manuals.
   f. All audio cables will be of professional audio quality and where applicable will be Oxygen Free Cables (OFC). If video cable run distance exceeds 20 meters, then fiber optic cables will be substituted for copper conductor cables.
8. The system will be complete and any items needed to ensure the required operation of the system will be included on the Bid Pricing. Items required that are not included in the specification should be included in the design and price submitted. CCC will not accept responsibility for omissions in the systems proposed, once a contract is awarded.
9. Warranty:
   a. All provided technology and systems shall be warranted to comply with this specification and shall be free of defects in materials and workmanship for a period of
two years from the date of acceptance.

10. Services:
   a. In addition to the complete engineering design, all labor and materials required for, or reasonably incident to, the manufacture, delivery, on-site supervision, and installation of all the systems and technology detailed in this RFP shall be included.
   b. Vendor’s proposal shall include a fixed price, including all travel and all expenses.
   c. Vendor will be responsible for providing all tools, equipment and materials required to complete the delivery of this specified product.
   d. For the purposes of this proposal, assume that you will be responsible for all off-loading and handling the components and equipment that you deliver to site.
   e. Installation supervision by vendor shall be included if a sub-contractor is used for installation.

11. Training:
   a. After completion of the installation, the contracted vendor will carry out full training on the system(s), including; fault finding, critical parts replacement, maintenance and daily checks and tests. This training will be conducted on site with up to four persons from CCC.
   b. The contracted vendor shall provide an additional 5 days operational training on the Fulldome Planetarium system for up to four persons from CCC. The selected Vendor is to submit a training syllabus to CCC for input/approval. Training will include, but is not limited to, production and installation of Content and Lesson Production.
   c. A training schedule will be developed with CCC to allow for training on the full dome system of the planetarium technology package that will allow for appropriate groups of personnel to be scheduled for training on the various subsystems. Training shall be of sufficient duration and depth and the schedule shall allow adequate time for personnel to absorb the training.

12. Pre-installed Content and Lesson Production:
   a. Fulldome Vendor will install “free” and open source content including but not limited to “Two Small Pieces of Glass” (National Science Foundation), ESO productions (“Mayan Archaeoastronomy: Observers of the Universe”, “Out There - The Quest for Extrasolar Worlds”, “Seeing”, “Phantom of the Universe”, “The Dark Matter Mystery: Exploring a Cosmic Secret”, “The Hot and Energetic Universe”, “From Earth to the Universe”, “Aurora Storm”, “New Horizons for A Distant Planet”), and short films from NASA, JPL and Space Telescope Science Institute (http://www.spacetelescope.org/videos/archive/category/fulldome/). District shall obtain licenses for performance before these installed programs can be shown.

PART - EXECUTION – NOT USED

END OF SECTION
SECTION 132315 - INSTRUCTIONAL PLANETARIUM MEDIA SYSTEMS (IPMS)

PART 1 – GENERAL

1.1 PROJECT DESCRIPTION/WORK INCLUDED

A. Please refer to diagrammatic and schematic level drawings A.1 PL, AV1. BLOCK DRAWING, A1.CONSOLE, and TE1.PL as well as attached specified equipment cut sheets. The selected contractor shall provide, install, train for, and support the following instructional media systems (IPMS):

1. INSET DOME PROJECTION SYSTEM. WUXGA projector produces a partial dome projection app. 8' high x 16' wide.

Specified Model: Panasonic PT-EZ770 with mount attached to dome tension ring

2. ULTRA-SHORT THROW PROJECTION SYSTEM. This is an Ultra Short-Throw (0.23 ratio) Projector for roll-down screen. Native Resolution is 1920 x 1080.

Specified Model: Viewsonic LS830 with wall mount PJ-WMK-304 Universal Wall Mount Kit

3. Two (2) 65" wall-mounted monitors

Specified Model: Panasonic TH-65SF2U

4. Roll-down electric screen for 52” x 92” (16:9) image

Specified Model: DA-LITE Tensioned Advantage Deluxe Electrol screen- DaMat surface -52” x 92”

5. 6 IN/4 OUT MEDIA MATRIX/ROUTING SWITCHER - for distributing six video/data sources with four outputs

Specified Model: Crestron DM-MD6X4

B. The Planetarium takes the form of multi-use domed theater and, in addition to astronomy, is also used for general instruction/lecture and visualization by various College Departments including: Science, Engineering, and Math.

C. Unless otherwise noted, a substituted component may be proposed and included, but only if approved in advance by the Planetarium Design Consultant and/or the Contra Costa College.

D. This specification shall apply to all phases of Work hereinafter specified, shown on drawing, or as required to provide a complete installation. Work required under this specification, is not limited to just the (IPMS - refer to Architectural, Electrical, Structural, and Raceway/Structural Cabling, as well as all other drawing applicable to this project, which designate the scope of work to be accomplished. The intent of the drawings and Specifications is to provide a complete and operable planetarium system that includes all documents that are a part of the Contract.

1. Work Included. Furnish labor, material, services and skilled supervision necessary for the construction, erection, installation, connections, testing, and adjustment of all IPMS equipment specified herein, or shown or noted on drawings, and its delivery to the Owner complete in all respects ready for use.
2. The IPMS work includes installation or connection of certain materials and equipment furnished by others. Verify installation details, installation and rough-in locations from the actual equipment or from the equipment shop drawings.

E. The associated system drawings are diagrammatic and are intended to convey the scope of work, indicating intended general arrangement of equipment. Follow drawings in laying out work and verify spaces for installation of materials and equipment based on actual dimensions of equipment furnished.

1.2 RELATED DOCUMENTS AND SECTIONS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 specification sections, apply to this section.

B. Division 06 sections for the construction of a custom audiovisual console for racks, cabling, wiring, devices, controls, adapters, etc. and other material and equipment required to complete the IPMS.

C. Division 26 sections for connections to fire-alarm systems, wiring, disconnect switches, and other electrical materials required to complete the IPMS.

D. Division 27 sections for communications racks, cabling, wiring, devices, adapters, etc. and other electrical materials required to complete IPMS.

1.3 GENERAL REQUIREMENTS

A. Guarantee: Furnish a written guarantee for a period of two years from date of acceptance.

B. All of the equipment in this specification shall be furnished and installed by the Authorized Factory Installer of the equipment with the most current software and firmware package available at the time of installation. At the time of Owner Acceptance of the installation, all equipment shall include any and all updated software or hardware revisions. In addition, when the software is available in disk format, a backup copy of the most up to date revision, in disk format, shall be handed to Owner at the completion of the project.

C. Verifying Drawings and Job Conditions:

1. Examine all project drawings and specifications to ensure full awareness of all work required under this Section.

2. Visit the site and verify existing conditions. Where existing conditions differ from drawings, make adjustments and allowances for all necessary equipment to complete all parts of the work. Verify actual dimensions of construction contiguous with Planetarium equipment by field measurements before fabrication.

3. Pre-installation Conferences: Conduct a minimum of one conference at the project site prior to the start of installation work. Where existing conditions differ from drawings, make adjustment and allowances for all necessary equipment to complete all parts of the work.

1.4 WORK IN COOPERATION WITH OTHER TRADES

A. Examine the drawings and specifications and determine the work to be performed by the electrical and other trades. Provide the type and amount of audiovisual systems materials and equipment necessary to place this work in proper operation, completely wired, tested and ready for use.

B. Confirm Low voltage conduit, boxes and power have been provided by the division 26 00 00 contractor.

1.5 TESTING AND ADJUSTMENT
A. Upon completion of all audiovisual systems work, provide testing and demonstrating in the presence of the owner's inspector that the all audio, digital video and control parameters are as stated in the factory data sheets.

B. Promptly repair or replace all equipment and parts discovered to be in need of correction. Then retest that part of the system and all associated components to correct the error. Perform all such replacement or repair at no additional cost to the Owner.

1.6 FINAL INSPECTION AND ACCEPTANCE

A. After all requirements of the specifications and/or the drawings have been fully completed, representatives of the Owner will inspect the work. Provide competent personnel to demonstrate the operation of any item or system to the full satisfaction of each representative.

B. Final acceptance of the work will be made by the Owner after receipt of approval and recommendation of acceptance from each representative.

1.7 RECORD DRAWINGS

A. Drawings of Record: Provide and keep up-to-date, a complete record set of drawings. Keep these corrected daily and show every change from the original drawings. Keep this set of prints on the job site for use only as a record set. This shall not be construed as authorization for your firm to make changes in the layout without Owner approval in each case.

B. Upon completion of the work, obtain a set of Contract Drawings from the General Contractor and create a record set professionally using a PDF editor. Deliver this set in PDF format as indicated in Submittals – Close-Out, below.

1.8 APPROVALS, EQUALS, SUBSTITUTIONS, ALTERNATIVES, NO KNOW EQUAL

A. Approvals: Where the words (or similar terms) “approved”, “approval”, “acceptable”, and “acceptance” are used, these refer to the requirement that acceptance by the Owner, Architect and Engineer is required.

B. Equal: Where the words (or similar terms) “equal”, “approved equal”, “equal to”, “or equal by”, “or equal” and “equivalent” are used, it shall be understood that these words are followed by the expression “in the opinion of the Owner, Architect, and Engineer.” For the purposes of specifying products, the above words shall indicate the same size, made of the same construction materials, manufactured with equivalent life expectancy, having the same aesthetic appearance/style (includes craftsmanship, physical attributes, color and finish), and the same performance.

C. Substitution: For the purposes of specifying products “substitution” shall refer to the submittal of a product not explicitly approved by the construction documents/specifications.

1. Substitutions of specified equipment shall be submitted and received by the Engineer ten days prior to the bid date for review and written approval. Regulatory Agency approval for all substitutions will be the sole responsibility of the Contractor. To receive consideration, requests for substitutions must be accompanied by documentary proof of its equality with the specified material. Documentary proof shall be in letterform and identify the specified values/materials alongside proposed equal values/materials. In addition, catalog brochures and samples, if requested, must be included in the submittal.

ONLY PRE-BID APPROVED PRODUCTS, ISSUED VIA A FORMAL BID ADDENDUM TO ALL BIDDERS, WILL BE ALLOWED ON THE PROJECT. REGARDLESS OF THE APPROVAL ON ANY SUBSTITUTION, ALL BIDS SHALL BE BASED ON THE PRODUCTS
EXACTLY AS SPECIFIED. PRICING FOR EACH APPROVED SUBSTITUTION SHALL BE INCLUDED IN THE BID SUBMITTAL AS A SEPARATE LINE ITEM.

2. The Contractor warrants that substitutions proposed for specified items will fully perform the functions required.

D. Alternates/Alternatives: For the purposes of specifying products, “alternatives/alternates” may be established to enable the Owner/Architect/Engineer to compare costs where alternative materials or methods might be used. An alternate price shall be submitted in addition to the base bid for consideration. If the alternate is deemed acceptable, written authorization will be issued.

E. No Known Equal: For the purposes of specifying products, “No Known Equal” shall mean that the Owner/Architect/Engineer is not aware of an equivalent product. The Contractor will need to submit a “Substitution” item, per the requirements listed above, if a different product is proposed to be utilized.

1.9 SUBMITTALS – PRE-CONSTRUCTION

A. Submit the shop drawing submittal as PDF files accompanied by Letter of Transmittal, which shall give a list of the number and dates of the drawings submitted.

B. Provide consecutively numbered drawings featuring the name of the project that indicate the name of the specific staff that checked and approved each drawing. Any drawings submitted without this approval will be rejected.

C. If the shop drawings show variations from the requirements of the Contract because of standard shop practice or other reasons, make specific mention of such variations in the Contractor’s letter of transmittal. If the substitution is accepted, the Contractor shall be responsible for proper adjustment that may be caused by the substitution. Submit samples upon request.

D. Only products listed as “Equal” within the contract documents, along with formally approved “Substitutions” will be reviewed. Products not conforming to these items will be rejected.

E. Shop drawings shall be submitted on the following but not limited to:

1. System functional diagrams, including control system wiring and audio DSP processing chain
2. Equipment locations and methods for mounting
3. Console layout, equipment placement, etc.
4. All other products called out on drawings that call for shop drawing submittal

1.10 SUBMITTALS – CLOSE-OUT

A. Subsequent to completing preliminary testing, provide to the Construction Manager, Owner, and Planetarium consultant, a letter/report documenting the results of the preliminary tests and the documentation detailed below. The receipt of this documentation will constitute the acknowledgment that the installation is complete, that it conforms to this specification, and that it is ready to be reviewed and tested.

B. Operation and Maintenance Manuals: Provide all manuals as PDF files on three duplicate CD-ROM disks or USB drives, named consistently with the manufacturer’s name and the model number in separate folders for the planetarium and exhibit hall. Copy the same file and folder organization to the Owner.

1. Provide step-by-step operating instructions for the day-to-day use of the system including power activation, connection of source devices, adjustment of volume levels, selection of sources, etc. Include illustrations and references to individual equipment manuals as nec-
essay. Hyperlink the references to the individual operation manual files included in this submission.

2. Organize the manual PDF files into folders by subsystem: audio, video, control, etc.

3. Equipment List: Include an Excel or other spreadsheet file listing all equipment including connectors and specialty hardware. Include columns for manufacturer, model, physical location, MAC address, IP address, if fixed or DHCP, VLAN, serial number, and cable label identification.

C. As-built drawings: Provide all as-built documentation as PDF files on the disks and online service mentioned above. In addition, provide a single copy each of the functional drawings, floor plans, and ceiling plans as laminated full-size drawing sets.

PART 2 - SYSTEM EQUIPMENT SPECIFICATION

2.01 PLANETARIUM INSTRUCTIONAL AND EVENT PRESENTATION SYSTEM

A. This is provision and installation of a fully integrated instructional/classroom/event video/graphic system capable of projecting computer data graphics and text in addition to distance learning recording, streaming, and video conferencing. Please refer to drawings A.1 PL, AV1. BLOCK DRAWING, A1.CONSOLE, and TE1.PL. The selected contractor shall provide, install, train for, and support the following instructional media systems (IPMS):

1. INSET DOME PROJECTION SYSTEM. WUXGA projector produces a partial dome projection app. 8’ high x 16’ wide.

Specified Model: Panasonic PT-EZ770 with mount attached to dome tension ring

2. ULTRA-SHORT THROW PROJECTION SYSTEM. This is an Ultra Short-Throw (0.23 ratio) Projector for roll-down screen. Native Resolution is 1920 x 1080.

Specified Model: Viewsonic LS830 with wall mount PJ-WMK-304 Universal Wall Mount Kit

3. Two (2) 65” wall-mounted monitors

Specified Model: Panasonic TH-65SF2U

4. Roll-down electric screen for 52” x 92” (16:9) image

Specified Model: DA-LITE Tensioned Advantage Deluxe Electrol screen- DaMat surface -52” x 92”

5. 6 IN/4 OUT MEDIA MATRIX/ROUTING SWITCHER - for distributing six video/data sources with four outputs

Specified Model: Crestron DM-MD6X4

Please see attached cut sheets for above specified equipment

B. At the lab table location, the IPMS shall have connections vis to adjacent floor box location.
C. Video input and output from source devices to displays and projectors is achieved through routing of the matrix switcher.

D. System displays:

1. Two data projectors one if front projecting on roll-down screen and one at the rear of the theater projecting on the dome screen (see 2.0.1 numbers #1 and #2)
2. Two 65" wall mounted LED displays see (see 2.0.1 numbers #3)
3. Fulldome Planetarium display located in center of theater and controlled at theater control console. Coordinate with Planetarium system provider.

PART 3 - EXECUTION

3.01 GENERAL INSTALLATION DESCRIPTION

A. Install Planetarium equipment level and plumb, according to manufacturer's written instructions and drawings from Planetarium Technology Consultant. The installation, configuration and wiring of the system shall be executed in accordance with the drawings and the equipment manufacturer's installation instructions and guidelines. Should any variations in these requirements occur, the Contractor shall notify the architect before making any changes. It shall be the responsibility of the factory-authorized installer of the approved equipment to install the equipment and guarantee the system to operate as per plans and specifications.

B. Complete equipment assembly and termination where field assembly is required.

D. Install equipment with access and maintenance clearances that comply with manufacturer's written installation instructions and with requirements of authorities having jurisdiction.

3.02 GENERAL TESTING REQUIREMENTS

A. Provide all instruments for testing and demonstrating in the presence of the owner's inspector that the all Audio, Digital Video and Control parameters are as stated in the factory data sheets. Check all circuits and wiring to verify they are free of shorts and grounds.

B. VOM shall be used to test continuity and phase of all new wiring and connections with the understanding that the system will function fully as designed.

C. Control functions shall be checked for proper operation, from controlling devices to controlled devices.

D. Adjust, balance, and align equipment for optimum quality and to meet the manufacturer's published specifications. Establish and mark normal settings for each level control with permanent machine printed labeling and provide in system documentation.

E. Controls: Adjust all controls to achieve the specified performance. Provide shaft-locks or covers for all level controls, as appropriate to prevent unauthorized gain changes. Confirm that all control system operations are properly programmed and repeatable.

F. Testing Report: Provide a letter/report documenting the results of these preliminary tests, including amplifier gain/level settings, crossover filter settings, and equalization curves for review by the AV Design Consultant.
G. Verify the following before beginning actual tests and adjustments on the System:

1. All electronic devices are properly grounded.
2. All powered devices have AC power from the proper circuit. All dedicated AC power circuits are properly wired, phased, and grounded.
3. Insulation and shrink tubing are present where required. All exposed bare wire shall be clear shrink wrapped or terminated within the phoenix block. NO exposed bare wire.
4. Dust, debris, solder splatter, etc. is removed.
5. All cable is dressed, routed, and labeled; all connections are properly made and consistent with regard to polarity.

H. Cable and Fiber.

1. Test all cables as installed for shorts between conductors or to building ground and for opens.
2. Certify all data cables installed to Category 6 standards or better.
3. Document all tests and complete measurement results including wire number, date, test equipment used, operator, and test results. If any problems are detected in testing, correct the problem, and retest.

I. Video System Tests:

1. Verify performance of all video connecting cables, as specified herein. Continuity tests are not acceptable. Replace any defective cable prior to continuing testing.
2. Perform video signal parameter tests on individual items of equipment, and the work as a whole in accordance with EIA, SMPTE and AES Recommended Practices and other recognized standards as listed under REFERENCES.
3. Provide full flat panel monitor display calibration and adjustments for optimal picture quality for a single HDMI input. Provide proper aspect ratio configuration for both 16:9 and 16:10 sources. Use a test generator for all setup verification, and verify proper image configuration with all inputs. (Contact the Owner’s Technical Representative prior to final adjustment to coordinate).
4. Projection Systems:
   a. Luminance testing consistent with performance of specified projectors and screens.
   b. Brightness, convergence per ANSI standard procedures for device.
   c. Measure nine points of illuminance per screen and calculate average value in lumens.
   d. High-bandwidth Digital Content Protection (HDCP) check
5. At spaces with HDMI transmission:
   a. Run HDCP check to ensure all devices are HDCP compliant.
   b. Test with sample source device with quantity of HDCP keys as required to operate by the system.

3.03 ACCEPTANCE TESTS

A. Acceptance Test: Owner’s Representative and/or Construction Manager will be present during acceptance testing and require assistance. Provide personnel who participated in the actual installation and preliminary testing and adjustment of the audiovisual systems. At their option, the Owner may contract and pay for a third-party consultant to perform system testing. This cost is not included in the Contractor’s contract.

Demonstrate each major component to function as specified.
B. Such tests may be performed on any piece of the system or individual equipment/device. If any test shows the equipment or system is defective or does not comply with the specifications, perform any remedies at your firm’s expense and pay the subsequent expenses of any required retesting.

3.04 TRAINING AND FIELD SUPPORT

C. Training: System Functionality
   a. Provide a minimum of one, eight-hour day of prepared and organized training sessions (separate from full dome training sessions) for the benefit of the Owner’s personnel. Demonstrate the location, wiring, operation and capabilities of each system component. Training time is to be non-contiguous, in multiple separate sessions.
   b. Develop with CCC, a training schedule to allow for training. Training shall be of sufficient duration and depth and the schedule shall allow adequate time for personnel to absorb the training.
   c. At minimum, include training on each component of the IPMS.

3.05 MISCELLANEOUS PROJECT REQUIREMENTS

A. Single Point of Contact: Provide an English-proficient, single point of contact, i.e., project manager, to speak for the Contractor and to provide the following functions:
   1. Initiate and coordinate tasks with Owner’s Project Manager, and others as specified by Owner’s Project Manager.
   2. Provide day-to-day direction and on-site supervision of Contractor personnel.
   3. Ensure conformance with all Contract provisions.
   4. Participate in weekly site project meetings as needed.
   5. This individual will remain as Project Manager for the duration of the project. The Contractor may change Project Managers only with the Owner’s Project Manager’s written approval.

B. Planning meetings and schedule: Within thirty (30) calendar days after the date of award of the Contract, an initial planning meeting will be held with the successful bidder to clarify all requirements (systems, services, distribution methods, etc.), identify responsibilities, and schedule the events that will transpire during the implementation of the project. Within one week of this initial meeting, the Contractor shall provide a written report and project schedule to clearly document the events and responsibilities associated with the project.

C. Site Cleaning: Throughout the progress of the plant construction, the Contractor shall keep the working area free from debris of all types and remove from the premises all rubbish resulting from any work done by Contractor. On a daily basis and at the completion of its work, the Contractor shall, to the extent possible, leave the premises in a clean and finished condition.

D. Safety Requirements: Contractor will utilize appropriate personnel and display warning signs, signals, flags and/or barricades at the work site to ensure adherence to safety regulations and as prudence requires.

E. Specification/Drawing Status: All specifications and drawings related to this project will be “frozen” after shop drawing approval. The Owner reserves the right to negotiate any future changes with the Contractor at any time.

F. Upon approval of shop drawings, contractor shall immediately place orders for all required materials, components, and supplies. In addition, contractor shall secure and forward written confirmations (including orders and shipping dates) direct from each manufacturer/vendor to the Owner’s Project Manager.
G. Contractor shall expedite shipment of all materials, components and supplies, as necessary to ensure the successful completion of the Project by the date required. All costs for expediting shall be included within contractor’s pricing as provided below.

H. The system cost herein shall include administration/maintenance training for at least ten Owner’s representatives with a minimum allotment of sixteen (16) hours. All training shall include written and/or video materials that shall remain the property of Owner. If materials are written, they shall be provided in quantities sufficient for each person trained; if materials are video, one copy of each will be required. The administration/maintenance training shall include, but not be limited to, the following:
   1. Review of as-built documentation, including a site demonstration.
   2. All warranty information.

3.06 DAMAGES

A. The Contractor will be held responsible for any and all damages to portions of the building caused by it, its employees or sub-contractors; including but not limited to:
   1. Damage to any portion of the building caused by the movement of tools, materials or equipment.
   2. Damage to any component of the construction of spaces.
   3. Damage to the electrical distribution system.
   4. Damage to the electrical, mechanical and/or life safety or other systems caused by inappropriate operation or connections made by the Contractor or other actions of Contractor.
   5. Damage to the materials, tools and/or equipment of the Owner, its consultants, agents and tenants.
   6. Damage to the projection dome surface
   7. Damage, interference, or outage to campus wide area or local area networks.

3.07 INSPECTIONS

A. On-going inspections shall be performed during construction by the Owner’s Project Manager. All work shall be performed in a high quality manner and the overall appearance shall be clean, neat and orderly. The following points will be examined and must be satisfactorily complied with:
   1. Are all cables properly labeled, from end-to-end?
   2. Have all terminated cables been properly tested in accordance with the specifications for the specific category as well as tested for opens, shorts, polarity reversals, transposition and presence of AC and/or DC voltage?
   3. Have the pathway guidelines been followed? Are all cable penetrations installed properly and fire stopped according to code?
   4. Has the Contractor avoided excessive cable bending?
   5. Is Cable fill correct?
   6. Are terminations compatible with applications equipment?
   7. Are connectors properly turned right side up in the Jack Panels or faceplates without cables wrapped or twisted?
   8. Is the jacket maintained right up to the termination?
   9. Are identification markings uniform, permanent and readable?

3.08 COMPLETION OF WORK

A. At the completion of the System, restore to its former condition, all aspects of the project site. On a daily basis, remove all waste and excess materials, rubbish debris, tools and equipment
resulting from or used in the services provided under this Contract. Provide all clean up, restoration, and removal noted above at no cost to Owner. If the Contractor fails in its duties under this paragraph, the Owner may upon notice to the Contractor perform the necessary clean up and deduct the costs thereof from any amounts due or to become due to the Contractor. Remove trash from work areas and bring it to the Contractor-provided dumpster.

B. Final Punch Walk: Complete a final inspection to determine if all conditions of the scope of work are completed to the owner’s satisfaction. Provide a punch list within ten days of the punch walk and present it to the Contractor for completion prior to final project sign-off by the owner. If an item is missed during the punch walk or not included on the “punch list” for any reason, it does not release the Contractor from completing the scope of work as defined in the specification or drawings.

C. Contractor shall submit complete Record Documentation as outlined in submittals section prior to project sign-off by owner.

3.09 SYSTEM AND/OR NETWORK TESTING

A. Upon completion of installation, execute all of the tests listed in this specification. Provide the Owner, written notice when all such tests have been completed to Owner’s satisfaction and Manufacturer’s specifications, Contractor shall give the Owner written notice thereof.

B. Assume responsibility of assuring that the system and network interface installed operates properly, including any required coordination with other suppliers.

3.10 FINAL ACCEPTANCE

A. The Owner or Owner's representative may visit the site during the installation of the system to ensure that correct installation practices are being followed.

B. Notify the Owner's representative when the systems are ready for a final job review. The review will take place within one week after notification.

C. If need for additional adjustment becomes evident during final acceptance and/or demonstration and testing, continue adjustment until the system functions fully as designed.

D. The Owner or Owner's representative will review the installation and certification data prior to the system acceptance.

E. The Owner or Owner's representative may test some of the system’s features to ensure that the certification data is correct. If a substantial discrepancy is found, the Owner reserves the right to have an independent consultant perform a certification of the entire system. If such a procedure is undertaken, the cost of the testing will be billed back to the Contractor.

F. In the event that repairs or adjustments are necessary, make these repairs at your firm’s expense. Complete all repairs within five days from the time they are disclosed to your firm.
SECTION 140413 - COMMON SUBMITTAL REQUIREMENTS FOR CONVEYING EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Supplementary administrative and procedural requirements for submitting Shop Drawings, Product Data, Samples, and other submittals specific to the work of this Division.

B. Related Requirements:
   1. Division 01 submittal requirements.

1.3 DEFINITIONS

A. Contractor: Refers to an entity in direct Contract with the Owner to furnish and/or perform any portion of the Work of the Contract.
   1. Contractor shall review and approve Product Submittals prior to forwarding them to the Architect.

B. Product Submittals: In general, Product Submittals show characteristics of the proposed construction in one of the following forms:
   1. Shop Drawings.
   2. Product Data.
   3. Samples.

C. Action Submittals: Written and graphic information and physical samples that require Architect/Engineer's responsive action. Action submittals are those submittals indicated in individual Specification Sections as "action submittals."

D. Sustainable Design Submittals: Submittals required by Section 01813 "Sustainable Design Requirements." Submit documentation for products and materials contributing to achievement of LEED rating indicated. Sustainable Design Submittals are in addition to other submittal requirements.

E. Informational Submittals: Written and graphic information and physical samples that do not require Architect/Engineer's responsive action. Submittals may be rejected for not complying with requirements. Informational submittals are those submittals indicated in individual Specification Sections as "informational submittals."

F. Submittal Review Sheet: Specific form required to accompany each submittal. Obtain Submittal Review Sheet from the SmithGroup Project Manager.
1.4 SUBMITTAL ADMINISTRATIVE REQUIREMENTS

A. Requirements specified for submittals are intended to provide efficient handling, while permitting review responsibilities to be carried out.

B. Avoidable Resubmittals: The first two reviews of each specified submittal will be processed without cost to the Contractor. After the second review, the Owner may charge the Contractor for the cost of such additional processing, unless the processing results from approved Change Orders causing revisions to previously approved submittals.

C. Coordination: Coordinate preparation and processing of submittals with performance of construction activities.
   1. Coordinate each submittal with fabrication, purchasing, testing, delivery, other submittals, and related activities that require sequential activity.
   2. Submit all submittal items required for each Specification Section concurrently unless partial submittals for portions of the Work are indicated on approved submittal schedule.
   3. Submit action submittals and informational submittals required by the same Specification Section as separate packages under separate transmittals.
   4. Coordinate transmittal of different types of submittals for related parts of the Work so processing will not be delayed because of need to review submittals concurrently for coordination.
      a. Architect and Engineer reserve the right to withhold action on a submittal requiring coordination with other submittals until related submittals are received.

D. Processing Time: Allow time for submittal review, including time for resubmittals, as follows. Time for review shall commence on Architect's receipt of submittal. No extension of the Contract Time will be authorized because of failure to transmit submittals enough in advance of the Work to permit processing, including resubmittals.
   1. Refer to Section 01330 for quantity of days allowed for review.
   2. When a large volume of submittal materials is scheduled, additional review time may be required. Similarly, a particular submittal may require review completion in less than the agreed normal time. Due to variations in submittal volume and processing needs, agreed review time is not intended to apply to extreme conditions.

E. Maintain at the Project Site ready access to the latest reviewed Shop Drawings and Product Data, and one set of samples.

PART 2 - PRODUCTS

2.1 SUSTAINABLE DESIGN REQUIREMENTS

A. The District requires the Contractor to implement practices and procedures to meet the project's environmental performance goals. The Contractor shall ensure that the minimum requirements related to these goals, as defined in Section 01813 "Sustainable Design Requirements" are implemented to the fullest extent possible. Specific materials and systems have been selected to this end. Substitutions, or other changes to the work proposed by the Contractor or their Subcontractors, shall not be allowed if such changes compromise the aforementioned environmental goals and LEED certification.
B. Specific material goals, beyond inherently designed facility service systems, that may impact this area of work include: use of products with third-party verified Environmental Product Declaration, use of products with Health Product Declarations, use of products from manufacturers with publicly disclosed Corporate Sustainability Reports, use of products with recycled-content materials; use of locally-purchased, manufactured and extracted materials; use of FSC certified wood; use of low-emitting materials; construction waste recycling; and the implementation of a construction indoor air quality management plan.

PART 3 - EXECUTION

3.1 CONTRACTOR'S REVIEW

A. Project Closeout and Maintenance Material Submittals: See requirements in Division 01.

B. Be responsible for quantities, weights, and dimensions to be confirmed and correlated at the site; for information that pertains solely to the fabrication processes and to the means, methods, techniques, sequences, and procedures of construction; and for coordination of the work of every trade, supplier, and subcontractor.

C. Be responsible for each submittal to be in conformance with information given and the design intent expressed in the Contract Documents.

D. Provide with each submittal specific written notice of any variation from the requirements of the Contract Documents by causing a specific notation to be made on the Submittal Review Sheet and Submittal Transmittal. Changes to the approved construction documents are subject to DSA review and approval, submitted by the Architect as a CCD per DSA IR A-6.

3.2 ARCHITECT/ENGINEER'S AND GENERAL CONTRACTOR'S ACTION

A. General: Architect will not review submittals that do not include the Submittal Review Sheet.

B. Action Submittals: Architect's staff and consultants will review the submittal, and mark the Submittal Review Sheet with an action code. The code meanings are described below.

C. Additional codes may be provided within comments or as an electronic submittal review stamp and shall be used in help indicating return of partial submittals.

E. Review Code meanings are as follows:

1. Action Codes Permitting Use:
   a. When an action code permitting use is assigned to a submittal, it does not authorize work that does not comply with the requirements of the Contract Documents. Acceptance of the Work will depend on compliance.
   b. Code AP - Approved: The Work covered by the submittal item may proceed, provided it complies with Contract Document requirements.
   c. Code AN - Approved as Noted: The Work covered by the submittal item may proceed, provided it complies with the Architect's notations and Contract Document requirements.
d. Code AN-R - Approved as Noted - Resubmit: Do not deliver or install the related work until the resubmittal has received Code AP or AN. However, fabrication and other off-site work covered by the submittal item may proceed, at the Contractor's risk, provided it complies with the Architect's notations and Contract Document requirements.

2. Action Code Prohibiting Use:
   a. Action Code REJ - Not Approved: The Work covered by the submittal item, including purchasing, fabrication, delivery, and other activity, shall not proceed. Revise the submittal item or prepare a new item in accordance with the Architect's notations. Resubmit the corrected or new item without delay; do not permit submittal items marked "Not Approved" to be used. Work incorporating such items will be rejected.

3. Action Code for Items Not Required:
   a. Action Code X - Not Requested by Contract Documents: The submittal item is not called for by the Contract Documents and is being returned unreviewed by the Architect except to the extent necessary to determine its status.

F. Informational Submittals: For Architect's information only. Architect will review each submittal and will not return it, or will return it if it does not comply with requirements. Architect will forward each submittal to appropriate party.

1. Action Code for Information Only:
   a. Action Code INF - Information Only - Received: The submittal item is not called for a return with a reviewed action code by the Contract Documents and is being returned unreviewed by the Architect except to the extent necessary to determine its status.

G. Partial submittals prepared for a portion of the Work will be reviewed when use of partial submittals has received prior approval from Architect.

H. Incomplete submittals are not acceptable, will be considered non-responsive, and will be returned without review.

I. Architect will return without review or discard submittals received from sources other than the Contractor.

J. Submittals not required by the Contract Documents may be returned by the Architect without action.
   1. Do not submit Material Safety Data Sheets. They will be returned without review or discarded.

3.3 SUBMITTAL TRANSMITTAL REQUIREMENTS

A. Submittal Transmittal shall be a PDF file in electronic format. It is recommended, to expedite the submittal review, the electronic form be emailed for review to the Architect as early as possible.
   1. Submittal Numbering: See below.
   2. Contact Information: Full Name, Phone Number and Email Address.

B. Submittal Definition
   1. Each submittal consists of items from only ONE Specifications section.
2. Complete Submittal: If ALL the items required by the Specifications section are listed on one Submittal Form (including continuation sheet), it is a complete submittal.

3. Partial Submittals: If it is necessary to divide the required items of a given Specifications section into two or more submittals to meet schedule or handling requirements, the separate submittals are partial submittals. All partial submittals have the same submittal number, and are differentiated by sequential P-numbers (see below).

4. All items in each submittal, whether complete or partial, will be processed together: Individual items will not be 'broken out' for special handling. Arrange submittals accordingly.

C. Submittal Numbering

1. Number submittals as described below to assist tracking.
2. Number each submittal in the format nnnnnn-nn.
   a. The 6-digit number is the number of the section that requires the submittal. For example, 044200.
   b. The 2-digit number is based on the numerical sequence of submittals from that section. In other words, for each section, the first submittal is 01, the second is 02, and so on. The 2-digit number does not change for partial or re-submittals, so that the submittal can be tracked.
   c. P-Number for Partial Submittals: Number each partial submittal in the pee space, beginning with P1, and increasing by one for each partial submittal of that submittal. If the submittal is a complete submittal, leave the P space blank.
   d. R-Number for Re-submittals: Number each re-submittal in the arr space, beginning with R1, and increasing by one for each re-submittal of that submittal. Do not include an R-Number for the initial submittal.
   e. Examples:

3.4 SUBMITTAL REVIEW SHEET REQUIREMENTS

A. Provide Submittal Review Sheet in PDF format. Submit as the page after the Submittal Transmittal.

B. When attached, the Submittal Review Sheet shall not obscure information contained in the submittal.

C. Do not edit any of the information contained within the Submittal Review Sheet except as follows:
   1. Submittal Number: See Submittal Numbering in Submittal Transmittal Requirements paragraph.

D. The Contractor shall submit the PDF file in a manner that will allow editing of the Submittal Review Sheet fields by SmithGroup and its consultants.

END OF SECTION
SECTION 142123.16 - MACHINE-ROOM-LESS ELECTRIC TRACTION ELEVATORS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary
Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes machine-room-less electric traction passenger and elevators.

B. Related Requirements:
   1. Section 033000 "Cast-in-Place Concrete" for setting sleeves, inserts, and anchoring devices in concrete.
   2. Section 051200 "Structural Steel Framing" for the following:
      a. Attachment plates, angle brackets, and other preparation of structural steel for fastening guide-rail brackets.
   3. Section 055000 "Metal Fabrications" for the following:
      a. Hoist beams.
      b. Structural-steel shapes for subsills.
      c. Pit ladders.
      d. Cants made from steel sheet in hoistways.
   4. Division 09 Section for resilient flooring.
   5. Division 27 section for "Communications Horizontal Cabling" for telephone service for elevators.
   6. Division 28 Section for "Fire-Alarm System" for smoke detectors in elevator lobbies to initiate emergency recall operation, for heat detectors in shafts and machine rooms to disconnect power from elevator equipment before or on sprinkler activation, and for connection to elevator controllers.

1.3 DEFINITIONS

A. Definitions in ASME A17.1 apply to work of this Section.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.
   1. Include capacities, sizes, performances, operations, safety features, finishes, and similar information.
   2. Include Product Data for car enclosures, hoistway entrances, and operation, control, and signal systems.

B. Sustainable Design Submittals required by Section 01813 applicable to this Section.

C. Shop Drawings:
1. Include plans, elevations, sections, and large-scale details indicating service at each landing, coordination with building structure, relationships with other construction, and locations of equipment.

2. Include large-scale layout of car-control station and standby power operation control panel.

3. Indicate maximum dynamic and static loads imposed on building structure at points of support, and maximum and average power demands.

D. Samples for Verification: For exposed car, hoistway door and frame, and signal equipment finishes; 3-inch-square Samples of sheet materials; and 4-inch lengths of running trim members.

E. Delegated-Design Submittal: For installed products indicated to comply with performance requirements and design criteria, including comprehensive engineering analysis signed and sealed by the qualified professional engineer responsible for their preparation.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For elevators to include in emergency, operation, and maintenance manuals.

1. Submit manufacturer's or Installer's standard operation and maintenance manual, according to ASME A17.1 including diagnostic and repair information available to manufacturer's and Installer's maintenance personnel.

B. Inspection and Acceptance Certificates and Operating Permits: As required by authorities having jurisdiction for normal, unrestricted elevator use.

C. Continuing Maintenance Proposal: Submit a continuing maintenance proposal from Installer to District, in the form of a standard two-year maintenance agreement, starting on date initial maintenance service is concluded. State services, obligations, conditions, and terms for agreement period and for future renewal options.

D. Continuing Maintenance Proposal: Submit a continuing maintenance proposal from Installer to OwnerDistrict with terms, conditions, and obligations as set forth in, and in same form as, a "Draft of Elevator Maintenance Agreement" at end of this Section, starting on date initial maintenance service is concluded.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: Elevator manufacturer or an authorized representative who is trained and approved by manufacturer.

B. Provide the following upon request:

1. Qualification Data: For Installer and structural engineer.

2. Seismic Qualification Certificates: For elevator equipment, accessories, and components, from manufacturer.

   a. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.

   b. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

   c. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
3. Manufacturer Certificates: Signed by elevator manufacturer certifying that hoistway and pit layout and dimensions, as indicated on Drawings, and electrical service including standby power generator, as shown and specified, are adequate for elevator system being provided.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Deliver, store, and handle materials, components, and equipment in manufacturer's protective packaging. Store materials, components, and equipment off of ground, under cover, and in a dry location.

1.8 COORDINATION

A. Coordinate installation of inserts, sleeves, block outs, elevator equipment with integral anchors, and other items that are embedded in concrete or masonry for elevator equipment. Furnish templates, inserts, sleeves, elevator equipment with integral anchors, and installation instructions and deliver to Project site in time for installation.

B. Coordinate locations and dimensions of work specified in other Sections that relates to electric traction elevators including pit ladders; sumps and floor drains in pits; entrance subsills; electrical service; and electrical outlets, lights, and switches in hoistways and pits.

1.9 WARRANTY

A. Manufacturer's Special Warranty: Manufacturer agrees to repair, restore, or replace elevator work that fails in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, operation or control system failure, including excessive malfunctions; performances below specified ratings; excessive wear; unusual deterioration or aging of materials or finishes; unsafe conditions; need for excessive maintenance; abnormal noise or vibration; and similar unusual, unexpected, and unsatisfactory conditions.

2. Warranty Period: 5 year(s) from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Basis-of-Design Product: Subject to compliance with requirements, provide Gen2 Machine-Room-Less Electric Underslung Traction elevator as manufactured by Otis Elevator Co., or comparable product by one of the following:

1. KONE Inc.
2. ThyssenKrupp Elevator.

B. Source Limitations: Obtain elevators from single manufacturer.

1. Major elevator components, including driving machines, controllers, signal fixtures, door operators, car frames, cars, and entrances, shall be manufactured by single manufacturer.
2.2 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer, as defined in Section 014000 "Quality Requirements," to design products indicated, including, but limited to:
   1. Hoist beams.
   2. Guide rails and attachments to structure.

B. Regulatory Requirements: Comply with ASME A17.1.

C. Accessibility Requirements: Comply with requirements for accessible elevators in the United States Access Board's ADA-ABA Accessibility Guidelines and with ICC A117.1.

D. Seismic Performance: Elevator system shall withstand the effects of earthquake motions determined according to ASCE/SEI 7 Insert requirement and shall comply with elevator seismic requirements in ASME A17.1.
   1. The term "withstand" means "the system will remain in place without separation of any parts when subjected to the seismic forces specified and the system will be fully operational after the seismic event."
   2. Project Seismic Design Category: As indicated in Drawings.
   3. Elevator Component Importance Factor: 1.5 1.0.
   4. Provide earthquake equipment required by ASME A17.1.
   5. Provide seismic switch required by ASCE/SEI7.

E. Speed and Capacity:
   1. Car Speed: +/- 3 percent of contract speed under any loading condition or direction of travel.
   2. Car Capacity: Safely lower, stop and hold up to 120 percent of rated load.

F. Ride Quality:
   1. Vertical Vibration (maximum): 20 milli-g
   2. Horizontal Vibration (maximum): 12 milli-g
   3. Vertical Jerk (maximum): 4.59 +/- 1.0 ft./sec^3 (1.4 +/- 0.3 m/ sec^3)
   4. Acceleration/Deceleration (maximum): 2.62 ft./sec^2 (0.8 m/ sec^2)
   5. In Car Noise: 55 - 60 dB(A)
   6. Stopping Accuracy: +/- 0.375 inch (+/- 10 mm) maximum, +/- 0.25 inch (+/- 6 mm) typical.
   7. Re-leveling Distance: +/- 0.5 inch (+/- 12 mm)

2.3 ELEVATORS

A. Elevator System, General: Manufacturer's standard elevator systems. Unless otherwise indicated, manufacturer's standard components shall be used, as included in standard elevator systems and as required for complete system.

B. Elevator Description: Passenger Service
   1. Rated Load: 5000 lb.
   2. Rated Speed: 350 fpm.
   3. Number of Stops: 4
   4. Auxiliary Operations:
      a. Battery-powered automatic lowering.
c. Automatic dispatching of loaded car.
d. Off-peak operation.
e. Automatic operation of lights and ventilation fans.

5. Car Enclosures:
   a. Inside Cab Height: 117 inches.
   b. Inside Ceiling Height: 193 inches. Insert dimension 08 inches to underside of ceiling.
   c. Front Walls (Return Panels): Satin stainless steel, No. 4 finish.
   d. Car Fixtures: Satin stainless steel, No. 4 finish.
   e. Side and Rear Wall Panels: Satin stainless steel, No. 4 finish.
   f. Door Faces (Interior): Satin stainless steel, No. 4 finish.
   g. Door Sills: Aluminum.
   h. Ceiling: Stainless steel, perimeter-lit LED.
   i. Handrails: Rectangular flat baluster dimension r, satin stainless steel at sides and rear of car.
   j. Floor prepared to receive resilient flooring (specified in Section 096516 "Resilient Sheet Flooring").
   k. Car Operating Panel: Swing return.

6. Hoistway Entrances:
   a. Width: 36 inches 42 inches 48 inches 54 inches Insert dimension.
   b. Height: 84 inches 96 inches.
   c. Type: Two-speed center opening.
   d. Frames: Satin stainless steel, No. 4 finish.
   e. Doors: Satin stainless steel, No. 4 finish.
   f. Sills: Aluminum.

   a. Hall Buttons: Lobby (First Floor), Intermediate, and Terminal (Roof).

10. Additional Requirements:
    a. Provide inspection certificate in each car, mounted under acrylic cover with frame made from polished stainless steel, No. 8 finish.
    b. Provide hooks for protective pads in all cars and one complete set(s) of full-height protective pads.

11. Main Power Supply: 480 Volts, +/- 5 percent of normal, Three-phase, with a separate equipment grounding conductor.

13. Machine Location: Inside the hoistway at the top of the hoistway.

14. Controller Location: Machine-Roomless Controller(s) shall be located at the front opening of the top terminal landing in entrance frame.

2.4 TRACTION SYSTEMS

A. Elevator Machines: Permanent magnet, variable-voltage, variable-frequency, ac-type hoisting machines and solid-state power converters.

1. Provide regenerative system that complies with the IgCC.
2. Limit total harmonic distortion of regenerated power to 5 percent per IEEE 519.
3. Provide means for absorbing regenerated power when elevator system is operating on standby power.
4. Provide line filters or chokes to prevent electrical peaks or spikes from feeding back into building power system.

B. Fluid for Hydraulic Buffers: Fire-resistant fluid.

C. Inserts: Furnish required concrete and masonry inserts and similar anchorage devices for installing guide rails, machinery, and other components of elevator work. Device installation is specified in another Section.

D. Machine Beams: Provide steel framing to support elevator hoisting machine and deflector sheaves from the building structure. Comply with Section 055000 "Metal Fabrications" for materials and fabrication.

E. Car Frame and Platform: Bolted- or welded-steel units.

F. Guides: Roller guides or polymer-coated, nonlubricated sliding guides. Provide guides at top and bottom of car and counterweight frames.

2.5 OPERATION SYSTEMS

A. General: Provide manufacturer's standard microprocessor operation systems as required to provide type of operation indicated.

B. Auxiliary Operations:
   1. Single-Car Battery-Powered Automatic Lowering: If power fails and car is at a floor, elevator shall remain at that floor, open doors, and shut down. If car is between floors, elevator shall move to lower floor, open doors, and shut down. System shall include rechargeable battery and automatic recharging system.
   2. Automatic Operation of Lights and Fan: When elevator is stopped and unoccupied with doors closed, lighting, ventilation fan, and cab displays are de-energized after five minutes and are re-energized before car doors open.

2.6 DOOR REOPENING DEVICES

A. Infrared Array: Provide door reopening device with uniform array of 36 or more microprocessor-controlled, infrared light beams projecting across car entrance. Interruption of one or more light beams shall cause doors to stop and reopen.

2.7 CAR ENCLOSURES

A. General: Provide enameled or powder-coated steel car enclosures to receive removable steel-framed car enclosures with nonremovable wall panels, with removable car roof, access doors, power door operators, and ventilation.
   1. Provide standard railings complying with ASME A17.1 on car tops where required by ASME A17.1.

B. Materials and Finishes: Manufacturer's standards, but not less than the following:
   1. Subfloor: Exterior, C-C Plugged grade plywood, not less than 7/8-inch nominal thickness.
   2. Stainless-Steel Wall Panels: Flush, formed-metal construction; fabricated from stainless-steel sheet.
   3. Fabricate car with recesses and cutouts for signal equipment.
4. Fabricate car door frame integrally with front wall of car.
5. Stainless-Steel Doors: Flush, hollow-metal construction; fabricated from stainless-steel sheet or by laminating stainless-steel sheet to exposed faces and edges of enameled or powder-coated steel doors using adhesive that fully bonds metal to metal without telegraphing or oil-canning.
6. Sills: Extruded or machined metal, with grooved surface, 1/4 inch thick.
7. Light Fixture Efficiency: Not less than 35 lumens/W.
8. Ventilation Fan Efficiency: Not less than 3.0 cfm/W.

2.8 HOISTWAY ENTRANCES

A. Hoistway Entrance Assemblies: Manufacturer's standard horizontal-sliding, door-and-frame hoistway entrances complete with track systems, hardware, sills, and accessories. Frame size and profile shall accommodate hoistway wall construction.
   1. Where gypsum board wall construction is indicated, frames shall be self-supporting with reinforced head sections.

B. Fire-Rated Hoistway Entrance Assemblies: Door and frame assemblies shall comply with NFPA 80 and be listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction based on testing at as close-to-neutral pressure as possible according to or .
   1. Fire-Protection Rating: As indicated1 hour 1-1/2 hours Insert rating with 30-minute temperature rise of 450 deg F.

C. Materials and Fabrication: Manufacturer's standards, but not less than the following:
   2. Star of Life Symbol: Identify emergency elevators with star of life symbol, not less than 3 inches high, on both jambs of hoistway door frames.
   3. Stainless-Steel Doors and Transoms: Flush, hollow-metal construction; fabricated from stainless-steel sheet or by laminating stainless-steel sheet to exposed faces and edges of enameled or powder-coated steel doors using adhesive that fully bonds metal to metal without telegraphing or oil-canning.
   4. Sills: Extruded or machined metal, with grooved surface, 1/4 inch thick.

2.9 SIGNAL EQUIPMENT

A. General: Provide hall-call and car-call buttons that light when activated and remain lit until call has been fulfilled. Provide vandal-resistant buttons and lighted elements illuminated with LEDs.

B. Car-Control Stations: Provide manufacturer's standard recessed car-control stations. Mount in return panel adjacent to car door unless otherwise indicated.
   1. Mark buttons and switches for required use or function. Use both tactile symbols and Braille.
   2. Provide "No Smoking" sign matching car-control station, either integral with car-control station or mounted adjacent to it, with text and graphics as required by authorities having jurisdiction.

C. Firefighters' Two-Way Telephone Communication Service: Provide flush-mounted cabinet telephone jack in each car and required conductors in traveling cable for firefighters' two-way telephone communication service specified in Division 28 Section for "Fire-Alarm System."
D. Car Position Indicator: Provide illuminated, digital-type car position indicator, located above car door or above car-control station. Also, provide audible signal to indicate to passengers that car is either stopping at or passing each of the floors served. Include travel direction arrows if not provided in car-control station.

E. Hall Push-Button Stations: Provide one hall push-button station at each landing.
   1. Provide units with flat faceplate for mounting with body of unit recessed in wall.
   2. Equip units with buttons for calling elevator and for indicating desired direction of travel.
      a. Provide for connecting units to building security access system so a card reader can be used to register calls.
   3. Provide telephone jack in each unit for firefighters' two-way telephone communication service specified in Division 28 Section for "Fire-Alarm System."

F. Hall Lanterns: Units with illuminated arrows; but provide single arrow at terminal landings. Provide one of the following:
   1. Units with flat faceplate for mounting with body of unit recessed in wall and with illuminated elements projecting from faceplate for ease of angular viewing.

G. Hall Annunciator: With each hall lantern, provide audible signals indicating car arrival and direction of travel. Signals sound once for up and twice for down.
   1. At manufacturer's option, audible signals may be placed on cars.

H. Fire-Command-Center Annunciator Panel: Provide panel containing illuminated position indicators for each elevator, clearly labeled with elevator designation; include illuminated signal that indicates when elevator is operational and when it is at the designated emergency return level with doors open. Provide standby power elevator selector switch(es), as required by ASME A17.1, adjacent to position indicators. Provide illuminated signal that indicates when normal power supply has failed.

I. Emergency Pictorial Signs: Fabricate from materials matching hall push-button stations, with text and graphics as required by authorities having jurisdiction, indicating that in case of fire, elevators are out of service and exits should be used instead. Provide one sign at each hall push-button station unless otherwise indicated.

2.10 FINISH MATERIALS

A. Cold-Rolled Steel Sheet: ASTM A 1008, commercial steel, Type B, exposed, matte finish.

B. Hot-Rolled Steel Sheet: ASTM A 1011, commercial steel, Type B, pickled.

C. Stainless-Steel Sheet: ASTM A 240, Type 304.

D. Stainless-Steel Bars: ASTM A 276, Type 304.

E. Stainless-Steel Tubing: ASTM A 554, Grade MT 304.

F. Aluminum Extrusions: ASTM B 221, Alloy 6063.
PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine elevator areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work. Examine hoistways, hoistway openings, and pits as constructed; verify critical dimensions; and examine supporting structure and other conditions under which elevator work is to be installed.

B. Prepare written report, endorsed by Installer, listing conditions detrimental to performance of the Work.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with manufacturer's written instructions.

B. Welded Construction: Provide welded connections for installing elevator work where bolted connections are not required for subsequent removal or for normal operation, adjustment, inspection, maintenance, and replacement of worn parts. Comply with AWS standards for workmanship and for qualifications of welding operators.

C. Sound Isolation: Mount rotating and vibrating equipment on vibration-isolating mounts to minimize vibration transmission to structure and structure-borne noise due to elevator system.

D. Lubricate operating parts of systems, including ropes, as recommended by manufacturers.

E. Alignment: Coordinate installation of hoistway entrances with installation of elevator guide rails for accurate alignment of entrances with car. Where possible, delay final adjustment of sills and doors until car is operable in shaft. Reduce clearances to minimum, safe, workable dimension at each landing.

F. Leveling Tolerance: 1/8 inch, up or down, regardless of load and travel direction.

G. Set sills flush with finished floor surface at landing. Fill space under sill solidly with nonshrink, nonmetallic grout.

H. Locate hall signal equipment for elevators as follows unless otherwise indicated:
   1. Place hall lanterns either above or beside each hoistway entrance.
   2. Mount hall lanterns at a minimum of 72 inches above finished floor.

3.3 FIELD QUALITY CONTROL

A. Acceptance Testing: On completion of elevator installation and before permitting elevator use (either temporary or permanent), perform acceptance tests as required and recommended by ASME A17.1 and by governing regulations and agencies.

B. Operating Test: Load elevator to rated capacity and operate continuously for 30 minutes over full travel distance, stopping at each level and proceeding immediately to the next. Record temperature rise of elevator machine during 30-minute test period. Record failure to perform as required.
C. Advise District, Architect, and authorities having jurisdiction in advance of dates and times that tests are to be performed on elevators.

3.4 PROTECTION

A. Temporary Use: Comply with the following requirements for elevator used for construction purposes:
   1. Provide car with temporary enclosure, either within finished car or in place of finished car, to protect finishes from damage.
   2. Provide strippable protective film on entrance and car doors and frames.
   3. Provide padded wood bumpers on entrance door frames covering jambs and frame faces.
   4. Provide other protective coverings, barriers, devices, signs, and procedures as needed to protect elevator and elevator equipment.
   5. Do not load elevators beyond their rated weight capacity.
   6. Engage elevator Installer to provide full maintenance service. Include preventive maintenance, repair or replacement of worn or defective components, lubrication, cleanup, and adjustment as necessary for proper elevator operation at rated speed and capacity. Provide parts and supplies same as those used in the manufacture and installation of original equipment.
   7. Engage elevator Installer to restore damaged work, if any, so no evidence remains of correction. Return items that cannot be refinished in the field to the shop, make required repairs and refinish entire unit, or provide new units as required.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train District's maintenance personnel to operate, adjust, and maintain elevator.

B. Check operation of elevator with District's personnel present before date of Substantial Completion and again not more than one month before end of warranty period. Determine that operation systems and devices are functioning properly.

3.6 MAINTENANCE SERVICE

A. Initial Maintenance Service: Beginning at Substantial Completion, maintenance service shall include 24 months' full maintenance by skilled employees of elevator Installer. Include monthly preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper elevator operation at rated speed and capacity. Parts and supplies shall be manufacturer's authorized replacement parts and supplies.
   1. Perform maintenance during normal working hours.
   2. Perform emergency callback service during normal working hours with response time of two hours or less.
   3. Include 24-hour-per-day, 7-day-per-week emergency callback service with response time of two hours or less.

END OF SECTION 00010
SECTION 210413 - COMMON SUBMITTAL REQUIREMENTS FOR FIRE SUPPRESSION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Supplementary administrative and procedural requirements for submitting Shop Drawings, Product Data, Samples, and other submittals specific to the work of this Division.

B. Related Requirements:
   1. Division 01 submittal requirements.

1.3 DEFINITIONS

A. Contractor: Refers to an entity in direct Contract with the Owner to furnish and/or perform any portion of the Work of the Contract.
   1. Contractor shall review and approve Product Submittals prior to forwarding them to the Architect.

B. Product Submittals: In general, Product Submittals show characteristics of the proposed construction in one of the following forms:
   1. Shop Drawings.
   2. Product Data.
   3. Samples.

C. Action Submittals: Written and graphic information and physical samples that require Architect/Engineer's responsive action. Action submittals are those submittals indicated in individual Specification Sections as "action submittals."

D. Sustainable Design Submittals: Submittals required by Section 01813 "Sustainable Design Requirements." Submit documentation for products and materials contributing to achievement of LEED rating indicated. Sustainable Design Submittals are in addition to other submittal requirements.

E. Informational Submittals: Written and graphic information and physical samples that do not require Architect/Engineer's responsive action. Submittals may be rejected for not complying with requirements. Informational submittals are those submittals indicated in individual Specification Sections as "informational submittals."

F. Submittal Review Sheet: Specific form required to accompany each submittal. Obtain Submittal Review Sheet from the SmithGroup Project Manager.
1.4 SUBMITTAL ADMINISTRATIVE REQUIREMENTS

A. Requirements specified for submittals are intended to provide efficient handling, while permitting review responsibilities to be carried out.

B. Avoidable Resubmittals: The first two reviews of each specified submittal will be processed without cost to the Contractor. After the second review, the Owner may charge the Contractor for the cost of such additional processing, unless the processing results from approved Change Orders causing revisions to previously approved submittals.

C. Coordination: Coordinate preparation and processing of submittals with performance of construction activities.

   1. Coordinate each submittal with fabrication, purchasing, testing, delivery, other submittals, and related activities that require sequential activity.
   2. Submit all submittal items required for each Specification Section concurrently unless partial submittals for portions of the Work are indicated on approved submittal schedule.
   3. Submit action submittals and informational submittals required by the same Specification Section as separate packages under separate transmittals.
   4. Coordinate transmittal of different types of submittals for related parts of the Work so processing will not be delayed because of need to review submittals concurrently for coordination.

      a. Architect and Engineer reserve the right to withhold action on a submittal requiring coordination with other submittals until related submittals are received.

D. Processing Time: Allow time for submittal review, including time for resubmittals, as follows. Time for review shall commence on Architect's receipt of submittal. No extension of the Contract Time will be authorized because of failure to transmit submittals enough in advance of the Work to permit processing, including resubmittals.

   1. Refer to Section 01330 for quantity of days allowed for review.
   2. When a large volume of submittal materials is scheduled, additional review time may be required. Similarly, a particular submittal may require review completion in less than the agreed normal time. Due to variations in submittal volume and processing needs, agreed review time is not intended to apply to extreme conditions.

E. Maintain at the Project Site ready access to the latest reviewed Shop Drawings and Product Data, and one set of samples.

PART 2 - PRODUCTS

2.1 SUSTAINABLE DESIGN REQUIREMENTS

A. The District requires the Contractor to implement practices and procedures to meet the project's environmental performance goals. The Contractor shall ensure that the minimum requirements related to these goals, as defined in Section 01813 "Sustainable Design Requirements" are implemented to the fullest extent possible. Specific materials and systems have been selected to this end. Substitutions, or other changes to the work proposed by the Contractor or their Subcontractors, shall not be allowed if such changes compromise the aforementioned environmental goals and LEED certification.
B. Specific material goals, beyond inherently designed facility service systems, that may impact this area of work include: use of products with third-party verified Environmental Product Declaration, use of products with Health Product Declarations, use of products from manufacturers with publicly disclosed Corporate Sustainability Reports, use of products with recycled-content materials; use of locally-purchased, manufactured and extracted materials; use of FSC certified wood; use of low-emitting materials; construction waste recycling; and the implementation of a construction indoor air quality management plan.

PART 3 - EXECUTION

3.1 CONTRACTOR’S REVIEW

A. Project Closeout and Maintenance Material Submittals: See requirements in Division 01.

B. Be responsible for quantities, weights, and dimensions to be confirmed and correlated at the site; for information that pertains solely to the fabrication processes and to the means, methods, techniques, sequences, and procedures of construction; and for coordination of the work of every trade, supplier, and subcontractor.

C. Be responsible for each submittal to be in conformance with information given and the design intent expressed in the Contract Documents.

D. Provide with each submittal specific written notice of any variation from the requirements of the Contract Documents by causing a specific notation to be made on the Submittal Review Sheet and Submittal Transmittal. Changes to the approved construction documents are subject to DSA review and approval, submitted by the Architect as a CCD per DSA IR A-6.

3.2 ARCHITECT/ENGINEER’S AND GENERAL CONTRACTOR’S ACTION

A. General: Architect will not review submittals that do not include the Submittal Review Sheet.

B. Action Submittals: Architect’s staff and consultants will review the submittal, and mark the Submittal Review Sheet with an action code. The code meanings are described below.

C. Additional codes may be provided within comments or as an electronic submittal review stamp and shall be used in help indicating return of partial submittals.

E. Review Code meanings are as follows:

1. Action Codes Permitting Use:

   a. When an action code permitting use is assigned to a submittal, it does not authorize work that does not comply with the requirements of the Contract Documents. Acceptance of the Work will depend on compliance.

   b. Code AP - Approved: The Work covered by the submittal item may proceed, provided it complies with Contract Document requirements.

   c. Code AN - Approved as Noted: The Work covered by the submittal item may proceed, provided it complies with the Architect’s notations and Contract Document requirements.
d. Code AN-R - Approved as Noted - Resubmit: Do not deliver or install the related work until the resubmittal has received Code AP or AN. However, fabrication and other off-site work covered by the submittal item may proceed, at the Contractor's risk, provided it complies with the Architect's notations and Contract Document requirements.

2. Action Code Prohibiting Use:
   a. Action Code REJ - Not Approved: The Work covered by the submittal item, including purchasing, fabrication, delivery, and other activity, shall not proceed. Revise the submittal item or prepare a new item in accordance with the Architect's notations. Resubmit the corrected or new item without delay; do not permit submittal items marked "Not Approved" to be used. Work incorporating such items will be rejected.

3. Action Code for Items Not Required:
   a. Action Code X - Not Requested by Contract Documents: The submittal item is not called for by the Contract Documents and is being returned unreviewed by the Architect except to the extent necessary to determine its status.

F. Informational Submittals: For Architect's information only. Architect will review each submittal and will not return it, or will return it if it does not comply with requirements. Architect will forward each submittal to appropriate party.

1. Action Code for Information Only:
   a. Action Code INF - Information Only - Received: The submittal item is not called for a return with a reviewed action code by the Contract Documents and is being returned unreviewed by the Architect except to the extent necessary to determine its status.

G. Partial submittals prepared for a portion of the Work will be reviewed when use of partial submittals has received prior approval from Architect.

H. Incomplete submittals are not acceptable, will be considered non-responsive, and will be returned without review.

I. Architect will return without review or discard submittals received from sources other than the Contractor.

J. Submittals not required by the Contract Documents may be returned by the Architect without action.

1. Do not submit Material Safety Data Sheets. They will be returned without review or discarded.

3.3 SUBMITTAL TRANSMITTAL REQUIREMENTS

A. Submittal Transmittal shall be a PDF file in electronic format. It is recommended, to expedite the submittal review, the electronic form be emailed for review to the Architect as early as possible.

1. Submittal Numbering: See below.
2. Contact Information: Full Name, Phone Number and Email Address.

B. Submittal Definition

1. Each submittal consists of items from only ONE Specifications section.
2. Complete Submittal: If ALL the items required by the Specifications section are listed on one Submittal Form (including continuation sheet), it is a complete submittal.
3. Partial Submittals: If it is necessary to divide the required items of a given Specifications section into two or more submittals to meet schedule or handling requirements, the separate submittals are partial submittals. All partial submittals have the same submittal number, and are differentiated by sequential P-numbers (see below).
4. All items in each submittal, whether complete or partial, will be processed together: Individual items will not be 'broken out' for special handling. Arrange submittals accordingly.

C. Submittal Numbering
1. Number submittals as described below to assist tracking.
2. Number each submittal in the format nnnnnn-nn.
   a. The 6-digit number is the number of the section that requires the submittal. For example, 044200.
   b. The 2-digit number is based on the numerical sequence of submittals from that section. In other words, for each section, the first submittal is 01, the second is 02, and so on. The 2-digit number does not change for partial or re-submittals, so that the submittal can be tracked.
   c. P-Number for Partial Submittals: Number each partial submittal in the pee space, beginning with P1, and increasing by one for each partial submittal of that submittal. If the submittal is a complete submittal, leave the P space blank.
   d. R-Number for Re-submittals: Number each re-submittal in the arr space, beginning with R1, and increasing by one for each re-submittal of that submittal. Do not include an R-Number for the initial submittal.
   e. Examples:

3.4 SUBMITTAL REVIEW SHEET REQUIREMENTS

A. Provide Submittal Review Sheet in PDF format. Submit as the page after the Submittal Transmittal.
B. When attached, the Submittal Review Sheet shall not obscure information contained in the submittal.
C. Do not edit any of the information contained within the Submittal Review Sheet except as follows:
   1. Submittal Number: See Submittal Numbering in Submittal Transmittal Requirements paragraph.
D. The Contractor shall submit the PDF file in a manner that will allow editing of the Submittal Review Sheet fields by SmithGroup and its consultants.

END OF SECTION
SECTION 21 13 13 – WET-PIPE SPRINKLER SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and the general provisions of the Contract, including General and Supplementary Conditions and other Division 01 specifications sections, apply to this section.

1.2 DESCRIPTION

A. Provide a complete wet pipe automatic fire sprinkler system throughout the building, as required by the California Building Code, California Fire Code and NFPA 13, and the authorities having jurisdiction.

1.3 WORK INCLUDED

A. Furnish all labor, materials, equipment, and services required for and/or reasonably incidental to the completion of the following work. Include all such work shown on the drawings and/or listed below.

B. Provide a complete wet-pipe automatic fire sprinkler system throughout the building to provide protection as required by NFPA 13, 2016 Edition and the authority having jurisdiction.

C. Provide a complete automatic deluge (open sprinkler) system for complete sprinkler coverage below planetarium dome, design and installed per NFPA 13.

D. Provide a manual, wet, class I standpipe system in the building in accordance with NFPA 14 2016 Edition and comply with the requirements of the authority having jurisdiction.

E. Provide all sprinklers and piping. All sprinklers shall be quick response unless noted otherwise on the contract drawings or prohibited by NFPA 13 or the equipment listings.

F. Provide all main, test, and auxiliary drains, as required.

G. All painting of portions of the fire protection system required to be painted by the College, Architect or Planetarium Consultant or the project specifications or drawings.

H. Comply with all design requirements of the authority having jurisdiction.

I. Arrange for all required inspections by the authority having jurisdiction. Cost of all testing and special inspection required shall be included in this contract.

J. Provide all shop drawings of the fire protection systems as required by NFPA 13. At a minimum the drawings shall show location and type of sprinklers, piping, hangers, bracing, seismic restraint, drains, test valves, and all related items.

L. Provide all permit and inspection fees for the work under this section.

M. Provide all alarm monitoring and equipment required by NFPA 13 and 14 for a complete system installation including paddle type flow switch is to be installed at each system riser, pressure switch at deluge riser and supervisory switches on all control valves. All equipment monitoring devices required shall be provided, adjusted and tested under this contract. Monitoring of the devices shall be under a different scope.

N. Coordinate the fire sprinkler system installation with the other trades on this project.

1.4 REFERENCED STANDARDS

A. The 2016 edition of NFPA 13 and 2013 edition of NFPA 14 shall be followed. Where these specifications or the authority having jurisdiction requirements vary from these standards, the more rigid requirements shall apply.

1.5 RELATED WORK UNDER OTHER SECTIONS

A. The following is not in the work under this section, but is covered under other sections.
   1. Installation of the underground fire protection system with exception of 5’-0” stub. Refer to Site Civil utility drawings for point of connection (POC). Civil underground pipe will stop 5 feet from building.
   2. Fire Alarm Systems and the electrical wiring for the fire sprinkler supervisory system.

1.6 CODE REQUIREMENTS

A. All work shall conform to the requirements of applicable Federal, State and local building and safety codes, ordinances and regulations.

B. Nothing in this specification or on the plans shall be construed as permitting a departure from any applicable Federal, State and local building and safety codes, ordinances and regulations, or from any requirement by the authority having jurisdiction.

C. Special attention shall be given to local fire and building regulations.

D. All work shall be done in accordance with the requirements of NFPA 13, 2016 and NFPA 14, 2013.

1.7 SUB-CONTRACTOR QUALIFICATIONS

A. All work must be performed by a State licensed automatic fire sprinkler contractor regularly and currently engaged in the installation of fire protection systems.

1.8 SHOP DRAWINGS AND SUBMITTALS

A. Before commencing any work or providing any materials at the job site for this project, this contractor shall submit to the Owner's Representative, for approval, Shop Drawings and Material Data Sheets. Shop drawings shall be in compliance with NFPA 13, NFPA 14 and include any local requirements. Material Data Sheets should contain the manufacturer's data regarding all material and equipment intended for use on this project.
B. Within thirty (30) days submit shop drawings to the Owner's Representative for review. These drawings shall include layout of all piping and valves.

C. Within thirty (30) days submit 6 copies of all materials to be used. Submittal shall include valves, pipe, fittings, etc., for review prior to any fabrication or installation.

D. After making corrections as indicated by the Owner's Representative, submit shop drawings to all authorities for approval.

E. This contractor must submit detailed shop drawings and inspection certificates to the authority having jurisdiction, and secure approval thereof, so as to cause no delay to construction schedule.

F. Upon completion of the project, submit final "as built" record drawings and calculations detailing installed supply piping, system control valves, main and branchline piping, and sprinkler head locations.

G. Upon completion of the job, furnish the Owner's Representative with a copy of the “Contractors Material and Test Certificate” signed by the authority having jurisdiction.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Overhead piping, fittings and certain hanger material shall conform to the requirements outlined in NFPA 13 and NFPA 14, all other material shall be listed in the Underwriters Laboratories, Inc., Fire Protection Equipment List, and the Factory Mutual Approval Guide, for use as intended in overhead automatic fire sprinkler and standpipe system installations, and shall be acceptable to the authority having jurisdiction. Material that is pending approval shall not be acceptable.

B. Fittings and couplings that are designed to be installed on plain end pipe or which incorporate set screws shall not be used. Fittings shall be designed to withstand earthquake forces and local vibration, which may be present in the building.

C. All sprinklers below ceilings are to be pendent style as noted on the fire protection drawings.

D. All sprinklers above ceilings are to be upright or pendent style as noted on the fire protection drawings.
E. Any pipe and fittings installed outside of the building and exposed to the elements shall be galvanized or painted to protect against corrosion.

F. Bushings shall not be used unless specifically approved.

G. All threaded pipe shall be Allied Tube Schedule 40 black steel or equal. UL Listed and FM Approved.

H. All grooved pipe shall be Allied Tube Schedule 10 black steel or equal. UL Listed and FM Approved.

I. All grooved fittings to be Victaulic or approved equal.

PART 3 - EXECUTION

3.1 INSTALLATION

A. It is the intent of these specifications that this contractor install the fire protection system to meet the specifications contained herein, including the various design and performance criteria delineated and to be responsible for the actual performance of the system according to these criteria.

B. Prior to bid, visit the job site; take measurements and other such information. Compare this with the drawings and specifications as to the conditions under which the work is to be performed. No allowance shall be subsequently made for extra expenses due to failure or neglect to make such an examination.

C. All piping shall be installed as required by NFPA 13, NFPA 14 and in a manner acceptable to the authority having jurisdiction.

D. All piping shall be pressure tested and flushed according to the procedures set forth in NFPA 13 and NFPA 14.

E. Sprinklers installed where they may be exposed or subjected to mechanical damage shall be furnished with head guards.

F. All piping shall be concealed unless shown as exposed on the contract drawings.

G. Installation of the sprinkler system shall not be started until complete plans and hydraulic calculations have been approved by the authority having jurisdiction.

H. All equipment installed under this contract shall be protected from external damage, including, but not limited to corrosion and settlement.

I. This contractor shall be responsible for any damage to other work caused by his installation or by leaks in the fire protection lines.

J. All work shall be done in a neat and workman like manner.

3.2 AS BUILT DRAWINGS
A. Keep a current set of “as-built” drawings on the job site at all times. These drawings should be updated as changes are made.

B. Keep a current set of Material Data Sheets, with catalog cuts, on the job site at all times.

3.3 CLEAN UP

A. Perform the work under this section so as to keep affected portions of the site neat, clean and orderly at all times. Upon completion of the work under this section, remove immediately all surplus materials, rubbish and equipment associated with or used in the performance of this work. Failure to perform such cleanup operations within 24 hours of notice by the Owner's Representative shall be considered adequate grounds for having the work done by others at contractor's expense.

END OF SECTION
SECTION 22 00 00 – PLUMBING GENERAL REQUIREMENTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Division 01.

B. The requirements of the General Conditions and Supplementary Conditions.

1.2 SUMMARY

A. Furnish and install a complete (fully tested, adjusted, and ready for operation) plumbing system as described by the Contract Drawings and Specifications.

B. The design described in the Project documents reflect a building designed for low consumption of energy and water and minimum environmental footprint. Any modifications to the systems described herein shall maintain or improve on the sustainability and energy efficiency features of the project.

C. All design modifications that pertain to system selection, system energy efficiency, water and energy use, material selection and indoor air quality issues shall require the approval of Integral Group.

D. Include incidental details not usually shown or specified, but necessary for proper installation and operation.

E. Check, verify, and coordinate Work with Contract Drawings and Specifications prepared by all other trades. Include modifications, relocations, and adjustments necessary to complete work or avoid interference with other trades.

F. Where architectural features govern location of Work, refer to Architectural Drawings.

G. Contractor may install additional piping, fittings, and valves, not shown on the drawings, for testing purposes or convenience of installation. Where such materials are installed, they shall comply with the specifications and shall be properly sized for the system and operation. Remove such installed materials when they interfere with design conditions or as directed by the Architect.

H. LEED: This building shall be LEED certified. Contractor and their subs shall provide all relevant support documentation pertaining to the LEED credits that relate to their work.

I. Commissioning: The scope of work for the Contractor shall not include the duties of the Commissioning Authority (CxA). Contractor will be required, however, to include in their scope of work duties relevant to the commissioning process, including but not limited to training of owner's personnel in the operation of the plumbing equipment, providing manufacturer's startup and pre functional checklists and contractor-provided pre-functional and startup checklists to Commissioning Authority, performing and documenting pre-functional tests for plumbing equipment, performing and documenting functional tests for plumbing equipment, supporting DDC Contractor and Test and Balance Contractor in the performance of their duties, and
providing operations and maintenance manuals. Refer to Division 23 “Commissioning of HVAC and Plumbing” for additional requirements.

1.3 CODES AND STANDARDS

A. All work and materials shall be in full accordance with the latest local rules and regulations, applicable sections of the California Code of Regulations, Title 24, State Fire Marshal, the Safety Orders of the Division of Industrial Safety, the California Electric Code and applicable State requirements. Nothing in these Plans and Specifications is to be construed to permit work not conforming to these requirements.

B. Wherever the Specifications call for or describe materials or construction of better quality or larger sizes than are required by the above rules and regulations, these Specifications shall govern. Should there be any direct conflict between the above rules and regulations and the Specifications the rules shall govern.

C. Equipment shall have UL label listing.

1.4 DRAWINGS

A. Layout of the equipment and work is diagrammatic, unless specifically dimensioned. Drawings and details shall be checked for interferences before installing the work. Any interference noted between different drawings, and between drawings and actual field conditions shall be brought to the attention of the Architect and Engineer of Record for a decision. The right is reserved to make any reasonable change in location of equipment without additional expense to the Owner.

B. For purposes of clarity and legibility, drawings are diagrammatic to the extent that many offsets, bends, special fittings, exact locations of items are not indicated, unless specifically dimensioned. Exact routing of piping and locations of equipment shall be governed by structural conditions and obstructions. Contractor shall make use of all data in Contract Drawings and Specifications and field conditions.

C. In the event a major re-routing of a system appears necessary, Contractor shall prepare and submit for approval, shop drawings of the proposed rearrangement. Because of the diagrammatic nature and small scale of the Contract Drawings, all necessary offsets, adjustments, and transitions required for the complete installation are not shown. Contractor shall carefully investigate the structural and finish conditions affecting all the Work and shall arrange such Work accordingly, furnishing such fittings, equipment, accessories, etc., as may be required to meet such conditions, at no increase in Contract Sum.

D. The construction documents for this project were prepared by the design team using BIM (Building Information Modeling). Using this software by the design team does not relieve the Contractor from performing the necessary coordination to provide complete, code compliant and operational building systems. The plans and sections provided are diagrammatic and show the design intent, these are not intended to be used for fabrication or installation. Contractor is responsible for generating shop drawings for fabrication that meet the design intent as shown on the Contract Documents. The exact location of the piping, electrical and support components are to be determined by the Contractor. All building sections and details provided are for information only and do not relieve the Contractor from performing final coordination. Contractor is responsible for coordinating with all other trades.
E. All dimensions and locations of equipment, doors, partitions, etc., are to be taken from the architectural plans but shall be verified at the site.

1.5 SUBMITTALS

A. See Division 01 “Administrative Requirements”, for submittal procedures.

B. Plumbing and related submittals are, in addition, subject to the requirements of this Article. In the event of a conflict between the requirements of Division 01 and this Article, the requirements of this Article shall supersede and take precedence over those of Division 01.

C. Engineer of Record will review submittals and provide comments within the following timeframe after receipt by the Engineer:
   1. For typical submittals, allow 10 working days.
   2. For large or complex submittals, allow 15 working days. Determination of “large and complex” submittal shall be at the discretion of the Engineer of Record.
   3. Do not send Engineer of Record more than 10 submittals in a contiguous period of 5 working days. If excess submittals are received, review period will be extended as necessary to perform proper review. Submittals will be reviewed in priority determined by Engineer of Record in consultation with Architect and Contractor.
   4. These submittal review periods supersede and take precedence over periods defined in Division 01, unless Division 01 allows for longer review periods.
   5. Submittal review periods shall not be reduced from the times herein except by agreement with the reviewing entity, in advance and in writing.

D. Submittal documentation and drawings shall consistently use the same abbreviations, symbols, nomenclature and identifiers. Use the same identifiers (e.g. equipment tags) used in Contract Drawings.

E. Submittals shall be provided in digital format.
   1. Provide a separate file for each submittal. For submittal packages, provide a separate file for each subsection (e.g. hardware cutsheets and shop drawings for the same Section shall be provided as separate files).
   2. Product cutsheets, test forms and other text documents shall be provided in word searchable digital format. Acceptable formats are MS Word, PDF (generated from another electronic document and word-searchable; scans of paper documents are not acceptable), and HTML; other formats require approval prior to submission.
   3. Drawings and schematics shall be provided in PDF format and in AutoCAD compatible format.
   4. Scanned paper documents are not acceptable
      a. Exception: original signed documents, such as qualifications, inspection certificates, and warranty documents.
   5. Hardcopy (paper) submittals are not acceptable and shall not be provided except as noted in Article 1.2).
   6. Submittals provided in the wrong format will be returned without action.

F. Submission and Resubmission Procedure
   1. Optional Pre-Submittals: At Contractor’s option, material may be submitted unofficially via email directly to the Engineer of Record for review and comment prior to formal submission. Comments provided by the Engineer are not official and may be changed or additional comments may be provided on the formal submittal. The intent of pre-
submittals is to reduce paperwork and review time, and to provide a venue to discuss technologies, products, designs or implementation strategies that are novel or unique.

2. Each submittal shall have a unique serial number that includes the associated Specification Section followed by a number for each sub-part of the submittal for that Specification Section, such as SUBMITTAL 220000-01. There is no requirement to assign particular serial numbers to any specific submittals – serial number assignment is arbitrary. The only requirements are that the serial numbers be sequential (to avoid confusing gaps) and, most importantly, consistent across all submittal correspondence.

3. Each resubmittal shall have the original unique serial number plus unique revision number such as SUBMITTAL 220000-01 REVISION 1.

4. Submit one copy of submittal in electronic format specified in Paragraph 1.5E. Submissions made in the wrong format will be returned without action.

5. Include with each submittal and resubmittal a copy of the relevant specification section(s) noting on each paragraph and sub-paragraph(s) the following:
   a. CONFORMS: Contractor has verified that the submitted product conforms to the noted requirement(s).
   b. CONFORMS AS NOTED: Contractor has verified that the submitted product conforms to the noted requirement(s) by means of being equal to or higher quality and / or performance.
   c. NON-CONFORM: Contractor has verified that the submitted product does not conform to the noted requirement(s) and delineates each deviation from the specification requirements.
   d. NOT APPLICABLE: Contractor has verified that the noted requirement(s), in their opinion do not apply to this product, delineating the reasons for this decision.
   e. Include with each submittal and resubmittal a copy of the relevant specification section(s) the printed name of the contractor reviewer, their signature, the company name, and date of review.

6. Revise submittal
   a. Respond to all comments:
      1) Revise initial submittal to resolve review comments and corrections.
      2) Provide complete responses to comments or suggestions which are not practical to implement in the opinion of the Contractor.
   b. Indicate any changes that have been made other than those requested.
   c. Clearly identify resubmittal by original submittal number and revision number.
   d. Resubmittals that are not responsive to all comments will be returned without action.

7. Resubmit revised submittals until no exceptions are taken.

8. Once submittals are accepted with "No Exceptions Taken" or "Approved As Noted", provide:
   a. Complete submittal of all accepted drawings and products in a single electronic file.
   b. Copies for coordination with other trades, if and as required by the General Contractor or Owner’s Representative.

G. Submit shop drawings, a list of proposed material and equipment manufacturers and the names of Subcontractors.

H. Shop drawings shall be provided for all plumbing systems for all floors of the building. Plumbing shop drawings shall also be provided for the underslab systems (under the foundation slab) and slab-embedded systems such as floor drains.
I. Materials and methods with which the words "for approval" or "approved" are used, and materials and methods which differ from those specified, shall be submitted.

J. Prepare and submit shop drawings, sections, details and diagrams to minimum scale 1/4" = 1'-0". Drawings shall be coordinated, dimensioned and indicate equipment, pipe, duct, fire protection, and electrical in relation to architectural and structural features. Include minor piping, drains, air vents, etc. Indicate exact locations and elevations of valves, piping specialties, access doors, dampers, etc. Electronic submittal is encouraged.

K. Submit manufacturer's specifications, product source, data sheets, certified equipment drawings and installation instructions, including installation dimensions, clearances, weights, materials, finishes, color selection, accessories, acoustical characteristics, capacity and full load and part load performance curves; complete with electrical data, motor horse power, KW; motor efficiency, amperage, voltage phases and wiring diagrams. Identify the particular specification section number, paragraph and equipment identification number per equipment schedule. Note that suppliers (wholesalers and distributors) data sheets are not acceptable unless they are also manufacturers of the product being submitted.

L. Pump systems, with equipment in parallel, shall have performance curves noting single equipment operation and all iterations of additional equipment.

M. Certified Equipment Drawings (8-1/2" x 11" sheets) shall be indexed in accordance with Specification Section. Drawings to be submitted at a later date shall be marked with a page as a placeholder for insertion when submitted. The original submittal shall note which shop drawings will be submitted later. Marked-up catalogs are not acceptable and will be returned without action. Electronic submittal is required.

N. Engineer of Record’s review of submittals is for limited purpose of verifying conformance with information given and design concept expressed in Contract Drawings and Specifications. Engineer’s review is not for purpose of determining accuracy or completeness of items such as dimensions and quantities, which remain responsibility of Contractor.

O. Contractor shall not commence with fabrication or installation of any equipment or system until the associated submittals have been approved by the Engineer of Record and returned with "no exceptions" taken. Contractor shall be solely liable for any costs incurred from starting fabrication before approved submittals are returned.

P. All final approved submittals and equipment datasheets shall be provided, in PDF format, to the owner as part of the as-built drawing set and shall be text searchable.

1.6 COORDINATION DRAWINGS

A. Utilize the latest version of 3D AutoCAD, Navisworks, and/or Revit software for the Coordination Drawings. No proprietary software of any kind shall be used other than that indicated. Drawing paper size shall not be larger than FULL SIZED Contract Drawings, and in no case larger than 30” x 42”. Coordinate available space with ALL other trades involved.

B. Provide Coordination Drawings in digital electronic format. Provide both native file format (AutoCAD, Navisworks, or Revit) and PDF format files. Hardcopy drawings are not acceptable.

C. These drawings are to show pipe sizes, valves and accessories, elevation of bottom of pipe, all elevations of materials and/or systems throughout each floor inclusive of hanger components, seismic bracing if applicable, and any component of construction that impacts vertical and/or
horizontal space. In addition, the locations of all valves and other items requiring access for service and maintenance are to be shown. The drawings are to also show electrical, structural beams, architectural bracing, structural bracing, ceiling heights, access doors, walls, floor to floor dimensions, columns, doors and other major architectural and structural features as shown on the architectural and structural drawings. Where the routing of work differs from that indicated on the Contract Drawings, such areas are to be indicated by highlighting with a note describing the reason for the change.

D. Rerouting of any system or part thereof shall be submitted separately in order to obtain concurrence of the Engineer of Record. Submitted rerouting must include fully documented proposed solutions with all trades coordinated. Contractor is fully responsible for coordination of systems included herein. Any effort by Engineer of Record beyond answering Contractor’s questions will be at Contractor’s expense, including attending coordination meetings, review of interim plans, or review of incomplete questions (routing issues without suggested solutions).

E. The Contractor and subcontractors are responsible to review and resolve any real or apparent interferences or conflicts as indicated by the coordination drawings produced by each trade.

F. After all conflicts or interferences are resolved, develop a final composite drawing showing the agreed upon routing, layout and juxtaposition of all piping, major conduit, valves, panels, lighting fixtures and all other major mechanical, plumbing and electrical installations. In the preparation of all the final Coordination Drawings, large scale details as well as cross and longitudinal sections are required to fully delineate all conditions.

G. Submit the Coordination Drawings as digital electronic files to Engineer of Record for review and comment, as indicated under “Shop Drawings” above. Coordination Drawings shall be digitally signed-off by all other trades.

H. Contractor shall not commence with fabrication or installation of any equipment or system until the associated shop drawings have been reviewed and returned by the Engineer of Record. Engineer’s review of shop drawings shall not be taken as approval of their contents. Contractor shall be solely liable for any costs incurred due to deviations from the Contract Drawings.

I. No extra compensation will be paid for relocating any pipe, duct, conduit, or other material that has been installed without proper coordination between all trades involved. If any improperly coordinated work, or installed work that is not in accordance with the approved coordination composites, or is specifically noted by the Architect or Engineer of Record for a valid reason, necessitates additional work by the other trades, the costs of all such additional work is to be borne solely by the Contractor.

J. All changes in the scope of work due to revisions formally issued and approved are to be shown on both the individual subcontractor’s Shop Drawings and the Coordination Drawings.

1.7 REQUESTS FOR INTERPRETATION AND CLARIFICATION

A. See Division 01 “Project Management”, for RFI procedures and forms.

B. Plumbing RFIs are, in addition, subject to the requirements of this Article. In the event of a conflict between the requirements of Division 01 and this Article, the requirements of this Article shall supersede and take precedence over those of Division 01.

C. Limit each RFI to a single issue or group of related issues.
D. Each RFI shall include a workable no-cost or lowest cost solution recommendation by Contractor.

E. Allow three (3) working days from time of RFI receipt by Engineer of Record for review and response.

F. Do not send Engineer of Record more than 10 RFIs in a contiguous period of 5 working days. If excess RFIs are received, review period will be extended as necessary to provide a professional response. RFIs will be reviewed in priority determined by Engineer of Record in consultation with Architect and Contractor.

1.8 MATERIALS AND SUBSTITUTIONS

A. Comply with Division 01 “Product Requirements”.

B. Requests for product or equipment substitution shall be accompanied by a marked up copy of the Engineer of Record's original specification. For each specified product feature or requirement, Contractor shall note the equivalent feature or attribute of the proposed substitute product or equipment.

C. Shop drawings of proposed material and equipment that differ from the specified materials and equipment, shall be accompanied by drawings that define changes. These drawings shall show modifications of architectural, plumbing, electrical and mechanical work required by the proposed materials and equipment, such as relocation of flues, drains, revised electrical circuits, relocation of roof or wall penetrations, revised foundations, etc.

1.9 COORDINATION WITH OTHER WORK

A. Contractor performing Work under this Section shall become thoroughly familiar with the Drawings and Specifications. Contractor shall adjust the Work to conform with the conditions shown on these drawings to provide the best possible assembly of the combined Work.

B. Obtain necessary information from the other trades regarding location of their work in order that the Work in this Section may be placed in correct position.

C. The inclusion and proper location of supports, pads, sleepers, openings, anchorages, etc. provided by others is the responsibility of the Contractor under this Section. Cutting and/or boring shall be permitted under this Section only with the written approval of the Architect.

D. It shall be the Contractor's responsibility to coordinate and have provided by other trades where not covered by the Contractor's scope of work, all electrical wiring and power to equipment, controls and devices, and any other work from other trades as required to provide fully functioning plumbing systems per the Contract Drawings and Specifications.

1.10 MANUFACTURER'S DIRECTIONS

A. Manufacturer's directions shall be followed in cases where the manufacturers of articles used in this contract furnish directions covering points not shown in the Contract Drawings and Specifications.
1.11 PROTECTION OF WORK

A. Equipment and materials shall be stored on dunnage and remain wrapped at all times until installed.

B. Duct and piping shall be remain capped during delivery and storage.

C. During installation, all installed duct and piping shall be capped and protected at the end of each working day.

D. Equipment shall be protected from weather and stored in an enclosed, indoor location.

E. Until final acceptance of the work, protect materials from damage and provide adequate and proper storage facilities. Replace damaged or defective work, material, and equipment before requesting final acceptance.

1.12 WORKMANSHIP

A. Equipment and materials shall be installed in a neat and workmanlike manner. Materials and equipment not so installed shall, upon order of the Architect or Engineer of Record, be removed and replaced in a satisfactory manner, without change in Contract Sum or additional cost to the Owner.

1.13 CLOSING IN UNINSPECTED WORK

A. Do not allow or cause any work to be covered up or enclosed until it has been inspected, tested, and accepted by the Architect, Engineer of Record, and/or Commissioning Authority.

B. Any work enclosed or covered-up prior to inspection and testing shall be uncovered. After the work has been tested, inspected and accepted, repair such materials as may be necessary to restore disturbed work to its original and proper condition at no extra cost to the Owner.

1.14 EQUIPMENT ANCHORING

A. Equipment shall be securely anchored to the building structure to prevent shifting or overturning during earthquakes.

1.15 PRELIMINARY OPERATION

A. Under this section, Contractor shall supervise and direct preliminary operation of systems should the Owner demand that any portion of the plant, apparatus, or equipment be operated previous to the final completion and acceptance of the work. Expenses for such preliminary operation will be paid by the Owner. Such preliminary operation or payment shall not be construed as an acceptance of the work.

1.16 CUTTING AND OPENINGS

A. Comply with Division 01 “Cutting and Patching”.

Contra Costa Community College District
Contra Costa College
C-4016 New Science Building - DSA Backcheck
1.17 "AS-BUILT" DRAWINGS
   A. Comply with Section Division 01 “Project Closeout”.
   B. As-built drawings shall be furnished in an electronic format. Provide in drafting software (AutoCAD or Revit) native format and also in PDF format.

1.18 FINAL INSPECTION
   A. At the time of final inspection, a service representative shall be available to make final adjustments.

1.19 FINAL OPERATION
   A. After acceptance of the installation, instruct the Owner's Representative in operation and maintenance, for a period of three (3), non-consecutive working days at a time requested by the Owner during the first year of warranty.
   B. At the beginning of the instruction period, deliver to the Owner three (3) copies of a durable binder as described under "Operating Instructions".

1.20 OPERATING INSTRUCTIONS
   A. The following O&M manual requirements do not replace O&M manual documentation requirements elsewhere in these Specifications.
   B. Division 22 shall compile and prepare documentation for all equipment and systems covered in Division 22 and deliver this documentation to the General Contractor for inclusion in the O&M manuals prior to the training of Owner personnel.
   C. Provide a summary of operating sequences (start-up, normal run, and shut-down), and control shop drawings in the main mechanical room.
   D. Provide three (3) complete sets of Operating Instructions. These instructions shall include brochures, diagrams, maintenance, and operating instructions and parts lists. See Article 1.19 "Final Operation”.
   E. Provide a copy of the O&M manuals to the Commissioning Authority for review.

1.21 TRAINING OF OWNER PERSONNEL
   A. The General Contractor shall be responsible for training coordination and scheduling and ultimately to ensure that training is completed.
   B. The Commissioning Authority (CxA) shall be responsible for overseeing and approving the content and adequacy of the training of Owner personnel for commissioned equipment.
   C. The Plumbing Contractor shall have the following training responsibilities:
      1. Provide the CxA with a training plan two weeks before the planned training.
2. Provide designated Owner personnel with comprehensive orientation and training in the understanding of the systems and the operation and maintenance of each piece of equipment including, but not limited to, pumps, heaters, controls, water treatment systems, etc.

3. Training shall normally start with classroom sessions followed by hands-on training on each piece of equipment, which shall illustrate the various modes of operation, including startup, shutdown, fire/smoke alarm, power failure, etc.

4. During any demonstration, should the system fail to perform in accordance with the requirements of the O&M manual or sequence of operations, the system will be repaired or adjusted as necessary and the demonstration repeated.

5. The appropriate trade or manufacturer’s representative shall provide the instructions on each major piece of equipment. This person may be the start-up technician for the piece of equipment, the installing contractor or manufacturer’s representative. Practical building operating expertise as well as in-depth knowledge of all modes of operation of the specific piece of equipment are required. More than one party may be required to execute the training.

6. The training sessions shall follow the outline in the Table of Contents of the operation and maintenance manual and illustrate whenever possible the use of the O&M manuals for reference.

7. Training shall include:
   
a. Use of the printed installation, operation and maintenance instruction material included in the O&M manuals.
   b. A review of the written O&M instructions emphasizing safe and proper operating requirements, preventative maintenance, special tools needed and spare parts inventory suggestions. The training shall include start-up, operation in all modes possible, shut-down, seasonal changeover and any emergency procedures.
   c. Discussion of relevant health and safety issues and concerns.
   d. Discussion of warranties and guarantees.
   e. Common troubleshooting problems and solutions.
   f. Explanatory information included in the O&M manuals and the location of all plans and manuals in the facility.
   g. Discussion of any peculiarities of equipment installation or operation.
   h. Instruction in the use of equipment controls that are integral to equipment or are provided by the equipment manufacturer. Equipment controls training shall include at least the following:

   1) Specific hardware configuration of installed systems in this building and specific instruction for operating the installed system and any interface with security and communication systems.
   2) Security levels, alarms, system start-up, shut-down, power outage and restart routines, changing setpoints and alarms and other typical changed parameters, overrides, freeze protection, manual operation of equipment, optional control strategies that can be considered, energy savings strategies and set points that if changed will adversely affect energy consumption, energy accounting, procedures for obtaining vendor assistance, etc.
   3) If system supports trending, all trending and monitoring features (values, change of state, totalization, etc.), including setting up, executing, downloading, viewing both tabular and graphically and printing trends. Trainees will actually set-up trends in the presence of the trainer.
   4) Every screen shall be completely discussed, allowing time for questions.
   5) Use of keypad or plug-in laptop computer for mobile control access.
   6) Use of remote access to the system via phone lines or networks, if applicable.
   7) Graphics generation, if applicable.
   8) Point database entry and modifications, if applicable.

j. Classroom sessions shall include the use of overhead projections, slides, video/audio-taped material as might be appropriate. A video record of the training session is suggested but not required.

8. Hands-on training shall include start-up, operation in all modes possible, including manual, shut-down and any emergency procedures and preventative maintenance for all pieces of equipment.

9. The Contractor shall fully explain and demonstrate the operation, function and overrides of any local packaged controls, not controlled by the central control system.

10. Training shall occur after functional testing is complete, unless approved otherwise by the Project Manager.

1.22 WARRANTY

A. In accordance with Division 01 Project Closeout requirements, Guarantees, Warranties, Bonds, Service & Maintenance Contracts and as follows.

B. Contractor shall leave entire installation in complete working order and free from defects in material, workmanship, or finish.

C. Warranty all materials, equipment, apparatus, and workmanship to be free of defective materials and faulty workmanship for a minimum period of one (1) year from date of Certificate of Occupancy, or per Division 01, whichever is longer.

D. Warranty also services including instructions, adjusting, testing, noise, balancing, etc.

E. For each piece of equipment or device with a manufacturer’s warranty in excess of one year, Contractor shall furnish certificate of manufacturer’s warranty and contact information for manufacturer’s warranty service. Contractor shall also provide a list or table of all equipment with warranties exceeding one (1) year in duration.

F. Provide new materials, equipment, apparatus, labor and/or service, and support to correct or replace that determined by the Owner to be defective or faulty.

G. The Owner reserves the right to make temporary repairs as necessary to keep equipment in operating condition without voiding the guarantees or relieving responsibility during the guarantee period.

H. After a period of 90 calendar days from date of acceptance of systems by Owner, provide, at no cost to the Owner, one service mechanic for an 8-hour period over as many working days as required to repair, replace any latent deficiency.

PART 2 - PRODUCTS (Not Applicable)

PART 3 - EXECUTION (Not Applicable)

END OF SECTION
SECTION 220413 - COMMON SUBMITTAL REQUIREMENTS FOR PLUMBING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Supplementary administrative and procedural requirements for submitting Shop Drawings, Product Data, Samples, and other submittals specific to the work of this Division.

B. Related Requirements:
   1. Division 01 submittal requirements.

1.3 DEFINITIONS

A. Contractor: Refers to an entity in direct Contract with the Owner to furnish and/or perform any portion of the Work of the Contract.
   1. Contractor shall review and approve Product Submittals prior to forwarding them to the Architect.

B. Product Submittals: In general, Product Submittals show characteristics of the proposed construction in one of the following forms:
   1. Shop Drawings.
   2. Product Data.
   3. Samples.

C. Action Submittals: Written and graphic information and physical samples that require Architect/Engineer's responsive action. Action submittals are those submittals indicated in individual Specification Sections as "action submittals."

D. Sustainable Design Submittals: Submittals required by Section 01813 "Sustainable Design Requirements." Submit documentation for products and materials contributing to achievement of LEED rating indicated. Sustainable Design Submittals are in addition to other submittal requirements.

E. Informational Submittals: Written and graphic information and physical samples that do not require Architect/Engineer's responsive action. Submittals may be rejected for not complying with requirements. Informational submittals are those submittals indicated in individual Specification Sections as "informational submittals."

F. Submittal Review Sheet: Specific form required to accompany each submittal. Obtain Submittal Review Sheet from the SmithGroup Project Manager.
1.4 SUBMITTAL ADMINISTRATIVE REQUIREMENTS

A. Requirements specified for submittals are intended to provide efficient handling, while permitting review responsibilities to be carried out.

B. Avoidable Resubmittals: The first two reviews of each specified submittal will be processed without cost to the Contractor. After the second review, the Owner may charge the Contractor for the cost of such additional processing, unless the processing results from approved Change Orders causing revisions to previously approved submittals.

C. Coordination: Coordinate preparation and processing of submittals with performance of construction activities.

1. Coordinate each submittal with fabrication, purchasing, testing, delivery, other submittals, and related activities that require sequential activity.
2. Submit all submittal items required for each Specification Section concurrently unless partial submittals for portions of the Work are indicated on approved submittal schedule.
3. Submit action submittals and informational submittals required by the same Specification Section as separate packages under separate transmittals.
4. Coordinate transmittal of different types of submittals for related parts of the Work so processing will not be delayed because of need to review submittals concurrently for coordination.
   a. Architect and Engineer reserve the right to withhold action on a submittal requiring coordination with other submittals until related submittals are received.

D. Processing Time: Allow time for submittal review, including time for resubmittals, as follows. Time for review shall commence on Architect's receipt of submittal. No extension of the Contract Time will be authorized because of failure to transmit submittals enough in advance of the Work to permit processing, including resubmittals.

1. Refer to Section 01330 for quantity of days allowed for review.
2. When a large volume of submittal materials is scheduled, additional review time may be required. Similarly, a particular submittal may require review completion in less than the agreed normal time. Due to variations in submittal volume and processing needs, agreed review time is not intended to apply to extreme conditions.

E. Maintain at the Project Site ready access to the latest reviewed Shop Drawings and Product Data, and one set of samples.

PART 2 - PRODUCTS

2.1 SUSTAINABLE DESIGN REQUIREMENTS

A. The District requires the Contractor to implement practices and procedures to meet the project's environmental performance goals. The Contractor shall ensure that the minimum requirements related to these goals, as defined in Section 01813 "Sustainable Design Requirements” are implemented to the fullest extent possible. Specific materials and systems have been selected to this end. Substitutions, or other changes to the work proposed by the Contractor or their Subcontractors, shall not be allowed if such changes compromise the aforementioned environmental goals and LEED certification.
B. Specific material goals, beyond inherently designed facility service systems, that may impact this area of work include: use of products with third-party verified Environmental Product Declaration, use of products with Health Product Declarations, use of products from manufacturers with publicly disclosed Corporate Sustainability Reports, use of products with recycled-content materials; use of locally-purchased, manufactured and extracted materials; use of FSC certified wood; use of low-emitting materials; construction waste recycling; and the implementation of a construction indoor air quality management plan.

PART 3 - EXECUTION

3.1 CONTRACTOR’S REVIEW

A. Project Closeout and Maintenance Material Submittals: See requirements in Division 01.

B. Be responsible for quantities, weights, and dimensions to be confirmed and correlated at the site; for information that pertains solely to the fabrication processes and to the means, methods, techniques, sequences, and procedures of construction; and for coordination of the work of every trade, supplier, and subcontractor.

C. Be responsible for each submittal to be in conformance with information given and the design intent expressed in the Contract Documents.

D. Provide with each submittal specific written notice of any variation from the requirements of the Contract Documents by causing a specific notation to be made on the Submittal Review Sheet and Submittal Transmittal. Changes to the approved construction documents are subject to DSA review and approval, submitted by the Architect as a CCD per DSA IR A-6.

3.2 ARCHITECT/ENGINEER’S AND GENERAL CONTRACTOR’S ACTION

A. General: Architect will not review submittals that do not include the Submittal Review Sheet.

B. Action Submittals: Architect’s staff and consultants will review the submittal, and mark the Submittal Review Sheet with an action code. The code meanings are described below.

C. Additional codes may be provided within comments or as an electronic submittal review stamp and shall be used in help indicating return of partial submittals.

E. Review Code meanings are as follows:

1. Action Codes Permitting Use:
   a. When an action code permitting use is assigned to a submittal, it does not authorize work that does not comply with the requirements of the Contract Documents. Acceptance of the Work will depend on compliance.
   b. Code AP - Approved: The Work covered by the submittal item may proceed, provided it complies with Contract Document requirements.
   c. Code AN - Approved as Noted: The Work covered by the submittal item may proceed, provided it complies with the Architect’s notations and Contract Document requirements.
d. Code AN-R - Approved as Noted - Resubmit: Do not deliver or install the related work until the resubmittal has received Code AP or AN. However, fabrication and other off-site work covered by the submittal item may proceed, at the Contractor's risk, provided it complies with the Architect's notations and Contract Document requirements.

2. Action Code Prohibiting Use:
   a. Action Code REJ - Not Approved: The Work covered by the submittal item, including purchasing, fabrication, delivery, and other activity, shall not proceed. Revise the submittal item or prepare a new item in accordance with the Architect's notations. Resubmit the corrected or new item without delay; do not permit submittal items marked "Not Approved" to be used. Work incorporating such items will be rejected.

3. Action Code for Items Not Required:
   a. Action Code X - Not Requested by Contract Documents: The submittal item is not called for by the Contract Documents and is being returned unreviewed by the Architect except to the extent necessary to determine its status.

F. Informational Submittals: For Architect's information only. Architect will review each submittal and will not return it, or will return it if it does not comply with requirements. Architect will forward each submittal to appropriate party.
   1. Action Code for Information Only:
      a. Action Code INF - Information Only - Received: The submittal item is not called for a return with a reviewed action code by the Contract Documents and is being returned un-reviewed by the Architect except to the extent necessary to determine its status.

G. Partial submittals prepared for a portion of the Work will be reviewed when use of partial submittals has received prior approval from Architect.

H. Incomplete submittals are not acceptable, will be considered non-responsive, and will be returned without review.

I. Architect will return without review or discard submittals received from sources other than the Contractor.

J. Submittals not required by the Contract Documents may be returned by the Architect without action.
   1. Do not submit Material Safety Data Sheets. They will be returned without review or discarded.

3.3 SUBMITTAL TRANSMITTAL REQUIREMENTS

A. Submittal Transmittal shall be a PDF file in electronic format. It is recommended, to expedite the submittal review, the electronic form be emailed for review to the Architect as early as possible.
   1. Submittal Numbering: See below.
   2. Contact Information: Full Name, Phone Number and Email Address.

B. Submittal Definition
   1. Each submittal consists of items from only ONE Specifications section.
2. Complete Submittal: If ALL the items required by the Specifications section are listed on one Submittal Form (including continuation sheet), it is a complete submittal.
3. Partial Submittals: If it is necessary to divide the required items of a given Specifications section into two or more submittals to meet schedule or handling requirements, the separate submittals are partial submittals. All partial submittals have the same submittal number, and are differentiated by sequential P-numbers (see below).
4. All items in each submittal, whether complete or partial, will be processed together: Individual items will not be ‘broken out’ for special handling. Arrange submittals accordingly.

C. Submittal Numbering
1. Number submittals as described below to assist tracking.
2. Number each submittal in the format nnnnnn-nn.
   a. The 6-digit number is the number of the section that requires the submittal. For example, 044200.
   b. The 2-digit number is based on the numerical sequence of submittals from that section. In other words, for each section, the first submittal is 01, the second is 02, and so on. The 2-digit number does not change for partial or re-submittals, so that the submittal can be tracked.
   c. P-Number for Partial Submittals: Number each partial submittal in the pee space, beginning with P1, and increasing by one for each partial submittal of that submittal. If the submittal is a complete submittal, leave the P space blank.
   d. R-Number for Re-submittals: Number each re-submittal in the arr space, beginning with R1, and increasing by one for each re-submittal of that submittal. Do not include an R-Number for the initial submittal.
   e. Examples:

3.4 SUBMITTAL REVIEW SHEET REQUIREMENTS

A. Provide Submittal Review Sheet in PDF format. Submit as the page after the Submittal Transmittal.
B. When attached, the Submittal Review Sheet shall not obscure information contained in the submittal.
C. Do not edit any of the information contained within the Submittal Review Sheet except as follows:
   1. Submittal Number: See Submittal Numbering in Submittal Transmittal Requirements paragraph.
D. The Contractor shall submit the PDF file in a manner that will allow editing of the Submittal Review Sheet fields by SmithGroup and its consultants.

END OF SECTION
SECTION 22 05 13 COMMON MOTOR REQUIREMENTS FOR PLUMBING EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
   A. Section includes general requirements for single-phase and poly-phase, general-purpose, horizontal, small and medium, squirrel-cage induction motors for use on ac power systems up to 600 V and installed at equipment manufacturer's factory or shipped separately by equipment manufacturer for field installation.

1.3 COORDINATION
   A. Coordinate features of motors, installed units, and accessory devices to be compatible with the following:
      1. Motor controllers.
      2. Torque, speed, and horsepower requirements of the load.
      3. Ratings and characteristics of supply circuit and required control sequence.
      4. Ambient and environmental conditions of installation location.

PART 2 - PRODUCTS

2.1 GENERAL MOTOR REQUIREMENTS
   A. Comply with NEMA MG 1 unless otherwise indicated.
   B. Comply with IEEE 841 for severe-duty motors.

2.2 MOTOR CHARACTERISTICS
   A. Duty: Continuous duty at ambient temperature of 40 deg C and at altitude of 3300 feet (1000 m) above sea level.
   B. Capacity and Torque Characteristics: Sufficient to start, accelerate, and operate connected loads at designated speeds, at installed altitude and environment, with indicated operating sequence, and without exceeding nameplate ratings or considering service factor.
2.3 POLYPHASE MOTORS

A. Description: NEMA MG 1, Design B, medium induction motor.

B. Efficiency: Energy efficient, as defined in NEMA MG 1.

C. Service Factor: 1.15.

D. Multispeed Motors: Variable torque.
   1. For motors with 2:1 speed ratio, consequent pole, single winding.
   2. For motors with other than 2:1 speed ratio, separate winding for each speed.

E. Multispeed Motors: Separate winding for each speed.

F. Rotor: Random-wound, squirrel cage.

G. Bearings: Regreasable, shielded, antifriction ball bearings suitable for radial and thrust loading.

H. Temperature Rise: Match insulation rating.

I. Insulation: Class B.

J. Code Letter Designation:
   1. Motors 15 HP and Larger: NEMA starting Code F or Code G.
   2. Motors Smaller than 15 HP: Manufacturer's standard starting characteristic.

K. Enclosure Material: Cast iron for motor frame sizes 324T and larger; rolled steel for motor frame sizes smaller than 324T.

2.4 POLYPHASE MOTORS WITH ADDITIONAL REQUIREMENTS

A. Motors Used with Reduced-Voltage and Multispeed Controllers: Match wiring connection requirements for controller with required motor leads. Provide terminals in motor terminal box, suited to control method.

B. Motors Used with Variable Frequency Controllers: Ratings, characteristics, and features coordinated with and approved by controller manufacturer.
   1. Windings: Copper magnet wire with moisture-resistant insulation varnish, designed and tested to resist transient spikes, high frequencies, and short time rise pulses produced by pulse-width modulated inverters.
   2. Energy- and Premium-Efficient Motors: Class B temperature rise; Class F insulation.
   3. Inverter-Duty Motors: Class F temperature rise; Class H insulation.
   4. Thermal Protection: Comply with NEMA MG 1 requirements for thermally protected motors.

C. Severe-Duty Motors: Comply with IEEE 841, with 1.15 minimum service factor.
2.5 SINGLE-PHASE MOTORS

A. Motors larger than 1/20 hp shall be one of the following, to suit starting torque and requirements of specific motor application:
   1. Permanent-split capacitor.
   2. Split phase.
   3. Capacitor start, inductor run.
   4. Capacitor start, capacitor run.

B. Multispeed Motors: Variable-torque, permanent-split-capacitor type.

C. Bearings: Pre-lubricated, antifriction ball bearings or sleeve bearings suitable for radial and thrust loading.

D. Motors 1/20 HP and Smaller: Shaded-pole type.

E. Thermal Protection: Internal protection to automatically open power supply circuit to motor when winding temperature exceeds a safe value calibrated to temperature rating of motor insulation. Thermal-protection device shall automatically reset when motor temperature returns to normal range.

PART 3 - EXECUTION (NOT USED)

END OF SECTION
SECTION 22 05 17 SLEEVES AND SLEEVE SEALS FOR PLUMBING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Sleeves.
   2. Stack-sleeve fittings.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

PART 2 - PRODUCTS

2.1 SLEEVES

A. Cast-Iron Wall Pipes: Cast or fabricated of cast or ductile iron and equivalent to ductile-iron pressure pipe, with plain ends and integral water stop unless otherwise indicated.

B. Galvanized-Steel Wall Pipes: ASTM A 53/A 53M, Schedule 40, with plain ends and welded steel collar; zinc coated.

C. Galvanized-Steel-Pipe Sleeves: ASTM A 53/A 53M, Type E, Grade B, Schedule 40, zinc coated, with plain ends.

D. Galvanized-Steel-Sheet Sleeves: 0.0239-inch minimum thickness; round tube closed with welded longitudinal joint.

E. Molded-PE or -PP Sleeves: Removable, tapered-cup shaped, and smooth outer surface with nailing flange for attaching to wooden forms.

2.2 STACK-SLEEVE FITTINGS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Zurn Industries, LLC.
2.3 SLEEVE-SEAL FITTINGS

A. Manufacturers: Subject to compliance with requirements, provide products by the following:
   1. HOLDRITE.
   2. Link-Seal - GPT Industries.
   3. Proco Products.

B. Description: Manufactured plastic, sleeve-type, water-stop assembly made for imbedding in concrete slab or wall. Unit has plastic or rubber water-stop collar with center opening to match piping OD.

2.4 GROUT

B. Characteristics: Nonshrink; recommended for interior and exterior applications.

C. Design Mix: 5000-psi, 28-day compressive strength.

D. Packaging: Premixed and factory packaged.

PART 3 - EXECUTION

3.1 SLEEVE INSTALLATION

A. Install sleeves for piping passing through penetrations in floors, partitions, roofs, and walls.

B. Install sleeves in concrete floors, concrete roof slabs, and concrete walls as new slabs and walls are constructed.
   1. Permanent sleeves are not required for holes in slabs formed by molded-PE or -PP sleeves.
   2. Cut sleeves to length for mounting flush with both surfaces.
      a. Exception: Extend sleeves installed in floors of mechanical equipment areas or other wet areas 2 inches above finished floor level.
   3. Using grout, seal the space outside of sleeves in slabs and walls without sleeve-seal system.

C. Install sleeves for pipes passing through interior partitions.
   1. Cut sleeves to length for mounting flush with both surfaces.
   2. Install sleeves that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation.
   3. Seal annular space between sleeve and piping or piping insulation; use joint sealants appropriate for size, depth, and location of joint. Comply with requirements for sealants specified in Section 07 92 00 "Joint Sealants."
D. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with firestop materials. Comply with requirements for firestopping specified in Section 07 84 13 "Penetration Firestopping."

3.2 STACK-SLEEVE-FITTING INSTALLATION

A. Install stack-sleeve fittings in new slabs as slabs are constructed.
1. Install fittings that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation.
2. Secure flashing between clamping flanges for pipes penetrating floors with membrane waterproofing. Comply with requirements for flashing specified in Section 07 62 00 "Sheet Metal Flashing and Trim."
3. Install section of cast-iron soil pipe to extend sleeve to 2 inches above finished floor level.
4. Extend cast-iron sleeve fittings below floor slab as required to secure clamping ring if ring is specified.
5. Using grout, seal the space around outside of stack-sleeve fittings.

B. Fire-Barrier Penetrations: Maintain indicated fire rating of floors at pipe penetrations. Seal pipe penetrations with firestop materials. Comply with requirements for firestopping specified in Section 07 84 13 "Penetration Firestopping."

3.3 SLEEVE-SEAL-FITTING INSTALLATION

A. Install sleeve-seal fittings in new walls and slabs as they are constructed.
B. Assemble fitting components of length to be flush with both surfaces of concrete slabs and walls. Position water-stop flange to be centered in concrete slab or wall.
C. Secure nailing flanges to concrete forms.
D. Using grout, seal the space around outside of sleeve-seal fittings.

3.4 SLEEVE SCHEDULE

A. Use sleeves for the following piping-penetration applications:
1. Exterior Concrete Walls above Grade:
   b. Piping NPS 6 (DN 150) and Larger: Galvanized-steel-pipe sleeves.
2. Exterior Concrete Walls below Grade:
      1) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.
   b. Piping NPS 6 and Larger: Galvanized-steel-pipe sleeves with sleeve-seal system.
      1) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.
3. Concrete Slabs-on-Grade:
1) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.

b. Piping NPS 6 and Larger: Galvanized-steel-pipe sleeves with sleeve-seal system.

1) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.

4. Concrete Slabs above Grade:
   b. Piping NPS 6 and Larger: Galvanized-steel-pipe sleeves.

5. Interior Partitions:
   a. Piping Smaller Than NPS 6 Galvanized-steel-pipe sleeves
   b. Piping NPS 6 and Larger: Galvanized-steel-sheet sleeves
SECTION 22 05 18 - ESCUTCHEONS FOR PLUMBING PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
   A. Drawings and general provisions of the Contract, including General and Supplementary
      Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
   A. Section Includes:
      1. Escutcheons.
      2. Floor plates.

1.3 ACTION SUBMITTALS
   A. Product Data: For each type of product indicated.

PART 2 - PRODUCTS

2.1 ESCUTCHEONS
   A. One-Piece, Cast-Brass Type: With polished, chrome-plated finish and setscrew fastener.
   B. One-Piece, Deep-Pattern Type: Deep-drawn, box-shaped brass with chrome-plated finish and spring-clip fasteners.
   C. One-Piece, Stamped-Steel Type: With chrome-plated finish and spring-clip fasteners.
   D. Split-Casting Brass Type: With polished, chrome-plated finish and with concealed hinge and setscrew.

2.2 FLOOR PLATES
   A. One-Piece Floor Plates: Cast-iron flange with holes for fasteners.
   B. Split-Casting Floor Plates: Cast brass with concealed hinge.

PART 3 - EXECUTION

3.1 INSTALLATION
   A. Install escutcheons for piping penetrations of walls, ceilings, and finished floors.
B. Install escutcheons with ID to closely fit around pipe, tube, and insulation of insulated piping and with OD that completely covers opening.

1. Escutcheons for New Piping:
   a. Piping with Fitting or Sleeve Protruding from Wall: One-piece, deep-pattern type.
   b. Chrome-Plated Piping: One-piece, cast-brass or split-casting brass type with polished, chrome-plated finish.
   c. Insulated Piping: One-piece, stamped-steel type or split-plate, stamped-steel type with concealed hinge or split-plate, stamped-steel type with exposed-rivet hinge.
   d. Bare Piping at Wall and Floor Penetrations in Finished Spaces: One-piece, cast-brass or split-casting brass type with polished, chrome-plated finish.
   e. Bare Piping at Ceiling Penetrations in Finished Spaces: One-piece, cast-brass or split-casting brass type with polished, chrome-plated finish.
   f. Bare Piping in Unfinished Service Spaces: One-piece, cast-brass or split-casting brass type with polished, chrome-plated finish.
   g. Bare Piping in Equipment Rooms: One-piece, cast-brass or split-casting brass type with polished, chrome-plated finish.

C. Install floor plates for piping penetrations of equipment-room floors.

D. Install floor plates with ID to closely fit around pipe, tube, and insulation of piping and with OD that completely covers opening.

1. New Piping: One-piece, floor-plate type.
2. Existing Piping: Split-casting, floor-plate type.

3.2 FIELD QUALITY CONTROL

A. Replace broken and damaged escutcheons and floor plates using new materials.

END OF SECTION
SECTION 22 05 19 - METERS AND GAUGES FOR PLUMBING PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Bimetallic-actuated thermometers.
   2. Thermowells.
   3. Dial-type pressure gauges.
   4. Gauge attachments.
   5. Test plugs.
   6. Test-plug kits.
   7. Sight flow indicators.
   8. Metering.

B. Related Sections:
   1. Section 22 11 16 "Domestic Water Piping" for water meters inside the building.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

1.4 INFORMATIONAL SUBMITTALS

A. Product Certificates: For each type of meter and gauge, from manufacturer.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For meters and gauges to include in operation and maintenance manuals.

PART 2 - PRODUCTS

2.1 BIMETALLIC-ACTUATED THERMOMETERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Ashcroft Inc.
   2. Trerice, H. O. Co.
3. Weksler Glass Thermometer Corp.

C. Case: sealed type(s); stainless steel with 3-inch nominal diameter.

D. Dial: Non reflective aluminum with permanently etched scale markings and scales in deg 200F.

E. Connector Type(s): Union joint, rigid, bottom, with unified-inch screw threads.

F. Connector Size: 1/2 inch, with ASME B1.1 screw threads.

G. Stem: 0.25 or 0.375 inch in diameter; stainless steel.

H. Window: Plain glass.

I. Ring: Stainless steel.

J. Element: Bimetal coil.

K. Pointer: Dark-colored metal.

L. Accuracy: Plus or minus 1 percent of scale range.

2.2 THERMOWELLS

A. Thermowells:
   2. Description: Pressure-tight, socket-type fitting made for insertion into piping tee fitting.
   3. Material for Use with Copper Tubing: CNR or CUNI.
   4. Material for Use with Steel Piping: CRES.
   5. Type: Stepped shank unless straight or tapered shank is indicated.
   6. External Threads: NPS 1/2, NPS 3/4, or NPS 1, ASME B1.20.1 pipe threads.
   7. Internal Threads: 1/2, 3/4, and 1 inch, with ASME B1.1 screw threads.
   8. Bore: Diameter required to match thermometer bulb or stem.
   9. Insertion Length: Length required to match thermometer bulb or stem.
   10. Lagging Extension: Include on thermowells for insulated piping and tubing.
   11. Bushings: For converting size of thermowell's internal screw thread to size of thermometer connection.

B. Heat-Transfer Medium: Mixture of graphite and glycerin.

2.3 PRESSURE GAUGES

A. Direct-Mounted, Metal-Case, Dial-Type Pressure Gauges:
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. Ashcroft Inc.
      b. Trerice, H. O. Co.
      c. Weksler Glass Thermometer Corp.
3. Case: Sealed Solid-front, pressure relief type(s); cast aluminum or drawn steel; 4-1/2-inch nominal diameter.
4. Pressure-Element Assembly: Bourdon tube unless otherwise indicated.
5. Pressure Connection: Brass, with NPS 1/4, ASME B1.20.1 pipe threads and bottom-outlet type unless back-outlet type is indicated.
6. Movement: Mechanical, with link to pressure element and connection to pointer.
7. Dial: Non reflective aluminum with permanently etched scale markings graduated in psi.
9. Window: Glass or plastic.
10. Ring: Metal.
11. Accuracy: Grade B, plus or minus 2 percent of middle half of scale range.

2.4 GAUGE ATTACHMENTS

A. Snubbers: ASME B40.100, brass; with NPS 1/4 or NPS 1/2, ASME B1.20.1 pipe threads and piston-type surge-dampening device. Include extension for use on insulated piping.

B. Valves: Brass or stainless-steel needle, with NPS 1/4 or NPS 1/2, ASME B1.20.1 pipe threads.

2.5 TEST PLUGS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Trerice, H. O. Co.
   2. Weiss Instruments, Inc.
   3. Weksler Glass Thermometer Corp.

B. Description: Test-station fitting made for insertion into piping tee fitting.

C. Body: Brass or stainless steel with core inserts and gasketed and threaded cap. Include extended stem on units to be installed in insulated piping.

D. Thread Size: NPS 1/4 or NPS 1/2, ASME B1.20.1 pipe thread.

E. Minimum Pressure and Temperature Rating: 500 psig at 200 deg F.

F. Core Inserts: EPDM self-sealing rubber.

2.6 TEST-PLUG KITS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Trerice, H. O. Co.
   2. Watts; a Watts Water Technologies company.
   3. Weiss Instruments, Inc.

B. Furnish one test-plug kit(s) containing one thermometer(s), one pressure gauge and adapter, and carrying case. Thermometer sensing elements, pressure gauge, and adapter probes shall be of diameter to fit test plugs and of length to project into piping.
C. Low-Range Thermometer: Small, bimetallic insertion type with 1- to 2-inch- diameter dial and tapered-end sensing element. Dial range shall be at least 25 to 125 deg F.

D. Pressure Gauge: Small, Bourdon-tube insertion type with 2- to 3-inch- diameter dial and probe. Dial range shall be at least 0 to 200 psig.

E. Carrying Case: Metal or plastic, with formed instrument padding.

2.7 SIGHT FLOW INDICATORS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Emerson Process Management; Rosemount Division.
   2. OPW Engineered Systems; OPW Fluid Transfer Group; a Dover company.
   3. Pentair Valves & Controls; Penberthy Brand.

B. Description: Piping inline-installation device for visual verification of flow.

C. Construction: Bronze or stainless-steel body, with sight glass and ball, flapper, or paddle wheel indicator, and threaded or flanged ends.

D. Minimum Pressure Rating: 150 psig.

E. Minimum Temperature Rating: 200 deg F.

F. End Connections for NPS 2 and Smaller: Threaded.

G. End Connections for NPS 2-1/2 and Larger: Flanged.

2.8 METERING

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Badger Meter, Inc.
   2. Neptune Technology Group Inc.
   4. Elster

B. Meters capable of the following:
   1. Recording daily water consumption.
   2. Communicating data remotely. Pulse output to BMS.
   3. Electronic data storage for five years.
   4. Reports showing daily, monthly, and annual water consumption.
   5. Alarming capability in accordance with Water User Efficiency Plan for Operation.

C. Meter potable and reclaimed water sources to the building and onsite non-potable water sources individually.

D. Submeter the following, when required:
   1. Automatically controlled irrigation systems.
2. Makeup-water lines to mechanical equipment including to and from blowdown lines from cooling towers.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install thermowells with socket extending a minimum of 2 inches into fluid and in vertical position in piping tees.

B. Install thermowells of sizes required to match thermometer connectors. Include bushings if required to match sizes.

C. Install thermowells with extension on insulated piping.

D. Fill thermowells with heat-transfer medium.

E. Install direct-mounted thermometers in thermowells and adjust vertical and tilted positions.

F. Install remote-mounted thermometer bulbs in thermowells and install cases on panels; connect cases with tubing and support tubing to prevent kinks. Use minimum tubing length.

G. Install direct-mounted pressure gauges in piping tees with pressure gauge located on pipe at the most readable position.

H. Install remote-mounted pressure gauges on panel.

I. Install valve and snubber in piping for each pressure gauge for fluids.

J. Install test plugs in piping tees.

K. Install thermometers in the following locations:
   1. Inlet and outlet of each water heater.
   2. Inlets and outlets of each domestic water heat exchanger.
   3. Inlet and outlet of each domestic hot-water storage tank.

L. Install pressure gauges in the following locations:
   1. Building water service entrance into building.
   2. Inlet and outlet of each pressure-reducing valve.
   3. Suction and discharge of each domestic water pump.

3.2 CONNECTIONS

A. Install meters and gauges adjacent to machines and equipment to allow service and maintenance of meters, gauges, machines, and equipment.

3.3 ADJUSTING

A. Adjust faces of meters and gauges to proper angle for best visibility.
3.4 THERMOMETER SCHEDULE

A. Thermometers at inlet and outlet of each domestic water heater shall be one of the following:
   1. Sealed, bimetallic-actuated type.
   2. Test plug with EPDM self-sealing rubber inserts.

B. Thermometers at inlets and outlets of each domestic water heat exchanger shall be the following:
   1. Sealed, bimetallic-actuated type.
   2. Test plug with EPDM self-sealing rubber inserts.

C. Thermometers at inlet and outlet of each domestic hot-water storage tank shall be the following:
   1. Sealed, bimetallic-actuated type.
   2. Test plug with EPDM self-sealing rubber inserts.

D. Thermometer stems shall be of length to match thermowell insertion length.

3.5 THERMOMETER SCALE-RANGE SCHEDULE

A. Scale Range for Domestic Cold-Water Piping: 0 to 100 deg F.

B. Scale Range for Domestic Hot-Water Piping: 30 to 240 deg F.

3.6 PRESSURE-GAUGE SCHEDULE

A. Pressure gauges at discharge of each water service into building shall be the following:
   2. Test plug with EPDM self-sealing rubber inserts.

B. Pressure gauges at inlet and outlet of each water pressure-reducing valve shall be the following:
   2. Test plug with EPDM self-sealing rubber inserts.

C. Pressure gauges at suction and discharge of each domestic water pump shall be the following:
   2. Test plug with EPDM self-sealing rubber inserts.

3.7 PRESSURE-GAUGE SCALE-RANGE SCHEDULE

A. Scale Range for Water Service Piping: 0 to 100 psi.

B. Scale Range for Domestic Water Piping: 0 to 160 psi.

END OF SECTION
SECTION 22 05 23 - GENERAL DUTY VALVES FOR PLUMBING PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Ball valves.
   2. Butterfly valves.
   3. Check valves.

B. Related Sections:
   1. Section 22 05 53 "Identification for Plumbing Piping and Equipment".
   2. Section 22 11 16 "Domestic Water Piping".
   3. Section 22 13 16 "Sanitary Waste and Vent Piping".
   4. Section 22 14 13 "Storm Drainage Piping".

1.3 DEFINITIONS

A. CWP: Cold working pressure.

B. EPDM: Ethylene propylene-diene terpolymer rubber.

C. PTFE: Polytetrafluoroethylene.

1.4 ACTION SUBMITTALS

A. See Division 01 and Section 22 00 00 “Plumbing General Requirements” for submittal procedures.

B. Product Data: For each type of valve.
   1. Certification that products that come into contact with potable water comply with NSF 61 Annex G and NSF 372.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: for each type of valve to include in operation and maintenance manuals.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Prepare valves for shipping as follows:
1. Protect internal parts against rust and corrosion.
2. Protect threads, flange faces, soldered ends, and grooves.
4. Set butterfly valves closed or slightly open.

B. Use the following precautions during storage:
   1. Maintain valve end protection.
   2. Store valves indoors and maintain at higher-than-ambient-dew-point temperature. If outdoor storage is necessary, store valves off the ground in watertight enclosures.

C. Use sling to handle large valves; rig sling to avoid damage to exposed parts. Do not use hand wheels or stems as lifting or rigging points.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS FOR VALVES

A. Source Limitations for Valves: Obtain each type of valve from single source from single manufacturer.

B. Valves shall be manufactured in the United States.

C. Coordinate joint connection with Valve schedule in Part 3 and piping system specifications.

D. ASME Compliance:
   1. ASME B1.20.1 for threaded end valves.
   2. ASME B16.1 for flanges on iron valves.
   3. ASME B16.5 for flanges on steel valves.
   4. ASME B16.10 and ASME B16.34 for ferrous valve dimensions and design criteria.
   6. ASME B31.9 for building service piping valves.

E. AWWA Compliance: Comply with AWWA C606 for grooved-end connections.

G. Bronze valves shall be made with dezincification-resistant materials. Bronze valves made with copper alloy (brass) containing more than 15 percent zinc are not permitted.

H. Valve Actuator Types:
   1. Gear Actuator: For valves NPS 8 and larger.

I. Valves in Insulated Piping: With 2-inch stem extensions; operating handles of nonthermal-conductive material and protective sleeves that allow operation of valves without breaking vapor seals or disturbing insulation.

J. All plumbing components including but not limited to valves and other wetted parts shall be lead free.
2.2 BALL VALVES

A. Two-Piece, Bronze Ball Valves with Full Port:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. NIBCO INC.
      b. Hammond Valve.
      c. Milwaukee Valve Company.
   2. Description: Two-Piece bronze body, chrome-plated brass ball, bronze trim, PTFE seat, steel handle with plated plastisol coating, \textbf{600 psig (4140 kPa)} CWP rating.

B. Steel Ball Valves with Full Port:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. NIBCO INC.
      b. Hammond Valve.
      c. Milwaukee Valve Company.
   2. Description: Carbon steel (ASTM A 216) split body, stainless steel ball and stem, PTFE seat.

2.3 BUTTERFLY VALVES

A. Iron, Single-Flange Butterfly Valves:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. NIBCO INC.
      b. Conbraco Industries, Inc.
      c. Hammond Valve.
      d. Milwaukee Valve Company.
      e. DeZURIK.
   2. Description: Cast iron (ASTM A 126) or ductile iron (ASTM A 536) lug type body, suitable for bidirectional dead-end service at rated pressure without use of downstream flange, EPDM seat, one or two piece stainless steel stem, nickel-plated ductile iron disc.
   3. Standard: MSS SP-67, Type I.

B. Iron, Grooved-End Butterfly Valves:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Victaulic Company.
      b. Kennedy Valve Company; a division of McWane, Inc.
      c. Tyco Fire Products LP.
   2. Description: Coated ductile iron body, EPDM seal, two-piece stainless steel stem, coated ductile iron disc.
   3. Standard: MSS SP-67, Type I.

2.4 CHECK VALVES

A. Bronze, Swing Check Valves:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
2.5 EXAMINATION

A. Examine valve interior for cleanliness, freedom from foreign matter, and corrosion. Remove special packing materials, such as blocks, used to prevent disc movement during shipping and handling.

B. Operate valves in positions from fully open to fully closed. Examine guides and seats made accessible by such operations.

C. Examine mating flange faces for damage. Check bolting for proper size, length, and material. Verify that gasket is of proper size, that its material composition is suitable for service, and that it is free from defects and damage.

D. Do not attempt to repair defective valves; replace with new valves.

2.6 INSTALLATION

A. Install valves with unions or flanges at each piece of equipment arranged to allow service, maintenance, and equipment removal without system shutdown.

B. Locate valves for easy access and provide separate support where necessary.

C. Install valves in horizontal piping with stem at or above center of pipe.

D. Install valves in position to allow full stem movement.

E. Install chain wheels on operators for butterfly valves NPS 4 and larger and more than 96 inches above floor. Extend chains to 60 inches above finished floor.

F. Install valve tags. Comply with requirements in Section 22 05 53 "Identification for Plumbing Piping and Equipment" for valve tags and schedules.

2.7 ADJUSTING

A. Adjust or replace valve packing after piping systems have been tested and put into service but before final adjusting and balancing. Replace valves if persistent leaking occurs.

2.8 VALVE SCHEDULE

A. Refer to piping system sections for valve schedules.

B. Coordinate Class or CWP rating with associated piping system rating.
   1. If valves with specified CWP ratings are unavailable, the same types of valves with higher CWP ratings may be substituted.
C. Valve Sizes: Same as upstream piping unless otherwise indicated.

END OF SECTION
SECTION 22 05 29 - HANGERS AND SUPPORTS FOR PLUMBING PIPING AND EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Metal pipe hangers and supports.
   2. Trapeze pipe hangers.
   3. Metal framing systems.
   4. Thermal-hanger shield inserts.
   5. Fastener systems.
   6. Pipe positioning systems.
   7. Equipment supports.

B. Related Sections:
   1. Section 05 5000 "Metal Fabrications" for structural-steel shapes and plates for trapeze hangers for pipe and equipment supports.
   2. Section 22 0548 "Vibration and Seismic Controls for Plumbing Piping and Equipment" for vibration isolation devices.
   3. Section 01 8113 “Sustainability and LEED – NC V2009 Requirements” for sustainability requirements.

1.3 DEFINITIONS

A. MSS: Manufacturers Standardization Society of the Valve and Fittings Industry Inc.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: Signed and sealed by a qualified professional engineer. Show fabrication and installation details and include calculations for the following; include Product Data for components:
   1. Trapeze pipe hangers.
   2. Equipment supports.

PART 2 - PRODUCTS

2.1 METAL PIPE HANGERS AND SUPPORTS

A. Carbon-Steel Pipe Hangers and Supports:
1. Description: MSS SP-58, Types 1 through 58, factory-fabricated components.
2. Galvanized Metallic Coatings: Pre-galvanized or hot dipped.
3. Nonmetallic Coatings: Plastic coating, jacket, or liner.
4. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion to support bearing surface of piping.

2.2 TRAPEZE PIPE HANGERS

A. Description: MSS SP-69, Type 59, shop- or field-fabricated pipe-support assembly made from structural carbon-steel shapes with MSS SP-58 carbon-steel hanger rods, nuts, saddles, and U-bolts.

B. Non-MFMA Manufacturer Metal Framing Systems:
   1. Description: Shop- or field-fabricated pipe-support assembly made of steel channels, accessories, fittings, and other components for supporting multiple parallel pipes.
   3. Channels: Continuous slotted steel channel with inturned lips.
   4. Channel Nuts: Formed or stamped steel nuts or other devices designed to fit into channel slot and, when tightened, prevent slipping along channel.

2.3 THERMAL-HANGER SHIELD INSERTS

A. Insulation-Insert Material for Hot Piping: Water-repellent treated, ASTM C 533, Type I calcium silicate with 100-psig minimum compressive strength.

B. For Trapeze or Clamped Systems: Insert and shield shall cover entire circumference of pipe.

C. For Clevis or Band Hangers: Insert and shield shall cover lower 180 degrees of pipe.

D. Insert Length: Extend 2 inches beyond sheet metal shield for piping operating below ambient air temperature.

2.4 FASTENER SYSTEMS

A. Mechanical-Expansion Anchors: Insert-wedge-type, zinc-coated steel anchors, for use in hardened portland cement concrete; with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

2.5 PIPE POSITIONING SYSTEMS

A. Description: IAPMO PS 42, positioning system of metal brackets, clips, and straps for positioning piping in pipe spaces; for plumbing fixtures in commercial applications.

2.6 EQUIPMENT SUPPORTS

A. Description: Welded, shop- or field-fabricated equipment support made from structural carbon-steel shapes.
2.7 MISCELLANEOUS MATERIALS

A. Structural Steel: ASTM A 36/A 36M, carbon-steel plates, shapes, and bars; black and galvanized.

B. Grout: ASTM C 1107, factory-mixed and -packaged, dry, hydraulic-cement, non-shrink and nonmetallic grout; suitable for interior and exterior applications.
   2. Design Mix: 5,000-psi, 28-day compressive strength.

PART 3 - EXECUTION

3.1 HANGER AND SUPPORT INSTALLATION

A. Metal Pipe-Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Install hangers, supports, clamps, and attachments as required to properly support piping from the building structure.

B. Metal Trapeze Pipe-Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Arrange for grouping of parallel runs of horizontal piping, and support together on field-fabricated trapeze pipe hangers.
   1. Pipes of Various Sizes: Support together and space trapezes for smallest pipe size or install intermediate supports for smaller diameter pipes as specified for individual pipe hangers.
   2. Field fabricate from ASTM A 36/A 36M, carbon-steel shapes selected for loads being supported. Weld steel according to AWS D1.1/D1.1M.

C. Thermal-Hanger Shield Installation: Install in pipe hanger or shield for insulated piping.

D. Fastener System Installation:
   1. Install mechanical-expansion anchors in concrete after concrete is placed and completely cured. Install fasteners according to manufacturer's written instructions.

E. Pipe Positioning-System Installation: Install support devices to make rigid supply and waste piping connections to each plumbing fixture.

F. Install hangers and supports complete with necessary attachments, inserts, bolts, rods, nuts, washers, and other accessories.

H. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.

I. Install lateral bracing with pipe hangers and supports to prevent swaying.

J. Install building attachments within concrete slabs or attach to structural steel. Install additional attachments at concentrated loads, including valves, flanges, and strainers, NPS 2-1/2 and larger and at changes in direction of piping. Install concrete inserts before concrete is placed; fasten inserts to forms and install reinforcing bars through openings at top of inserts.
K. Load Distribution: Install hangers and supports so that piping live and dead loads and stresses from movement will not be transmitted to connected equipment.

L. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes and to not exceed maximum pipe deflections allowed by ASME B31.9 for building services piping.

M. Insulated Piping:
1. Attach clamps and spacers to piping.
   a. Piping Operating above Ambient Air Temperature: Clamp may project through insulation.
   b. Piping Operating below Ambient Air Temperature: Use thermal-hanger shield insert with clamp sized to match OD of insert.
   c. Do not exceed pipe stress limits allowed by ASME B31.9 for building services piping.
2. Install MSS SP-58, Type 39, protection saddles if insulation without vapor barrier is indicated. Fill interior voids with insulation that matches adjoining insulation.
   a. Option: Thermal-hanger shield inserts may be used. Include steel weight-distribution plate for pipe NPS 4 and larger if pipe is installed on rollers.
3. Install MSS SP-58, Type 40, protective shields on cold piping with vapor barrier. Shields shall span an arc of 180 degrees.
   a. Option: Thermal-hanger shield inserts may be used. Include steel weight-distribution plate for pipe NPS 4 and larger if pipe is installed on rollers.
4. Shield Dimensions for Pipe: Not less than the following:
   a. NPS 1/4 to NPS 3-1/2: (12 inches) long and 0.048 inch thick.
   b. NPS 4: (12 inches) long and 0.06 inch thick.
   c. NPS 5 and NPS 6: (18 inches) long and 0.06 inch thick.
   d. NPS 8 to NPS 14: (24 inches long and 0.075 inch thick.
   e. NPS 16 to NPS 24: (24 inches) long and 0.105 inch thick.
5. Pipes NPS 8 and Larger: Include wood or reinforced calcium-silicate-insulation inserts of length at least as long as protective shield.
6. Thermal-Hanger Shields: Install with insulation same thickness as piping insulation.

3.2 EQUIPMENT SUPPORTS

A. Fabricate structural-steel stands to suspend equipment from structure overhead or to support equipment above floor.

B. Grouting: Place grout under supports for equipment and make bearing surface smooth.

C. Provide lateral bracing, to prevent swaying, for equipment supports.

3.3 METAL FABRICATIONS

A. Cut, drill, and fit miscellaneous metal fabrications for trapeze pipe hangers and equipment supports.

B. Fit exposed connections together to form hairline joints. Field weld connections that cannot be shop welded because of shipping size limitations.
3.4 ADJUSTING

A. Hanger Adjustments: Adjust hangers to distribute loads equally on attachments and to achieve indicated slope of pipe.

B. Trim excess length of continuous-thread hanger and support rods to 1-1/2 inches.

3.5 PAINTING

A. Touchup: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.
   1. Apply paint by brush or spray to provide a minimum dry film thickness of 2.0 mils.

B. Touchup: Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint on miscellaneous metal are specified in Section 09 9123 “Interior Painting.”

C. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A 780.

3.6 HANGER AND SUPPORT SCHEDULE

A. Specific hanger and support requirements are in Sections specifying piping systems and equipment.

B. Comply with MSS SP-69 for pipe-hanger selections and applications that are not specified in piping system Sections.

C. Use hangers and supports with galvanized metallic coatings for piping and equipment that will not have field-applied finish.

D. Use nonmetallic coatings on attachments for electrolytic protection where attachments are in direct contact with copper tubing.

E. Use carbon-steel pipe hangers and supports and attachments for general service applications.

F. Use copper-plated pipe hangers and copper or stainless-steel attachments for copper piping and tubing.

G. Use padded hangers for piping that is subject to scratching.

H. Use thermal-hanger shield inserts for insulated piping and tubing.

I. Horizontal-Piping Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Adjustable, Steel Clevis Hangers (MSS Type 1): For suspension of noninsulated or insulated, stationary pipes NPS 1/2 to NPS .
   2. Steel Pipe Clamps (MSS Type 4): For suspension of cold and hot pipes NPS 1/2 to NPS 24 if little or no insulation is required.
   3. Pipe Hangers (MSS Type 5): For suspension of pipes NPS 1/2 to NPS , to allow off-center closure for hanger installation before pipe erection.
4. **Adjustable, Steel Band Hangers (MSS Type 7):** For suspension of noninsulated, stationary pipes NPS 1/2 to NPS.

5. **Adjustable Band Hangers (MSS Type 9):** For suspension of noninsulated, stationary pipes NPS 1/2 to NPS.

6. **Adjustable, Swivel-Ring Band Hangers (MSS Type 10):** For suspension of noninsulated, stationary pipes NPS 1/2 to NPS.

7. **Split Pipe Ring with or without Turnbuckle Hangers (MSS Type 11):** For suspension of noninsulated, stationary pipes NPS 1/2 to NPS.

8. **U-Bolts (MSS Type 24):** For support of heavy pipes NPS 1/2 to NPS 30.

9. **Clips (MSS Type 26):** For support of insulated pipes not subject to expansion or contraction.

10. **Pipe Saddle Supports (MSS Type 36):** For support of pipes NPS 4 to NPS 36, with steel-pipe base stanchion support and cast-iron floor flange or carbon-steel plate.

11. **Pipe Stanchion Saddles (MSS Type 37):** For support of pipes NPS 4 to NPS 36, with steel-pipe base stanchion support and cast-iron floor flange or carbon-steel plate, and with U-bolt to retain pipe.

12. **Adjustable Pipe Saddle Supports (MSS Type 38):** For stanchion-type support for pipes NPS 2-1/2 to NPS 36 if vertical adjustment is required, with steel-pipe base stanchion support and cast-iron floor flange.

13. **Single-Pipe Rolls (MSS Type 41):** For suspension of pipes NPS 1 to NPS 30, from two rods if longitudinal movement caused by expansion and contraction might occur.

**J. Vertical-Piping Clamps:** Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. **Extension Pipe or Riser Clamps (MSS Type 8):** For support of pipe risers NPS 3/4 to NPS.

2. **Carbon- or Alloy-Steel Riser Clamps (MSS Type 42):** For support of pipe risers NPS 3/4 to NPS 24 if longer ends are required for riser clamps.

**K. Hanger-Rod Attachments:** Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. **Steel Turnbuckles (MSS Type 13):** For adjustment up to 6 inches for heavy loads.

2. **Steel Clevises (MSS Type 14):** For 120 to 450 deg F piping installations.

3. **Swivel Turnbuckles (MSS Type 15):** For use with MSS Type 11, split pipe rings.

4. **Malleable-Iron Sockets (MSS Type 16):** For attaching hanger rods to various types of building attachments.

5. **Steel Weldless Eye Nuts (MSS Type 17):** For 120 to 450 deg piping installations.

**L. Building Attachments:** Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. **Steel or Malleable Concrete Inserts (MSS Type 18):** For upper attachment to suspend pipe hangers from concrete ceiling.

2. **C-Clamps (MSS Type 23):** For structural shapes.

3. **Welded-Steel Brackets:** For support of pipes from below or for suspending from above by using clip and rod. Use one of the following for indicated loads:
   a. **Light (MSS Type 31):** 750 lb.
   b. **Medium (MSS Type 32):** 1500 lb.
   c. **Heavy (MSS Type 33):** 3000 lb.

4. **Horizontal Travelers (MSS Type 58):** For supporting piping systems subject to linear horizontal movement where headroom is limited.

**M. Saddles and Shields:** Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. **Steel-Pipe-Covering Protection Saddles (MSS Type 39):** To fill interior voids with insulation that matches adjoining insulation.
2. Protection Shields (MSS Type 40): Of length recommended in writing by manufacturer to prevent crushing insulation.
3. Thermal-Hanger Shield Inserts: For supporting insulated pipe.

N. Spring Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Restraint-Control Devices (MSS Type 47): Where indicated to control piping movement.
   2. Spring Cushions (MSS Type 48): For light loads if vertical movement does not exceed 1-1/4 in.
   3. Spring Sway Braces (MSS Type 50): To retard sway, shock, vibration, or thermal expansion in piping systems.
   4. Constant Supports: For critical piping stress and if necessary to avoid transfer of stress from one support to another support, critical terminal, or connected equipment. Include auxiliary stops for erection, hydrostatic test, and load-adjustment capability. These supports include the following types:
      a. Horizontal (MSS Type 54): Mounted horizontally.
      b. Vertical (MSS Type 55): Mounted vertically.
      c. Trapeze (MSS Type 56): Two vertical-type supports and one trapeze member.

O. Comply with MSS SP-69 for trapeze pipe-hanger selections and applications that are not specified in piping system Sections.

P. Comply with MFMA-103 for metal framing system selections and applications that are not specified in piping system Sections.

Q. Use mechanical-expansion anchors instead of building attachments where required in concrete construction.

R. Use pipe positioning systems in pipe spaces behind plumbing fixtures to support supply and waste piping for plumbing fixtures.

END OF SECTION
SECTION 22 05 48 - VIBRATION AND SEISMIC CONTROLS FOR PLUMBING PIPING AND EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Elastomeric isolation pads.
   2. Housed-spring isolators.
   3. Restrained-spring isolators.
   5. Pipe-riser resilient supports.
   6. Elastomeric hangers.
   7. Restraint channel bracings.
   8. Restraint cables.
   10. Mechanical anchor bolts.
   11. Adhesive anchor bolts.

B. Related Requirements:
   1. Section 21 0548 "Vibration and Seismic Controls for Fire-Suppression Piping and Equipment" for devices for fire-suppression equipment and systems.
   2. Section 23 0548 "Vibration and Seismic Controls for HVAC" for devices for HVAC equipment and systems.

1.3 DEFINITIONS

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.
   1. Include rated load, rated deflection, and overload capacity for each vibration isolation device.
   2. Illustrate and indicate style, material, strength, fastening provision, and finish for each type and size of vibration isolation device and seismic-restraint component required.
      a. Tabulate types and sizes of seismic restraints, complete with report numbers and rated strength in tension and shear as evaluated by an evaluation service member of ICC-ES.
      b. Annotate to indicate application of each product submitted and compliance with requirements.
   3. Interlocking Snubbers: Include ratings for horizontal, vertical, and combined loads.

B. Shop Drawings:
1. Detail fabrication and assembly of equipment bases. Detail fabrication including anchorages and attachments to structure and to supported equipment.

1.5 INFORMATIONAL SUBMITTALS
A. Coordination Drawings: Show coordination of vibration isolation device installation and seismic bracing for plumbing piping and equipment with other systems and equipment in the vicinity, including other supports and restraints, if any.
B. Qualification Data: For professional engineer and testing agency.
C. Welding certificates.
D. Field quality-control reports.

1.6 QUALITY ASSURANCE
A. Testing Agency Qualifications: An independent agency, with the experience and capability to conduct the testing indicated, that is an NRTL as defined by OSHA in 29 CFR 1910.7 and that is acceptable to authorities having jurisdiction.
B. Comply with seismic-restraint requirements in the IBC unless requirements in this Section are more stringent.
C. Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."
D. Seismic-restraint devices shall have horizontal and vertical load testing and analysis and shall bear anchorage preapproval OPM number from OSHPD, preapproval by ICC-ES, or preapproval by another agency acceptable to authorities having jurisdiction, showing maximum seismic-restraint ratings. Ratings based on independent testing are preferred to ratings based on calculations. If preapproved ratings are unavailable, submittals based on independent testing are preferred. Calculations (including combining shear and tensile loads) to support seismic-restraint designs must be signed and sealed by a qualified professional engineer.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS
A. Seismic-Restraint Loading:
   1. Site Class as Defined in the IBC: D.
   2. Assigned Seismic Use Group or Building Category as Defined in the IBC: III
      a. Component Importance Factor: 1.0.
      b. Component Response Modification Factor: \( a = 2.5 \) | \( R = 2.0 \)
      c. See structural sheet S0.02 and specification for other seismic design categories.

2.2 ELASTOMERIC ISOLATION PADS
A. Elastomeric Isolation Pads:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. California Dynamics Corporation.
   b. Isolation Technology, Inc.
   c. Mason Industries, Inc.
2. Fabrication: Single or multiple layers of sufficient durometer stiffness for uniform loading over pad area.
3. Size: Factory or field cut to match requirements of supported equipment.
4. Pad Material: Oil and water resistant with elastomeric properties.
5. Surface Pattern: Waffle pattern.
6. Infused nonwoven cotton or synthetic fibers.
7. Load-bearing metal plates adhered to pads.
8. Sandwich-Core Material: elastomeric.
   a. Surface Pattern: Waffle pattern.
   b. Infused nonwoven cotton or synthetic fibers.

2.3 PIPE-RISER RESILIENT SUPPORT
A. Description: All-directional, acoustical pipe anchor consisting of two steel tubes separated by a minimum 1/2-inch thick neoprene.
   1. Vertical-Limit Stops: Steel and neoprene vertical-limit stops arranged to prevent vertical travel in both directions.
   2. Maximum Load Per Support: 500 psig on isolation material providing equal isolation in all directions.

2.4 RESTRAINT CHANNEL BRACINGS
A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. B-line.
   2. Mason Industries.
   3. Unistrut.
   4. Tolco.
B. Description: MFMA-4, shop- or field-fabricated bracing assembly made of slotted steel channels with accessories for attachment to braced component at one end and to building structure at the other end and other matching components and with corrosion-resistant coating; rated in tension, compression, and torsion forces.

2.5 RESTRAINT CABLES
A. Restraint Cables: ASTM A 603 galvanized, ASTM A 492 stainless-steel cables where exposed to weather or moisture. End connections made of steel assemblies with thimbles, brackets, swivel, and bolts designed for restraining cable service; with a minimum of two clamping bolts for cable engagement.

2.6 SEISMIC-RESTRAINT ACCESSORIES
A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. B-line
2. Mason Industries
3. Unistrut.
4. Tolco.

B. Hanger-Rod Stiffener: Steel tube or steel slotted-support-system sleeve with internally bolted connections to hanger rod.

C. Hinged and Swivel Brace Attachments: Multifunctional steel connectors for attaching hangers to rigid channel bracings and restraint cables.

D. Bushings for Floor-Mounted Equipment Anchor Bolts: Neoprene bushings designed for rigid equipment mountings, and matched to type and size of anchor bolts and studs.

E. Bushing Assemblies for Wall-Mounted Equipment Anchorage: Assemblies of neoprene elements and steel sleeves designed for rigid equipment mountings, and matched to type and size of attachment devices used.

F. Resilient Isolation Washers and Bushings: One-piece, molded, oil- and water-resistant neoprene, with a flat washer face.

2.7 MECHANICAL ANCHOR BOLTS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. B-line
   2. Mason Industries
   3. Hilti, Inc.
   4. Kinetic Noise Control, Inc.

B. Mechanical Anchor Bolts: Drilled-in and stud-wedge or female-wedge type in zinc-coated steel for interior applications and stainless steel for exterior applications. Select anchor bolts with strength required for anchor and as tested according to ASTM E 488.

2.8 ADHESIVE ANCHOR BOLTS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Hilti, Inc.
   2. Mason Industries
   3. Kinetic Noise Control, Inc.

B. Adhesive Anchor Bolts: Drilled-in and capsule anchor system containing PVC or urethane methacrylate-based resin and accelerator, or injected polymer or hybrid mortar adhesive. Provide anchor bolts and hardware with zinc-coated steel for interior applications and stainless steel for exterior applications. Select anchor bolts with strength required for anchor and as tested according to ASTM E 488.
PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and equipment to receive vibration isolation and seismic-control devices for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in of reinforcement and cast-in-place anchors to verify actual locations before installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 APPLICATIONS

A. Multiple Pipe Supports: Secure pipes to trapeze member with clamps approved for application by an evaluation service member of ICC-ES.

B. Hanger-Rod Stiffeners: Install hanger-rod stiffeners where indicated or scheduled on Drawings to receive them and where required to prevent buckling of hanger rods due to seismic forces.

C. Strength of Support and Seismic-Restraint Assemblies: Where not indicated, select sizes of components so strength is adequate to carry present and future static and seismic loads within specified loading limits.

3.3 VIBRATION CONTROL AND SEISMIC-RESTRAINT DEVICE INSTALLATION

A. Coordinate the location of embedded connection hardware with supported equipment attachment and mounting points and with requirements for concrete reinforcement and formwork specified in Section 03 3000 "Cast-in-Place Concrete." and/or Section 03 3053 "Miscellaneous Cast-In-Place Concrete."

B. Installation of vibration isolators must not cause any change of position of equipment, piping, or ductwork resulting in stresses or misalignment.

C. Comply with requirements in Section 07 7200 "Roof Accessories" for installation of roof curbs, equipment supports, and roof penetrations.

D. Equipment Restraints:
   1. Install resilient bolt isolation washers on equipment anchor bolts where clearance between anchor and adjacent surface exceeds 0.125 inch (3.2 mm).
   2. Install seismic-restraint devices using methods approved by an evaluation service member of ICC-ES that provides required submittals for component.

E. Piping Restraints:
   1. Comply with requirements in MSS SP-127.
   2. Space lateral supports a maximum of 40 feet and longitudinal supports a maximum of 80 feet.
   3. Brace a change of direction longer than 12 feet.

F. Install cables so they do not bend across edges of adjacent equipment or building structure.
G. Install seismic-restraint devices using methods approved by an evaluation service member of ICC-ES that provides required submittals for component.

H. Install bushing assemblies for anchor bolts for floor-mounted equipment, arranged to provide resilient media between anchor bolt and mounting hole in concrete base.

I. Install bushing assemblies for mounting bolts for wall-mounted equipment, arranged to provide resilient media where equipment or equipment-mounting channels are attached to wall.

J. Attachment to Structure: If specific attachment is not indicated, anchor bracing to structure at flanges of beams, at upper truss chords of bar joists, or at concrete members.

K. Drilled-in Anchors:
   1. Identify position of reinforcing steel and other embedded items prior to drilling holes for anchors. Do not damage existing reinforcing or embedded items during coring or drilling. Notify the structural engineer if reinforcing steel or other embedded items are encountered during drilling. Locate and avoid prestressed tendons, electrical and telecommunications conduit, and gas lines.
   2. Do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength.
   3. Wedge Anchors: Protect threads from damage during anchor installation. Heavy-duty sleeve anchors shall be installed with sleeve fully engaged in the structural element to which anchor is to be fastened.
   4. Adhesive Anchors: Clean holes to remove loose material and drilling dust prior to installation of adhesive. Place adhesive in holes proceeding from the bottom of the hole and progressing toward the surface in such a manner as to avoid introduction of air pockets in the adhesive.
   5. Set anchors to manufacturer's recommended torque, using a torque wrench.
   6. Install zinc-coated steel anchors for interior and stainless-steel anchors for exterior applications.

3.4 ACCOMMODATION OF DIFFERENTIAL SEISMIC MOTION

A. Install flexible connections in piping where they cross seismic joints, where adjacent sections or branches are supported by different structural elements, and where the connections terminate with connection to equipment that is anchored to a different structural element from the one supporting the connections as they approach equipment. Comply with requirements in Section 22 1116 "Domestic Water Piping" for piping flexible connections.

3.5 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Perform tests and inspections.

C. Tests and Inspections:
   1. Provide evidence of recent calibration of test equipment by a testing agency acceptable to authorities having jurisdiction.
   2. Schedule test with Owner, through Architect, before connecting anchorage device to restrained component (unless postconnection testing has been approved), and with at least seven days' advance notice.
4. Test at least four of each type and size of installed anchors and fasteners selected by Architect.
5. Test to 90 percent of rated proof load of device.
7. Measure isolator deflection.
8. Verify snubber minimum clearances.

D. Remove and replace malfunctioning units and retest as specified above.

E. Prepare test and inspection reports.

3.6 ADJUSTING

A. Adjust isolators after piping system is at operating weight.

B. Adjust limit stops on restrained-spring isolators to mount equipment at normal operating height. After equipment installation is complete, adjust limit stops so they are out of contact during normal operation.

END OF SECTION
SECTION 22 05 53 - IDENTIFICATION FOR PLUMBING PIPING AND EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Equipment labels.
   2. Warning signs and labels.
   3. Pipe labels.
   4. Stencils.
   5. Valve tags.
   6. Warning tags.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

B. Samples: For color, letter style, and graphic representation required for each identification material and device.

C. Equipment Label Schedule: Include a listing of all equipment to be labeled with the proposed content for each label.

D. Valve numbering scheme.

E. Valve Schedules: For each piping system to include in maintenance manuals.

PART 2 - PRODUCTS

2.1 EQUIPMENT LABELS

A. Metal Labels for Equipment:
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. Brady Corporation.
      b. Kolbi Pipe Marker Co.
      c. Seton Identification Products.
   2. Material and Thickness: Brass, 0.032-inch minimum thickness, and having predrilled or stamped holes for attachment hardware.
4. Background Color: Black.
5. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.
6. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-quarters the size of principal lettering.
8. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.

B. Plastic Labels for Equipment:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Brady Corporation.
   b. Kolbi Pipe Marker Co.
   c. Seton Identification Products.
2. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, 1/16 inch thick, and having predrilled holes for attachment hardware.
4. Background Color: Black.
5. Maximum Temperature: Able to withstand temperatures up to 160 deg F.
6. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.
7. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-quarters the size of principal lettering.
9. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.

C. Label Content: Include equipment's Drawing designation or unique equipment number, Drawing numbers where equipment is indicated (plans, details, and schedules), and the Specification Section number and title where equipment is specified.

D. Equipment Label Schedule: For each item of equipment to be labeled, on 8-1/2-by-11-inch (A4) bond paper. Tabulate equipment identification number, and identify Drawing numbers where equipment is indicated (plans, details, and schedules) and the Specification Section number and title where equipment is specified. Equipment schedule shall be included in operation and maintenance data.

2.2 WARNING SIGNS AND LABELS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Brady Corporation.
2. Marking Services Inc.

B. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, 1/8 inch thick, and having predrilled holes for attachment hardware.

C. Letter Color: Black.
D. Background Color: Yellow.

E. Maximum Temperature: Able to withstand temperatures up to 160 deg F.

F. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.

G. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-quarters the size of principal lettering.

I. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.

J. Label Content: Include caution and warning information plus emergency notification instructions.

2.3 PIPE LABELS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Brady Corporation.
   2. Kolbi Pipe Marker Co.

B. General Requirements for Manufactured Pipe Labels: Preprinted, color-coded, with lettering indicating service, and showing flow direction.

C. Pretensioned Pipe Labels: Precoiled, semirigid plastic formed to cover full circumference of pipe and to attach to pipe without fasteners or adhesive.

D. Self-Adhesive Pipe Labels: Printed plastic with contact-type, permanent-adhesive backing.

E. Pipe Label Contents: Include identification of piping service using same designations or abbreviations as used on Drawings; also include pipe size and an arrow indicating flow direction.
   1. Flow-Direction Arrows: Integral with piping-system service lettering to accommodate both directions or as separate unit on each pipe label to indicate flow direction.
   2. Lettering Size: Size letters according to ASME A13.1 for piping and at least 1/2 inch for viewing distances up to 72 inches and proportionately larger lettering for greater viewing distances.

2.4 STENCILS

A. Stencils for Piping:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Brimar Industries, Inc.
      b. Kolbi Pipe Marker Co.
c. Marking Services Inc.

2. Lettering Size: Size letters according to ASME A13.1 for piping and at least 1/2 inch for viewing distances up to 72 inches and proportionately larger lettering for greater viewing distances.

4. Stencil Paint: Exterior, gloss, acrylic enamel in colors complying with recommendations in ASME A13.1 unless otherwise indicated. Paint may be in pressurized spray-can form.

5. Identification Paint: Exterior, acrylic enamel in colors according to ASME A13.1 unless otherwise indicated. Paint may be in pressurized spray-can form.

2.5 VALVE TAGS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Brady Corporation.
   2. Kolbi Pipe Marker Co.

B. Valve Tags: Stamped or engraved with 1/4-inch letters for piping system abbreviation and 1/2-inch numbers.
   1. Tag Material: Brass, 0.032-inch or anodized aluminum, 0.032-inch minimum thickness, and having predrilled or stamped holes for attachment hardware.
   2. Fasteners: Brass wire-link chain or beaded chain or S-hook.

C. Valve Schedules: For each piping system, on 8-1/2-by-11-inch (A4) bond paper. Tabulate valve number, piping system, system abbreviation (as shown on valve tag), location of valve (room or space), normal-operating position (open, closed, or modulating), and variations for identification. Mark valves for emergency shutoff and similar special uses.
   1. Valve-tag schedule shall be included in operation and maintenance data.

2.6 WARNING TAGS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Brady Corporation.
   2. Kolbi Pipe Marker Co.

B. Description: Preprinted or partially preprinted accident-prevention tags of plasticized card stock with matte finish suitable for writing.
   1. Size: 3 by 5-1/4 inches minimum.
   2. Fasteners: Brass grommet and wire.
   3. Nomenclature: Large-size primary caption such as "DANGER," "CAUTION," or "DO NOT OPERATE."
PART 3 - EXECUTION

3.1 PREPARATION

A. Clean piping and equipment surfaces of substances that could impair bond of identification devices, including dirt, oil, grease, release agents, and incompatible primers, paints, and encapsulants.

3.2 GENERAL INSTALLATION REQUIREMENTS

A. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.

B. Coordinate installation of identifying devices with locations of access panels and doors.

C. Install identifying devices before installing acoustical ceilings and similar concealment.

3.3 EQUIPMENT LABEL INSTALLATION

A. Install or permanently fasten labels on each major item of mechanical equipment.

B. Locate equipment labels where accessible and visible.

3.4 PIPE LABEL INSTALLATION

A. Piping Color Coding: Painting of piping is specified in Section 09 9123 "Interior Painting."

B. Stenciled Pipe Label Option: Stenciled labels may be provided instead of manufactured pipe labels, at Installer's option. Install stenciled pipe labels, complying with ASME A13.1, with painted, color-coded bands or rectangles on each piping system.
   1. Identification Paint: Use for contrasting background.

C. Pipe Label Locations: Locate pipe labels where piping is exposed or above accessible ceilings in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior exposed locations as follows:
   1. Near each valve and control device.
   2. Near each branch connection, excluding short takeoffs for fixtures and terminal units and at each valve. Where flow pattern is not obvious, mark each pipe at branch.
   3. Near penetrations through walls, floors, ceilings, and inaccessible enclosures.
   4. At access doors, manholes, and similar access points that permit view of concealed piping.
   5. Near major equipment items and other points of origination and termination.
   6. Spaced at maximum intervals of 25 feet (7.6 m) along each run.
   8. On both sides of walls or partitions penetrated by piping.

D. Directional Flow Arrows: Arrows shall be used to indicate direction of flow in pipes, including pipes where flow is allowed in both directions.
E. **Pipe Label Color Schedule:**
   1. **Domestic Water Piping**
      a. Background: Safety green.
   2. **Sanitary Waste and Storm Drainage Piping:**
      a. Background Color: Safety black.

3.5 **VALVE-TAG INSTALLATION**

A. Install tags on valves and control devices in piping systems, except check valves, valves within factory-fabricated equipment units, shutoff valves, faucets, convenience and lawn-watering hose connections, and similar roughing-in connections of end-use fixtures and units. List tagged valves in a valve schedule.

B. **Valve-Tag Application Schedule:** Tag valves according to size, shape, and color scheme and with captions similar to those indicated in the following subparagraphs:
   1. **Valve-Tag Size and Shape:**
   2. **Valve-Tag Colors:**
   3. **Letter Colors:**

3.6 **WARNING-TAG INSTALLATION**

A. Write required message on, and attach warning tags to, equipment and other items where required.

END OF SECTION
SECTION 22 07 16 - PLUMBING EQUIPMENT INSULATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes insulating the following plumbing equipment:
   1. Domestic water, hot-water pumps.

B. Related Sections:
   1. Section 22 07 19 "Plumbing Piping Insulation."

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated. Include thermal conductivity, water-vapor permeance thickness, and jackets (both factory and field applied, if any).

B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
   1. Detail application of protective shields, saddles, and inserts at hangers for each type of insulation and hanger.
   2. Detail removable insulation at equipment connections and access panels.
   3. Detail application of field-applied jackets.
   4. Detail application at linkages of control devices.
   5. Detail field application for each equipment type.

C. Samples: For each type of insulation and jacket indicated. Identify each Sample, describing product and intended use. Sample sizes are as follows:
   1. Sheet Form Insulation Materials: 12 inches square.
   2. Sheet Jacket Materials: 12 inches square.
   3. Manufacturer's Color Charts: For products where color is specified, show the full range of colors available for each type of finish material.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified Installer.

B. Material Test Reports: From a qualified testing agency acceptable to authorities having jurisdiction indicating, interpreting, and certifying test results for compliance of insulation materials, sealers, attachments, cements, and jackets, with requirements indicated. Include dates of tests and test methods employed.

C. Field quality-control reports.
1.5 QUALITY ASSURANCE

A. Installer Qualifications: Skilled mechanics who have successfully completed an apprenticeship program or another craft training program certified by the Department of Labor, Bureau of Apprenticeship and Training.

B. Surface-Burning Characteristics: For insulation and related materials, as determined by testing identical products according to ASTM E 84 by a testing agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing agency.
   1. Insulation Installed Indoors: Flame-spread index of 25 or less, and smoke-developed index of 50 or less.
   2. Insulation Installed Outdoors: Flame-spread index of 75 or less, and smoke-developed index of 150 or less.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Packaging: Insulation material containers shall be marked by manufacturer with appropriate ASTM standard designation, type and grade, and maximum use temperature.

1.7 COORDINATION

A. Coordinate sizes and locations of supports, hangers, and insulation shields specified in Section 22 05 29 "Hangers and Supports for Plumbing Piping and Equipment."

B. Coordinate clearance requirements with equipment Installer for equipment insulation application.

1.8 SCHEDULING

A. Schedule insulation application after pressure testing systems and, where required, after installing and testing heat tracing. Insulation application may begin on segments that have satisfactory test results.

B. Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.

PART 2 - PRODUCTS

2.1 INSULATION MATERIALS

A. Comply with requirements in "Equipment Insulation Schedule" articles for where insulating materials shall be applied.

B. Products shall not contain asbestos, lead, mercury, or mercury compounds.

C. Products that come in contact with stainless steel shall have a leachable chloride content of less than 50 ppm when tested according to ASTM C 871.
D. Insulation materials for use on austenitic stainless steel shall be qualified as acceptable according to ASTM C 795.

E. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process.

F. Calcium Silicate:
   1. Manufacturers: Subject to compliance with requirements, provide products by the following:
      a. Industrial Insulation Group, LLC (IIG-LLC).
      b. Johns Manville
   2. Flat-, curved-, and grooved-block sections of noncombustible, inorganic, hydrous calcium silicate with a non-asbestos fibrous reinforcement. Comply with ASTM C 533, Type I.

G. Mineral-Fiber Blanket Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 553, Type II and ASTM C 1290, Type I. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.

H. Mineral-Fiber, Preformed Pipe Insulation:
   1. Manufacturers: Subject to compliance with requirements, provide products by the following:
      a. ROXUL
      b. Knauf Insulation.
      c. Johns Manville.
   2. Type I, 850 Deg F Materials: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 547, Type I, Grade A, with factory-applied ASJ-SSL. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.

I. Mineral-Fiber, Pipe and Tank Insulation: Mineral or glass fibers bonded with a thermosetting resin. Semirigid board material with factory-applied ASJ complying with ASTM C 1393, Type II or Type IIIA Category 2, or with properties similar to ASTM C 612, Type IB. Nominal density is 2.5 lb/cu. ft. or more. Thermal conductivity (k-value) at 100 deg F is 0.29 Btu x in./h x sq. ft. x deg F or less. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. CertainTeed Corporation.
      b. Johns Manville; a Berkshire Hathaway company.
      c. Knauf Insulation.
      d. Owens Corning.

2.2 INSULATING CEMENTS

2.3 ADHESIVES

A. Materials shall be compatible with insulation materials, jackets, and substrates and for bonding insulation to itself and to surfaces to be insulated unless otherwise indicated.

B. Mineral-Fiber Adhesive: Comply with MIL-A-3316C, Class 2, Grade A.
2.4 LAGGING ADHESIVES

A. Description: Comply with MIL-A-3316C, Class I, Grade A, and shall be compatible with insulation materials, jackets, and substrates.
1. For indoor applications, use lagging adhesives that have a low VOC content for LEED IEQ Credit 4 requirement.
2. Fire-resistant, water-based lagging adhesive and coating for use indoors to adhere fire-resistant lagging cloths over insulation.
3. Service Temperature Range: 0 to plus 180 deg F.

2.5 SEALANTS

A. FSK and Metal Jacket Flashing Sealants:
1. Materials shall be compatible with insulation materials, jackets, and substrates.
2. Fire- and water-resistant, flexible, elastomeric sealant.
3. Service Temperature Range: Minus 40 to plus 250 deg F.

2.6 FACTORY-APPLIED JACKETS

A. Insulation system schedules indicate factory-applied jackets on various applications. When factory-applied jackets are indicated, comply with the following:
1. ASJ-SSL: ASJ with self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip; complying with ASTM C 1136, Type I.

2.7 FIELD-APPLIED FABRIC-REINFORCING MESH

A. Woven Polyester Fabric: Approximately 1 oz./sq. yd. with a thread count of 10 strands by 10 strands/sq. in., in a Leno weave, for equipment.

2.8 FIELD-APPLIED JACKETS

A. Field-applied jackets shall comply with ASTM C 921, Type I, unless otherwise indicated.

B. Metal Jacket:
   a. Factory cut and rolled to size.
   b. Finish and thickness are indicated in field-applied jacket schedules.

2.9 SECUREMENTS

A. Bands:
1. Aluminum: ASTM B 209, Alloy 3003, 3005, 3105, or 5005; Temper H-14, 0.020 inch thick, 3/4 inch wide with wing seal.
B. Wire: 0.080-inch nickel-copper alloy 0.062-inch soft-annealed, stainless steel 0.062-inch soft-annealed, galvanized steel.

2.10 CORNER ANGLES

A. Aluminum Corner Angles: 0.040 inch thick, minimum 1 by 1 inch, aluminum according to ASTM B 209, Alloy 3003, 3005, 3105, or 5005; Temper H-14.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of insulation application.
   1. Verify that systems and equipment to be insulated have been tested and are free of defects.
   2. Verify that surfaces to be insulated are clean and dry.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Surface Preparation: Clean and dry surfaces to receive insulation. Remove materials that will adversely affect insulation application.

B. Surface Preparation: Clean and prepare surfaces to be insulated. Before insulating, apply a corrosion coating to insulated surfaces as follows:
   1. Stainless Steel: Coat 300 series stainless steel with an epoxy primer 5 mils thick and an epoxy finish 5 mils thick if operating in a temperature range between 140 and 300 deg. F. Consult coating manufacturer for appropriate coating materials and application methods for operating temperature range.
   2. Carbon Steel: Coat carbon steel operating at a service temperature between 32 and 300 deg. F with an epoxy coating. Consult coating manufacturer for appropriate coating materials and application methods for operating temperature range.

C. Coordinate insulation installation with the trade installing heat tracing. Comply with requirements for heat tracing that apply to insulation.

D. Mix insulating cements with clean potable water; if insulating cements are to be in contact with stainless-steel surfaces, use demineralized water.

3.3 GENERAL INSTALLATION REQUIREMENTS

A. Install insulation materials, accessories, and finishes with smooth, straight, and even surfaces; free of voids throughout the length of equipment.

B. Install insulation materials, forms, vapor barriers or retarders, jackets, and thicknesses required for each item as specified in insulation system schedules.
C. Install accessories compatible with insulation materials and suitable for the service. Install accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.

D. Install insulation with longitudinal seams at top and bottom of horizontal runs.

E. Install multiple layers of insulation with longitudinal and end seams staggered.

F. Keep insulation materials dry during application and finishing.

G. Install insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by insulation material manufacturer.

H. Install insulation with least number of joints practical.

I. Where vapor barrier is indicated, seal joints, seams, and penetrations in insulation at hangers, supports, anchors, and other projections with vapor-barrier mastic.
   1. Install insulation continuously through hangers and around anchor attachments.
   2. For insulation application where vapor barriers are indicated, extend insulation on anchor legs from point of attachment to supported item to point of attachment to structure. Taper and seal ends at attachment to structure with vapor-barrier mastic.
   3. Install insert materials and install insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by insulation material manufacturer.
   4. Cover inserts with jacket material matching adjacent pipe insulation. Install shields over jacket, arranged to protect jacket from tear or puncture by hanger, support, and shield.

J. Apply adhesives, mastics, and sealants at manufacturer's recommended coverage rate and wet and dry film thicknesses.

K. Install insulation with factory-applied jackets as follows:
   1. Draw jacket tight and smooth.
   2. Cover circumferential joints with 3-inch-wide strips, of same material as insulation jacket. Secure strips with adhesive and outward clinching staples along both edges of strip, spaced 4 inches o.c.
   3. Overlap jacket longitudinal seams at least 1-1/2 inches. Install insulation with longitudinal seams at bottom of pipe. Clean and dry surface to receive self-sealing lap. Staple laps with outward clinching staples along edge at 2 inches o.c.
      a. For below ambient services, apply vapor-barrier mastic over staples.
   4. Cover joints and seams with tape, according to insulation material manufacturer's written instructions, to maintain vapor seal.
   5. Where vapor barriers are indicated, apply vapor-barrier mastic on seams and joints.

L. Cut insulation in a manner to avoid compressing insulation more than 75 percent of its nominal thickness.

M. Finish installation with systems at operating conditions. Repair joint separations and cracking due to thermal movement.

N. Repair damaged insulation facings by applying same facing material over damaged areas. Extend patches at least 4 inches beyond damaged areas. Adhere, staple, and seal patches similar to butt joints.

O. For above ambient services, do not install insulation to the following:
   1. Vibration-control devices.
2. Testing agency labels and stamps.
3. Nameplates and data plates.
5. Handholes.
6. Cleanouts.

3.4 INSTALLATION OF EQUIPMENT, TANK, AND VESSEL INSULATION

A. Mineral-Fiber, Pipe, and Tank Insulation Installation for Tanks and Vessels: Secure insulation with adhesive and anchor pins and speed washers.
1. Apply adhesives according to manufacturer's recommended coverage rates per unit area, for 100 percent coverage of tank and vessel surfaces.
2. Groove and score insulation materials to fit as closely as possible to equipment, including contours. Bevel insulation edges for cylindrical surfaces for tight joints. Stagger end joints.
3. Protect exposed corners with secured corner angles.
4. Install adhesively attached or self-sticking insulation hangers and speed washers on sides of tanks and vessels as follows:
   a. Do not weld anchor pins to ASME-labeled pressure vessels.
   b. Select insulation hangers and adhesive that are compatible with service temperature and with substrate.
   c. On tanks and vessels, maximum anchor-pin spacing is 3 inches from insulation end joints, and 16 inches o.c. in both directions.
   d. Do not over compress insulation during installation.
   e. Cut and miter insulation segments to fit curved sides and domed heads of tanks and vessels.
   f. Impale insulation over anchor pins and attach speed washers.
   g. Cut excess portion of pins extending beyond speed washers or bend parallel with insulation surface. Cover exposed pins and washers with tape matching insulation facing.
5. Secure each layer of insulation with stainless-steel or aluminum bands. Select band material compatible with insulation materials.
6. Where insulation hangers on equipment and vessels are not permitted or practical and where insulation support rings are not provided, install a girdle network for securing insulation. Stretch prestressed aircraft cable around the diameter of vessel and make taut with clamps, turnbuckles, or breather springs. Place one circumferential girdle around equipment approximately 6 inches from each end. Install wire or cable between two circumferential girdles 12 inches o.c. Install a wire ring around each end and around outer periphery of center openings, and stretch prestressed aircraft cable radially from the wire ring to nearest circumferential girdle. Install additional circumferential girdles along the body of equipment or tank at a minimum spacing of 48 inches o.c. Use this network for securing insulation with tie wire or bands.
7. Stagger joints between insulation layers at least 3 inches.
8. Install insulation in removable segments on equipment access doors, manholes, handholes, and other elements that require frequent removal for service and inspection.
9. Bevel and seal insulation ends around manholes, handholes, ASME stamps, and nameplates.
10. For equipment with surface temperatures below ambient, apply mastic to open ends, joints, seams, breaks, and punctures in insulation.

B. Flexible Elastomeric Thermal Insulation Installation for Tanks and Vessels: Install insulation over entire surface of tanks and vessels.
1. Apply 100 percent coverage of adhesive to surface with manufacturer's recommended adhesive.
2. Seal longitudinal seams and end joints.
C. Insulation Installation on Pumps:
   1. Fabricate metal boxes lined with insulation. Fit boxes around pumps and coincide box joints with splits in pump casings. Fabricate joints with outward bolted flanges. Bolt flanges on 6-inch centers, starting at corners. Install 3/8-inch- diameter fasteners with wing nuts. Alternatively, secure the box sections together using a latching mechanism.
   2. Fabricate boxes from aluminum, at least 0.060 inch thick.
   3. For below ambient services, install a vapor barrier at seams, joints, and penetrations. Seal between flanges with replaceable gasket material to form a vapor barrier.

3.5 INSTALLATION OF CALCIUM SILICATE INSULATION
A. Insulation Installation on Domestic Water Boiler Breechings:
   1. Secure single-layer insulation with stainless-steel bands at 12-inch intervals and tighten bands without deforming insulation material.
   2. Install two-layer insulation with joints tightly butted and staggered at least 3 inches. Secure inner layer with wire spaced at 12-inch intervals. Secure outer layer with stainless-steel bands at 12-inch intervals.
   3. On exposed applications without metal jacket, finish insulation surface with a skim coat of mineral-fiber, hydraulic-setting cement. When cement is dry, apply flood coat of lagging adhesive and press on one layer of glass cloth. Overlap edges at least 1 inch. Apply finish coat of lagging adhesive over glass cloth. Thin finish coat to achieve smooth, uniform finish.

3.6 INSTALLATION OF FLEXIBLE ELASTOMERIC INSULATION
A. Seal longitudinal seams and end joints with manufacturer's recommended adhesive to eliminate openings in insulation that allow passage of air to surface being insulated.

3.7 FIELD-APPLIED JACKET INSTALLATION
A. Where metal jackets are indicated, install with 2-inch overlap at longitudinal seams and end joints. Overlap longitudinal seams arranged to shed water. Seal end joints with weatherproof sealant recommended by insulation manufacturer. Secure jacket with stainless-steel bands 12 inches o.c. and at end joints.

3.8 FINISHES
A. Do not field paint aluminum or stainless-steel jackets.

3.9 FIELD QUALITY CONTROL
A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
B. Perform tests and inspections.
C. Tests and Inspections:
1. Inspect field-insulated equipment, randomly selected by Architect, by removing field-applied jacket and insulation in layers in reverse order of their installation. Extent of inspection shall be limited to one location(s) for each type of equipment defined in the "Equipment Insulation Schedule" Article. For large equipment, remove only a portion adequate to determine compliance.

D. All insulation applications will be considered defective Work if sample inspection reveals noncompliance with requirements.
   1. Nominal density.

3.10 EQUIPMENT INSULATION SCHEDULE

A. Insulation materials and thicknesses are identified below. If more than one material is listed for a type of equipment, selection from materials listed is Contractor's option.

B. Insulate indoor and outdoor equipment that is not factory insulated.

C. Domestic water pump insulation shall be one of the following:
   1. Mineral-Fiber Blanket: 1 inch thick and 6-lb/cu. ft. nominal density.
   2. Mineral-Fiber Board: 1 inch thick and 6-lb/cu. ft. nominal density.

D. Domestic hot-water pump insulation shall be one of the following:
   1. Mineral-Fiber Blanket: 1 inch thick and 6-lb/cu. ft. nominal density.
   2. Mineral-Fiber Board: 1 inch thick and nominal density.

3.11 INDOOR, FIELD-APPLIED JACKET SCHEDULE

A. Install jacket over insulation material. For insulation with factory-applied jacket, install the field-applied jacket over the factory-applied jacket.

B. If more than one material is listed, selection from materials listed is Contractor's option.

C. Equipment, Concealed:
   1. Aluminum, Smooth: 0.016 inch thick.

D. Equipment, Exposed, up to 48 Inches in Diameter or with Flat Surfaces up to 72 Inches:
   1. Aluminum, Smooth: 0.016 inch thick.

E. Equipment, Exposed, Larger Than 48 Inches in Diameter or with Flat Surfaces Larger Than 72 Inches:
   1. Aluminum, Smooth with: 0.032 inch thick.

END OF SECTION
SECTION 22 07 19 - PLUMBING PIPING INSULATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes insulating the following plumbing piping services:
   1. Domestic cold-water piping for acoustics in Ceiling (where require by Acoustic Engineer.)
   2. Domestic hot-water piping.
   3. Domestic recirculating hot-water piping.
   4. Industrial Water Piping cold-water piping for acoustics in Ceiling (where require by Acoustic Engineer.)
   5. Industrial Hot Water piping.
   6. Industrial Hot Water Return piping
   7. Roof drains and rainwater leaders.
   8. Supplies and drains for handicap-accessible lavatories and sinks.
   9. Sanitary piping for acoustics in Ceiling (where require by Acoustic Engineer.)
  10. Storm piping for acoustics in Ceiling (where require by Acoustic Engineer.)
  11. Lab Waste piping for acoustics in Ceiling (where require by Acoustic Engineer.)
  12. Process Vacuum piping for acoustics in Ceiling (where require by Acoustic Engineer.)
  13. Purified Water piping for acoustics in Ceiling (where require by Acoustic Engineer.)

B. Related Sections:
   1. Section 22 07 16 "Plumbing Equipment Insulation."

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated. Include thermal conductivity, water-vapor permeance thickness, and jackets (both factory- and field-applied, if any).

B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
   1. Detail application of protective shields, saddles, and inserts at hangers for each type of insulation and hanger.
   2. Detail insulation application at pipe expansion joints for each type of insulation.
   3. Detail insulation application at elbows, fittings, flanges, valves, and specialties for each type of insulation.
   4. Detail removable insulation at piping specialties, equipment connections, and access panels.
   5. Detail application of field-applied jackets.
   6. Detail application at linkages of control devices.
1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified Installer.

B. Material Test Reports: From a qualified testing agency acceptable to authorities having jurisdiction indicating, interpreting, and certifying test results for compliance of insulation materials, sealers, attachments, cements, and jackets, with requirements indicated. Include dates of tests and test methods employed.

C. Field quality-control reports.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: Skilled mechanics who have successfully completed an apprenticeship program or another craft training program certified by the Department of Labor, Bureau of Apprenticeship and Training.

B. Surface-Burning Characteristics: For insulation and related materials, as determined by testing identical products according to ASTM E 84 by a testing agency acceptable to authorities having jurisdiction. Factory label insulation and jacket materials and adhesive, mastic, tapes, and cement material containers, with appropriate markings of applicable testing agency.
   1. Insulation Installed Indoors: Flame-spread index of 25 or less, and smoke-developed index of 50 or less.

C. Comply with the following applicable standards and other requirements specified for miscellaneous components:

1.6 DELIVERY, STORAGE, AND HANDLING

A. Packaging: Insulation material containers shall be marked by manufacturer with appropriate ASTM standard designation, type and grade, and maximum use temperature.

1.7 COORDINATION

A. Coordinate sizes and locations of supports, hangers, and insulation shields specified in Section 22 05 29 "Hangers and Supports for Plumbing Piping and Equipment."

B. Coordinate clearance requirements with piping Installer for piping insulation application. Before preparing piping Shop Drawings, establish and maintain clearance requirements for installation of insulation and field-applied jackets and finishes and for space required for maintenance.

1.8 SCHEDULING

A. Schedule insulation application after pressure testing systems and, where required, after installing and testing heat tracing. Insulation application may begin on segments that have satisfactory test results.

B. Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.
PART 2 - PRODUCTS

2.1 INSULATION MATERIALS

B. Products shall not contain asbestos, lead, mercury, or mercury compounds.

C. Products that come in contact with stainless steel shall have a leachable chloride content of less than 50 ppm when tested according to ASTM C 871.

D. Insulation materials for use on austenitic stainless steel shall be qualified as acceptable according to ASTM C 795.

E. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process.

F. Mineral-Fiber, Preformed Pipe Insulation:
   1. Manufacturers: Subject to compliance with requirements, provide products by the following:
      a. ROXUL
      b. Knauf Insulation.
      c. Johns Manville
   2. Type I, 850 Deg F Materials: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C 547, Type I, Grade A, with factory-applied ASJ-SSL. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article.

2.2 INSULATING CEMENTS

   1. Manufacturers: Subject to compliance with requirements, provide products by the following:
      a. Ramco Insulation, Inc.

2.3 ADHESIVES

A. Materials shall be compatible with insulation materials, jackets, and substrates and for bonding insulation to itself and to surfaces to be insulated, unless otherwise indicated.

B. Mineral-Fiber Adhesive: Comply with MIL-A-3316C, Class 2, Grade A.

2.4 SEALANTS

A. FSK and Metal Jacket Flashing Sealants:
   1. Materials shall be compatible with insulation materials, jackets, and substrates.
   2. Fire- and water-resistant, flexible, elastomeric sealant.
2.5 FACTORY-APPLIED JACKETS

A. Insulation system schedules indicate factory-applied jackets on various applications. When factory-applied jackets are indicated, comply with the following:

1. ASJ-SSL: ASJ with self-sealing, pressure-sensitive, acrylic-based adhesive covered by a removable protective strip; complying with ASTM C 1136, Type I.

2.6 FIELD-APPLIED FABRIC-REINFORCING MESH

A. Woven Glass-Fiber Fabric: Approximately 2 oz./sq. yd. with a thread count of 10 strands by 10 strands/sq. in. for covering pipe and pipe fittings.

B. Woven Polyester Fabric: Approximately 1 oz./sq. yd. with a thread count of 10 strands by 10 strands/sq. in., in a Leno weave, for pipe.

2.7 FIELD-APPLIED JACKETS

A. Field-applied jackets shall comply with ASTM C 921, Type I, unless otherwise indicated.

B. Metal Jacket:
      a. Factory cut and rolled to size.
      b. Finish and thickness are indicated in field-applied jacket schedules.
      c. Factory-Fabricated Fitting Covers:
         1) Same material, finish, and thickness as jacket.
         2) Preformed 2-piece or gore, 45- and 90-degree, short- and long-radius elbows.
         3) Tee covers.
         4) Flange and union covers.
         5) End caps.
         6) Beveled collars.
         7) Valve covers.
         8) Field fabricate fitting covers only if factory-fabricated fitting covers are not available.

2.8 SECUREMENTS

A. Bands:
   1. Aluminum: ASTM B 209, Alloy 3003, 3005, 3105, or 5005; Temper H-14, 0.020 inch thick, 3/4 inch wide with wing seal.

B. Wire: 0.080-inch nickel-copper alloy 0.062-inch soft-annealed, stainless steel 0.062-inch soft-annealed, galvanized steel.

2.9 PROTECTIVE SHIELDING GUARDS

A. Protective Shielding Pipe Covers:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Insul-Tect Products Co.
      b. Plumberex Specialty Products, Inc.
c. Truebro.

2. Description: Manufactured plastic wraps for covering plumbing fixture hot- and cold-water supplies and trap and drain piping. Comply with Americans with Disabilities Act (ADA) requirements.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions for compliance with requirements for installation tolerances and other conditions affecting performance of insulation application.
   1. Verify that systems to be insulated have been tested and are free of defects.
   2. Verify that surfaces to be insulated are clean and dry.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Surface Preparation: Clean and dry surfaces to receive insulation. Remove materials that will adversely affect insulation application.

B. Surface Preparation: Clean and prepare surfaces to be insulated. Before insulating, apply a corrosion coating to insulated surfaces as follows:
   1. Carbon Steel: Coat carbon steel operating at a service temperature between 32 and 300 deg F with an epoxy coating. Consult coating manufacturer for appropriate coating materials and application methods for operating temperature range.

C. Coordinate insulation installation with the trade installing heat tracing. Comply with requirements for heat tracing that apply to insulation.

D. Mix insulating cements with clean potable water; if insulating cements are to be in contact with stainless-steel surfaces, use demineralized water.

3.3 GENERAL INSTALLATION REQUIREMENTS

A. Install insulation materials, accessories, and finishes with smooth, straight, and even surfaces; free of voids throughout the length of piping including fittings, valves, and specialties.

B. Install insulation materials, forms, vapor barriers or retarders, jackets, and thicknesses required for each item of pipe system as specified in insulation system schedules.

C. Install accessories compatible with insulation materials and suitable for the service. Install accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.

D. Install insulation with longitudinal seams at top and bottom of horizontal runs.

E. Install multiple layers of insulation with longitudinal and end seams staggered.

F. Do not weld brackets, clips, or other attachment devices to piping, fittings, and specialties.

G. Keep insulation materials dry during application and finishing.
H. Install insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by insulation material manufacturer.

I. Install insulation with least number of joints practical.

J. Where vapor barrier is indicated, seal joints, seams, and penetrations in insulation at hangers, supports, anchors, and other projections with vapor-barrier mastic.
   1. Install insulation continuously through hangers and around anchor attachments.
   2. For insulation application where vapor barriers are indicated, extend insulation on anchor legs from point of attachment to supported item to point of attachment to structure. Taper and seal ends at attachment to structure with vapor-barrier mastic.
   3. Install insert materials and install insulation to tightly join the insert. Seal insulation to insulation inserts with adhesive or sealing compound recommended by insulation material manufacturer.
   4. Cover inserts with jacket material matching adjacent pipe insulation. Install shields over jacket, arranged to protect jacket from tear or puncture by hanger, support, and shield.

K. Apply adhesives, mastics, and sealants at manufacturer’s recommended coverage rate and wet and dry film thicknesses.

L. Install insulation with factory-applied jackets as follows:
   1. Draw jacket tight and smooth.
   2. Cover circumferential joints with 3-inch-wide strips, of same material as insulation jacket. Secure strips with adhesive and outward clinching staples along both edges of strip, spaced 4 inches o.c.
   3. Overlap jacket longitudinal seams at least 1-1/2 inches. Install insulation with longitudinal seams at bottom of pipe. Clean and dry surface to receive self-sealing lap. Staple laps with outward clinching staples along edge at 2 inches o.c.
      a. For below-ambient services, apply vapor-barrier mastic over staples.
   4. Cover joints and seams with tape, according to insulation material manufacturer’s written instructions, to maintain vapor seal.
   5. Where vapor barriers are indicated, apply vapor-barrier mastic on seams and joints and at ends adjacent to pipe flanges and fittings.

M. Cut insulation in a manner to avoid compressing insulation more than 75 percent of its nominal thickness.

N. Finish installation with systems at operating conditions. Repair joint separations and cracking due to thermal movement.

O. Repair damaged insulation facings by applying same facing material over damaged areas. Extend patches at least 4 inches beyond damaged areas. Adhere, staple, and seal patches similar to butt joints.

P. For above-ambient services, do not install insulation to the following:
   1. Vibration-control devices.
   2. Testing agency labels and stamps.
   3. Nameplates and data plates.

3.4 PENETRATIONS

A. Insulation Installation at Roof Penetrations: Install insulation continuously through roof penetrations.
   1. Seal penetrations with flashing sealant.
2. For applications requiring only indoor insulation, terminate insulation above roof surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.
3. Extend jacket of outdoor insulation outside roof flashing at least 2 inches below top of roof flashing.
4. Seal jacket to roof flashing with flashing sealant.

B. Insulation Installation at Aboveground Exterior Wall Penetrations: Install insulation continuously through wall penetrations.
   1. Seal penetrations with flashing sealant.
   2. For applications requiring only indoor insulation, terminate insulation inside wall surface and seal with joint sealant. For applications requiring indoor and outdoor insulation, install insulation for outdoor applications tightly joined to indoor insulation ends. Seal joint with joint sealant.
   3. Extend jacket of outdoor insulation outside wall flashing and overlap wall flashing at least 2 inches.
   4. Seal jacket to wall flashing with flashing sealant.

C. Insulation Installation at Interior Wall and Partition Penetrations (That Are Not Fire Rated): Install insulation continuously through walls and partitions.

D. Insulation Installation at Fire-Rated Wall and Partition Penetrations: Install insulation continuously through penetrations of fire-rated walls and partitions.
   1. Comply with requirements in Section 07 84 13 "Penetration Firestopping" for firestopping and fire-resistive joint sealers.

E. Insulation Installation at Floor Penetrations:
   1. Pipe: Install insulation continuously through floor penetrations.
   2. Seal penetrations through fire-rated assemblies. Comply with requirements in Section 07 84 13 "Penetration Firestopping."

3.5 GENERAL PIPE INSULATION INSTALLATION

A. Requirements in this article generally apply to all insulation materials except where more specific requirements are specified in various pipe insulation material installation articles.

B. Insulation Installation on Fittings, Valves, Strainers, Flanges, and Unions:
   1. Install insulation over fittings, valves, strainers, flanges, unions, and other specialties with continuous thermal and vapor-retarder integrity unless otherwise indicated.
   2. Insulate pipe elbows using preformed fitting insulation or mitered fittings made from same material and density as adjacent pipe insulation. Each piece shall be butted tightly against adjoining piece and bonded with adhesive. Fill joints, seams, voids, and irregular surfaces with insulating cement finished to a smooth, hard, and uniform contour that is uniform with adjoining pipe insulation.
   3. Insulate tee fittings with preformed fitting insulation or sectional pipe insulation of same material and thickness as used for adjacent pipe. Cut sectional pipe insulation to fit. Butt each section closely to the next and hold in place with tie wire. Bond pieces with adhesive.
   4. Insulate valves using preformed fitting insulation or sectional pipe insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. For valves, insulate up to and including the bonnets, valve stuffing-box studs, bolts, and nuts. Fill joints, seams, and irregular surfaces with insulating cement.
5. Insulate strainers using preformed fitting insulation or sectional pipe insulation of same material, density, and thickness as used for adjacent pipe. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker. Fill joints, seams, and irregular surfaces with insulating cement. Insulate strainers so strainer basket flange or plug can be easily removed and replaced without damaging the insulation and jacket. Provide a removable reusable insulation cover. For below-ambient services, provide a design that maintains vapor barrier.

6. Insulate flanges and unions using a section of oversized preformed pipe insulation. Overlap adjoining pipe insulation by not less than two times the thickness of pipe insulation, or one pipe diameter, whichever is thicker.

7. Cover segmented insulated surfaces with a layer of finishing cement and coat with a mastic. Install vapor-barrier mastic for below-ambient services and a breather mastic for above-ambient services. Reinforce the mastic with fabric-reinforcing mesh. Trowel the mastic to a smooth and well-shaped contour.

8. Stencil or label the outside insulation jacket of each union with the word "union." Match size and color of pipe labels.

C. Insulate instrument connections for thermometers, pressure gages, pressure temperature taps, test connections, flow meters, sensors, switches, and transmitters on insulated pipes. Shape insulation at these connections by tapering it to and around the connection with insulating cement and finish with finishing cement, mastic, and flashing sealant.

D. Install removable insulation covers at locations indicated. Installation shall conform to the following:
   1. Make removable flange and union insulation from sectional pipe insulation of same thickness as that on adjoining pipe. Install same insulation jacket as adjoining pipe insulation.
   2. When flange and union covers are made from sectional pipe insulation, extend insulation from flanges or union long at least two times the insulation thickness over adjacent pipe insulation on each side of flange or union. Secure flange cover in place with stainless-steel or aluminum bands. Select band material compatible with insulation and jacket.
   3. Construct removable valve insulation covers in same manner as for flanges, except divide the two-part section on the vertical center line of valve body.
   4. When covers are made from block insulation, make two halves, each consisting of mitered blocks wired to stainless-steel fabric. Secure this wire frame, with its attached insulation, to flanges with tie wire. Extend insulation at least 2 inches over adjacent pipe insulation on each side of valve. Fill space between flange or union cover and pipe insulation with insulating cement. Finish cover assembly with insulating cement applied in two coats. After first coat is dry, apply and trowel second coat to a smooth finish.
   5. Unless a PVC jacket is indicated in field-applied jacket schedules, finish exposed surfaces with a metal jacket.

3.6 INSTALLATION OF MINERAL-FIBER INSULATION

A. Insulation Installation on Straight Pipes and Tubes:
   1. Secure each layer of preformed pipe insulation to pipe with wire or bands and tighten bands without deforming insulation materials.
   2. Where vapor barriers are indicated, seal longitudinal seams, end joints, and protrusions with vapor-barrier mastic and joint sealant.
   3. For insulation with factory-applied jackets on above-ambient surfaces, secure laps with outward clinched staples at 6 inches o.c.
   4. For insulation with factory-applied jackets on below-ambient surfaces, do not staple longitudinal tabs. Instead, secure tabs with additional adhesive as recommended by insulation material manufacturer and seal with vapor-barrier mastic and flashing sealant.
B. Insulation Installation on Pipe Flanges:
1. Install preformed pipe insulation to outer diameter of pipe flange.
2. Make width of insulation section same as overall width of flange and bolts, plus twice the thickness of pipe insulation.
3. Fill voids between inner circumference of flange insulation and outer circumference of adjacent straight pipe segments with mineral-fiber blanket insulation.
4. Install jacket material with manufacturer's recommended adhesive, overlap seams at least 1 inch, and seal joints with flashing sealant.

C. Insulation Installation on Pipe Fittings and Elbows:
1. Install preformed sections of same material as straight segments of pipe insulation when available.
2. When preformed insulation elbows and fittings are not available, install mitered sections of pipe insulation, to a thickness equal to adjoining pipe insulation. Secure insulation materials with wire or bands.

D. Insulation Installation on Valves and Pipe Specialties:
1. Install preformed sections of same material as straight segments of pipe insulation when available.
2. When preformed sections are not available, install mitered sections of pipe insulation to valve body.
3. Arrange insulation to permit access to packing and to allow valve operation without disturbing insulation.
4. Install insulation to flanges as specified for flange insulation application.

3.7 FIELD-APPLIED JACKET INSTALLATION
A. Where metal jackets are indicated, install with 2-inch overlap at longitudinal seams and end joints. Overlap longitudinal seams arranged to shed water. Seal end joints with weatherproof sealant recommended by insulation manufacturer. Secure jacket with stainless-steel bands 12 inches o.c. and at end joints.

3.8 FINISHES
A. Do not field paint aluminum or stainless-steel jackets.

3.9 FIELD QUALITY CONTROL
A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Perform tests and inspections.

C. Tests and Inspections:
1. Inspect pipe, fittings, strainers, and valves, randomly selected by Architect, by removing field-applied jacket and insulation in layers in reverse order of their installation. Extent of inspection shall be limited to three locations of straight pipe, three locations of threaded fittings, three locations of welded fittings, two locations of threaded strainers, two locations of welded strainers, three locations of threaded valves, and three locations of flanged valves for each pipe service defined in the "Piping Insulation Schedule, General" Article.

D. All insulation applications will be considered defective Work if sample inspection reveals noncompliance with requirements.
3.10 PIPING INSULATION SCHEDULE, GENERAL

A. Acceptable preformed pipe and tubular insulation materials and thicknesses are identified for each piping system and pipe size range. If more than one material is listed for a piping system, selection from materials listed is Contractor's option.

B. Items Not Insulated: Unless otherwise indicated, do not install insulation on the following:
   1. Drainage piping located in crawl spaces.
   2. Underground piping unless serving hot water system.
   3. Chrome-plated pipes and fittings unless there is a potential for personnel injury and serving hot water system.

C. Domestic Cold-Water and Industrial Cold Water:
   1. Refer to Acoustic Engineer requirements for insulation requirements.

D. Domestic Hot, Industrial Hot, Recirculated Hot Water and Recirculated Industrial Hot Water:
   1. All domestic hot water and hot recirculation pipe shall be insulated per Title 24 and CPC 2016, whichever is stringent.
   2. NPS 1-1/4 (DN 32) and Smaller: Insulation shall be the following:
      a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch thick.
   3. NPS 1-1/2 (DN 40) and Larger: Insulation shall be the following:
      a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1-1/2" thick.

E. Storm water and Overflow:
   1. All Pipe Sizes: Insulation shall be the following:
      a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch thick.

F. Roof Drain and Overflow Drain Bodies:
   1. All Pipe Sizes: Insulation shall be one of the following:
      a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch thick.

G. Sanitary and Storm Water in Ceiling:
   1. Refer to Acoustic Engineer requirements for insulation requirements.

H. Exposed Sanitary Drains, Domestic Water, Domestic Hot Water, and Stops for Plumbing Fixtures for People with Disabilities:
   1. All Pipe Sizes: Insulation shall be the following:
      a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch thick.

I. Floor Drains, Traps, and Sanitary Drain Piping within 10 Feet of Drain Receiving Condensate and Equipment Drain Water below 60 Deg F:
   1. All Pipe Sizes: Insulation shall be the following:
      a. Mineral-Fiber, Preformed Pipe Insulation, Type I: 1 inch thick.

J. Process Vacuum Piping:
   1. Refer to Acoustic Engineer requirements for insulation requirements.

K. Purified Water Piping:
   1. Refer to Acoustic Engineer requirements for insulation requirements.
3.11 INDOOR, FIELD-APPLIED JACKET SCHEDULE

A. Install jacket over insulation material. For insulation with factory-applied jacket, install the field-applied jacket over the factory-applied jacket.

B. If more than one material is listed, selection from materials listed is Contractor's option.

C. Piping, Concealed:
   1. None.
   2. Aluminum, Smooth: 0.016 inch thick.

D. Piping, Exposed:
   1. Aluminum, Smooth: 0.016 inch thick.

END OF SECTION
SECTION 220800 – COMMISSIONING OF PLUMBING SYSTEMS

PART 1 - GENERAL

1.1. RELATED DOCUMENTS

A. The General Conditions, Supplementary Conditions and Division 01 are fully applicable to this Section, as if repeated herein.

1.2. RELATED WORK SPECIFIED ELSEWHERE

A. Division 01, Section 01910, General Commissioning Requirements

B. All Division 22 Sections, and Division 23 and 25 Sections pertaining to BAS Controls for Plumbing Systems.

1.3. REFERENCES

A. USGBC:
   1. LEED v4.0 Reference Guide for Building Design and Construction:
      a. Energy and Atmosphere Prerequisite: Fundamental Commissioning and Verification.

B. California Energy Commission:
   1. Title 24, Part 6, 2016, Building Energy Efficiency Standards, Section 10-103 and Section 120.8-Building Commissioning

C. ASHRAE:
   1. ASHRAE Guideline 0-2013: The Commissioning Process

1.4. DEFINITIONS

A. Basis of Design (BOD): The documentation of design criteria and assumptions for systems, components, and methods chosen to meet the Owner’s Project Requirements and applicable regulatory requirements, standards, and guidelines. The document includes narrative descriptions of the systems to be commissioned. The BOD is prepared by the Design Professionals.

B. Building Automation System (BAS): The automated building system providing control and user interaction with select building systems, such as the HVAC, domestic hot water and lighting systems. Also, often referred to as building management system (BMS), energy management system (EMS), or an energy management and control system (EMCS).

C. Commissioning (Cx): A quality-focused process to verify and document that building systems are installed and perform as intended per the OPR, BOD and design documents.
D. Commissioning Authority (CxA): An independent agent hired directly by the Owner and not otherwise associated with the Design Professionals or the General Contractor. The CxA is the authority on commissioning results and other commissioning program elements completion, and assists the General Contractor with coordinating commissioning activities and witnesses the activities on behalf of the Owner.

E. Commissioning Issue: A condition that affects, prevents or inhibits commissioning, and must be resolved to complete the commissioning process.

F. Commissioning Issues & Recommendations Log (Cx Log): A log maintained by the CxA listing and describing all Cx issues and recommendations documented during the commissioning process, including providing the status, recommended action, contractor updates and resolution, and associated dates. All Cx issues require action, correction and closure.

G. Commissioning Report (Cx Report): The final report issued at the conclusion of the commissioning process. The report will include an executive summary abbreviating the outcome of the commissioning process and identifying all outstanding issues. The report also contains all commissioning documentation collected throughout all phases of the project.

H. Commissioning Plan (Cx Plan): A document that outlines the organization, coordination, and requirements of the commissioning process in more detail and contains project specific commissioning forms.

I. General Contractor (GC): The contractor directly contracted to the Owner with overall responsibility for the project and all commissioning activities described herein.

J. Commissioning Coordinator (CxC): Individual within the GC firm who plans, schedules, directs and coordinates all the Trade Subcontractor’s commissioning activities, and serves as the CxA’s single point of contact for all administrative, documentation and coordination functions.

K. Deferred Testing: Testing performed at a later time, due to partial occupancy, equipment, load, seasonal requirements, design or other site conditions that disallow the test from being performed prior to substantial completion.

L. Deficiency: A condition in the installation, function or performance of a component, equipment or system that is not in compliance with the contract documents and design. A deficiency will be considered a Cx issue and documented on the Cx Log.

M. Design Professional (DP): Architects, engineers and other consultants involved in the design of the project.

N. Functional Performance Test (FPT): A test of the dynamic function, operation and control of the equipment and systems to verify system performance to the fullest extent. Systems are tested under various operating modes and control sequences including failure modes. The FPTs are performed using manual (direct observation) or monitoring methods. The FPTs can include sequence of operation tests, performance tests, verification tests, integrated systems tests, and trend analysis.

O. HVAC&R: Heating, ventilation, air conditioning and refrigeration.

P. Installation Verification (IV): Field verification and documentation of proper installation of system equipment, assemblies and components, per design documents and manufacturer requirements. The IV process is typically complete when systems are ready for startup or operation. IV is organized and documented under the System Readiness Checklist (SRC) forms.
Q. Monitoring: The recording of parameters (temperature, flow, current, status, pressure, etc.) of equipment operation, which shall be completed using data-loggers or the trending capabilities of BAS or control systems.

R. Owner’s Project Requirements (OPR): A document describing the operational and functional requirements of a project, the expectations of how the facility will be used and operated, and the equipment and system expectations and requirements, as defined by the Owner. This document provides an explanation of the ideas, concepts, goals, success criteria, and supporting information for the project.

S. Percent Sampling: Witnessing the startup, checkout or testing of a selected fraction of the total number of identical or near-identical pieces of equipment or systems.

T. Pre-Functional Checks and Tests (PFCT): These are various checks and tests performed on a piece of equipment or system before, during, or after the initial startup and operation, but prior to the FPT phase. They are performed to confirm the system equipment and individual components were installed correctly and are working properly and meeting applicable performance requirements and specifications. They are all organized and documented under the SRC forms and are to be completed prior to FPTs.

U. Startup: Initial starting or activating of equipment usually performed by the Trade Subcontractor or the Manufacturer’s authorized representative.

V. Systems Manual: A manual that provides the operating staff the information needed to understand and optimally operate the commissioned systems. It expands upon the scope of traditional operating and maintenance documents and is compiled of multiple documents such as the final BOD, single line diagrams, and as-built controls drawings and sequences of operation.

W. System Readiness Checklist (SRC): A construction checklist, typically one or two pages, listing the necessary commissioning tasks and required documentation to verify a system is ready for FPTs, or system operation if no FPTs are performed. The tasks covered in the SRC include IV, Startup and PFCT, and the Trade Subcontractor completed forms for these tasks are attached to the specific SRC. The SRC must be completed and signed by the GC prior to conducting the FPTs.

X. TAB: Testing, Adjusting, and Balancing (TAB) work on the plumbing water systems to ensure design flow, pressure and temperature conditions are met. Performed by the TAB Trade Subcontractor.

Y. Trade Subcontractor: Typically, a subcontractor to the GC who provides and installs specific building components and systems and/or provides certain services.

Z. Trending: Monitoring using the BAS or a control system, to aid in functional testing and to verify system operation and performance under actual operating conditions.

AA. Warranty Phase: The phase of the project immediately after the initiation of the building equipment warranty which spans the entire length of the project warranty.

1.5. DESCRIPTION OF WORK

A. Systems and equipment to be commissioned:
   1. Domestic cold and hot water systems and controls.
   2. Pumping systems and controls, including booster, sump, and sewage ejector pumps.
3. Plumbing fixtures with automatic controls.
5. Water recovery and re-use systems.
6. Any BAS controls or monitoring for plumbing systems.

B. Process equipment are not included in the commissioning scope of work.

C. The work includes the completion and documentation of formal commissioning procedures by the GC and Trade Subcontractors.
   1. The GC and Trade Subcontractors shall provide the quality control for the installation, startup, checkout and testing of the systems. The commissioning process provides independent review throughout the process and qualitative functional performance testing in order to formally observe and document the quality control efforts are completed.
   2. Refer to Section 01910, General Commissioning Requirements for summary description of the general commissioning process and requirements.
   3. The Trade Subcontractors and the factory authorized service representatives shall be responsible for participation in the commissioning process as outlined in this specification and Section 01910, General Commissioning Requirements.

1.6. COMMISSIONING PROCESS

A. Submittal Reviews by the CxA
   1. The CxA will review pertinent Trade Subcontractor submittals for the appropriate systems in the commissioning scope, concurrently with the Design Professionals and will provide review comments to the Design Professionals.
   2. The GC shall provide a submittal log to the CxA for referencing the requested submittals to be reviewed by the CxA (for which the GC shall issue to the CxA concurrently with the submission to the Design Professionals). Alternatively, the GC shall include the CxA on the distribution of all Trade Subcontractor submittals issued to the Design Professionals, for systems applicable to this specification.
   3. The GC shall issue the requested submittals to the CxA for review at the same time they issue the submittals to the Design Professionals.
   4. The CxA will also use the information from the submittals to develop commissioning forms and test procedures.

B. Cx Plan and Form Development
   1. The CxA prepares a Preliminary Cx Plan either during the project final design phase or early construction phase. The Cx Plan provides guidance in the execution of the commissioning process during construction and will contain the project specific commissioning forms.
   2. Commissioning during construction begins with a kickoff meeting conducted by the CxA where the CxA reviews the commissioning process and responsibilities with the appropriate team members. The CxA presents the Preliminary Cx Plan and discusses the project specific requirements.
   3. The CxA develops the SRC forms, which list the commissioning tasks and the associated IV, Startup, and PFCT documentation required for each system and equipment to be commissioned.
   4. The CxA provides the SRC forms to the GC and Trade Subcontractors for review and comment.
   5. The CxC shall submit to the CxA, for review and approval, the representative blank IV, Startup, and PFCT forms and plans for completing all IV, Startup, and PFCT tasks, prior to conducting any of these tasks.
a. IV forms are to provide field verification and documentation of proper installation of system equipment, assemblies and components, typically completed prior to formal Startup. Where appropriate and approved by the CxA, these forms may be combined with the Startup or PFCT forms.
   1) The IV forms are a combination of Trade Subcontractor provided forms (which may include any applicable design drawings, floor plans, details, or single line diagrams that will be field verified) and the applicable equipment IV (pre-startup) checklists contained in the Manufacturer’s installation manuals.
   2) The Trade Subcontractors are to verify equipment installation per the Manufacturer’s guidelines and requirements, and thus are encouraged to use and complete any applicable equipment IV checklists contained in the Manufacturer’s installation manuals, in addition to any IV forms used by the Trade Subcontractors to verify system installation per design.

b. Startup forms consist of Manufacturer and/or Trade Subcontractor provided forms and plans used to document the completion of formal startup procedures and associated checks and verifications during the startup and initial operation. Where applicable, these forms shall include checks of the equipment internal / factory provided controls including sensors and control devices.

c. PFCT forms and plans are Trade Subcontractor provided forms and plans used to document the completion and results for the various checks and tests performed before, during, or after startup.

d. The CxA reviews the blank IV, Startup and PFCT forms and plans, and will issue any comments, which may include additions or changes to be made to the forms and plans, and/or supplemental forms may be issued by the CxA, where appropriate, to improve the forms and commissioning process.

6. The CxA will develop FPT procedures and forms, and provide the draft forms to the GC and Trade Subcontractors for review and comment.

7. The CxA will update and finalize the Cx Plan with equipment specific blank SRC, IV, PFCT and FPT forms.

C. System Readiness (Pre-Functional) Activities

1. Meetings will be conducted throughout construction with commissioning team members, as required, to plan, coordinate, and schedule commissioning activities, review documentation, and resolve Cx issues.

2. The Trade Subcontractors shall perform the IV, Startup and PFCT tasks for all systems and equipment (no sampling allowed), unless the contract or design documents allow for sampling of the pre-functional tests.
   a. In general, the GC and Trade Subcontractors should complete IV prior to Startup, but where appropriate and approved by the CxA, they can combine IV and Startup into one activity (and Startup is not performed if there are deficiencies identified from the IV).

3. The Trade Subcontractors and the CxC shall document completion of the IV, Startup and PFCT tasks on the IV, Startup, PFCT and SRC forms, and shall complete the SRC forms and attach the completed IV, Startup, and PFCT forms to the SRCs forms.
   a. The intent of the SRC forms is for the GC and Trade Subcontractors to certify that the plumbing systems, controls and instrumentation, equipment and assemblies have been installed, started, calibrated and are operating per the contract and design documents.

4. The CxA will review the completed IV, Startup, PFCT and SRC forms. The CxA will also perform various field observations and reviews, and witness a sample of the Startup and
PFCT activities (some PFCT witnessing may be performed as back-checks after PFCT tasks are completed).

a. The Trade Subcontractor shall resolve any IV and PFCT results deemed unacceptable by the CxA. And the Trade Subcontractor shall execute a new sample of the PFCT to be witnessed by the CxA. The CxA shall deem the PFCT acceptable after resolution of all issues and any witnessed sampling results in no issues.

5. The CxC shall submit all completed SRC forms to the CxA for review prior to conducting the FPTs. The CxA shall deem the SRCs acceptable after all SRC forms and supporting IV, Startup and PFCT forms are complete and any issues have been addressed.

D. Functional Performance Testing

1. FPTs are to test the dynamic function, performance and control of the equipment and systems under various modes of operation. These tests verify the correct implementation of the sequences of operation and the system performance meets the design criteria. The FPTs are performed using manual (direct observation) or monitoring methods. FPTs include the following types of tests, where applicable:

a. Sequence of Operation Tests.
   
   1) Sequence of operation tests are witnessed by the CxA for each unique sequence of operation but may not necessarily be repeated across identical systems, equipment or spaces, if the contractor has verified the same programmed sequence of operation code (as tested) has been programmed across multiple identical systems, equipment or spaces, based sample verification tests witnessed by the CxA (see below).

b. Verification Tests.
   
   1) Verification tests are often less detailed tests than the sequence of operation tests and are typically witnessed by the CxA at a higher sample rate. Examples of verification tests include:

   a) verifying the programmed sequence of operation code is the same as the as-tested code per the sequence of operation tests,
   b) verifying the alarm points are configured per the sequence of operation tests (without having to repeat the actual sequence tests),
   c) reviewing and confirming control point displays on system graphics and required setpoints (for example verifying the BAS VAV min, max cool, max heat airflow setpoints are correct per design),
   d) testing certain critical or important sequences with a higher sample rate across identical systems, equipment or spaces, beyond the individual sequence of operation tests.

c. Performance Tests.
   
   1) Performance tests are to be performed after the sequence of operation and verifications tests, and are focused on testing and verifying performance. Performance tests are typically witnessed by the CxA at a lower sample rate. Examples include:

   a) testing and measuring fixture hot water temperature and delivery time per design criteria,
   b) testing the DHW heater water flow and temperature performance at simulated high cooling load conditions per design.

d. Integrated Systems Tests.
1) Integrated systems tests verify the operation and performance of multiple systems together operating in a coordinated, stable and efficient manner. Often the integrated systems tests are combined with the performance tests.

e. Trend Analysis.

2. The CxA will develop FPT forms that contain:
   a. Specific step-by-step procedures to execute the test in a clear, sequential and repeatable format, including any control system point value or setpoint overrides required to simulate a test condition or sequence mode.
   b. The expected system response and acceptance criteria of proper performance with a Yes/No check box to allow for clearly marking whether or not proper performance of each part of the test was achieved.
   c. A section for recording actual system response, notes and comments.

3. Once the SRC forms are complete, the Trade Subcontractors shall execute the FPTs, with the FPTs witnessed by the CxA.
   a. The GC and Trade Subcontractors are responsible for ensuring all systems are installed, operating and performing per the requirements of the contract and design documents, and are ready for the FPTs.
   b. The Trade Subcontractors shall determine what level of pre-testing is appropriate in order to prepare for the CxA witnessed FPTs.
   c. The CxA recommends the Trade Sub-Contractors complete the Title 24 acceptance testing and forms (see paragraph f below) as part of the contractor’s pre-testing and readiness for the CxA witnessed FPTs.
   d. A percent sampling approach shall be used for executing the FPTs of identical systems and equipment. The approximate system sampling rates for the manual (direct observation) FPTs are defined in Part 3 of this specification and/or in the Cx Plan.
   e. The acceptance criteria for the FPT sampling shall be zero, meaning, any FPTs that do not pass shall require the Trade Subcontractor to resolve the issue for all applicable systems and equipment (even those specifically not in the original sample) and new sample rates selected for a re-test executed by the Trade Subcontractor and witnessed by the CxA. The CxA shall deem the FPTs acceptable after all FPTs, including re-tests, have passed and resolution of all issues completed.
   f. The CxA will document the results of all FPTs on the associated FPT forms created by the CxA, unless indicated otherwise on the FPTs, and excluding completion of the Title 24 Certificate of Acceptance forms.

   a. Completion of the Title 24 Certificate of Acceptance forms (contained in Appendix A of the Title 24, Part 6 Compliance Manual) is a contractor responsibility, not the CxA responsibility.
   b. The responsible Division 22, 23, 25 and 26 Trade Subcontractors are also responsible for providing qualified and certified “Field Technicians” (per Title 24, Part 6 requirements) to perform and document the results of the acceptance tests on the applicable Title 24, Part 6 Certificate of Acceptance forms.

4. The Cx Plan will define any required seasonal or deferred testing.

E. Cx Issues and Recommendations

1. Throughout the process, the CxA records Cx issues and recommendations on the Cx Log and distributes the Cx List to the team. The GC and Trade Subcontractors shall correct Cx issues and recheck or retest the system(s) without delay at no additional cost to the Owner. The CxA will verify the completion of the issues and recommendations, and make all amendments to the Cx Log.
F. Training Verification and Final Documentation

1. The GC shall submit a comprehensive Training Plan (with specific training agendas provided by the Trade Subcontractors) for review by the Design Professionals, CxA and Owner, prior to conducting any training. The Training Plan shall meet the specific requirements in the contract documents and specifications for each applicable system to be commissioned and the LEED Enhanced Commissioning requirements, and may include both operations and maintenance (O&M) staff training and building occupant training. The GC shall coordinate with the Owner and/or Owner’s Representatives, as needed, regarding any specific requirements for occupant training.

2. The CxA will verify completion of the training by witnessing some training sessions and receiving a copy of all training class sign-in sheets and any training materials / handouts, to be provided by the CxC or Trade Subcontractors.

3. The CxA will develop the Systems Manual (per the LEED requirements), including the current facility requirements, a preventative information and an ongoing Cx plan, with assistance from the GC and Trade Subcontractors.

4. The CxA will complete the Commissioning Report and all associated documentation for the Owner with assistance from the GC and Trade Subcontractors.

G. Post-Occupancy Warranty Phase Commissioning

1. The CxA will report any identified operational or performance issues (identified by the building O&M staff or warranty phase Cx activities) to the CxC via a Warranty Phase Cx Log for resolution by the GC and Trade Subcontractors during or prior to the end of the warranty period.

2. The Trade Subcontractors shall execute any defined seasonal or deferred FPTs, witnessed by the CxA.

3. The CxA may and analyze review trend data during the Warranty Phase and will report any identified issues and recommendations for system improvements from the trend analysis.

4. No later than either 10 months after substation completion or two months prior to the expiration of the first 12-month warranty period of building occupancy, the CxA will return to the facility to interview facility O&M staff, walk the facility and review systems operation and trend data where applicable. Key representatives from the GC and Trade Subcontractors shall attend a site walk-through and meeting, as determined by the CxA.

1.7. COMMISSIONING TEAM

A. The Commissioning Team is responsible for performing the process and achieving successful commissioning results. The Commissioning Team is comprised of the following:

1. Owner and Owner’s Representatives
2. Commissioning Authority (CxA).
3. Design Professionals
4. General Contractor (GC)
5. GC’s Commissioning Coordinator (CxC)
6. Trade Subcontractors responsible for systems covered in this section include:
   a. Plumbing Contractor
   b. BAS Controls Contractor (if applicable)
   c. TAB Contractor (if applicable)
   d. Water Recovery & Re-use System Specialist or Manufacturer’s Representative (if applicable)

7. Manufacturer Representatives supplying equipment, materials, components and controls for the systems to be commissioned.
1.8. RESPONSIBILITIES

A. General.
  1. The Commissioning Team and all others involved in the commissioning process shall follow the Commissioning Plan, attend the commissioning kickoff meeting, and attend additional commissioning meetings as necessary.

B. Commissioning Authority (CxA)
  1. See Section 01910, General Commissioning Requirements.

C. General Contractor:
  1. See Section 01910, General Commissioning Requirements.

D. Trade Subcontractors – General Requirements:
  1. Provide and submit for CxA review, the representative blank forms and plans for completing all IV, Startup, and PFCT tasks, including manufacturer’s installation checks and startup procedures. Electronic files are acceptable.
  2. Provide any equipment and construction submittals and shop drawings, including detailed sequences of operation, and any other requested contract documentation for systems to be commissioned, as requested by the CxA. Electronic files are acceptable.
  3. Attend commissioning meetings as directed by the CxA and GC’s CxC to facilitate the commissioning process.
  4. Assign personnel with expertise and authority to act on behalf of the Trade Subcontractor and schedule them to participate in and perform assigned commissioning tasks.
  5. Ensure that any required manufacturer factory tests are performed and provide the factory test data and results where required.
     a. Perform IV, Startup and PFCT tasks for all systems and equipment (no sampling), unless the contract or design documents allow for sampling of these tasks.
     b. Complete all IV, Startup and PFCT documentation clearly and legibly.
     c. Submit all completed IV, Startup and PFCT forms to the CxC and CxA, as part of completing the SRC forms, for review by the CxA.
  7. Provide a schedule and access for the CxA to witness any equipment Startup and PFCT tasks. Notify the CxC and CxA at least 10 days in advance of Startup and PFCT tasks.
  8. Ensure that any required manufacturer’s representative field tests and on-site IV, startup and checkout of selected equipment are performed per the contract documents. Provide completed manufacturer documentation and commissioning forms for these activities to the CxC.
  9. Address applicable Cx issues promptly. All IV, Startup and PFCT issues must be resolved before the FPTs can proceed.
 10. Assist the CxA in preparing the FPT procedures, clarifying the operation and control of commissioned equipment where the specifications, control drawings or equipment documentation are not sufficient for writing detailed testing procedures.
 11. Review the FPT procedures to ensure feasibility, safety and equipment protection, and provide necessary written alarm limits, setpoint changes and overrides to be used during the tests.
 12. Setup any additional control system software points, global commands, overrides of any sensor values or relays, and overrides of any setpoints or schedules, to simulate certain conditions and operating modes, in order to conduct the FPTs.
 13. Perform the FPTs, with the FPTs witnessed by the CxA. Provide at least 10 days advance notice to the CxC and CxA for scheduling the FPTs.
14. The Division 22, 23 and 25 Trade Subcontractors (Plumbing, Mechanical and BAS) are responsible for providing qualified and certified "Field Technicians" (per Title 24, Part 6 requirements, where applicable) to perform and document the results of the acceptance procedures (Acceptance Tests) on Certificate of Acceptance forms per Title 24, Part 6.
   a. The GC or the responsible Trade Subcontractor shall be the designated "Responsible Person" per Title 24, Part 6, for certification of the acceptance testing/verification on the Certificate of Acceptance forms (contained in Appendix A of the Title 24, Part 6 Compliance Manual).

15. Setup the BAS and any other control system trends and provide all requested Trend data for the FPTs and post-occupancy warranty phase commissioning review to the CxA.
   a. As an Owner approved alternative, the Trade Subcontractors may provide the CxA remote access to the BAS and any other control system, with the Owner's permission, which will allow the CxA to easily and directly download the trend data files.

16. Prepare a training agenda for each training class for the equipment and systems to be commissioned.

17. Coordinate with the GC and Owner to schedule and plan training. Execute training of Owner's personnel per approved training agenda and schedule. Provide copies of training class sign-in sheets and materials / handouts.

18. Prepare O&M Manuals according to the Contract Documents.

19. Assist the CxA in developing the Systems Manual, including providing as-built drawings, controls sequences, setpoints, single-line diagrams, etc., necessary for the Systems Manual.

E. Trade Subcontractors – Specific Plumbing System Requirements

1. In addition to the general Trade Subcontractor responsibilities outlined above, the Plumbing Trade Subcontractor responsibilities during commissioning shall include, but are not limited to:
   a. Provide approved submittals, including shop drawings, control drawings (showing all control points and sensors), points list and detailed sequences of operation for each piece of equipment and system to be controlled (inclusive of any local, stand-alone plumbing system controls). The control system diagrams shall show all control points, sensor locations, actuators, and controllers. The system sequence of operation shall fully describe their equipment components and functionality, including setpoints, failure modes and alarm functions. The detailed sequence of operation shall be provided regardless of the completeness and clarity of the sequences in the controls specification and/or drawings. Electronic files are acceptable.
   b. Provide a list of any test metering and sensors to be used for sensor and device calibration purposes. All test meter and sensors shall have been calibrated within a year and have calibration documentation.
   c. Submit a Pipe System Pressure Test Plan for all applicable plumbing systems (including water recovery and re-use), for review by the CxA, at least 4 weeks in advance of conducting any required tests. The Test Plan shall include the section of pipe to be tested, and the test methods, pressures and durations.
   d. Submit a Clean, Flush and Treatment Plan for all applicable plumbing systems (including water recovery and re-use), for review by the CxA, at least 4 weeks in advance of filling any plumbing hydronic systems. The Plan shall include the following:
      1) The intended minimum durations for all pipe cleaning and flushing, the associated disinfectants to be used and any applicable water treatment to be performed after the clean and flush.
e. For any applicable, dedicated Plumbing and Water Recovery / Re-use Control Systems (not part of the BAS or not plumbing equipment factory controls), submit representative blank forms for conducting any Controls IV and PFCT tasks to be conducted by the Trade Subcontractors, for review by the CxA, at least 4 weeks in advance of performing any Controls IV and PFCT tasks. The dedicated plumbing Control Systems IV and PFCT tasks forms shall include:

1) Installation verification checks of the control input and output points (sensors, actuators, relays, etc.) to verify all points have been installed per the points list and the physical installation of each point has been verified.
2) Point-to-point checks with the local controller display interface or graphics.
3) Sensor accuracy checks or calibration results:
   a) For analog input sensors that are factory calibrated (no field calibration is required per Specifications):
      i. The controller or control system program setup (point type, range/scale, etc.) shall be verified and recorded in the PFCT forms, and the sensor reading on the local controller display or graphics shall be recorded on the PFCT forms and shall be checked by verifying the sensor reading is within the expected range.
      ii. Sensor readings that are questionable or outside the expected range shall be checked using a hand-held sensor of equal accuracy.
   b) For sensors that require field calibration, follow the manufacturer requirements for calibration and record the calibration results in the PFCT forms, including any readings using a hand-held sensor of equal accuracy.
4) Actuator checks:
   a) At a minimum, all actuators shall be physically checked at commanded full open position (100% open), commanded half-open position (50% open) and commanded fully closed position (0% open).

f. For the BAS Controls IV and PFCT blank forms applicable to the plumbing systems, see Section 23 08 00.
g. For local plumbing equipment factory provided controls, the controls IV and PFCT forms can be included in the equipment specific IV and Startup forms (for example, as part of the plumbing contractor's or manufacturer representative's IV and Startup forms for the specific equipment inclusive of all local controls).
h. Submit the applicable completed dedicated plumbing Control System IV and PFCT forms for review by the CxA. After submitting the completed forms, the CxA may request onsite field review and back-check of the Controls IV and PFCTs, for an approximate 10% to 20% sample, to be selected by the CxA, or what can be accomplished in 1 full day.
i. Submit representative blank Plumbing Fixture Controls IV and PFCT forms, for review by the CxA, at least 4 weeks in advance of performing any IV.

1) The forms shall either contain floor plan based checklists or room by room table checklists that indicate completion of the IV and PFCT tasks for each plumbing fixture with automatic controls.
2) The intent of the forms is to:
   a) verify the installation of each fixture per design documents and manufacturer requirements,
   b) to verify any applicable automatic control settings have been adjusted and checked,
c) and to verify the operation and control has been tested.

3) The completed forms shall be attached to the corresponding SRC form.

j. Submit the completed Plumbing Fixture Controls IV and PFCT forms for review by the CxA. After submitting the completed forms, the CxA may request onsite field review and back-check, for an approximate 10% to 20% sample, to be selected by the CxA, or what can be accomplished in 1 full day.

k. Submit a Plumbing Water and Gas Meter IV and PFCT Plan with blank forms, for review by the CxA, at least 4 weeks in advance of conducting any IV. The Plan shall include the following items:

1) An outline of the plumbing meter IV per design and manufacturer requirements.
2) An outline of any plumbing meter pre-functional tests, required per specifications.
3) An outline of any plumbing meter pre-functional checks (e.g., meter programming checks, meter alarm configurations, etc.).
4) The representative blank IV and PFCT forms to be used.

I. Submit the completed Plumbing Meter IV and PFCT forms for review by the CxA. After submitting the completed forms, the CxA may request an onsite field review and back-check prior to conducting any FPTs.

m. Submit Plans for all other applicable plumbing systems pre-functional testing, per the project specifications, for review at least 4 weeks in advance of any required tests.

n. The Trade Subcontractors shall configure all plumbing system local equipment controls settings and/or control system settings, graphics and programming logic for the sequence of operations and associated setpoints, schedules, and alarms and verify the system operation, including the control loop tuning, prior to starting FPTs.

o. Prior to conducting the CxA witnessed FPTs, place the systems and controls into the operating modes intended for testing. Check all control system safety cutouts, alarms, and interlocks with other systems during each mode of operation prior to functional testing. Ensure all systems are operating and performing per the requirements of the contract and design documents, and have been pre-tested per the FPTs, and are ready for the CxA witnessed FPTs.

1) The Trade Subcontractors shall determine the appropriate level of pre-testing, to prepare for the CxA witnessed FPTs.

p. Participate in any applicable integrated whole building tests under emergency power. This test is initiated by disconnecting the utility power to the building, and it will involve multiple disciplines. All Trade Subcontractors shall participate in the FPTs as required for operation of the inter-related systems.

F. Trade Subcontractors – Specific BAS Control Requirements

1. See Section 230800 for the additional specific BAS Trade Subcontractor responsibilities, applicable for any BAS controls and monitoring for plumbing systems.

G. Trade Subcontractors – Specific TAB Requirements

1. See Section 230800 for the additional specific TAB Trade Subcontractor responsibilities, applicable for any TAB work for plumbing systems.

1.9. SUBMITTAL REQUIREMENTS FOR COMMISSIONING

A. Trade Subcontractor Commissioning Forms. The Trade Subcontractors shall submit to the CxA all applicable representative, blank forms and plans for IV, Startup and PFCT tasks for the project

Contra Costa Community College District
Contra Costa College
C-4016 New Science Building – DSA Increment 2

Section 220800 - Page 12 of 18
COMMISSIONING OF PLUMBING SYSTEMS
(as listed in 1.8 Trade Subcontractor Responsibilities), at least 4 weeks in advance of performing any of these tasks.

1. The draft SRC forms issued by the CxA will list the required IV, Startup and PFCT forms and plans, required for this project. The Trade Subcontractor shall review the draft SRCs to ensure all applicable, representative IV, Startup and PFCT forms and plans have been submitted for the CxA review.

2. The CxA will review these submitted commissioning forms including whether all project specific requirements are included.

3. The CxA may request additional data, changes and/or additions to these forms to confirm application prior to their use. If the Trade Subcontractor cannot submit sufficient forms, the CxA will provide forms based on the construction documents and specifications, manufacturer installation manuals and procedures, and/or industry standards or guidelines.

B. Training Agenda. The Trade Subcontractors shall develop a Training Agenda for each training session, per the requirements of the contract documents and specifications, and the LEED Enhanced Commissioning requirements, and may include both operations and maintenance (O&M) staff training and occupant training. The Training Agenda shall be included in the comprehensive Training Plan to be submitted by the GC for review by the CxA, Design Professionals, and/or the Owner (see Section 01910, General Commissioning Requirements). The GC and Trade Subcontractors shall coordinate to fully develop the comprehensive Training Plan with input from the Owner.

1. The Training Agenda for each training session shall include the following:
   a. equipment and/or systems covered;
   b. recommended attendees;
   c. proposed location;
   d. estimated duration;
   e. level of instruction to be provided and an outline of the training topics and subjects to be covered;
   f. list of any materials and handouts to be provided (or provided in advance);
   g. company to provide the training and the instructor's name and qualifications.

PART 2 - PRODUCTS – NOT USED

PART 3 - EXECUTION

3.1. MEETINGS, SCHEDULING AND COORDINATION

A. See Section 01910 – General Commissioning Requirements.

3.2. DOCUMENTATION

A. The Trade Subcontractors have specific responsibilities for assisting in the development of equipment check, test and verification procedures and forms, and in performing and documenting commissioning tests, as directed by the CxC and as overseen by the CxA.

B. The Trade Subcontractors shall provide, wherever the Contract Documents require, system checks and testing, test reports, factory test data and reports, checklists, operational verifications and demonstration, etc., whether specified or not in the commissioning sections.
3.3. TEST EQUIPMENT

A. The Trade Subcontractor shall provide all test equipment in sufficient quantities to execute all Pre-Functional and Functional Performance Tests in an expedient fashion.

B. The test equipment shall be of industrial quality and suitable for testing and calibration with accuracy within the tolerance necessary to demonstrate system performance per the Contract Documents. If not otherwise specified, the following minimum requirements apply:

1. Temperature sensors and digital thermometers shall have a certified calibration within the past year to an accuracy of 0.5 degree F and a resolution to + or – 0.1 degree F.
2. Pressure sensors shall have an accuracy of + or – 2.0 percent of the value range being measured (not full range of meter) and have been calibrated within the last year.
3. Meters for measuring total dissolved solids (TDS) via electrical conductivity shall have an accuracy of + or – 2.0 percent and have been calibrated within the last year. Offsite lab testing of Water Recovery and Reuse System TDS levels is not required for testing and verification of installed TDS meters / sensors.

C. The test equipment shall have calibration certification per equipment manufacturer’s interval level or within one year if not otherwise specified. The calibration tags shall be affixed or certificates readily available for all test equipment.

3.4. SYSTEM READINESS: INSTALLATION VERIFICATION, STARTUP, PRE-FUNCTIONAL CHECKS & TESTS

A. The Trade Subcontractors shall conduct all startup procedures and tests without compromise to human or equipment safety. The GC and Trade Subcontractors shall be responsible for the liability and safety of conducting all startup, checks and tests.

B. The Trade Subcontractors shall clearly identify and list any issues and deficiencies resulting from the IV, Startup and PFCT tasks on the associated forms and immediately notify the CxA. The CxA will additionally document the issues on the Cx Log. Once issues and deficiencies are corrected and verified, the associated forms shall be updated and resubmitted, and any necessary field review, back-checks or re-tests witnessed by the CxA.

C. The CxC and Trade Subcontractors shall provide a minimum 10 days’ notice to the CxA for witnessing equipment Startup and PFCT tasks.

1. The sample rates for the CxA witnessing of plumbing system piping PFCT tasks and equipment startups, will be defined in the Cx Plan.

D. The GC and Trade Subcontractors shall ensure the completion of the SRC forms. Review and approval of the completed SRC forms by the CxA is required prior to conducting the FPTs.

3.5. FUNCTIONAL PERFORMANCE TESTS

A. The Trade Subcontractors shall perform all FPTs per the final FPT forms and complete the Title 24 Part 6 acceptance test requirements and Certificate of Acceptance forms, for all systems and equipment in the scope of commissioning. The FPTs shall be witnessed by the CxA. The Trade Subcontractors may need to complete off hours or weekend work in order to complete the FPTs.
B. The CxA will document all testing results on the FPT forms, not including the Title 24 Certificate of Acceptance forms. The completion of the Title 24 Certificate of Acceptance forms is a contractor responsibility.

C. As outlined in the Part 1 general commissioning process, a sampling approach shall be used for the FPTs of identical systems and equipment, using the sample rates as defined in the Cx Plan, with the specific systems and equipment selected by the CxA.

D. The Trade Subcontractors shall determine what level of pre-testing is appropriate in order to prepare for the CxA witnessed FPTs.

E. The CxC and Trade Subcontractors shall coordinate all FPTs with the CxA, and provide a minimum of 10 days' notice prior to conducting each test.

F. The GC and Trade Subcontractors shall have responsibility for the liability and safety of conducting all functional performance tests.

G. The Trade Subcontractor executing the test shall provide all necessary materials, system modifications, etc. to produce the necessary flows, pressures, temperatures, etc. to execute the test according to the test procedures.
   1. The Trade Subcontractors shall provide any necessary control system global or system level commands and setpoint adjustments necessary to conduct the testing as called out in the FPT procedures.

H. At completion of the test, the Trade Subcontractor shall return all affected building equipment and systems to their pre-test normal condition.

3.6. COMMISSIONING ISSUES, BACK-CHECKS AND RE-TESTS

A. When Cx issues are identified during testing, the CxA will discuss with the executing Trade Subcontractor and/or CxC and determine whether or not testing can proceed. The CxA may allow immediate correction of minor issues and deficiencies identified during testing. The Cx issue and any identified resolution will be documented on the test form in use in addition to the Cx Log.

B. The CxA will maintain and update the Cx Log, and document the issue resolution process. Copies will be distributed to the GC, Owner, and Trade Subcontractors as appropriate. The Trade Subcontractors shall provide updates and comments regarding issue status and resolution.

C. The Trade Subcontractors shall promptly correct all Cx issues. The responsible party shall correct the issue and inform the CxC and CxA of the resolution and completion date, and update the Cx Log accordingly (in the fields assigned for contractor updates).

D. The CxA will record completion on the Cx Log after a successful witnessed re-test, field review, back-check, verification obtained through appropriate documentation or photographs, or acceptance by the Design Professional or Owner. The CxC shall reschedule any applicable re-testing with the CxA and Trade Subcontractor. The Trade Subcontractor shall retest until achievement of passing performance or Owner acceptance of the noted issue.
   1. Where sampling is used for the PFCTs and FPTs, the results shall be deemed acceptable once all noted issues are resolved and any new sample tests or checks have passed.

E. Additional parties may require input during a dispute regarding a Cx issue. Regardless of the validity or responsibility of the issue, the CxA will have the final interpretive authority on Cx issues and the Owner will have the final approval authority.
F. The CxA may recommend solutions to Cx issues. However, the GC and Trade Subcontractors ultimately have the burden of responsibility to solve, correct and perform required retests.

G. Back-checks, Verifications and Re-testing:
   1. The CxA will witness one (1) re-test or will perform one (1) field back-check or verification of any Cx issue.
   2. The CxA’s total onsite time for re-test witnessing and field verification or back-check of Cx issues will be limited to no more than 2 work days (full 8-hour work days) for all applicable systems in the commissioning scope.
   3. The Owner may back-charge the GC for any additional fees from the CxA, resulting from any additional re-testing or field back-checks or verifications beyond this allocated total time.
   4. The CxC must provide a minimum 48 hours’ notice for scheduling any re-testing, though the CxA will attempt to accommodate a shorter timeframe if feasible.
   5. Any required re-testing shall not be considered a justified reason for a claim of delay or for a time extension.

H. For any re-testing required, the CxA will determine if the entire test must be re-tested or if it is acceptable to re-test specific portions of the test that had failed.

3.7. DEFERRED & SEASONAL TESTING

A. Before or during the end of the first year warranty period, the Trade Subcontractor shall complete any seasonal or deferred testing, required per the design specifications and as defined in the Cx Plan. The Trade Subcontractors shall complete tests in the same manner as all other commissioning tests, including CxA witnessing.

B. The CxC and Trade Subcontractor shall coordinate with CxA and Owner and schedule all deferred and seasonal testing.

3.8. TRAINING VERIFICATION

A. The CxC and Trade Subcontractors shall coordinate and schedule the training for the Owner’s facility and operations personnel, and building occupants. The CxC shall ensure that training is completed per the requirements of the contract documents and specifications.

B. Trade Subcontractors responsible for specific equipment and system training shall submit to the CxC, a written training agenda for each training class for the equipment and systems to be commissioned. The GC shall submit a comprehensive Training Plan, including the specific training agendas, to Owner, Design Professionals and CxA for review and approval. See also Section 01910, General Commissioning Requirements.

C. The CxA will review the Training Plans for commissioning verification prior to conducting the actual training.

D. For verification of actual training conducted, the CxC shall submit to CxA ‘attendee signed’ attendance sheets for each training session conducted and a copy of any final training presentations or handout materials.
3.9. COMMISSIONING ACCEPTANCE, CLOSE-OUT AND REPORTING

A. Completion of the main commissioning activities (system readiness checks, functional performance testing, and training) shall be accomplished as a prerequisite for substantial completion. Completion of any re-testing shall be completed prior to final acceptance of commissioning.

B. After completion of the main commissioning activities and following review of the completed commissioning documents, test results and the current Cx Log with the Owner, the Owner will indicate whether they accept completion of the project construction phase commissioning or if not, the requirements for acceptance. Upon Owner acceptance, any remaining open Cx issues will be transferred to the warranty phase Cx Log for tracking resolution and completion as part of the warranty phase commissioning.

C. Upon completion of all commissioning activities, the CxA will prepare and submit to the Owner a Cx Report detailing all completed commissioning activities and documentation. The CxC shall support this effort by providing all GC and Trade Subcontractor commissioning documentation.

D. The CxA will complete a Systems Manual for the systems and equipment commissioned, following the LEED requirements, with assistance provided by the CxC and Trade Subcontractors. The Systems Manual will provide the operating staff the information needed to understand and optimally operate the commissioned systems. It will also include the current facility requirements, O&M preventative maintenance information, and an ongoing commissioning plan. Per LEED enhanced commissioning requirements, the Systems Manual will contain the following sections and detail:

1. Current facility requirements including the final version of the BOD and systems narrative.
2. Final equipment list.
3. Systems single line diagrams or schematics.
4. Final as-built sequence of operations, control drawings (P&IDs), points lists and setpoints.
5. Additional operating instructions for key systems or integrated building systems such as water-side and air-side HVAC systems and controls, plumbing systems, lighting controls, etc.
6. Recommended schedule of major preventative maintenance requirements and frequency.
7. Ongoing Cx Plan
   a. Definition of the ongoing commissioning process, defined roles and responsibilities, a recommended schedule for recommissioning the systems;
   b. Recommended schedule for retesting of commissioned systems with blank test forms from the Final Commissioning Plan.
   c. Recommended schedule for calibrating sensors and actuators.

3.10. POST-OCCUPANCY WARRANTY PHASE COMMISSIONING

A. The Trade Subcontractors shall execute any defined seasonal or deferred FPTs, witnessed by the CxA.

B. The CxA may review BAS trend data during the Warranty Phase. The BAS Trade Contractor shall be responsible for providing post-occupancy trend data to the CxA.

C. The CxA will report any identified issues and recommendations to the CxC via a Warranty Phase Cx Log for review and resolution by the GC and Trade Subcontractors prior to the end of the warranty period, for any issues or recommendations identified either by the CxA or the Owner. The CxC shall work with the Trade Subcontractors and O&M staff to make corrections and adjustments as required to address the issues and recommendations.
D. Key representatives from the GC and Trade Subcontractors shall attend a near end of warranty commissioning review meeting, to be scheduled with the Owner’s facility staff and the CxA, no later than either 10 months after substation completion or two months prior to the expiration of the first 12-month warranty period of building occupancy.

1. During this meeting, the operation of the systems will be discussed with the Owner’s staff, the results of any commissioning trend analysis will be reviewed and the warranty phase Cx Log will be reviewed. If needed, a walk-through of the systems with the Owner’s staff will be conducted.

2. Next steps and actions items for any open Cx issues and recommendations will be discussed and documented via meeting minutes or a field report issued by the CxA. The intent is to resolve any open Cx issues prior to the end of the warranty phase.

E. After correcting noted Warranty Phase Cx issues, the CxC shall notify the CxA, and the CxA will back-check and verify resolution of the Cx issues and recommendations.

F. Issues identified during the warranty period will remain warranty phase Cx issues until satisfactory completion by Trade Subcontractors, even if the warranty period expires during the correction and back-check period.

END OF SECTION
SECTION 22 11 16 - DOMESTIC WATER PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Under-building-slab and aboveground domestic water pipes, tubes, and fittings inside buildings.
   2. Section 22 11 13 "Facility Water Distribution Piping" for water-service piping and water meters outside the building from source to the point where water-service piping enters the building.

1.3 ACTION SUBMITTALS

A. Product Data: For transition fittings and dielectric fittings.

1.4 INFORMATIONAL SUBMITTALS

A. System purging and disinfecting activities report.
   B. Field quality-control reports.

1.5 FIELD CONDITIONS

A. Interruption of Existing Water Service: Do not interrupt water service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary water service according to requirements indicated:
   1. Notify Construction Manager no fewer than two days in advance of proposed interruption of water service.
   2. Do not interrupt water service without Construction Manager's written permission.

PART 2 - PRODUCTS

2.1 PIPING MATERIALS

A. Comply with requirements in "Piping Schedule" Article for applications of pipe, tube, fitting materials, and joining methods for specific services, service locations, and pipe sizes.

B. Potable-water piping and components shall comply with NSF 14 and NSF 61 Annex G. Plastic piping components shall be marked with "NSF-pw."
C. All materials that come into contact with potable water shall be lead free.
D. All materials specified in this section shall be manufactured in the United States.

2.2 COPPER TUBE AND FITTINGS

A. Copper Tube: ASTM B 88, Type L (ASTM B 88M, Type B) water tube, hard drawn temper.
B. Copper Tube: ASTM B 88, Type K (ASTM B 88M, Type A) water tube, annealed (hard drawn) temper.
D. Copper Unions:
   1. MSS SP-123.
   4. Solder-joint or threaded ends.
   5. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Anvil International.
      b. Grinnell Mechanical Products.
      c. Victaulic Company.
   7. Mechanical Couplings for Grooved-End Copper Tubing:
      a. Copper-tube dimensions and design similar to AWWA C606.
      b. EPDM-rubber gaskets suitable for hot and cold water.
      c. Bolts and nuts.
      d. Minimum Pressure Rating: 300 psig (2070 kPa).

2.3 PIPING JOINING MATERIALS

A. Pipe-Flange Gasket Materials:
   1. AWWA C110/A21.10, rubber, flat face, 1/8 inch (3.2 mm) thick or ASME B16.21, nonmetallic and asbestos free unless otherwise indicated.
   2. Full-face or ring type unless otherwise indicated.
B. Metal, Pipe-Flange Bolts and Nuts: ASME B18.2.1, carbon steel unless otherwise indicated.
C. Solder Filler Metals: ASTM B 32, lead-free alloys.
D. Flux: ASTM B 813, water flushable.
E. Brazing Filler Metals: AWS A5.8/A5.8M, BCuP Series, copper-phosphorus alloys for general-duty brazing unless otherwise indicated.
F. Plastic, Pipe-Flange Gaskets, Bolts, and Nuts: Type and material recommended by piping system manufacturer unless otherwise indicated.

2.4 TRANSITION FITTINGS

A. General Requirements:
1. Same size as pipes to be joined.
2. Pressure rating at least equal to pipes to be joined.
3. End connections compatible with pipes to be joined.
4. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Dresser, Inc.
   c. Romac Industries, Inc.

2.5 DIELECTRIC FITTINGS

A. General Requirements: Assembly of copper alloy and ferrous materials with separating nonconductive insulating material. Include end connections compatible with pipes to be joined.

B. Dielectric Flanges:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Watts; a Watts Water Technologies company.
      b. Wilkins.
      c. Zurn Industries, LLC.
   3. Factory-fabricated, bolted, companion-flange assembly.
   4. Pressure Rating: 125 psig (860 kPa) minimum at 180 deg F (82 deg C).
   5. End Connections: Solder-joint copper alloy and threaded ferrous; threaded solder-joint copper alloy and threaded ferrous.
   6. 6" brass nipple.

PART 3 - EXECUTION

3.1 EARTHWORK

A. Comply with requirements in Section 31 2000 "Earth Moving" for excavating, trenching, and backfilling.

3.2 PIPING INSTALLATION

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of domestic water piping. Indicated locations and arrangements are used to size pipe and calculate friction loss, expansion, and other design considerations. Install piping as indicated unless deviations to layout are approved on coordination drawings.

B. Install copper tubing under building slab according to CDA's "Copper Tube Handbook."

C. Install shutoff valve, hose-end drain valve, strainer, pressure gage, and test tee with valve inside the building at each domestic water-service entrance. Comply with requirements for pressure gages in Section 22 0519 "Meters and Gages for Plumbing Piping" and with requirements for drain valves and strainers in Section 22 1119 "Domestic Water Piping Specialties."

D. Install shutoff valve immediately upstream of each dielectric fitting.
E. Install water-pressure-reducing valves downstream from shutoff valves. Comply with requirements for pressure-reducing valves in Section 22.1119 "Domestic Water Piping Specialties."

F. Install domestic water piping level with 0.25 percent slope downward toward drain and plumb.

G. Install seismic restraints on piping. Comply with requirements for seismic-restraint devices in Section 22.0548 "Vibration and Seismic Controls for Plumbing Piping and Equipment."

H. Install piping concealed from view and protected from physical contact by building occupants unless otherwise indicated and except in equipment rooms and service areas.

I. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

J. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal, and coordinate with other services occupying that space.

K. Install piping to permit valve servicing.

L. Install nipples, unions, special fittings, and valves with pressure ratings the same as or higher than the system pressure rating used in applications below unless otherwise indicated.

M. Install piping free of sags and bends.

N. Install fittings for changes in direction and branch connections.

O. Install unions in copper tubing at final connection to each piece of equipment, machine, and specialty.

P. Install pressure gages on suction and discharge piping for each plumbing pump and packaged booster pump. Comply with requirements for pressure gages in Section 22.0519 "Meters and Gages for Plumbing Piping."

Q. Install thermostats in hot-water circulation piping. Comply with requirements for thermostats in Section 22.1123 "Domestic Water Pumps."

R. Install thermometers on inlet and outlet piping from each water heater. Comply with requirements for thermometers in Section 22.0519 "Meters and Gages for Plumbing Piping."

S. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in Section 22.0517 "Sleeves and Sleeve Seals for Plumbing Piping."

T. Install sleeve seals for piping penetrations of concrete walls and slabs. Comply with requirements for sleeve seals specified in Section 22.0517 "Sleeves and Sleeve Seals for Plumbing Piping."

U. Install escutcheons for piping penetrations of walls, ceilings, and floors. Comply with requirements for escutcheons specified in Section 22.0518 "Escutcheons for Plumbing Piping."

3.3 JOINT CONSTRUCTION

A. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.
B. Remove scale, slag, dirt, and debris from inside and outside of pipes, tubes, and fittings before assembly.

C. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
   1. Apply appropriate tape or thread compound to external pipe threads.
   2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged.

D. Brazed Joints for Copper Tubing: Comply with CDA's "Copper Tube Handbook," "Brazed Joints" chapter.

E. Soldered Joints for Copper Tubing: Apply ASTM B 813, water-flushable flux to end of tube. Join copper tube and fittings according to ASTM B 828 or CDA's "Copper Tube Handbook."

F. Joint Construction for Grooved-End Copper Tubing: Make joints according to AWWA C606. Roll groove ends of tubes. Lubricate and install gasket over ends of tubes or tube and fitting. Install coupling housing sections over gasket with keys seated in tubing grooves. Install and tighten housing bolts.

G. Flanged Joints: Select appropriate asbestos-free, nonmetallic gasket material in size, type, and thickness suitable for domestic water service. Join flanges with gasket and bolts according to ASME B31.9.

H. Joints for Dissimilar-Material Piping: Make joints using adapters compatible with materials of both piping systems.

3.4 TRANSITION FITTING INSTALLATION

A. Install transition couplings at joints of dissimilar piping.

B. Transition Fittings in Underground Domestic Water Piping:
   1. Fittings for NPS 1-1/2 (DN 40) and Smaller: Fitting-type coupling.
   2. Fittings for NPS 2 (DN 50) and Larger: Sleeve-type coupling.

3.5 DIELECTRIC FITTING INSTALLATION

A. Install dielectric fittings in piping at connections of dissimilar metal piping and tubing.

B. Dielectric Fittings for NPS 2 (DN 50) and Smaller: Use dielectric nipples.

C. Dielectric Fittings for NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Use dielectric flanges nipples.

D. Dielectric Fittings for NPS 5 (DN 125) and Larger: Use dielectric flange kits.

3.6 HANGER AND SUPPORT INSTALLATION

A. Comply with requirements for seismic-restraint devices in Section 22 0548 "Vibration and Seismic Controls for Plumbing Piping and Equipment."

B. Comply with requirements for pipe hanger, support products, and installation in Section 22 0529 "Hangers and Supports for Plumbing Piping and Equipment."
1. Vertical Piping: MSS Type 8 or 42, clamps.
2. Individual, Straight, Horizontal Piping Runs:
   a. 100 Feet (30 m) and Less: MSS Type 1, adjustable, steel clevis hangers.
   b. Longer Than 100 Feet (30 m): MSS Type 43, adjustable roller hangers.
   c. Longer Than 100 Feet (30 m) if Indicated: MSS Type 49, spring cushion rolls.
3. Multiple, Straight, Horizontal Piping Runs 100 Feet (30 m) or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.
4. Base of Vertical Piping: MSS Type 52, spring hangers.

C. Support vertical piping and tubing at base and at each floor.

D. Rod diameter may be reduced one size for double-rod hangers, to a minimum of 3/8 inch (10 mm).

E. Install hangers for copper tubing with the following maximum horizontal spacing and minimum rod diameters:
   1. NPS 3/4 (DN 20) and Smaller: 60 inches (1500 mm) with 3/8-inch (10-mm) rod.
   2. NPS 1 and NPS 1-1/2 (DN 25 and DN 32): 72 inches (1800 mm) with 3/8-inch (10-mm) rod.
   3. NPS 2 (DN 40 and DN 50): 96 inches (2400 mm) with 3/8-inch (10-mm) rod.
   4. NPS 2-1/2 (DN 65): 108 inches (2700 mm) with 1/2-inch (13-mm) rod.
   5. NPS 3 to NPS 5 (DN 80 to DN 125): 10 feet (3 m) with 1/2-inch (13-mm) rod.
   6. NPS 6 (DN 150): 10 feet (3 m) with 5/8-inch (16-mm) rod.
   7. NPS 8 (DN 200): 10 feet (3 m) with 3/4-inch (19-mm) rod.

F. Install supports for vertical copper tubing every 10 feet (3 m).

G. Install hangers for steel piping with the following maximum horizontal spacing and minimum rod diameters:
   1. NPS 1-1/4 (DN 32) and Smaller: 84 inches (2100 mm) with 3/8-inch (10-mm) rod.
   2. NPS 1-1/2 (DN 40): 108 inches (2700 mm) with 3/8-inch (10-mm) rod.
   3. NPS 2 (DN 50): 10 feet (3 m) with 3/8-inch (10-mm) rod.
   4. NPS 2-1/2 (DN 65): 11 feet (3.4 m) with 1/2-inch (13-mm) rod.
   5. NPS 3 and NPS 3-1/2 (DN 80 and DN 90): 12 feet (3.7 m) with 1/2-inch (13-mm) rod.
   6. NPS 4 and NPS 5 (DN 100 and DN 125): 12 feet (3.7 m) with 5/8-inch (16-mm) rod.
   7. NPS 6 (DN 150): 12 feet (3.7 m) with 3/4-inch (19-mm) rod.
   8. NPS 8 to NPS 12 (DN 200 to DN 300): 12 feet (3.7 m) with 7/8-inch (22-mm) rod.

H. Install supports for vertical steel piping every 15 feet (4.5 m).

I. Install hangers for stainless-steel piping with the following maximum horizontal spacing and minimum rod diameters:
   1. NPS 1-1/4 (DN 32) and Smaller: 84 inches (2100 mm) with 3/8-inch (10-mm) rod.
   2. NPS 1-1/2 (DN 40): 108 inches (2700 mm) with 3/8-inch (10-mm) rod.
   3. NPS 2 (DN 50): 10 feet (3 m) with 3/8-inch (10-mm) rod.
   4. NPS 2-1/2 (DN 65): 11 feet (3.4 m) with 1/2-inch (13-mm) rod.
   5. NPS 3 and NPS 3-1/2 (DN 80 and DN 90): 12 feet (3.7 m) with 1/2-inch (13-mm) rod.
   6. NPS 4 and NPS 5 (DN 100 and DN 125): 12 feet (3.7 m) with 5/8-inch (16-mm) rod.
   7. NPS 6 (DN 150): 12 feet (3.7 m) with 3/4-inch (19-mm) rod.
   8. NPS 8 to NPS 12 (DN 200 to DN 300): 12 feet (3.7 m) with 7/8-inch (22-mm) rod.

3.7 CONNECTIONS
1. Domestic Water Booster Pumps: Cold-water suction and discharge piping.
2. Water Heaters: Cold-water inlet and hot-water outlet piping in sizes indicated, but not smaller than sizes of water heater connections.
3. Plumbing Fixtures: Cold- and hot-water-supply piping in sizes indicated, but not smaller than that required by plumbing code.
4. Equipment: Cold- and hot-water-supply piping as indicated, but not smaller than equipment connections. Provide shutoff valve and union for each connection. Use flanges instead of unions for NPS 2-1/2 (DN 65) and larger.

3.8 IDENTIFICATION

A. Identify system components. Comply with requirements for identification materials and installation in Section 22 0553 "Identification for Plumbing Piping and Equipment."

B. Label pressure piping with system operating pressure.

3.9 FIELD QUALITY CONTROL

A. Perform the following tests and inspections:
   1. Piping Inspections:
      a. Do not enclose, cover, or put piping into operation until it has been inspected and approved by authorities having jurisdiction.
      b. During installation, notify authorities having jurisdiction at least one day before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction:
         1) Roughing-in Inspection: Arrange for inspection of piping before concealing or closing in after roughing in and before setting fixtures.
         2) Final Inspection: Arrange for authorities having jurisdiction to observe tests specified in "Piping Tests" Subparagraph below and to ensure compliance with requirements.
      c. Reinspection: If authorities having jurisdiction find that piping will not pass tests or inspections, make required corrections and arrange for reinspection.
      d. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.
   2. Piping Tests:
      a. Fill domestic water piping. Check components to determine that they are not air bound and that piping is full of water.
      b. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit a separate report for each test, complete with diagram of portion of piping tested.
      c. Leave new, altered, extended, or replaced domestic water piping uncovered and unconcealed until it has been tested and approved. Expose work that was covered or concealed before it was tested.
      d. Cap and subject piping to static water pressure of 50 psig (345 kPa) above operating pressure, without exceeding pressure rating of piping system materials. Isolate test source and allow it to stand for four hours. Leaks and loss in test pressure constitute defects that must be repaired.
      e. Repair leaks and defects with new materials, and retest piping or portion thereof until satisfactory results are obtained.
      f. Prepare reports for tests and for corrective action required.

B. Domestic water piping will be considered defective if it does not pass tests and inspections.

C. Prepare test and inspection reports.
3.10 ADJUSTING

A. Perform the following adjustments before operation:
   1. Close drain valves, hydrants, and hose bibbs.
   2. Open shutoff valves to fully open position.
   3. Open throttling valves to proper setting.
   4. Adjust balancing valves in hot-water-circulation return piping to provide adequate flow.
      a. Manually adjust ball-type balancing valves in hot-water-circulation return piping to provide hot-water flow in each branch.
      b. Adjust calibrated balancing valves to flows indicated.
   5. Remove plugs used during testing of piping and for temporary sealing of piping during installation.
   7. Remove filter cartridges from housings and verify that cartridges are as specified for application where used and are clean and ready for use.
   8. Check plumbing specialties and verify proper settings, adjustments, and operation.

3.11 CLEANING

A. Clean and disinfect potable domestic water piping as follows:
   1. Purge new piping and parts of existing piping that have been altered, extended, or repaired before using.
   2. Use purging and disinfecting procedures prescribed by authorities having jurisdiction; if methods are not prescribed, use procedures described in either AWWA C651 or AWWA C652 or follow procedures described below:
      a. Flush piping system with clean, potable water until dirty water does not appear at outlets.
      b. Fill and isolate system according to either of the following:
         1) Fill system or part thereof with water/chlorine solution with at least 50 ppm (50 mg/L) of chlorine. Isolate with valves and allow to stand for 24 hours.
         2) Fill system or part thereof with water/chlorine solution with at least 200 ppm (200 mg/L) of chlorine. Isolate and allow to stand for three hours.
      c. Flush system with clean, potable water until no chlorine is in water coming from system after the standing time.
      d. Repeat procedures if biological examination shows contamination.
      e. Submit water samples in sterile bottles to authorities having jurisdiction.
   3. Purge new piping and parts of existing piping that have been altered, extended, or repaired before using.
   4. Use purging procedures prescribed by authorities having jurisdiction or; if methods are not prescribed, follow procedures described below:
      a. Flush piping system with clean, potable water until dirty water does not appear at outlets.
      b. Submit water samples in sterile bottles to authorities having jurisdiction. Repeat procedures if biological examination shows contamination.

B. Prepare and submit reports of purging and disinfecting activities. Include copies of water-sample approvals from authorities having jurisdiction.

C. Clean interior of domestic water piping system. Remove dirt and debris as work progresses.

3.12 PIPING SCHEDULE

A. Transition and special fittings with pressure ratings at least equal to piping rating may be used in applications below unless otherwise indicated.
B. Flanges and unions may be used for aboveground piping joints unless otherwise indicated.

C. Fitting Option: Extruded-tee connections and brazed joints may be used on aboveground copper tubing.

D. Under-building-slab, domestic water, building-service piping, NPS 3(DN 80) and smaller, shall be one of the following:
   1. Soft copper tube, ASTM B 88, Type K (ASTM B 88M, Type A); wrought-copper, solder-joint fittings; and brazed joints.

E. Under-building-slab, domestic water, building-service piping, NPS 4 to NPS 8 (DN 100 to DN 200) and larger, shall be one of the following:
   1. Copper (hard drawn) tube, ASTM B 88, Type K (ASTM B 88M, Type A); wrought-copper, brazed joints.

F. Aboveground domestic water piping, NPS 2 (DN 50)-1/2 and smaller, shall be one of the following:
   1. Hard copper tube, ASTM B 88, Type L (ASTM B 88M, Type B); wrought-copper, solder-joint fittings; and soldered joints.

G. Aboveground domestic water piping, NPS 2 (DN 50) and smaller, shall be:
   1. Hard copper tube, ASTM B 88, Type L wrought copper, solder-joint fittings; and soldered joints.

3.13 VALVE SCHEDULE

A. Drawings indicate valve types to be used. Where specific valve types are not indicated, the following requirements apply:
   1. Shutoff Duty: Use ball or gate valves for piping NPS 2 (DN 50) and smaller. Use butterfly, ball, or gate valves with flanged ends for piping NPS 2-1/2 (DN 65) and larger.
   2. Throttling Duty: Use ball or globe valves for piping NPS 2 (DN 50) and smaller. Use butterfly or ball valves with flanged ends for piping NPS 2-1/2 (DN 65) and larger.

B. Use check valves to maintain correct direction of domestic water flow to and from equipment.

END OF SECTION
SECTION 22 11 18 - NATURAL-GAS PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Pipes, tubes, and fittings.
   2. Piping specialties.
   3. Piping and tubing joining materials.
   4. Valves.
   5. Pressure regulators.
   7. Concrete bases.

1.3 DEFINITIONS

A. Finished Spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe and duct shafts, unheated spaces immediately below roof, spaces above ceilings, unexcavated spaces, crawlspace, and tunnels.

B. Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.

C. Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations.

1.4 PERFORMANCE REQUIREMENTS

A. Minimum Operating-Pressure Ratings:
   1. Piping and Valves: 100 psig minimum unless otherwise indicated.
   2. Service Regulators: 100 psig minimum unless otherwise indicated.

B. Natural-Gas System Pressure within Buildings: 0.5 psig.

C. Natural-Gas System Pressures within Buildings: Two pressure ranges. Primary pressure is more than 0.5 psig but not more than 2 psig, and is reduced to secondary pressure of 0.25 psig or less.
1.5 ACTION SUBMITTALS

A. Product Data: For each type of the following:
   1. Piping specialties.
   2. Corrugated, stainless-steel tubing with associated components.
   3. Valves. Include pressure rating, capacity, settings, and electrical connection data of selected models.
   4. Pressure regulators. Indicate pressure ratings and capacities.
   5. Service meters. Indicate 100 psi capacities.
   6. Dielectric fittings.

B. Shop Drawings: For facility natural-gas piping layout. Include plans, piping layout and elevations, sections, and details for fabrication of pipe anchors, hangers, supports for multiple pipes, alignment guides, expansion joints and loops, and attachments of the same to building structure. Detail location of anchors, alignment guides, and expansion joints and loops.
   1. Shop Drawing Scale: 1/4 inch per foot.
   2. Detail mounting, supports, and valve arrangements for service meter assembly and pressure regulator assembly.

1.6 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Plans and details, drawn to scale, on which natural-gas piping is shown and coordinated with other installations, using input from installers of the items involved.

B. Site Survey: Plans, drawn to scale, on which natural-gas piping is shown and coordinated with other services and utilities.

C. Qualification Data: For qualified professional engineer.

D. Welding certificates.

E. Field quality-control reports.

1.7 QUALITY ASSURANCE

A. Steel Support Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, “Structural Welding Code - Steel.”

B. Pipe Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Handling Flammable Liquids: Remove and dispose of liquids from existing natural-gas piping according to requirements of authorities having jurisdiction.
B. Deliver pipes and tubes with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe end damage and to prevent entrance of dirt, debris, and moisture.

C. Store and handle pipes and tubes having factory-applied protective coatings to avoid damaging coating, and protect from direct sunlight.

D. Protect stored PE pipes and valves from direct sunlight.

1.9 PROJECT CONDITIONS

A. Perform site survey, research public utility records, and verify existing utility locations. Contact utility-locating service for area where Project is located.

B. Interruption of Existing Natural-Gas Service: Do not interrupt natural-gas service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide purging and startup of natural-gas supply according to requirements indicated:
   1. Notify Architect and/or Owner no fewer than 5 days in advance of proposed interruption of natural-gas service.
   2. Do not proceed with interruption of natural-gas service without Owner's written permission.

1.10 COORDINATION

A. Coordinate sizes and locations of concrete bases with actual equipment provided.

B. Coordinate requirements for access panels and doors for valves installed concealed behind finished surfaces. Comply with requirements in Section 08 3113 "Access Doors and Frames."

PART 2 - PRODUCTS

2.1 PIPES, TUBES, AND FITTINGS

A. Steel Pipe: ASTM A 53/A 53M, black steel, Schedule 40, Type E or S, Grade B.

4. Forged-Steel Flanges and Flanged Fittings: ASME B16.5, minimum Class 150, including bolts, nuts, and gaskets of the following material group, end connections, and facings:

   b. End Connections: Threaded or butt welding to match pipe.
   c. Lapped Face: Not permitted underground.
   e. Bolts and Nuts: ASME B18.2.1, carbon steel aboveground and stainless steel underground.
5. **Protective Coating for Underground Piping:** Factory-applied, three-layer coating of epoxy, adhesive, and PE.
   a. **Joint Cover Kits:** Epoxy paint, adhesive, and heat-shrink PE sleeves.

B. **Corrugated, Stainless-Steel Tubing:** Comply with ANSI/IAS LC 1.
   1. **Tubing:** ASTM A 240/A 240M, corrugated, Series 300 stainless steel.
   2. **Coating:** PE with flame retardant.
      a. **Surface-Burning Characteristics:** As determined by testing identical products according to ASTM E 84 by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
         1) Flame-Spread Index: 25 or less.
         2) Smoke-Developed Index: 50 or less.
   3. **Fittings:** Copper-alloy mechanical fittings with ends made to fit and listed for use with corrugated stainless-steel tubing and capable of metal-to-metal seal without gaskets. Include brazing socket or threaded ends complying with ASME B1.20.1.
   4. **Striker Plates:** Steel, designed to protect tubing from penetrations.
   5. **Manifolds:** Malleable iron or steel with factory-applied protective coating. Threaded connections shall comply with ASME B1.20.1 for pipe inlet and corrugated tubing outlets.
   6. **Operating-Pressure Rating:** 5 psig.

C. **PE Pipe:** ASTM D 2513, SDR 11.
   1. **PE Fittings:** ASTM D 2683, socket-fusion type or ASTM D 3261, butt-fusion type with dimensions matching PE pipe.
   2. **PE Transition Fittings:** Factory-fabricated fittings with PE pipe complying with ASTM D 2513, SDR 11; and steel pipe complying with ASTM A 53/A 53M, black steel, Schedule 40, Type E or S, Grade B.
   3. **Anodeless Service-Line Risers:** Factory fabricated and leak tested.
      a. **Underground Portion:** PE pipe complying with ASTM D 2513, SDR 11 inlet.
      b. **Casing:** Steel pipe complying with ASTM A 53/A 53M, Schedule 40, black steel, Type E or S, Grade B, with corrosion-protective coating covering.
      c. **Aboveground Portion:** PE transition fitting.
      d. **Outlet:** threaded or flanged or suitable for welded connection.
      e. **Tracer wire connection.**
      f. **Ultraviolet shield.**
      g. **Stake supports:** with factory finish to match steel pipe casing or carrier pipe.
   4. **Transition Service-Line Risers:** Factory fabricated and leak tested.
      a. **Underground Portion:** PE pipe complying with ASTM D 2513, SDR 11 inlet connected to steel pipe complying with ASTM A 53/A 53M, Schedule 40, Type E or S, Grade B, with corrosion-protective coating for aboveground outlet.
      b. **Outlets:** threaded or flanged or suitable for welded connection.
      c. **Bridging sleeve over mechanical coupling.**
      d. **Factory-connected anode.**
      e. **Tracer wire connection.**
      f. **Ultraviolet shield.**
      g. **Stake supports:** with factory finish to match steel pipe casing or carrier pipe.

2.2 **PIPING SPECIALTIES**

A. **Appliance Flexible Connectors:**
   1. **Indoor, Fixed-Appliance Flexible Connectors:** Comply with ANSI Z21.24.
   2. **Indoor, Movable-Appliance Flexible Connectors:** Comply with ANSI Z21.69.
   3. **Outdoor, Appliance Flexible Connectors:** Comply with ANSI Z21.75.
4. Corrugated stainless-steel tubing with polymer coating.
5. Operating-Pressure Rating: 0.5 psig.

B. Quick-Disconnect Devices: Comply with ANSI Z21.41.
1. Copper-alloy convenience outlet and matching plug connector.
2. Nitrile seals.
3. Hand operated with automatic shutoff when disconnected.
4. For indoor or outdoor applications.
5. Adjustable, retractable restraining cable.

C. Basket Strainers:
1. Body: ASTM A 126, Class B, high-tensile cast iron with bolted cover and bottom drain connection.
2. End Connections: Threaded ends for NPS 2 and smaller; flanged ends for NPS 2-1/2 and larger.
3. Strainer Screen: 40-mesh startup strainer, and perforated stainless-steel basket with 50 percent free area.

D. Weatherproof Vent Cap: Cast- or malleable-iron increaser fitting with corrosion-resistant wire screen, with free area at least equal to cross-sectional area of connecting pipe and threaded-end connection.

2.3 JOINING MATERIALS

A. Joint Compound and Tape: Suitable for natural gas.

2.4 MANUAL GAS SHUTOFF VALVES

A. See "Underground Manual Gas Shutoff Valve Schedule" and "Aboveground Manual Gas Shutoff Valve Schedule" Articles for where each valve type is applied in various services.

B. General Requirements for Metallic Valves, NPS 2 and Smaller: Comply with ASME B16.33.
1. CWP Rating: 125 psig.
3. Dryseal Threads on Flare Ends: Comply with ASME B1.20.3.
5. Listing: Listed and labeled by an NRTL acceptable to authorities having jurisdiction for valves 1 inch and smaller.
6. Service Mark: Valves 1-1/4 inches to NPS 2 shall have initials "WOG" permanently marked on valve body.

C. General Requirements for Metallic Valves, NPS 2-1/2 and Larger: Comply with ASME B16.38.
1. CWP Rating: 125 psig.
2. Flanged Ends: Comply with ASME B16.5 for steel flanges.
4. Service Mark: Initials "WOG" shall be permanently marked on valve body.

D. Bronze Plug Valves: MSS SP-78.
2. Plug: Bronze.
4. Operator: Square head or lug type with tamperproof feature where indicated.
5. Pressure Class: 125 psig.
6. Listing: Valves NPS 1 and smaller shall be listed and labeled by an NRTL acceptable to authorities having jurisdiction.
7. Service: Suitable for natural-gas service with "WOG" indicated on valve body.

E. Cast-Iron, Nonlubricated Plug Valves: MSS SP-78.
1. Manufacturer: A.A. McDonald, Mueller Co., Xomox Corporation.
2. Body: Cast iron, complying with ASTM A 126, Class B.
3. Plug: Bronze or nickel-plated cast iron.
4. Seat: Coated with thermoplastic.
5. Stem Seal: Compatible with natural gas.
7. Operator: Square head or lug type with tamperproof feature where indicated.
8. Pressure Class: 125 psig (862 kPa).
9. Listing: Valves NPS 1 (DN 25) and smaller shall be listed and labeled by an NRTL acceptable to authorities having jurisdiction.
10. Service: Suitable for natural-gas service with "WOG" indicated on valve body.

F. Cast-Iron, Lubricated Plug Valves: MSS SP-78.
1. Manufacturer: A.A. McDonald, Mueller Co., Homestead Valve, Flowserve Corporation.
2. Body: Cast iron, complying with ASTM A 126, Class B.
3. Plug: Bronze or nickel-plated cast iron.
4. Seat: Coated with thermoplastic.
5. Stem Seal: Compatible with natural gas.
7. Operator: Square head or lug type with tamperproof feature where indicated.
8. Pressure Class: 125 psig (862 kPa).
9. Listing: Valves NPS 1 (DN 25) and smaller shall be listed and labeled by an NRTL acceptable to authorities having jurisdiction.
10. Service: Suitable for natural-gas service with "WOG" indicated on valve body.

G. Valve Boxes:
1. Cast-iron, two-section box.
2. Top section with cover with "GAS" lettering.
3. Bottom section with base to fit over valve and barrel a minimum of 5 inches (125 mm) in diameter.
4. Adjustable cast-iron extensions of length required for depth of bury.
5. Include tee-handle, steel operating wrench with socket end fitting valve nut or flat head, and with stem of length required to operate valve.
2.5 EARTHQUAKE VALVES

A. Earthquake Valves: Comply with ASCE 25,
   1. Manufacturer: Earthquake Valves, Vanguard Valves
   2. Listing: Listed and labeled by an NRTL acceptable to authorities having jurisdiction.
   3. Maximum Operating Pressure: 5 psig.
   5. Nitrile-rubber valve washer.
   7. Threaded end connections complying with ASME B1.20.1.
   8. Wall mounting bracket with bubble level indicator.

2.6 PRESSURE REGULATORS

A. General Requirements:
   1. Single stage and suitable for natural gas.
   2. Steel jacket and corrosion-resistant components.
   3. Elevation compensator.
   4. End Connections: Threaded for regulators NPS 2 (DN 50) and smaller; flanged for regulators NPS 2-1/2 (DN 65) and larger.

B. Service Pressure Regulators: Comply with ANSI Z21.80.
   1. Manufacturer: American Meter, Fisher Control Valves, Invensys, Emerson, Maxitrol.
   2. Body and Diaphragm Case: Cast iron or die-cast aluminum.
   5. Seat Disc: Nitrile rubber resistant to gas impurities, abrasion, and deformation at the valve port.
   6. Orifice: Aluminum; interchangeable.
   8. Single-port, self-contained regulator with orifice no larger than required at maximum pressure inlet, and no pressure sensing piping external to the regulator.
   9. Pressure regulator shall maintain discharge pressure setting downstream, and not exceed 150 percent of design discharge pressure at shutoff.
   11. Atmospheric Vent: Factory- or field-installed, stainless-steel screen in opening if not connected to vent piping.

   1. Manufacturer: American Meter, Fisher Control Valves, Invensys, Emerson, Maxitrol.
   2. Body and Diaphragm Case: Cast iron or die-cast aluminum.
   5. Seat Disc: Nitrile rubber resistant to gas impurities, abrasion, and deformation at the valve port.
   6. Orifice: Aluminum; interchangeable.
   8. Single-port, self-contained regulator with orifice no larger than required at maximum pressure inlet, and no pressure sensing piping external to the regulator.
   9. Pressure regulator shall maintain discharge pressure setting downstream, and not exceed 150 percent of design discharge pressure at shutoff.
11. Atmospheric Vent: Factory- or field-installed, stainless-steel screen in opening if not connected to vent piping.
12. Maximum Inlet Pressure: 5 psig.

2.7 DIELECTRIC FITTINGS

A. General Requirements: Assembly of copper alloy and ferrous materials with separating nonconductive insulating material. Include end connections compatible with pipes to be joined.

B. Dielectric Unions:
   1. Manufacturer: A.Y. McDonald, Watts, Wilkins, Zurn.
   2. Description:
      b. Pressure Rating: 150 psig.
      c. End Connections: Solder-joint copper alloy and threaded ferrous.

C. Dielectric Flanges:
   1. Manufacturer: A.Y. McDonald, Watts, Wilkins, Zurn.
   2. Description:
      b. Factory-fabricated, bolted, companion-flange assembly.
      c. Pressure Rating: 150 psig.
      d. End Connections: Solder-joint copper alloy and threaded ferrous; threaded solder-joint copper alloy and threaded ferrous.

2.8 LABELING AND IDENTIFYING

A. Detectable Warning Tape: Acid- and alkali-resistant, PE film warning tape manufactured for marking and identifying underground utilities, a minimum of 6 inches wide and 4 mils thick, continuously inscribed with a description of utility, with metallic core encased in a protective jacket for corrosion protection, detectable by metal detector when tape is buried up to 30 inches deep; colored yellow.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine roughing-in for natural-gas piping system to verify actual locations of piping connections before equipment installation.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Close equipment shut-off valves before turning off natural gas to premises or piping section.

B. Inspect natural-gas piping according to NFPA 54 to determine that natural-gas utilization devices are turned off in piping section affected.
C. Comply with NFPA 54 requirements for prevention of accidental ignition.

3.3 OUTDOOR PIPING INSTALLATION

A. Comply with NFPA 54 for installation and purging of natural-gas piping.

B. Install underground, natural-gas piping buried at least 36 inches below finished grade, or as required. Comply with requirements in Section 31 2000 "Earth Moving" for excavating, trenching, and backfilling.
   1. If natural-gas piping is installed less than 36 inches below finished grade, install it in containment conduit.

C. Install underground, PE, natural-gas piping according to ASTM D 2774.

D. Steel Piping with Protective Coating:
   1. Apply joint cover kits to pipe after joining to cover, seal, and protect joints.
   2. Repair damage to PE coating on pipe as recommended in writing by protective coating manufacturer.
   3. Replace pipe having damaged PE coating with new pipe.

E. Copper Tubing with Protective Coating:
   1. Apply joint cover kits over tubing to cover, seal, and protect joints.
   2. Repair damage to PE coating on pipe as recommended in writing by protective coating manufacturer.

F. Install fittings for changes in direction and branch connections.

G. Install pressure gage downstream from each service regulator. Pressure gages are specified in Section 23 0519 "Meters and Gages for HVAC Piping."

3.4 INDOOR PIPING INSTALLATION

A. Comply with NFPA 54 for installation and purging of natural-gas piping.

B. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements are used to size pipe and calculate friction loss, expansion, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.

C. Arrange for pipe spaces, chases, slots, sleeves, and openings in building structure during progress of construction, to allow for mechanical installations.

D. Install piping in concealed locations unless otherwise indicated and except in equipment rooms and service areas.

E. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

F. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.
G. Locate valves for easy access.

H. Install natural-gas piping at uniform grade of 2 percent down toward drip and sediment traps.

I. Install piping free of sags and bends.

J. Install fittings for changes in direction and branch connections.

K. Verify final equipment locations for roughing-in.

L. Comply with requirements in Sections specifying gas-fired appliances and equipment for roughing-in requirements.

M. Drips and Sediment Traps: Install drips at points where condensate may collect, including service-meter outlets. Locate where accessible to permit cleaning and emptying. Do not install where condensate is subject to freezing.
   1. Construct drips and sediment traps using tee fitting with bottom outlet plugged or capped. Use nipple a minimum length of 3 pipe diameters, but not less than 3 inches (75 mm) long and same size as connected pipe. Install with space below bottom of drip to remove plug or cap.

N. Extend relief vent connections for service regulators, line regulators, and overpressure protection devices to outdoors and terminate with weatherproof vent cap.

O. Conceal pipe installations in walls, pipe spaces, utility spaces, above ceilings, below grade or floors, and in floor channels unless indicated to be exposed to view.

P. Concealed Location Installations: Except as specified below, install concealed natural-gas piping and piping installed under the building in containment conduit constructed of steel pipe with welded joints as described in Part 2. Install a vent pipe from containment conduit to outdoors and terminate with weatherproof vent cap.
   1. Above Accessible Ceilings: Natural-gas piping, fittings, valves, and regulators may be installed in accessible spaces without containment conduit.
   2. In Floors: Install natural-gas piping with welded or brazed joints and protective coating in cast-in-place concrete floors. Cover piping to be cast in concrete slabs with minimum of 1-1/2 inches of concrete. Piping may not be in physical contact with other metallic structures such as reinforcing rods or electrically neutral conductors. Do not embed piping in concrete slabs containing quick-set additives or cinder aggregate.
   3. In Floor Channels: Install natural-gas piping in floor channels. Channels must have cover and be open to space above cover for ventilation.
   4. In Walls or Partitions: Protect tubing installed inside partitions or hollow walls from physical damage using steel striker barriers at rigid supports.
      a. Exception: Tubing passing through partitions or walls does not require striker barriers.
   5. Prohibited Locations:
      a. Do not install natural-gas piping in or through circulating air ducts, clothes or trash chutes, chimneys or gas vents (flues), ventilating ducts, or dumbwaiter or elevator shafts.
      b. Do not install natural-gas piping in solid walls or partitions.

Q. Use eccentric reducer fittings to make reductions in pipe sizes. Install fittings with level side down.

R. Connect branch piping from top or side of horizontal piping.
S. Install unions in pipes NPS 2 (DN 50) and smaller, adjacent to each valve, at final connection to each piece of equipment. Unions are not required at flanged connections.

T. Do not use natural-gas piping as grounding electrode.

U. Install strainer on inlet of each line-pressure regulator and automatic or electrically operated valve.

V. Install pressure gage downstream from each line regulator. Pressure gages are specified in Section 23 0519 "Meters and Gages for HVAC Piping."

W. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in Section 23 0517 "Sleeves and Sleeve Seals for HVAC Piping."

X. Install sleeve seals for piping penetrations of concrete walls and slabs. Comply with requirements for sleeve seals specified in Section 23 0517 "Sleeves and Sleeve Seals for HVAC Piping."

Y. Install escutcheons for piping penetrations of walls, ceilings, and floors. Comply with requirements for escutcheons specified in Section 23 0518 "Escutcheons for HVAC Piping."

Z. Install underground piping under the building to comply with NFPA 54 Section 7.1.6.2, using a PE pipe encased in a Schedule 40 PVC pipe.

3.5 VALVE INSTALLATION

A. Install manual gas shutoff valve for each gas appliance ahead of corrugated stainless-steel tubing, aluminum, or copper connector.

B. Install underground valves with valve boxes.

C. Install regulators and overpressure protection devices with maintenance access space adequate for servicing and testing.

D. Install earthquake valves aboveground outside buildings according to listing.

E. Install anode for metallic valves in underground PE piping.

3.6 PIPING JOINT CONSTRUCTION

A. Ream ends of pipes and tubes and remove burrs.

B. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

C. Threaded Joints:
   1. Thread pipe with tapered pipe threads complying with ASME B1.20.1.
   2. Cut threads full and clean using sharp dies.
   3. Ream threaded pipe ends to remove burrs and restore full inside diameter of pipe.
   4. Apply appropriate tape or thread compound to external pipe threads unless dryseal threading is specified.
5. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

D. Welded Joints:
2. Bevel plain ends of steel pipe.
3. Patch factory-applied protective coating as recommended by manufacturer at field welds and where damage to coating occurs during construction.

E. Brazed Joints: Construct joints according to AWS's "Brazing Handbook," "Pipe and Tube" Chapter.

F. Flanged Joints: Install gasket material, size, type, and thickness appropriate for natural-gas service. Install gasket concentrically positioned.

G. Flared Joints: Cut tubing with roll cutting tool. Flare tube end with tool to result in flare dimensions complying with SAE J513. Tighten finger tight, then use wrench. Do not overtighten.

H. PE Piping Heat-Fusion Joints: Clean and dry joining surfaces by wiping with clean cloth or paper towels. Join according to ASTM D 2657.
1. Plain-End Pipe and Fittings: Use butt fusion.
2. Plain-End Pipe and Socket Fittings: Use socket fusion.

3.7 HANGER AND SUPPORT INSTALLATION

A. Install seismic restraints on piping. Comply with requirements for seismic-restraint devices specified in Section 23 0548 "Vibration and Seismic Controls for HVAC."

B. Comply with requirements for pipe hangers and supports specified in Section 23 0529 "Hangers and Supports for HVAC Piping and Equipment."

C. Install hangers for horizontal steel piping with the following maximum spacing and minimum rod sizes:
1. NPS 1/2 and Smaller: Maximum span, 72 inches; minimum rod size, 3/8 inch.
2. NPS 3/4 and NPS 1: Maximum span, 96 inches; minimum rod size, 3/8 inch.
3. NPS 1-1/4: Maximum span, 108 inches; minimum rod size, 3/8 inch.
4. NPS 1-1/2 and NPS 2: Maximum span, 108 inches; minimum rod size, 3/8 inch.
5. NPS 2-1/2 to NPS 3-1/2: Maximum span, 10 feet; minimum rod size, 1/2 inch.
6. NPS 4 and Larger: Maximum span, 10 feet; minimum rod size, 5/8 inch.

3.8 CONNECTIONS

A. Connect to utility's gas main according to utility's procedures and requirements.

B. Install natural-gas piping electrically continuous, and bonded to gas appliance equipment grounding conductor of the circuit powering the appliance according to NFPA 70.

C. Install piping adjacent to appliances to allow service and maintenance of appliances.
D. Connect piping to appliances using manual gas shutoff valves and unions. Install valve within 72 inches (1800 mm) of each gas-fired appliance and equipment. Install union between valve and appliances or equipment.

E. Sediment Traps: Install tee fitting with capped nipple in bottom to form drip, as close as practical to inlet of each appliance.

3.9 PAINTING

A. Comply with requirements in Section 09 9113 "Exterior Painting" and Section 09 9123 "Interior Painting" for painting interior and exterior natural-gas piping.

B. Paint exposed, exterior metal piping, valves, service regulators, service meters and meter bars, earthquake valves, and piping specialties, except components, with factory-applied paint or protective coating.
   1. Alkyd System: MPI EXT 5.1D.
      c. Topcoat: Exterior alkyd enamel flat.
      d. Color: Gray.

C. Damage and Touchup: Repair marred and damaged factory-applied finishes with materials and by procedures to match original factory finish.

3.10 FIELD QUALITY CONTROL

A. Perform tests and inspections.

B. Tests and Inspections:
   1. Test, inspect, and purge natural gas according to NFPA 54 and authorities having jurisdiction.

C. Natural-gas piping will be considered defective if it does not pass tests and inspections.

D. Prepare test and inspection reports.

3.11 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain earthquake valves.

3.12 OUTDOOR PIPING SCHEDULE

A. Underground natural-gas piping shall be one of the following:
   1. PE pipe and fittings joined by heat fusion, or mechanical couplings; service-line risers with tracer wire terminated in an accessible location.
   2. Steel pipe with wrought-steel fittings and welded joints, or mechanical couplings. Coat pipe and fittings with protective coating for steel piping; OR wrapped with tape.
B. Aboveground natural-gas piping shall be [one of] the following:
   1. Steel pipe with malleable-iron fittings and threaded joints.
   2. Steel pipe with wrought-steel fittings and welded joints.

3.13 INDOOR PIPING SCHEDULE FOR SYSTEM PRESSURES LESS THAN 0.5 PSIG

   A. Aboveground, distribution piping shall be one of the following:
      1. Steel pipe with malleable-iron fittings and threaded joints.
      2. Steel pipe with wrought-steel fittings and welded joints.

3.14 INDOOR PIPING SCHEDULE FOR SYSTEM PRESSURES MORE THAN 0.5 PSIG AND LESS THAN 5 PSIG

   A. Aboveground, distribution piping shall be one of the following:
      1. Steel pipe with malleable-iron fittings and threaded joints.
      2. Steel pipe with steel welding fittings and welded joints.
      3. Drawn-temper copper tube with wrought-copper fittings and brazed joints.

3.15 ABOVEGROUND MANUAL GAS SHUTOFF VALVE SCHEDULE

   A. Valves for pipe sizes NPS 2 (DN 50) and smaller at service meter shall be one of the following:
      1. Bronze plug valve.

   B. Valves for pipe sizes NPS 2-1/2 and larger at service meter shall be one of the following:
      1. Cast-iron, non lubricated plug valve.

   C. Distribution piping valves for pipe sizes NPS 2 and smaller shall be one of the following:
      1. Bronze plug valve.

   D. Distribution piping valves for pipe sizes NPS 2-1/2 and larger shall be one of the following:
      1. Bronze plug valve.
      2. Cast-iron, non lubricated plug valve.

   E. Valves in branch piping for single appliance shall be one of the following:
      1. Bronze plug valve.

END OF SECTION
SECTION 22 11 19 - DOMESTIC WATER PIPING SPECIALTIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Backflow preventers.
   2. Water pressure-reducing valves.
   4. Temperature-actuated, water mixing valves.
   5. Strainers.
   6. Outlet boxes.
   8. Hose bibs.
   9. Wall hydrants.
   10. Drain valves.
   12. Trap-seal primer valves.
   13. Trap-seal primer systems.
   14. Flexible connectors.
   15. Water meters.

B. Related Requirements:
   1. Section 22 0519 "Meters and Gages for Plumbing Piping" for thermometers, pressure gages, and flow meters in domestic water piping.
   2. Section 22 1116 "Domestic Water Piping" for water meters.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: For domestic water piping specialties.
   1. Include diagrams for power, signal, and control wiring.

1.4 INFORMATIONAL SUBMITTALS

A. Field quality-control reports.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For domestic water piping specialties to include in emergency, operation, and maintenance manuals.
PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS FOR PIPING SPECIALTIES

A. Potable-water piping and components shall comply with NSF 61 Annex G and NSF 14.

B. All plumbing components including but not limited to valves, strainers, backflow preventers and other wetted parts shall be lead free.

C. Domestic water piping specialties shall be manufactured in the United States.

D. Backflow preventers shall be listed with the University of Southern California Foundation for Cross-Connection Control and Hydraulic Research

2.2 PERFORMANCE REQUIREMENTS

A. Minimum Working Pressure for Domestic Water Piping Specialties: 125 psig unless otherwise indicated.

2.3 BACKFLOW PREVENTERS

A. Reduced-Pressure-Principle Backflow Preventers:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Watts; a Watts Water Technologies company.
      b. Ames Co.
      c. Zurn Industries, LLC.
   3. Operation: Continuous-pressure applications.
   4. Pressure Loss: 12 psig maximum, through middle third of flow range.
   5. Size: See schedule.
   6. Design Flow Rate: See schedule.
   7. Selected Unit Flow Range Limits: See schedule.
   8. Body: Bronze for NPS 2 and smaller; cast iron with interior lining that complies with AWWA C550 or that is FDA approved for NPS 2-1/2 and larger.
   9. End Connections: Threaded for NPS 2 and smaller; flanged for NPS 2-1/2 and larger.
   10. Configuration: Designed for See plans and schedule flow.
   11. Accessories:
      a. Valves NPS 2 and Smaller: Ball type with threaded ends on inlet and outlet.
      b. Valves NPS 2-1/2 and Larger: Outside-screw and yoke-gate type with flanged ends on inlet and outlet.

B. Double-Check, Detector-Assembly Backflow Preventers (For fire protection service piping only):
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Watts; a Watts Water Technologies company.
      b. Ames Co.
      c. Zurn Industries, LLC.
   2. Standard: ASSE 1048 and is FM Global approved or UL listed.
3. Operation: Continuous-pressure applications.
4. Pressure Loss: 5 psig maximum, through middle third of flow range.
5. Size: See schedule.
6. Design Flow Rate: See schedule.
7. Selected Unit Flow Range Limits: See schedule.
8. Pressure Loss at Design Flow Rate: See schedule.
9. Body: Cast iron with interior lining that complies with AWWA C550 or that is FDA approved.
11. Configuration: Designed for See plan drawings flow.
12. Accessories:
   a. Valves: Outside-screw and yoke-gate type with flanged ends on inlet and outlet.
   b. Bypass: With displacement-type water meter, shutoff valves, and reduced-pressure backflow preventer.

2.4 WATER PRESSURE-REDUCING VALVES

A. Water Regulators:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Watts; a Watts Water Technologies company.
      b. Conbraco Industries, Inc.
      c. Zurn Industries, LLC.
   4. Size: See schedule.
   5. Design Flow Rate: See schedule.
   6. Design Inlet Pressure: See schedule.
   7. Design Outlet Pressure Setting: See schedule.
   8. Body: Bronze for NPS 2 and smaller; cast iron with interior lining that complies with AWWA C550 or that is FDA approved for NPS 2-1/2 and NPS 3.
   10. End Connections: Threaded for NPS 2 and smaller; flanged for NPS 2-1/2 and NPS 3.

B. Water-Control Valves:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. CLA-VAL Automatic Control Valves.
      b. Watts; a Watts Water Technologies company.
      c. Zurn Industries, LLC.
   2. Description: Pilot-operated, diaphragm-type, single-seated, main water-control valve.
   3. Pressure Rating: Initial working pressure of 150 psig minimum with AWWA C550 or FDA-approved, interior epoxy coating. Include small pilot-control valve, restrictor device, specialty fittings, and sensor piping.
   4. Main Valve Body: Cast- or ductile-iron body with AWWA C550 or FDA-approved, interior epoxy coating; or stainless-steel body.
      a. Size: See schedule.
      c. Trim: Stainless steel.
   6. Design Inlet Pressure: See schedule.
   7. Design Outlet Pressure Setting: See schedule.
   8. End Connections: Threaded for NPS 2 and smaller; flanged for NPS 2-1/2 and larger.
2.5 BALANCING VALVES

A. Copper-Alloy Calibrated Balancing Valves:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      b. NIBCO INC.
      c. Watts; a Watts Water Technologies company.
      d. ITT Corporation.
      e. Taco Incorporated.
      f. Watts.
   2. Type: Ball valve with two readout ports and memory-setting indicator.
   3. Body: Brass or bronze.
   4. Size: Same as connected piping, but not larger than NPS 2.
   5. Accessories: Meter hoses, fittings, valves, differential pressure meter, and carrying case.

B. Cast-Iron Calibrated Balancing Valves:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      b. NIBCO INC.
      c. Watts; a Watts Water Technologies company.
   2. Type: Adjustable with Y-pattern globe valve, two readout ports, and memory-setting indicator.
   3. Size: Same as connected piping, but not smaller than NPS 2-1/2.
   4. Accessories: Meter hoses, fittings, valves, differential pressure meter, and carrying case.

C. Memory-Stop Balancing Valves:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Conbraco Industries, Inc.
      b. Milwaukee Valve Company.
      c. NIBCO INC.
   2. Standard: MSS SP-110 for two-piece, copper-alloy ball valves.
   3. Pressure Rating: 400-psig minimum CWP.
   4. Size: NPS 2 or smaller.
   5. Body: Copper alloy.
   6. Port: Standard or full port.
   7. Ball: Chrome-plated brass.
   8. Seats and Seals: Replaceable.
   9. End Connections: Solder joint or threaded.

2.6 TEMPERATURE-ACTUATED, WATER MIXING VALVES

A. Water-Temperature Limiting Devices:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Conbraco Industries, Inc.
      b. Honeywell.
      c. Watts.
      d. Zurn.
      e. NIBCO INC.
4. Type: Thermostatically controlled, water mixing valve.
5. Material: Bronze body with corrosion-resistant interior components.
7. Accessories: Check stops on hot-and cold-water supplies, and adjustable, temperature-control handle.
8. Tempered-Water Setting: 180 deg F.
9. Tempered-Water Design Flow Rate: see schedule.
10. Valve Finish: Rough bronze.

B. Primary, Thermostatic, Water Mixing Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Leonard Valve Company.
   b. Powers.
   c. Symmons.
   d. Zurn.
3. Pressure Rating: 125 psig minimum unless otherwise indicated.
4. Type: Exposed-mounted or Cabinet-type, thermostatically controlled, water mixing valve.
5. Material: Bronze body with corrosion-resistant interior components.
7. Accessories: Manual temperature control, check stops on hot- and cold-water supplies, and adjustable, temperature-control handle.
8. Tempered-Water Setting: 180°F.
9. Tempered-Water Design Flow Rate: see schedule.
10. Selected Valve Flow Rate at 45-psig Pressure Drop: see schedule.
11. Pressure Drop at Design Flow Rate: see schedule.
13. Piping Finish: Copper.

2.7 STRAINERS FOR DOMESTIC WATER PIPING

A. Y-Pattern Strainers
1. Pressure Rating: 125 psig minimum unless otherwise indicated.
2. Body: Bronze for NPS 2 and smaller; cast iron with interior lining that complies with AWWA C550 or that is FDA approved, epoxy coated and for NPS 2-1/2 and larger.
3. End Connections: Threaded for NPS 2 and smaller; flanged for NPS 2-1/2 and larger.
4. Screen: Stainless steel with round perforations unless otherwise indicated.
5. Perforation Size:
   a. Strainers NPS 2 and Smaller: 0.020 inch.
   b. Strainers NPS 2-1/2 to NPS 4: 0.045 inch.
   c. Strainers NPS 5 and Larger: 0.10 inch.

2.8 OUTLET BOXES

A. Clothes Washer Outlet Boxes:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. Oatey.
b. IPS Corporation.
c. LSP Products Group, Inc.
4. Faucet: Combination valved fitting or separate hot- and cold-water valved fittings complying with ASME A112.18.1. Include garden-hose thread complying with ASME B1.20.7 on outlets.
5. Supply Shutoff Fittings: NPS 1/2 gate, globe, or ball valves and NPS 1/2 copper, water tubing.
6. Drain: NPS 2 standpipe and P-trap for direct waste connection to drainage piping.
7. Inlet Hoses: Two 60-inch-long, rubber household clothes washer inlet hoses with female, garden-hose-thread couplings. Include rubber washers.
8. Drain Hose: One 48-inch-long, rubber household clothes washer drain hose with hooked end.

B. Icemaker Outlet Boxes:
1. Mounting: Recessed.
3. Faucet: Valved fitting complying with ASME A112.18.1. Include NPS 1/2 or smaller copper tube outlet.
4. Supply Shutoff Fitting: NPS 1/2 gate, globe, or ball valve and NPS 1/2 copper, water tubing.

2.9 HOSE BIBBS

A. Hose Bibbs:
4. Supply Connections: NPS 1/2 or NPS 3/4 threaded or solder-joint inlet.
5. Outlet Connection: Garden-hose thread complying with ASME B1.20.7.
8. Finish for Equipment Rooms: Rough bronze, or chrome or nickel plated.
10. Finish for Finished Rooms: Chrome or nickel plated.
11. Operation for Equipment Rooms: Wheel handle or operating key.
14. Include operating key with each operating-key hose bibb.
15. Include integral wall flange with each chrome- or nickel-plated hose bibb.

2.10 WALL HYDRANTS

A. Non-freeze Wall Hydrants:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   b. Watts; a Watts Water Technologies company.
   c. Woodford Manufacturing Company.
   d. Zurn Industries, LLC.
4. Operation: Loose key.
5. Casing and Operating Rod: Of length required to match wall thickness. Include wall clamp.
6. Inlet: NPS 3/4 or NPS 1.
7. Outlet: Concealed, with integral vacuum breaker and garden-hose thread complying with ASME B1.20.7.
8. Box: Deep, flush mounted with cover.

B. Moderate-Climate Wall Hydrants >:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   b. Watts; a Watts Water Technologies company.
   c. Woodford Manufacturing Company.
   d. Zurn Industries, LLC.
4. Operation: Loose key.
5. Inlet: NPS 3/4 or NPS 1.
6. Outlet:
   a. Concealed, with integral vacuum breaker or nonremovable hose-connection vacuum breaker complying with ASSE 1011 or backflow preventer complying with ASSE 1052.
   b. Garden-hose thread complying with ASME B1.20.7.
7. Box: Deep, flush mounted with cover.
8. Box and Cover Finish: Polished nickel bronze Retain "Outlet," "Box," and "Box and Cover Finish" subparagraphs above for concealed-outlet-type wall hydrants or "Outlet" and "Nozzle and Wall-Plate Finish" subparagraphs below for exposed-outlet-type wall hydrants.
9. Outlet:
   a. Concealed, with integral vacuum breaker or nonremovable hose-connection vacuum breaker complying with ASSE 1011 or backflow preventer complying with ASSE 1052.
   b. Garden-hose thread complying with ASME B1.20.7.
10. Nozzle and Wall-Plate Finish: Polished nickel bronze
11. Operating Key(s): Two with each wall hydrant.

C. Vacuum Breaker Wall Hydrants :
1. Standard: ASSE 1019, Type A or Type B.
2. Type: Freeze-resistant, automatic draining with integral air-inlet valve.
3. Classification: Type B, for automatic draining with hose removed or with hose attached and nozzle closed.
5. Operation: Loose key.
6. Casing and Operating Rod: Of length required to match wall thickness. Include wall clamp.
7. Inlet: NPS 1/2 or NPS 3/4.
2.11 DRAIN VALVES

A. Ball-Valve-Type, Hose-End Drain Valves:
2. Pressure Rating: 400-psig minimum CWP.
4. Body: Copper alloy.
5. Ball: Chrome-plated brass.
8. Inlet: Threaded or solder joint.

2.12 WATER-HAMMER ARRESTERS

A. Water-Hammer Arresters:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Precision Plumbing Products.
   b. Sioux Chief Manufacturing Company, Inc.
   c. Watts; a Watts Water Technologies company.
   d. Zurn Industries, LLC.
3. Type: Copper tube with piston.
4. Size: ASSE 1010, Sizes AA and A through F, or PDI-WH 201, Sizes A through F.

2.13 TRAP-SEAL PRIMER DEVICE

A. Supply-Type, Trap-Seal Primer Device:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. MIFAB, Inc.
   b. Precision Plumbing Products.
   c. Zurn Industries, LLC.
5. Inlet and Outlet Connections: NPS 1/2 threaded, union, or solder joint.
6. Gravity Drain Outlet Connection: NPS 1/2 threaded or solder joint.
7. Finish: Chrome plated, or rough bronze for units used with pipe or tube that is not chrome finished.

2.14 TRAP-SEAL PRIMER SYSTEMS

A. Trap-Seal Primer Systems:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Precision Plumbing Products.
   b. Zurn Industries, LLC.
2. Standard: ASSE 1044.
3. Piping: NPS 3/4, ASTM B 88, Type L; copper, water tubing.
5. Electric Controls: 24-hour timer, solenoid valve, and manual switch for 120-V ac power.
   a. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
7. Number Outlets: See plans and schedule. Insert number.

2.15 FLEXIBLE CONNECTORS
A. Stainless-Steel-Hose Flexible Connectors: Corrugated-stainless-steel tubing with stainless-steel wire-braid covering and ends welded to inner tubing.
   2. End Connections NPS 2 and Smaller: Threaded steel-pipe nipple.
   3. End Connections NPS 2-1/2 and Larger: Flanged steel nipple.

2.16 WATER METERS
A. Electromagnetic Water Meter

PART 3 - EXECUTION

3.1 INSTALLATION
A. Install backflow preventers in each water supply to mechanical equipment and systems and to other equipment and water systems that may be sources of contamination. Comply with authorities having jurisdiction.
   1. Locate backflow preventers in same room as connected equipment or system.
   2. Install drain for backflow preventers with atmospheric-vent drain connection with air-gap fitting, fixed air-gap fitting, or equivalent positive pipe separation of at least two pipe diameters in drain piping and pipe-to-floor drain. Locate air-gap device attached to or under backflow preventer. Simple air breaks are unacceptable for this application.
   3. Do not install bypass piping around backflow preventers.
B. Install water regulators with inlet and outlet shutoff valves. Install pressure gages on inlet and outlet.
C. Install water-control valves with inlet and outlet shutoff valves. Install pressure gages on inlet and outlet.
D. Install balancing valves in locations where they can easily be adjusted.
E. Install temperature-actuated, water mixing valves with check stops or shutoff valves on inlets and with shutoff valve on outlet.
   1. Install cabinet-type units recessed in or surface mounted on wall as specified.
F. Install Y-pattern strainers for water on supply side of each control valve, water pressure-reducing valve, solenoid valve, and pump.
G. Install outlet boxes recessed in wall or surface mounted on wall. Install 2-by-4-inch fire-retardant-treated-wood blocking, wall reinforcement between studs. Comply with requirements for fire-retardant-treated-wood blocking in Section 06 1000 "Rough Carpentry."

H. Install hose stations with check stops or shutoff valves on inlets and with thermometer on outlet.
   1. Install cabinet-type units recessed in or surface mounted on wall as specified. Install 2-by-4-inch fire-retardant-treated-wood blocking, wall reinforcement between studs. Comply with requirements for fire-retardant-treated-wood blocking in Section 06 1000 "Rough Carpentry."

I. Set non-freeze, non-draining-type post hydrants in concrete or pavement.

J. Set freeze-resistant yard hydrants with riser pipe in concrete or pavement. Do not encase canister in concrete.

K. Install water-hammer arresters in water piping according to PDI-WH 201.

L. Install air vents at high points of water piping.

M. Install supply-type, trap-seal primer valves with outlet piping pitched down toward drain trap a minimum of 1 percent, and connect to floor-drain body, trap, or inlet fitting. Adjust valve for proper flow.

N. Install drainage-type, trap-seal primer valves as lavatory trap with outlet piping pitched down toward drain trap a minimum of 1 percent, and connect to floor-drain body, trap, or inlet fitting.

O. Install trap-seal primer systems with outlet piping pitched down toward drain trap a minimum of 1 percent, and connect to floor-drain body, trap, or inlet fitting. Adjust system for proper flow.

3.2 CONNECTIONS

A. Comply with requirements for ground equipment in Section 26 0526 "Grounding and Bonding for Electrical Systems."

B. Fire-retardant-treated-wood blocking is specified in Section 26 0519 "Low-Voltage Electrical Power Conductors and Cables" for electrical connections.

3.3 LABELING AND IDENTIFYING

A. Equipment Nameplates and Signs: Install engraved plastic-laminate equipment nameplate or sign on or near each of the following:
   1. Reduced-pressure-principle backflow preventers.
   2. Double-check, backflow-prevention assemblies.
   3. Dual-check-valve backflow preventers.
   4. Reduced-pressure-detector, fire-protection, backflow-preventer assemblies.
   5. Double-check, detector-assembly backflow preventers.
   7. Calibrated balancing valves.
   8. Primary, thermostatic, water mixing valves.
   9. Primary water tempering valves.
   10. Outlet boxes.
   11. Hose stations.
12. Supply-type, trap-seal primer valves.
13. Trap-seal primer systems.

B. Distinguish among multiple units, inform operator of operational requirements, indicate safety and emergency precautions, and warn of hazards and improper operations, in addition to identifying unit. Nameplates and signs are specified in Section 22 0553 "Identification for Plumbing Piping and Equipment."

FIELD QUALITY CONTROL

C. Perform the following tests and inspections:
1. Test each reduced-pressure-principle backflow preventer and double-check, detector-assembly backflow preventer according to authorities having jurisdiction and the device's reference standard.

D. Domestic water piping specialties will be considered defective if they do not pass tests and inspections.

E. Prepare test and inspection reports.

3.4 ADJUSTING

A. Set field-adjustable pressure set points of water pressure-reducing valves.

B. Set field-adjustable flow set points of balancing valves.

C. Set field-adjustable temperature set points of temperature-actuated, water mixing valves.

END OF SECTION
SECTION 22 11 23.13 DOMESTIC - WATER PACKAGED BOOSTER PUMPS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Multiplex, variable-speed booster pumps.

B. Related Sections:
   1. Section 22 30000 "Plumbing Equipment" for domestic-water circulation pumps.

1.3 DEFINITIONS

A. VFC: Variable-frequency controller(s).

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product indicated. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

B. Shop Drawings: For booster pumps. Include plans, elevations, sections, details, and attachments to other work.
   1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   2. Wiring Diagrams: For power, signal, and control wiring.

1.5 INFORMATIONAL SUBMITTALS

A. Seismic Qualification Certificates: For booster pumps, accessories, and components, from manufacturer.
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
   2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
   3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
1.6 CLOSEOUT SUBMITTALS
   A. Operation and Maintenance Data: For booster pumps to include in emergency, operation, and maintenance manuals.

1.7 QUALITY ASSURANCE
   A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
   B. ASME Compliance: Comply with ASME B31.9 for piping.
   C. UL Compliance for Packaged Pumping Systems:
      1. UL 508, "Industrial Control Equipment."
      2. UL 508A, "Industrial Control Panels."
      3. UL 778, "Motor-Operated Water Pumps."
   D. Booster pumps shall be listed and labeled as packaged pumping systems by testing agency acceptable to authorities having jurisdiction.

1.8 DELIVERY, STORAGE, AND HANDLING
   A. Retain protective coatings and flange’s protective covers during storage.

1.9 COORDINATION
   A. Coordinate sizes and locations of concrete bases with actual equipment provided.

PART 2 - PRODUCTS

2.1 MULTIPLEX, VARIABLE-SPEED BOOSTER PUMPS
   A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      1. Bell & Gossett; a Xylem brand.
      2. Flowtherm.
      3. Grundfos Pumps Corporation U.S.A.
   B. Description: Factory-assembled, duplex, and -tested, fluid-handling system for domestic water, with pumps, piping, valves, specialties, and controls, and mounted on base.
   C. Control Panel: Factory installed and connected as an integral part of booster pump; automatic for multiple-pump, variable-speed operation, with load control and protection functions.
   D. Base: Structural steel.
   E. Capacities and Characteristics:
      1. Refer to drawings.
2.2 MOTORS
A. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors.

PART 3 - EXECUTION

3.1 EXAMINATION
A. Examine roughing-in for booster pumps to verify actual locations of piping connections before booster-pump installation.

3.2 INSTALLATION
A. Equipment Mounting:
   1. Install booster pumps on cast-in-place concrete equipment base(s). Comply with requirements for equipment bases and foundations specified in Section 03 3000 "Cast-in-Place Concrete." Section 03 3053 "Miscellaneous Cast-in-Place Concrete."
   2. Comply with requirements for vibration isolation and seismic control devices specified in Section 22 0548 "Vibration and Seismic Controls for Plumbing Piping and Equipment."
   3. Comply with requirements for vibration isolation devices specified in Section 22 0548.13 "Vibration Controls for Plumbing Piping and Equipment."

B. Support connected domestic-water piping so weight of piping is not supported by booster pumps.

3.3 CONNECTIONS
A. Comply with requirements for piping specified in Section 22 1116 "Domestic Water Piping." Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect domestic-water piping to booster pumps. Install suction and discharge pipe equal to or greater than size of system suction and discharge headers or piping.
   1. Install shutoff valves on piping connections to booster-pump suction and discharge headers or piping. Install ball, butterfly, or gate valves same size as suction and discharge headers or piping. Comply with requirements for general-duty valves specified in Section 22 0523.12 "Ball Valves for Plumbing Piping," Section 22 0523.13 "Butterfly Valves for Plumbing Piping," and Section 22 0523.15 "Gate Valves for Plumbing Piping."
   2. Install union, flanged, or grooved-joint connections on suction and discharge headers or piping at connection to domestic-water piping. Comply with requirements for unions and flanges specified in Section 22 1116 "Domestic Water Piping."
   3. Install valved bypass, same size as and between piping, at connections to booster-pump suction and discharge headers or piping. Comply with requirements for domestic-water piping specified in Section 22 1116 "Domestic Water Piping."
   4. Install flexible connectors, same size as piping, on piping connections to booster-pump suction and discharge headers or piping. Comply with requirements for flexible connectors specified in Section 22 1116 "Domestic Water Piping."
   5. Install piping adjacent to booster pumps to allow service and maintenance.
3.4 IDENTIFICATION

A. Identify system components. Comply with requirements for identification specified in Section 22 0553 "Identification for Plumbing Piping and Equipment."

3.5 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.

B. Perform tests and inspections.
   1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

C. Tests and Inspections:
   1. Perform visual and mechanical inspection.
   2. Leak Test: After installation, charge booster pump and test for leaks. Repair leaks and retest until no leaks exist.
   3. Operational Test: After electrical circuitry has been energized, start booster pumps to confirm proper motor rotation and booster-pump operation.
   4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

D. Pumps and controls will be considered defective if they do not pass tests and inspections.

E. Prepare test and inspection reports.

3.6 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.
   1. Complete installation and startup checks according to manufacturer's written instructions.

3.7 ADJUSTING

A. Adjust booster pumps to function smoothly, and lubricate as recommended by manufacturer.

B. Adjust pressure set points.

C. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting booster pump to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.

3.8 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain booster pumps.

END OF SECTION
SECTION 22 13 16 - SANITARY WASTE AND VENT PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Pipe, tube, and fittings.
   2. Specialty pipe fittings.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.
B. Shop Drawings: For hubless drainage system. Include plans, elevations, sections, and details.

1.4 INFORMATIONAL SUBMITTALS

A. Seismic Qualification Certificates: For waste and vent piping, accessories, and components, from manufacturer.
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
   2. Detailed description of piping anchorage devices on which the certification is based and their installation requirements.
B. Field quality-control reports.

1.5 FIELD CONDITIONS

A. Interruption of Existing Sanitary Waste Service: Do not interrupt service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary service according to requirements indicated:
   1. Notify Construction Manager no fewer than two days in advance of proposed interruption of sanitary waste service.
   2. Do not proceed with interruption of sanitary waste service without Construction Manager's written permission.
PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Components and installation shall be capable of withstanding the following minimum working pressure unless otherwise indicated:

B. Seismic Performance: Soil, waste, and vent piping and support and installation shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

2.2 PIPING MATERIALS

A. Piping materials shall bear label, stamp, or other markings of specified testing agency.

B. Comply with requirements in "Piping Schedule" Article for applications of pipe, tube, fitting materials, and joining methods for specific services, service locations, and pipe sizes.

C. Pipe, fittings and couplings shall be manufactured in the United States.

D. Pipe and fittings shall be marked with the collective trademark of the Cast Iron Soil Pipe Institute or receive prior approval of the engineer.

E. Manufacturers:
1. AB&I Foundry
2. Charlotte Pipe
3. Tyler Pipe
4. No other known equal

2.3 HUB-AND-SPIGOT, CAST-IRON SOIL PIPE AND FITTINGS

A. Pipe and Fittings: ASTM A 74, Service class(es).

B. Gaskets: ASTM C 564, rubber.

2.4 HUBLESS, CAST-IRON SOIL PIPE AND FITTINGS

A. Pipe and Fittings: ASTM A 888 or CISPI 301.

B. Heavy-Duty, Hubless-Piping Couplings:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. ANACO-Husky.
   b. Mission Rubber Company, LLC; a division of MCP Industries.
   c. Tyler Pipe; a subsidiary of McWane Inc.
3. Description: Stainless-steel shield with stainless-steel bands and tightening devices; and ASTM C 564, rubber sleeve with integral, center pipe stop.
2.5 GALVANIZED-STEEL PIPE AND FITTINGS

A. Galvanized-Steel Pipe: ASTM A 53/A 53M, Type E, Standard Weight class. Include square-cut-grooved or threaded ends matching joining method.

C. Steel Pipe Pressure Fittings:

D. Cast-Iron Flanges: ASME B16.1, Class 125.
   1. Flange Gasket Materials: ASME B16.21, full-face, flat, nonmetallic, asbestos-free, 1/8-inch maximum thickness unless thickness or specific material is indicated.
   2. Flange Bolts and Nuts: ASME B18.2.1, carbon steel unless otherwise indicated.

2.6 COPPER TUBE AND FITTINGS

A. Copper Type DWV Tube: ASTM B 306, drainage tube, drawn temper.

B. Copper Drainage Fittings: ASME B16.23, cast copper or ASME B16.29, wrought copper, solder-joint fittings.

C. Hard Copper Tube: ASTM B 88, Type L and Type M, water tube, drawn temper.

D. Soft Copper Tube: ASTM B 88, Type L, water tube, annealed temper.

E. Copper Pressure Fittings:
   2. Copper Unions: MSS SP-123, copper-alloy, hexagonal-stock body with ball-and-socket, metal-to-metal seating surfaces, and solder-joint or threaded ends.

F. Solder: ASTM B 32, lead free with ASTM B 813, water-flushable flux.

G. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Charlotte Pipe
   2. AB&I Foundry
   3. Tyler Pipe

H. PVC Schedule 40 solid wall pipe: ASTM D1784, ASTM D1785 and ASTM D2665, Class of 12454,
2.7 SPECIALTY PIPE FITTINGS

A. Transition Couplings:
1. Fitting-Type Transition Couplings: Manufactured piping coupling or specified piping system fitting.
2. Shielded, Non-pressure Transition Couplings:
   b. Description: Elastomeric or rubber sleeve with full-length, corrosion-resistant outer shield and corrosion-resistant-metal tension band and tightening mechanism on each end.
   c. End Connections: Same size as and compatible with pipes to be joined.
3. Pressure Transition Couplings:
   b. Description: Metal, sleeve-type same size as, with pressure rating at least equal to, and ends compatible with, pipes to be joined.
   c. Center-Sleeve Material: Stainless steel.
   d. Gasket Material: Natural or synthetic rubber.
   e. Metal Component Finish: Corrosion-resistant coating or material.

B. Dielectric Fittings:
1. Dielectric Flanges:
   a. Manufacturers:
      1) Watts; a Watts Water Technologies company.
      2) Wilkins.
      3) Zurn Industries, LLC.
   b. Description:
      1) Standard: ASSE 1079.
      2) Factory-fabricated, bolted, companion-flange assembly.
      3) Pressure Rating: 125 psig minimum at 180 deg F.
      4) End Connections: Solder-joint copper alloy and threaded ferrous; threaded solder-joint copper alloy and threaded ferrous.
2. Dielectric Nipples:
   a. 6" brass nipple

PART 3 - EXECUTION

3.1 EARTH MOVING

A. Comply with requirements for excavating, trenching, and backfilling specified in Section 31 2000 "Earth Moving."

3.2 PIPING INSTALLATION

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems.
   1. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations.
   2. Install piping as indicated unless deviations to layout are approved on coordination drawings.
B. Install piping in concealed locations unless otherwise indicated and except in equipment rooms and service areas.

C. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

D. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

E. Install piping to permit valve servicing.

F. Install piping at indicated slopes.

G. Install piping free of sags and bends.

H. Install fittings for changes in direction and branch connections.

I. Install piping to allow application of insulation.

J. Install seismic restraints on piping. Comply with requirements for seismic-restraint devices specified in Section 22 0548 "Vibration and Seismic Controls for Plumbing Piping and Equipment."

K. Make changes in direction for soil and waste drainage and vent piping using appropriate branches, bends, and long-sweep bends.
   1. Sanitary tees and short-sweep 1/4 bends may be used on vertical stacks if change in direction of flow is from horizontal to vertical.
   2. Use long-turn, double Y-branch and 1/8-bend fittings if two fixtures are installed back to back or side by side with common drain pipe.
      a. Straight tees, elbows, and crosses may be used on vent lines.
   3. Do not change direction of flow more than 90 degrees.
   4. Use proper size of standard increasers and reducers if pipes of different sizes are connected.
      a. Reducing size of waste piping in direction of flow is prohibited.

L. Lay buried building waste piping beginning at low point of each system.
   1. Install true to grades and alignment indicated, with unbroken continuity of invert. Place hub ends of piping upstream.
   2. Install required gaskets according to manufacturer's written instructions for use of lubricants, cements, and other installation requirements.
   3. Maintain swab in piping and pull past each joint as completed.

M. Install soil and waste and vent piping at the following minimum slopes unless otherwise indicated:
   1. Building Sanitary Waste: 2 percent downward in direction of flow for piping NPS 3 and smaller; 2 percent downward in direction of flow for piping NPS 4 and larger.
   3. Vent Piping: 1 percent down toward vertical fixture vent or toward vent stack.

N. Install cast-iron soil piping according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook," Chapter IV, "Installation of Cast Iron Soil Pipe and Fittings."

O. Install steel piping according to applicable plumbing code.

P. Install stainless-steel piping according to ASME A112.3.1 and applicable plumbing code.
Q. Install aboveground copper tubing according to CDA's "Copper Tube Handbook."

R. Install force mains at elevations indicated.

S. Plumbing Specialties:
   1. Install backwater valves in sanitary waster gravity-flow piping.
      a. Comply with requirements for backwater valves specified in Section 22 13 19 "Sanitary Waste Piping Specialties."
   2. Install cleanouts at grade and extend to where building sanitary drains connect to building sanitary sewers in sanitary waste gravity-flow piping.
      a. Install cleanout fitting with closure plug inside the building in sanitary drainage force-main piping.
      b. Comply with requirements for cleanouts specified in Section 22 13 19 "Sanitary Waste Piping Specialties."
   3. Install drains in sanitary waste gravity-flow piping.
      a. Comply with requirements for drains specified in Section 22 13 19 "Sanitary Waste Piping Specialties."

T. Do not enclose, cover, or put piping into operation until it is inspected and approved by authorities having jurisdiction.

U. Install sleeves for piping penetrations of walls, ceilings, and floors.
   1. Comply with requirements for sleeves specified in Section 22 05 17 "Sleeves and Sleeve Seals for Plumbing Piping."

V. Install sleeve seals for piping penetrations of concrete walls and slabs.
   1. Comply with requirements for sleeve seals specified in Section 22 05 17 "Sleeves and Sleeve Seals for Plumbing Piping."

W. Install escutcheons for piping penetrations of walls, ceilings, and floors.
   1. Comply with requirements for escutcheons specified in Section 22 05 18 "Escutcheons for Plumbing Piping."

3.3 Joint Construction

C. Join hubless, cast-iron soil piping according to CISPI 310 and CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for hubless-piping coupling joints.

D. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1.
   1. Cut threads full and clean using sharp dies.
   2. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
      a. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
      b. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged.
      c. Do not use pipe sections that have cracked or open welds.
E. Join stainless-steel pipe and fittings with gaskets according to ASME A112.3.1.

F. Join copper tube and fittings with soldered joints according to ASTM B 828. Use ASTM B 813, water-flushable, lead-free flux and ASTM B 32, lead-free-alloy solder.

G. Grooved Joints: Cut groove ends of pipe according to AWWA C606. Lubricate and install gasket over ends of pipes or pipe and fitting. Install coupling housing sections, over gasket, with keys seated in piping grooves. Install and tighten housing bolts.

H. Flanged Joints: Align bolt holes. Select appropriate gasket material, size, type, and thickness. Install gasket concentrically positioned. Use suitable lubricants on bolt threads. Torque bolts in cross pattern.

3.4 SPECIALTY PIPE FITTING INSTALLATION

A. Transition Couplings:
   1. Install transition couplings at joints of piping with small differences in ODs.
   2. In Waste Drainage Piping: Shielded, non pressure transition couplings.
   4. In Underground Force Main Piping:
      a. NPS 1-1/2 and Smaller: Fitting-type transition couplings.
      b. NPS 2 and Larger: Pressure transition couplings.

B. Dielectric Fittings:
   1. Install dielectric fittings in piping at connections of dissimilar metal piping and tubing.
   2. Dielectric Fittings for NPS 2 and Smaller: Use dielectric nipples.
   3. Dielectric Fittings for NPS 2-1/2 to NPS 4: Use dielectric nipples.
   4. Dielectric Fittings for NPS 5 and Larger: Use dielectric flange kits.

3.5 VALVE INSTALLATION

A. Comply with requirements in Section 22 0523.12 "Ball Valves for Plumbing Piping," Section 22 0523.13 "Butterfly Valves for Plumbing Piping," Section 22 0523.14 "Check Valves for Plumbing Piping," and Section 22 0523.15 "Gate Valves for Plumbing Piping" for general-duty valve installation requirements.

B. Shutoff Valves:
   1. Install shutoff valve on each sewage pump discharge.
   2. Install gate or full-port ball valve for piping NPS 2 and smaller.
   3. Install gate valve for piping NPS 2-1/2 and larger.

C. Check Valves: Install swing check valve, between pump and shutoff valve, on each sewage pump discharge.

3.6 HANGER AND SUPPORT INSTALLATION

A. Comply with requirements for seismic-restraint devices specified in Section 22 0548 "Vibration and Seismic Controls for Plumbing Piping and Equipment."

B. Comply with requirements for pipe hanger and support devices and installation specified in Section 22 0529 "Hangers and Supports for Plumbing Piping and Equipment." Section 22 0548.13 "Vibration Controls for Plumbing Piping and Equipment."
1. Install carbon-steel pipe hangers for horizontal piping in noncorrosive environments.
2. Install carbon-steel pipe support clamps for vertical piping in noncorrosive environments.
3. Vertical Piping: MSS Type 8 or Type 42, clamps.
4. Install individual, straight, horizontal piping runs:
   a. 100 Feet and Less: MSS Type 1, adjustable, steel clevis hangers.
   b. Longer Than 100 Feet: MSS Type 43, adjustable roller hangers.
   c. Longer Than 100 Feet if Indicated: MSS Type 49, spring cushion rolls.
5. Multiple, Straight, Horizontal Piping Runs 100 Feet or Longer: MSS Type 44, pipe rolls.
   Support pipe rolls on trapeze.
6. Base of Vertical Piping: MSS Type 52, spring hangers.

C. Support horizontal piping and tubing within 12 inches of each fitting, valve, and coupling.

D. Support vertical piping and tubing at base and at each floor.

E. Rod diameter may be reduced one size for double-rod hangers, with 3/8-inch minimum rods.

F. Install hangers for cast-iron soil piping with the following maximum horizontal spacing and minimum rod diameters:
   1. NPS 1-1/2 and NPS 2: 60 inches with 3/8-inch rod.
   2. NPS 3: 60 inches with 1/2-inch rod.
   3. NPS 4 and NPS 5: 60 inches with 5/8-inch rod.
   4. NPS 6 and NPS 8: 60 inches with 3/4-inch rod.
   5. NPS 10 and NPS 12: 60 inches with 7/8-inch rod.
   6. Spacing for 10-foot lengths may be increased to 10 feet. Spacing for fittings is limited to 60 inches.

G. Install supports for vertical cast-iron soil piping every 15 feet.

H. Install hangers for steel piping with the following maximum horizontal spacing and minimum rod diameters:
   1. NPS 1-1/4: 84 inches with 3/8-inch rod.
   2. NPS 1-1/2: 108 inches with 3/8-inch rod.
   3. NPS 2: 10 feet with 3/8-inch rod.
   4. NPS 2-1/2: 11 feet with 1/2-inch rod.
   5. NPS 3: 12 feet with 1/2-inch rod.
   6. NPS 4 and NPS 5: 12 feet with 5/8-inch rod.
   7. NPS 6 and NPS 8: 12 feet with 3/4-inch rod.
   8. NPS 10 and NPS 12: 12 feet with 7/8-inch rod.

I. Install supports for vertical steel piping every 15 feet.

J. Install hangers for copper tubing with the following maximum horizontal spacing and minimum rod diameters:
   1. NPS 1-1/4: 72 inches with 3/8-inch rod.
   2. NPS 1-1/2 and NPS 2: 96 inches with 3/8-inch rod.
   3. NPS 2-1/2: 108 inches with 1/2-inch rod.
   4. NPS 3 and NPS 5: 10 feet with 1/2-inch rod.
   5. NPS 6: 10 feet with 5/8-inch rod.
   6. NPS 8: 10 feet with 3/4-inch rod.

K. Install supports for vertical copper tubing every 10 feet.

L. Support piping and tubing not listed above according to MSS SP-58 and manufacturer's written instructions.
3.7 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect soil and waste piping to exterior sanitary sewerage piping. Use transition fitting to join dissimilar piping materials.

C. Connect waste and vent piping to the following:
   1. Plumbing Fixtures: Connect waste piping in sizes indicated, but not smaller than required by plumbing code.
   2. Plumbing Fixtures and Equipment: Connect atmospheric vent piping in sizes indicated, but not smaller than required by authorities having jurisdiction.
   3. Plumbing Specialties: Connect waste and vent piping in sizes indicated, but not smaller than required by plumbing code.
   4. Install test tees (wall cleanouts) in conductors near floor and floor cleanouts with cover flush with floor.
   5. Comply with requirements for cleanouts and drains specified in Section 22 1319 "Sanitary Waste Piping Specialties."
   6. Equipment: Connect waste piping as indicated.
      a. Provide shutoff valve if indicated and union for each connection.
      b. Use flanges instead of unions for connections NPS 2-1/2 and larger.

D. Where installing piping adjacent to equipment, allow space for service and maintenance of equipment.

E. Make connections according to the following unless otherwise indicated:
   1. Install unions, in piping NPS 2 and smaller, adjacent to each valve and at final connection to each piece of equipment.
   2. Install flanges, in piping NPS 2-1/2 and larger, adjacent to flanged valves and at final connection to each piece of equipment.

3.8 IDENTIFICATION

A. Identify exposed sanitary waste and vent piping.

B. Comply with requirements for identification specified in Section 22 0553 "Identification for Plumbing Piping and Equipment."

3.9 FIELD QUALITY CONTROL

A. During installation, notify authorities having jurisdiction at least 24 hours before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction.
   1. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in and before setting fixtures.
   2. Final Inspection: Arrange for final inspection by authorities having jurisdiction to observe tests specified below and to ensure compliance with requirements.

B. Reinspection: If authorities having jurisdiction find that piping will not pass test or inspection, make required corrections and arrange for reinspection.

C. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.
D. Test sanitary waste and vent piping according to procedures of authorities having jurisdiction or, in absence of published procedures, as follows:
   1. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired.
      a. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.
   2. Leave uncovered and unconcealed new, altered, extended, or replaced waste and vent piping until it has been tested and approved.
      a. Expose work that was covered or concealed before it was tested.
   3. Roughing-in Plumbing Test Procedure: Test waste and vent piping except outside leaders on completion of roughing-in.
      a. Close openings in piping system and fill with water to point of overflow, but not less than 10-foot head of water.
      b. From 15 minutes before inspection starts to completion of inspection, water level must not drop.
      c. Inspect joints for leaks.
   4. Finished Plumbing Test Procedure: After plumbing fixtures have been set and traps filled with water, test connections and prove they are gastight and watertight.
      a. Plug vent-stack openings on roof and building drains where they leave building. Introduce air into piping system equal to pressure of 1-inch wg.
      b. Use U-tube or manometer inserted in trap of water closet to measure this pressure.
      c. Air pressure must remain constant without introducing additional air throughout period of inspection.
      d. Inspect plumbing fixture connections for gas and water leaks.
   5. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.
   6. Prepare reports for tests and required corrective action.

3.10 CLEANING AND PROTECTION

A. Clean interior of piping. Remove dirt and debris as work progresses.

B. Protect sanitary waste and vent piping during remainder of construction period to avoid clogging with dirt and debris and to prevent damage from traffic and construction work.

C. Place plugs in ends of uncompleted piping at end of day and when work stops.

D. Repair damage to adjacent materials caused by waste and vent piping installation.

3.11 PIPING SCHEDULE

A. Flanges and unions may be used on aboveground pressure piping unless otherwise indicated.

B. Aboveground, soil and waste piping NPS 4 and smaller shall be any of the following:
   1. Hubless, cast-iron soil pipe and fittings; CISPI heavy-duty hubless-piping couplings; and coupled joints.
   2. Copper Type DWV tube, copper drainage fittings, and soldered joints.

C. Aboveground, soil and waste piping NPS 6 and larger shall be any of the following:
   1. Hubless, cast-iron soil pipe and fittings; CISPI heavy-duty hubless-piping couplings; and coupled joints.
D. Aboveground, vent piping NPS 4 and smaller shall be any of the following:
1. Hubless, cast-iron soil pipe and fittings; CISPI heavy-duty hubless-piping couplings; and coupled joints.
2. Copper Type DWV tube, copper drainage fittings, and soldered joints.

E. Aboveground, vent piping NPS 5 and larger shall be any of the following:
1. Hubless, cast-iron soil pipe and fittings; CISPI heavy-duty hubless-piping couplings; and coupled joints.

F. Underground, soil, waste, and vent piping NPS 4 and smaller shall be any of the following:
1. Virgin rigid PVC (polyvinyl chloride) vinyl compounds with a cell class of 12454 as identified in ASTM D1784. PVC Schedule 40 pipe shall be Iron Pipe Size (IPS) conforming to ASTM D1785 and ASTM D2665.

G. Underground, soil and waste piping NPS 5 and larger shall be any of the following:
1. Virgin rigid PVC (polyvinyl chloride) vinyl compounds with a cell class of 12454 as identified in ASTM D1784. PVC Schedule 40 pipe shall be Iron Pipe Size (IPS) conforming to ASTM D1785 and ASTM D2665.

END OF SECTION
SECTION 22 13 19 - SANITARY WASTE PIPING SPECIALITES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Backwater valves.
   2. Cleanouts.
   3. Roof flashing assemblies.
   4. Through-penetration firestop assemblies.
   5. Miscellaneous sanitary drainage piping specialties.

B. Related Requirements:
   1. Section 22 1423 "Storm Drainage Piping Specialties" for trench drains for storm water, channel drainage systems for storm water, roof drains, and catch basins.
   2. Section 33 4100 "Storm Utility Drainage Piping" for storm drainage piping and piping specialties outside the building.

1.3 DEFINITIONS

B. FOG: Fats, oils, and greases.

C. PVC: Polyvinyl chloride.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product. Include rated capacities, operating characteristics, and accessories for the following:
   1. FOG disposal systems.

B. Shop Drawings:
   1. Show fabrication and installation details for frost-resistant vent terminals.
   2. Wiring Diagrams: Power, signal, and control wiring.

1.5 INFORMATIONAL SUBMITTALS

A. Seismic Qualification Certificates: For FOG disposal systems, accessories, and components, from manufacturer.
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

B. Field quality-control reports.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For sanitary waste piping specialties to include in emergency, operation, and maintenance manuals.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Cultures: Provide 1-gal. bottles of bacteria culture recommended by manufacturer of FOG disposal systems equal to 200 percent of amount installed, but no fewer than 2 1-gal. bottles.

PART 2 - PRODUCTS

2.1 ASSEMBLY DESCRIPTIONS

A. Sanitary waste piping specialties shall bear label, stamp, or other markings of specified testing agency.

B. Comply with NSF 14 for plastic sanitary waste piping specialty components.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing, and marked for intended location and application.

2.2 BACKWATER VALVES

A. Horizontal, Cast-Iron Backwater Valves:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      b. Josam Company.
      c. Zurn Industries, LLC.
   3. Size: Same as connected piping.
   5. Cover: Cast iron with bolted or threaded access check valve.
   6. End Connections: Hub and spigot or hubless.
   7. Type Check Valve: Removable, bronze, swing check, factory assembled or field modified to hang closed.
   8. Extension: ASTM A 74, Service class; full-size, cast-iron, soil-pipe extension to field-installed cleanout at floor; replaces backwater valve cover.
   9. Refer to Schedules.
2.3 CLEANOUTS

A. Cast-Iron Exposed Cleanouts:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      b. Josam Company.
      c. Zurn Industries, LLC.
   2. Standard: ASME A112.36.2M.
   3. Size: Same as connected drainage piping
   4. Body Material: Hub-and-spigot, cast-iron soil pipe T-branch or Hubless, cast-iron soil pipe test tee as required to match connected piping.
   5. Closure: Countersunk or raised-head, brass plug.
   6. Closure Plug Size: Same as or not more than one size smaller than cleanout size.
   7. Refer to Schedules.

B. Cast-Iron Exposed Floor Cleanouts:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      b. Josam Company.
      c. Zurn Industries, LLC.
   2. Standard: ASME A112.36.2M for cast-iron soil pipe with cast-iron ferrule threaded, adjustable housing cleanout.
   3. Size: Same as connected branch.
   4. Type: Cast-iron soil pipe with cast-iron ferrule, heavy-duty, adjustable housing threaded.
   5. Body or Ferrule: Cast iron.
   6. Clamping Device: As required.
   7. Outlet Connection: Inside calk, spigot or Threaded.
   8. Closure: Brass plug with tapered threads.
   9. Adjustable Housing Material: Cast iron with threads.
   11. Frame and Cover Shape: Round.
   12. Top Loading Classification: Heavy Duty.
   13. Riser: ASTM A 74, service class, cast-iron drainage pipe fitting and riser to cleanout.
   14. Refer to Schedules.

C. Cast-Iron Wall Cleanouts:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      b. Josam Company.
      c. Zurn Industries, LLC.
   2. Standard: ASME A112.36.2M. Include wall access.
   3. Size: Same as connected drainage piping
   4. Body: Hub-and-spigot, cast-iron soil pipe T-branch or hubless, cast-iron soil pipe test tee as required to match connected piping.
   5. Closure Plug:
      a. Brass.
      b. Countersunk or raised head.
      c. Drilled and threaded for cover attachment screw.
      d. Size: Same as or not more than one size smaller than cleanout size.
      e. Refer to Schedules.

2.4 ROOF FLASHING ASSEMBLIES

A. Roof Flashing Assemblies:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      b. Thaler Metal Industries Ltd.
      c. Zurn Industries, LLC.
   2. Description: Manufactured assembly made of 4.0-lb/sq. ft., 0.0625-inch-thick, lead flashing collar and skirt extending at least 6 inches from pipe, with galvanized-steel boot reinforcement and counterflash fitting.
      b. Low-Silhouette Vent Cap: With vandal-proof vent cap.
      c. Extended Vent Cap: With field-installed, vandal-proof vent cap.

2.5 THROUGH-PENETRATION FIRESTOP ASSEMBLIES

A. Through-Penetration Firestop Assemblies:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. 3M.
      b. Hilti.
      c. ProSet Systems Inc.
   3. Size: Same as connected soil, waste, or vent stack.
   4. Sleeve: Molded-PVC plastic, of length to match slab thickness and with integral nailing flange on one end for installation in cast-in-place concrete slabs.

2.6 MISCELLANEOUS SANITARY DRAINAGE PIPING SPECIALTIES

A. Open Drains:
   1. Description: Shop or field fabricate from ASTM A 74, Service class, hub-and-spigot, cast-iron soil-pipe fittings. Include P-trap, hub-and-spigot riser section; and where required, increaser fitting joined with ASTM C 564 rubber gaskets.
   2. Size: Same as connected waste piping with increaser fitting of size indicated.

B. Deep-Seal Traps:
   1. Description: Cast-iron or bronze casting, with inlet and outlet matching connected piping and cleanout trap-seal primer valve connection.
   2. Size: Same as connected waste piping.
      a. NPS 2: 4-inch minimum water seal.
      b. NPS 2-1/2and Larger: 5-inch-minimum water seal.

C. Floor-Drain, Trap-Seal Primer Fittings:
   1. Description: Cast iron, with threaded inlet and threaded or spigot outlet, and trap-seal primer valve connection.
   2. Size: Same as floor drain outlet with NPS 1/2 side inlet.

D. Air-Gap Fittings:
1. **Standard:** ASME A112.1.2, for fitting designed to ensure fixed, positive air gap between installed inlet and outlet piping.
2. **Body:** Bronze or cast iron.
3. **Inlet:** Opening in top of body.
4. **Outlet:** Larger than inlet.
5. **Size:** Same as connected waste piping and with inlet large enough for associated indirect waste piping.
6. **Refer to Schedules.**

### E. Sleeve Flashing Device:
1. **Description:** Manufactured, cast-iron fitting, with clamping device that forms sleeve for pipe floor penetrations of floor membrane. Include galvanized-steel pipe extension in top of fitting that will extend 2 inches above finished floor and galvanized-steel pipe extension in bottom of fitting that will extend through floor slab.
2. **Size:** As required for close fit to riser or stack piping.

### F. Stack Flashing Fittings:
1. **Description:** Counterflashing-type, cast-iron fitting, with bottom recess for terminating roof membrane, and with threaded or hub top for extending vent pipe.
2. **Size:** Same as connected stack vent or vent stack.

### G. Vent Caps:
1. **Description:** Cast-iron body with threaded or hub inlet and vandal-proof design. Include vented hood and setscrews to secure to vent pipe.
2. **Size:** Same as connected stack vent or vent stack.
3. **Refer to Schedules.**

---

**PART 3 - EXECUTION**

### 3.1 INSTALLATION

**A. Equipment Mounting:**
1. Install FOG disposal systems per code and manufacturer's requirements.
   a. Comply with requirements for equipment bases and foundations specified in Section 03 3000 "Cast-in-Place Concrete." Section 03 3053 "Miscellaneous Cast-in-Place Concrete."
2. Comply with requirements for vibration-isolation and seismic-control devices specified in Section 22 0548 "Vibration and Seismic Controls for Plumbing Piping and Equipment."
3. Comply with requirements for vibration-isolation devices specified in Section 22 0548.13 "Vibration Controls for Plumbing Piping and Equipment."

**B. Install backwater valves in building drain piping, where required.**
1. For interior installation, provide cleanout deck plate flush with floor and centered over backwater valve cover, and of adequate size to remove valve cover for servicing.

**C. Install cleanouts in aboveground piping and building drain piping according to the following, unless otherwise indicated:**
1. **Size** same as drainage piping up to NPS 4. Use NPS 4 for larger drainage piping unless larger cleanout is indicated.
2. **Locate** at each change in direction of piping greater than 45 degrees.
3. **Locate** at minimum intervals of 50 feet for piping NPS 4 and smaller and 100 feet for larger piping.
4. **Locate** at base of each vertical soil and waste stack.
D. For floor cleanouts for piping below floors, install cleanout deck plates with top flush with finished floor.

E. For cleanouts located in concealed piping, install cleanout wall access covers, of types indicated, with frame and cover flush with finished wall.

F. Install roof flashing assemblies on sanitary stack vents and vent stacks that extend through roof. Comply with requirements in Section 07 6200 "Sheet Metal Flashing and Trim."

G. Install flashing fittings on sanitary stack vents and vent stacks that extend through roof. Comply with requirements in Section 07 6200 "Sheet Metal Flashing and Trim."

H. Install through-penetration firestop assemblies in plastic conductors and stacks at floor penetrations.
   1. Comply with requirements in Section 07 8413 "Penetration Firestopping."

I. Assemble open drain fittings and install with top of hub 2 inches above floor unless otherwise noted.

J. Install deep-seal traps on floor drains and other waste outlets, if indicated.

K. Install floor-drain, trap-seal primer fittings on inlet of all floor drains, floorsinks and hub drains.
   1. Exception: Fitting may be omitted if trap has trap-seal primer connection.
   2. Size: Same as floor drain inlet.

L. Install air-gap fittings on draining-type backflow preventers and on indirect-waste piping discharge into sanitary drainage system.

M. Install sleeve and sleeve seals with each riser and stack passing through floors with waterproof membrane.

N. Install vent caps on each vent pipe passing through roof.

O. Install expansion joints on vertical stacks and conductors. Position expansion joints for easy access and maintenance.

P. Assemble components of FOG disposal systems and install on floor.
   1. Install trap, vent, fresh-air inlet, and flow-control fitting according to authorities having jurisdiction.
   2. Install shelf fastened to reinforcement in wall construction and adjacent to unit, unless otherwise indicated.
   3. Install culture bottle, culture metering pump, timer, and control on shelf. Install tubing between culture bottle, metering pump, and chamber.

Q. Install wood-blocking reinforcement for wall-mounting-type specialties.

R. Install traps on plumbing specialty drain outlets. Omit traps on indirect wastes unless trap is indicated.

3.2 CONNECTIONS

A. Comply with requirements in Section 22 1316 "Sanitary Waste and Vent Piping" for piping installation requirements. Drawings indicate general arrangement of piping, fittings, and specialties.
B. Install piping adjacent to equipment to allow service and maintenance.

C. FOG Disposal Systems: Connect inlet and outlet to unit, connect flow-control fitting and fresh-air inlet piping to unit inlet piping, and connect vent piping between trap and media chamber. Connect electrical power.

D. Ground equipment according to Section 26 0526 "Grounding and Bonding for Electrical Systems."

E. Connect wiring according to Section 26 0519 "Low-Voltage Electrical Power Conductors and Cables."

3.3 FLASHING INSTALLATION

A. Comply with requirements in Section 07 6200 "Sheet Metal Flashing and Trim."

B. Fabricate flashing from single piece unless large pans, sumps, or other drainage shapes are required.

C. Install sheet flashing on pipes, sleeves, and specialties passing through or embedded in floors and roofs with waterproof membrane.
   1. Pipe Flashing: Sleeve type, matching pipe size, with minimum length of 10 inches, and skirt or flange extending at least 8 inches around pipe.
   2. Sleeve Flashing: Flat sheet, with skirt or flange extending at least 8 inches around sleeve.
   3. Embedded Specialty Flashing: Flat sheet, with skirt or flange extending at least 8 inches around specialty.

D. Set flashing on floors and roofs in solid coating of bituminous cement.

E. Secure flashing into sleeve and specialty clamping ring or device.

F. Install flashing for piping passing through roofs with counterflashing or commercially made flashing fittings, according to Section 07 6200 "Sheet Metal Flashing and Trim."

G. Extend flashing up vent pipe passing through roofs and turn down into pipe, or secure flashing into cast-iron sleeve having calking recess.

3.4 LABELING AND IDENTIFYING

A. Equipment Nameplates and Signs: Install engraved plastic-laminate equipment nameplate or sign on or near each of the following:
   1. FOG disposal systems.

B. Distinguish among multiple units, inform operator of operational requirements, indicate safety and emergency precautions, and warn of hazards and improper operations, in addition to identifying unit.
   1. Nameplates and signs are specified in Section 22 0553 "Identification for Plumbing Piping and Equipment."
3.5 FIELD QUALITY CONTROL

A. Perform tests and inspections, and prepare test reports.
   1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect field-assembled FOG disposal systems and their installation, including piping and electrical connections, and to assist in testing.

B. Tests and Inspections:
   1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
   2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

3.6 PROTECTION

A. Protect drains during remainder of construction period to avoid clogging with dirt or debris and to prevent damage from traffic or construction work.

B. Place plugs in ends of uncompleted piping at end of each day or when work stops.

3.7 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain FOG disposal systems. Refer to Section 01 7900 "Demonstration and Training."

END OF SECTION
SECTION 22 13 19.13 - SANITARY DRAINS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
A. Section Includes:
   1. Floor drains.
   2. Floor Sinks.
   3. Trench drains.

1.3 ACTION SUBMITTALS
A. Product Data: For each type of product.

PART 2 - PRODUCTS

2.1 DRAIN ASSEMBLIES
A. Sanitary drains shall bear label, stamp, or other markings of specified testing agency.

2.2 FLOOR DRAINS
A. Cast-Iron Floor Drains:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Zurn Industries, LLC.
      c. Watts; a Watts Water Technologies company.
   2. Standard: ASME A112.6.3.
   5. Seepage Flange: Required.
   6. Anchor Flange: Required.
   7. Clamping Device: Required.
   8. Outlet: Bottom.
   11. Sediment Bucket: Not required.
   12. Top or Strainer Material: Nickel bronze.
   14. Top Shape: Round.
15. Dimensions of Top or Strainer: See schedule.
17. Funnel: Not required.
18. Inlet Fitting: Gray iron, with threaded inlet and threaded or spigot outlet, and trap-seal primer valve connection.
22. Garage Drains, refer to schedules.

2.3 FLOOR SINKS

A. Cast-Iron Floor Sinks:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Zurn Industries, LLC.
   c. Watts; a Watts Water Technologies company.
3. Pattern: Floor Sink.
5. Seepage Flange: Required.
6. Anchor Flange: Required.
7. Clamping Device: Required.
8. Outlet: Bottom.
11. Sediment Bucket: Required.
12. Top or Strainer Material: Nickel bronze.
14. Top Shape: square.
15. Dimensions of Top or Strainer: See schedule.
17. Inlet Fitting: Gray iron, with threaded inlet and threaded or spigot outlet, and trap-seal primer valve connection.
18. Trap Material: Cast iron.
20. Trap Features: Trap-seal primer valve drain connection.

2.4 TRENCH DRAINS

A. Trench Drains:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Zurn Industries, LLC.
   c. Watts; a Watts Water Technologies company.
3. Material: Ductile or gray iron.
5. Clamping Device: Required.
6. Outlet: Bottom.
7. Grate Material: Ductile iron.
10. Top Loading Classification: Medium Duty.
11. Trap Material: Not required.
12. Trap Pattern: Not required.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install floor drains at low points of surface areas to be drained. Set grates of drains flush with finished floor, unless otherwise indicated.
1. Position floor drains and floor sinks for easy access and maintenance.
2. Set floor drains below elevation of surrounding finished floor to allow floor drainage.
3. Set with grates depressed according to the following drainage area radii:
   a. Radius, 30 Inches or Less: Equivalent to 1 percent slope, but not less than 1/4-inch total depression.
   b. Radius, 30 to 60 Inches: Equivalent to 1 percent slope.
   c. Radius, 60 Inches or Larger: Equivalent to 1 percent slope, but not greater than 1-inch total depression.
4. Install floor-drain flashing collar or flange, so no leakage occurs between drain and adjoining flooring.
   a. Maintain integrity of waterproof membranes where penetrated.
5. Install individual traps for floor drains and floor sinks, connected to sanitary building drain, unless otherwise indicated.

B. Install trench drains at low points of surface areas to be drained.
1. Set grates of drains flush with finished surface, unless otherwise indicated.

C. Install open drain fittings with top of hub 1 inch above floor.

3.2 CONNECTIONS

A. Comply with requirements in Section 22 1316 "Sanitary Waste and Vent Piping" for piping installation requirements. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Comply with requirements in Section 22 1319 "Sanitary Waste Piping Specialties" for backwater valves, air admittance devices and miscellaneous sanitary drainage piping specialties.

C. Comply with requirements in Section 22 1323 "Sanitary Waste Interceptors" for grease interceptors, grease-removal devices, oil interceptors, sand interceptors, and solid interceptors.

D. Install piping adjacent to equipment to allow service and maintenance.

E. Ground equipment according to Section 26 0526 "Grounding and Bonding for Electrical Systems."

F. Connect wiring according to Section 26 0519 "Low-Voltage Electrical Power Conductors and Cables."
3.3 LABELING AND IDENTIFYING

A. Distinguish among multiple units, inform operator of operational requirements, indicate safety and emergency precautions, and warn of hazards and improper operations, in addition to identifying unit. Nameplates and signs are specified in Section 22 0553 "Identification for Plumbing Piping and Equipment."

3.4 PROTECTION

A. Protect drains during remainder of construction period to avoid clogging with dirt or debris and to prevent damage from traffic or construction work.

B. Place plugs in ends of uncompleted piping at end of each day or when work stops.

END OF SECTION
SECTION 22 14 13 - STORM DRAINAGE PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Pipe, tube, and fittings.
   2. Specialty pipe fittings.

B. Related Sections:
   1. Section 33 4100 "Storm Utility Drainage Piping" for storm drainage piping outside the building.

1.3 PERFORMANCE REQUIREMENTS

A. Components and installation shall be capable of withstanding the following minimum working pressure unless otherwise indicated:
   1. Storm Drainage Piping: 10-foot head of water.
   2. Storm Drainage, Force-Main Piping: 100 psig.

B. Seismic Performance: Storm drainage piping and support and installation shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

1.5 INFORMATIONAL SUBMITTALS

A. Seismic Qualification Certificates: For storm drainage piping, accessories, and components, from manufacturer.
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
   2. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

B. Field quality-control reports.

1.6 QUALITY ASSURANCE

A. Piping materials shall bear label, stamp, or other markings of specified testing agency.
1.7 PROJECT CONDITIONS

A. Interruption of Existing Storm-Drainage Service: Do not interrupt service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary service according to requirements indicated:
   1. Notify Construction Manager no fewer than two days in advance of proposed interruption of storm-drainage service.
   2. Do not proceed with interruption of storm-drainage service without Construction Manager's written permission.

PART 2 - PRODUCTS

2.1 PIPING MATERIALS

A. Comply with requirements in "Piping Schedule" Article for applications of pipe, tube, fitting materials, and joining methods for specific services, service locations, and pipe sizes.

B. Pipe, fittings and couplings shall be manufactured in the United States.

C. Pipe and fittings shall be marked with the collective trademark of the Cast Iron Soil Pipe Institute or receive prior approval of the engineer.

D. Manufacturers:
   1. AB&I Foundry
   2. Charlotte Pipe
   3. Tyler Pipe
   4. No other known equal

2.2 HUB-AND-SPIGOT, CAST-IRON SOIL PIPE AND FITTINGS

A. Pipe and Fittings: ASTM A 74, Service classes.

B. Gaskets: ASTM C 564, rubber.

2.3 HUBLESS, CAST-IRON SOIL PIPE AND FITTINGS

A. Pipe and Fittings: ASTM A 888 or CISPI 301.

B. Heavy-Duty, Hubless-Piping Couplings:
   1. Manufacturers:
      a. ANACO-Husky.
      b. Mission Rubber Company, LLC; a division of MCP Industries.
      c. Tyler Pipe; a subsidiary of McWane Inc.
   3. Description: Stainless-steel shield with stainless-steel bands and tightening devices; and ASTM C 564, rubber sleeve with integral, center pipe stop.
2.4 PVC SCHEDULE 40 SOLID WALL PIPING AND FITTINGS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Charlotte Pipe
   2. AB&I Foundry
   3. Tyler Pipe

B. PVC Schedule 40 solid wall pipe: ASTM D1784, ASTM D1785 and ASTM D2665, Class of 12454,

2.5 GALVANIZED-STEEL PIPE AND FITTINGS

A. Galvanized-Steel Pipe (where exposed to weather): ASTM A 53/A 53M, Type E, Standard Weight. Include square-cut-grooved or threaded ends matching joining method.

C. Steel-Pipe Pressure Fittings:

D. Cast-Iron Flanges: ASME B16.1, Class 125.
   1. Flange Gasket Materials: ASME B16.21, full-face, flat, nonmetallic, asbestos-free, 1/8-inch maximum thickness unless thickness or specific material is indicated.
   2. Flange Bolts and Nuts: ASME B18.2.1, carbon steel unless otherwise indicated.

E. Grooved-Joint, Galvanized-Steel-Pipe Appurtenances:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Anvil International.
      b. Grinnell Mechanical Products.
      c. Victaulic Company.
   3. Grooved Mechanical Couplings for Galvanized-Steel Piping: ASTM F 1476, Type I. Include ferrous housing sections with continuous curved keys; EPDM-rubber gasket suitable for hot and cold water; and bolts and nuts.

2.6 COPPER TUBE AND FITTINGS

A. Copper DWV Tube: ASTM B 306, drainage tube, drawn temper.

B. Copper Drainage Fittings: ASME B16.23, cast-copper fittings or ASME B16.29, wrought-copper, solder-joint fittings.
C. **Hard Copper Tube:** ASTM B 88, Type L, water tube, drawn temper.

D. **Soft Copper Tube:** ASTM B 88, Type L, water tube, annealed temper.

E. **Copper Pressure Fittings:**
   1. **Copper Fittings:** ASME B16.18, cast-copper-alloy fittings or ASME B16.22, wrought-copper, solder-joint fittings. Furnish wrought-copper fittings if indicated.
   2. **Copper Unions:** MSS SP-123, copper-alloy, hexagonal-stock body with ball-and-socket, metal-to-metal seating surfaces, and solder-joint or threaded ends.

F. **Copper Flanges:** ASME B16.24, Class 150, cast copper with solder-joint end.
   1. **Flange Gasket Materials:** ASME B16.21, full-face, flat, nonmetallic, asbestos-free, 1/8-inch maximum thickness unless thickness or specific material is indicated.
   2. **Flange Bolts and Nuts:** ASME B18.2.1, carbon steel unless otherwise indicated.

G. **Solder:** ASTM B 32, lead free with ASTM B 813, water-flushable flux.

2.7 **SPECIALTY PIPE FITTINGS**

A. **Transition Couplings:**
   1. **General Requirements:** Fitting or device for joining piping with small differences in ODs or of different materials. Include end connections same size as and compatible with pipes to be joined.
   2. **Fitting-Type Transition Couplings:** Manufactured piping coupling or specified-piping-system fitting.
   3. **Shielded, Nonpressure Transition Couplings:**
      a. **Manufacturers:** Subject to compliance with requirements, provide products by the following:
         1) Mission Rubber Company, LLC; a division of MCP Industries.
         b. **Standard:** ASTM C 1460.
         c. **Description:** Elastomeric or rubber sleeve with full-length, corrosion-resistant outer shield and corrosion-resistant-metal tension band and tightening mechanism on each end.
   4. **Pressure Transition Couplings:**
      a. **Manufacturers:** Subject to compliance with requirements, provide products by one of the following:
         1) Dresser, Inc.
         3) Romac Industries, Inc.
      b. **Standard:** AWWA C219.
      c. **Description:** Metal, sleeve-type couplings same size as, with pressure rating at least equal to and ends compatible with, pipes to be joined.
      d. **Center-Sleeve Material:** Stainless steel.
      e. **Gasket Material:** Natural or synthetic rubber.
      f. **Metal Component Finish:** Corrosion-resistant coating or material.

B. **Dielectric Fittings:**
   1. **General Requirements:** Assembly of copper alloy and ferrous materials with separating nonconductive insulating material. Include end connections compatible with pipes to be joined.
   2. **Dielectric Flanges:**
      a. **Manufacturers:** Subject to compliance with requirements, provide products by one of the following:
         1) Watts; a Watts Water Technologies company.
         2) Wilkins.
3) Zurn Industries, LLC.

b. Description:
   1) Standard: ASSE 1079.
   2) Factory-fabricated, bolted, companion-flange assembly.
   3) Pressure Rating: 150 psig.
   4) End Connections: Solder-joint copper alloy and threaded ferrous; threaded solder-joint copper alloy and threaded ferrous.

3. Dielectric Nipples:
   a. Description:
      1) 6" brass nipple

**PART 3 - EXECUTION**

3.1 EARTH MOVING

A. Comply with requirements for excavating, trenching, and backfilling specified in Section 31 2000 "Earth Moving."

3.2 PIPING INSTALLATION

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations from layout are approved on coordination drawings.

B. Install piping in concealed locations unless otherwise indicated and except in equipment rooms and service areas.

C. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

D. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.

E. Install piping to permit valve servicing.

F. Install piping at indicated slopes.

G. Install piping free of sags and bends.

H. Install fittings for sags and bends.

I. Install piping to allow changes in direction and branch connections.

J. Install seismic restraints on piping. Comply with requirements for seismic-restraint devices specified in Section 22 0548 "Vibration and Seismic Controls for Plumbing Piping and Equipment."

K. Make changes in direction for storm drainage piping using appropriate branches, bends, and long-sweep bends. Do not change direction of flow more than 90 degrees. Use proper size of standard increasers and reducers if pipes of different sizes are connected. Reducing size of drainage piping in direction of flow is prohibited.
L. Lay buried building storm drainage piping beginning at low point of each system. Install true to grades and alignment indicated, with unbroken continuity of invert. Place hub ends of piping upstream. Install required gaskets according to manufacturer's written instructions for use of lubricants, cements, and other installation requirements. Maintain swab in piping and pull past each joint as completed.

M. Install storm drainage piping at the following minimum slopes unless otherwise indicated:
   1. Building Storm Drain: 1 percent downward in direction of flow for piping NPS 3 and smaller; 1 percent downward in direction of flow for piping NPS 4 and larger.
   2. Horizontal Storm-Drainage Piping: 2 percent downward in direction of flow.

N. Install cast-iron soil piping according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook," Chapter IV, "Installation of Cast Iron Soil Pipe and Fittings."

O. Install steel piping according to applicable plumbing code.

P. Install aboveground copper tubing according to CDA's "Copper Tube Handbook."

Q. Install underground, ductile-iron, force-main piping according to AWWA C600. Install buried piping inside building between wall and floor penetrations and connection to storm sewer piping outside building with restrained joints. Anchor pipe to wall or floor. Install thrust-block supports at vertical and horizontal offsets.

R. Install underground, copper, force-main tubing according to CDA's "Copper Tube Handbook."

S. Install force mains at elevations indicated.

T. Plumbing Specialties:
   1. Install cleanouts at grade and extend to where building storm drains connect to building storm sewers in storm drainage gravity-flow piping. Install cleanout fitting with closure plug inside the building in storm drainage force-main piping. Comply with requirements for cleanouts specified in Section 22 1423 "Storm Drainage Piping Specialties."
   2. Install drains in storm drainage gravity-flow piping. Comply with requirements for drains specified in Section 22 1423 "Storm Drainage Piping Specialties."

U. Do not enclose, cover, or put piping into operation until it is inspected and approved by authorities having jurisdiction.

V. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in Section 22 0517 "Sleeves and Sleeve Seals for Plumbing Piping."

W. Install sleeve seals for piping penetrations of concrete walls and slabs. Comply with requirements for sleeve seals specified in Section 22 0517 "Sleeves and Sleeve Seals for Plumbing Piping."

X. Install escutcheons for piping penetrations of walls, ceilings, and floors. Comply with requirements for escutcheons specified in Section 22 0518 "Escutcheons for Plumbing Piping."

3.3 JOINT CONSTRUCTION

C. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
   1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
   2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

D. Join copper tube and fittings with soldered joints according to ASTM B 828 procedure. Use ASTM B 813, water-flushable, lead-free flux and ASTM B 32, lead-free-alloy solder.

E. Grooved Joints: Cut groove ends of pipe according to AWWA C606. Lubricate and install gasket over ends of pipes or pipe and fittings. Install coupling housing sections, over gasket, with keys seated in piping grooves. Install and tighten housing bolts.

F. Flanged Joints: Align bolt holes. Select appropriate gasket material, size, type, and thickness. Install gasket concentrically positioned. Use suitable lubricants on bolt threads. Torque bolts in cross pattern.

3.4 SPECIALTY PIPE FITTING INSTALLATION

A. Transition Couplings:
   1. Install transition couplings at joints of piping with small differences in ODs.
   2. In Drainage Piping: Shielded, non-pressure transition couplings.
   4. In Underground Force-Main Piping:
      a. NPS 1-1/2 and Smaller: Fitting-type transition couplings.
      b. NPS 2 and Larger: Pressure transition couplings.

B. Dielectric Fittings:
   1. Install dielectric fittings in piping at connections of dissimilar metal piping and tubing.
   2. Dielectric Fittings for NPS 2 and Smaller: Use dielectric nipples.
   3. Dielectric Fittings for NPS 2-1/2 to NPS 4: Use dielectric nipples.
   4. Dielectric Fittings for NPS 5 and Larger: Use dielectric flange kits.

3.5 VALVE INSTALLATION

A. General valve installation requirements are specified in Section 22 0523.12 "Ball Valves for Plumbing Piping," Section 22 0523.14 "Check Valves for Plumbing Piping," and Section 22 0523.15 "Gate Valves for Plumbing Piping."

B. Shutoff Valves: Install shutoff valve on each sump pump discharge.
   1. Install gate or full-port ball valve for piping NPS 2 and smaller.
   2. Install gate valve for piping NPS 2-1/2 and larger.

C. Check Valves: Install swing-check valve, between pump and shutoff valve, on each sump pump discharge.
3.6 HANGER AND SUPPORT INSTALLATION

A. Comply with requirements for seismic-restraint devices specified in Section 22.0548 "Vibration and Seismic Controls for Plumbing Piping and Equipment."

B. Comply with requirements for pipe hanger and support devices and installation specified in Section 22.0529 "Hangers and Supports for Plumbing Piping and Equipment."
   1. Install carbon-steel pipe hangers for horizontal piping in noncorrosive environments.
   2. Install carbon-steel pipe support clamps for vertical piping in noncorrosive environments.
   3. Install stainless-steel pipe support clamps for vertical piping in corrosive environments.
   4. Vertical Piping: MSS Type 8 or Type 42, clamps.
   5. Individual, Straight, Horizontal Piping Runs:
      a. 100 Feet and Less: MSS Type 1, adjustable, steel clevis hangers.
      b. Longer Than 100 Feet: MSS Type 43, adjustable roller hangers.
      c. Longer Than 100 Feet if Indicated: MSS Type 49, spring cushion rolls.
   6. Multiple, Straight, Horizontal Piping Runs 100 Feet or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.
   7. Base of Vertical Piping: MSS Type 52, spring hangers.

C. Support horizontal piping and tubing within 12 inches of each fitting, valve, and coupling.

D. Support vertical piping and tubing at base and at each floor.

E. Rod diameter may be reduced one size for double-rod hangers, with 3/8-inch minimum rods.

F. Install hangers for cast-iron soil piping with the following maximum horizontal spacing and minimum rod diameters:
   1. NPS 1-1/2 and NPS 2: 60 inches with 3/8-inch rod.
   2. NPS 3: 60 inches with 1/2-inch rod.
   3. NPS 4 and NPS 5: 60 inches with 5/8-inch rod.
   4. NPS 6 and NPS 8: 60 inches with 3/4-inch rod.
   5. NPS 10 and NPS 12: 60 inches with 7/8-inch rod.
   6. Spacing for 10-foot pipe lengths may be increased to 10 feet. Spacing for fittings is limited to 60 inches.

G. Install supports for vertical cast-iron soil piping every 15 feet.

H. Install hangers for steel piping with the following maximum horizontal spacing and minimum rod diameters:
   1. NPS 1-1/4: 84 inches with 3/8-inch rod.
   2. NPS 1-1/2: 108 inches with 3/8-inch rod.
   3. NPS 2: 10 feet with 3/8-inch rod.
   4. NPS 2-1/2: 11 feet with 1/2-inch rod.
   5. NPS 3: 12 feet with 1/2-inch rod.
   6. NPS 4 and NPS 5: 12 feet with 5/8-inch rod.
   7. NPS 6 and NPS 8: 12 feet with 3/4-inch rod.
   8. NPS 10 and NPS 12: 12 feet with 7/8-inch rod.

I. Install supports for vertical steel piping every 15 feet.

J. Install hangers for copper tubing with the following maximum horizontal spacing and minimum rod diameters:
   1. NPS 1-1/4: 72 inches with 3/8-inch rod.
   2. NPS 1-1/2 and NPS 2: 96 inches with 3/8-inch rod.
   3. NPS 2-1/2: 108 inches with 1/2-inch rod.
4. NPS 3 to NPS 5: 10 feet with 1/2-inch rod.
5. NPS 6: 10 feet with 5/8-inch rod.
6. NPS 8: 10 feet with 3/4-inch rod.

K. Install supports for vertical copper tubing every 10 feet.

L. Support piping and tubing not listed above according to MSS SP-69 and manufacturer's written instructions.

3.7 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Connect interior storm drainage piping to exterior storm drainage piping. Use transition fitting to join dissimilar piping materials.

C. Connect storm drainage piping to roof drains and storm drainage specialties.
   1. Install test tees (wall cleanouts) in conductors near floor, and floor cleanouts with cover flush with floor.
   2. Comply with requirements for cleanouts and drains specified in Section 22 1423 "Storm Drainage Piping Specialties."

D. Connect force-main piping to the following:
   1. Storm Sewer: To exterior force main.
   2. Sump Pumps: To sump pump discharge.

E. Where installing piping adjacent to equipment, allow space for service and maintenance of equipment.

F. Make connections according to the following unless otherwise indicated:
   1. Install unions, in piping NPS 2 and smaller, adjacent to each valve and at final connection to each piece of equipment.
   2. Install flanges, in piping NPS 2-1/2 and larger, adjacent to flanged valves and at final connection to each piece of equipment.

3.8 IDENTIFICATION

A. Identify exposed storm drainage piping. Comply with requirements for identification specified in Section 22 0553 "Identification for Plumbing Piping and Equipment."

3.9 FIELD QUALITY CONTROL

A. During installation, notify authorities having jurisdiction at least 24 hours before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction.
   1. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in.
   2. Final Inspection: Arrange for final inspection by authorities having jurisdiction to observe tests specified below and to ensure compliance with requirements.

B. Reinspection: If authorities having jurisdiction find that piping will not pass test or inspection, make required corrections and arrange for reinspection.
C. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.

D. Test storm drainage piping according to procedures of authorities having jurisdiction or, in absence of published procedures, as follows:
   1. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.
   2. Leave uncovered and unconcealed new, altered, extended, or replaced storm drainage piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.
   3. Test Procedure: Test storm drainage piping on completion of roughing-in. Close openings in piping system and fill with water to point of overflow, but not less than 10-foot head of water. From 15 minutes before inspection starts until completion of inspection, water level must not drop. Inspect joints for leaks.
   4. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.
   5. Prepare reports for tests and required corrective action.

E. Test force-main piping according to procedures of authorities having jurisdiction or, in absence of published procedures, as follows:
   1. Leave uncovered and unconcealed new, altered, extended, or replaced force-main piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.
   2. Cap and subject piping to static-water pressure of 50 psig above operating pressure, without exceeding pressure rating of piping system materials. Isolate test source and allow to stand for four hours. Leaks and loss in test pressure constitute defects that must be repaired.
   3. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.
   4. Prepare reports for tests and required corrective action.

3.10 CLEANING

A. Clean interior of piping. Remove dirt and debris as work progresses.

B. Protect drains during remainder of construction period to avoid clogging with dirt and debris and to prevent damage from traffic and construction work.

C. Place plugs in ends of uncompleted piping at end of day and when work stops.

3.11 PIPING SCHEDULE

A. Flanges and unions may be used on aboveground pressure piping unless otherwise indicated.

B. Aboveground storm drainage piping NPS 6 and smaller shall be any of the following:
   1. Hubless, cast-iron soil pipe and fittings; CISPI, heavy-duty, hubless-piping couplings; and coupled joints.
   2. Galvanized-steel pipe, drainage fittings, and threaded joints.
   3. Copper DWV tube, copper drainage fittings, and soldered joints.

C. Aboveground, storm drainage piping NPS 8 and larger shall be any of the following:
1. Hubless, cast-iron soil pipe and fittings; CISPI, heavy-duty, hubless-piping couplings; and coupled joints.
2. Galvanized-steel pipe, drainage fittings, and threaded joints.
3. Copper DWV tube, copper drainage fittings, and soldered joints.

D. Underground storm drainage piping NPS 6 and smaller shall be any of the following:
   1. Virgin rigid PVC (polyvinyl chloride) vinyl compounds with a cell class of 12454 as identified in ASTM D1784. PVC Schedule 40 pipe shall be Iron Pipe Size (IPS) conforming to ASTM D1785 and ASTM D2665.
   2. Dissimilar Pipe-Material Couplings: Shielded, nonpressure transition couplings.END OF SECTION
SECTION 22 14 23 - STORM DRAINAGE PIPING AND SPECIALTIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Roof drains.
   2. Miscellaneous storm drainage piping specialties.
   3. Cleanouts.
   4. Through-penetration firestop assemblies.
   5. Flashing materials.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

1.4 QUALITY ASSURANCE

A. Drainage piping specialties shall bear label, stamp, or other markings of specified testing agency.

PART 2 - PRODUCTS

2.1 METAL ROOF DRAINS

A. Cast-Iron, Large-Sump, General-Purpose Roof Drains:
   1. Manufacturers:
      b. Watts; a Watts Water Technologies company.
      c. Zurn Industries, LLC.
      d. Refer to Schedules for Basis of Design.
   2. Standard: ASME A112.6.4, for general-purpose roof drains.
   5. Combination Flashing Ring and Gravel Stop: Required.
   7. Outlet: Bottom.
   8. Extension Collars: Not required.
  10. Expansion Joint: Not required.
  11. Sump Receiver Plate: Not required.
13. Perforated Gravel Guard: Not required.
15. Water Dam: 2 inches high. Water dam required on overflow drains only.

2.2 MISCELLANEOUS STORM DRAINAGE PIPING SPECIALTIES

A. Downspout Boots:
1. Description: Manufactured, ASTM A 48/A 48M, gray-iron casting, with strap or ears for attaching to building; NPS 4-outlet; and shop-applied bituminous coating.
2. Size: Inlet size to match downspout and NPS 4 outlet.

B. Conductor Nozzles:
1. Description: Bronze body with threaded inlet and bronze wall flange with mounting holes.
2. Size: Same as connected conductor.

2.3 CLEANOUTS

A. Floor Cleanouts:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   b. Watts; a Watts Water Technologies company.
   c. Zurn Industries, LLC.
   d. Refer to Schedules for Basis of Design.
2. Standard: ASME A112.36.2M, for adjustable housing cleanouts.
3. Size: Same as connected branch.
4. Type: Adjustable housing.
5. Body or Ferrule Material: Cast iron.
7. Outlet Connection: Inside calk.
8. Closure: Brass plug with tapered threads.
9. Adjustable Housing Material: Cast iron with threads.
11. Frame and Cover Shape: Round.
13. Riser: ASTM A 74, Service class, cast-iron drainage pipe fitting and riser to cleanout.

B. Test Tees:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   b. Watts; a Watts Water Technologies company.
   c. Zurn Industries, LLC.
2. Standard: ASME A112.36.2M and ASTM A 74, ASTM A 888, or CISPI 301, for cleanout test tees.
3. Size: Same as connected drainage piping.
4. Body Material: Hub-and-spigot, cast-iron soil-pipe T-branch or hub-less, cast-iron soil-pipe test tee as required to match connected piping.
5. Closure Plug: Countersunk.
6. Closure Plug Size: Same as or not more than one size smaller than cleanout size.

C. Wall Cleanouts:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   b. Watts; a Watts Water Technologies company.
   c. Zurn Industries, LLC.
   d. Refer to Schedules for Basis of Design.
2. Standard: ASME A112.36.2M, for cleanouts. Include wall access.
3. Size: Same as connected drainage piping.
4. Body Material: Hub-less, cast-iron soil-pipe test tee as required to match connected piping.
5. Closure: Countersunk, plug.
6. Closure Plug Size: Same as or not more than one size smaller than cleanout size.

2.4 THROUGH- PENETRATION FIRESTOP ASSEMBLIES

A. Through-Penetration Firestop Assemblies:
   1. Manufacturers: Subject to compliance with requirements, provide products by the following:
      a. 3M.
      b. Hilti, Inc.
      c. ProSet Systems Inc.
   2. Standard: ASTM E 814, for through-penetration firestop assemblies.
   4. Size: Same as connected pipe.
   5. Sleeve: Molded PVC plastic, of length to match slab thickness and with integral nailing flange on one end for installation in cast-in-place concrete slabs.
   7. Special Coating: Corrosion resistant on interior of fittings.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install roof drains at low points of roof areas according to roof membrane manufacturer's written installation instructions.
   1. Install flashing collar or flange of roof drain to prevent leakage between drain and adjoining roofing. Maintain integrity of waterproof membranes where penetrated.
   2. Install expansion joints, if indicated, in roof drain outlets.
   3. Position roof drains for easy access and maintenance.

B. Install downspout adapters on outlet of back-outlet parapet roof drains and connect to sheet metal downspouts.

C. Install downspout boots at grade with top 12 inches above grade unless otherwise indicated. Secure to building wall.

D. Install conductor nozzles at exposed bottom of conductors where they spill onto grade.
E. Install cleanouts in aboveground piping and building drain piping according to the following instructions unless otherwise indicated:
   1. Use cleanouts the same size as drainage piping up to NPS 4. Use NPS 4 for larger drainage piping unless larger cleanout is indicated.
   2. Locate cleanouts at each change in direction of piping greater than 45 degrees.
   3. Locate cleanouts at minimum intervals of 50 feet for piping NPS 4 and smaller and 100 feet for larger piping.
   4. Locate cleanouts at base of each vertical soil and waste stack.

F. For floor cleanouts for piping below floors, install cleanout deck plates with top flush with finished floor.

G. For cleanouts located in concealed piping, install cleanout wall access covers, of types indicated, with frame and cover flush with finished wall.

H. Install test tees in vertical conductors and near floor.

I. Install wall cleanouts in vertical conductors. Install access door in wall if indicated.

J. Install trench drains at low points of surface areas to be drained. Set grates of drains flush with finished surface unless otherwise indicated.

K. Install through-penetration firestop assemblies in plastic conductors at concrete floor penetrations.

L. Install sleeve flashing device with each conductor passing through floors with waterproof membrane.

3.2 CONNECTIONS

A. Comply with requirements for piping specified in Section 22 1413 "Facility Storm Drainage Piping." Drawings indicate general arrangement of piping, fittings, and specialties.

3.3 PROTECTION

A. Protect drains during remainder of construction period to avoid clogging with dirt or debris and to prevent damage from traffic or construction work.

B. Place plugs in ends of uncompleted piping at end of each day or when work stops.

END OF SECTION
SECTION 22 30 00 - PLUMBING EQUIPMENT

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Air Source Heat Pump Water Heaters
B. Storage Tank Water Heaters
C. Circulator Pumps
D. Expansion Tanks

1.2 RELATED REQUIREMENTS

A. Section 26 27 26 - Wiring Devices: Electrical Characteristics and wiring connections
B. Section 22 05 01 - Plumbing General Requirements

1.3 REFERENCE STANDARDS

1.4 SUBMITTALS

A. See Section 01 33 00 - Submittal Procedures
B. Product Data:
   1. Provide dimension drawings of water heaters and heat pumps indicating components and connections to other equipment and piping.
   2. Indicate pump type, capacity, power requirements.
   3. Provide certified pump curves showing pump performance characteristics with pump and system operating point plotted. Include NPSH curve when applicable.
   4. Provide electrical characteristics and connection requirements.
   5. Provide product cutsheets with the submitted product’s model number clearly identified.
C. Shop Drawings:
   1. Diagram power, signal, and control wiring.
D. Operation and Maintenance Data: Include operation, maintenance, and inspection data, replacement part numbers and availability, and service depot location and telephone number.
E. Warranty: Submit manufacturer warranty and ensure forms have been completed in District’s name and registered with manufacturer.
1.5 QUALITY ASSURANCE

A. Manufacturer Qualifications: Company specializing in manufacturing the type of products specified in this section, with minimum three years of documented experience.

B. Identification: Provide pumps with manufacturer's name, model number, and rating/capacity identified by permanently attached label.

C. Performance: Ensure pumps operate at specified system fluid temperatures without vapor binding and cavitation, are non-overloading in parallel or individual operation, operate within 25 percent of midpoint of published maximum efficiency curve.

D. Source Limitations: Obtain same type of water heaters through one source from a single manufacturer.

E. Product Options: Drawings indicate size, profiles, and dimensional requirements of water heaters and are based on specific units indicated. Other manufacturers' products complying with requirements may be considered. Refer to Division 1 Section "Substitutions."

F. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by testing agency acceptable to authorities having jurisdiction, and marked for intended use.

G. ANSI Compliance: Provide gas water heaters that comply with ANSI standards for gas water heaters and related products and that bear AGA certification label.

H. ASME Compliance: Fabricate and label water heater, hot-water storage tanks to comply with ASME Boiler and Pressure Vessel Code: Section VIII, "Pressure Vessels," Division 1.

I. ASHRAE Standards: Comply with performance efficiencies prescribed for the following:
   3. Regulatory Requirements: Fabricate and test steam condensate pumps to comply with HI 1.1-1.5, "Centrifugal Pumps for Nomenclature, Definitions, Application and Operation," and HI 1.6, "Centrifugal Pump Tests."

1.6 WARRANTY

A. General Warranty: Special warranty specified in this Article shall not deprive City of other rights City may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by Contractor under requirements of the Contract Documents.

B. Special Warranty: Written warranty, executed by manufacturer agreeing to repair or replace components of water heaters that fail in materials or workmanship within specified warranty period.

1.7 CERTIFICATIONS

A. Water Heaters: NSF approved.
1.8 DELIVERY, STORAGE, AND HANDLING

A. Provide temporary inlet and outlet caps. Maintain caps in place until installation.

1.9 WARRANTY

A. See Section 01 78 00 - Closeout Submittals, for additional warranty requirements.

B. Provide five year manufacturer warranty for domestic water heaters.

PART 2 - PRODUCTS

2.1 AIR SOURCE HEAT PUMP WATER HEATER (HPWH)

A. Manufacturers:
   2. See Schedule for Basis for Design

B. Description: Heat Pump unit shall consist of compressor, condenser, evaporator coil, fan, hot water circulating pump, piping, and controls, factory assembled, charged, and tested. The heat pump shall contain the following components, and features:
   1. Cabinet: Shall be type 304 stainless steel. Supports, channels and beams shall also be constructed of type 304 stainless steel. Compartments shall have large access doors for servicing. Compressor and condenser shall be located in separate compartment from fan and evaporator for in-operation servicing. Base section under evaporator coil shall have stainless steel drip pan for condensate. Cabinet shall be designed for outdoor operation. Cabinet shall be insulated to prevent condensation from forming on exterior surfaces.
   2. Fan: The fan arrangement shall be draw-through design. Fans shall be centrifugal type, belt driven. Blower scroll construction shall be of 304 stainless steel with stainless steel fasteners. Blower wheel construction shall be galvanized steel. Motor shall be foot mounted to stainless steel mount having belt adjusting feature. Shaft bearing shall be pillow block type with easily accessible remote lubrication fittings.
   3. Evaporator Coil: Shall be constructed with aluminum waffle plate fins mechanically bonded to seamless copper tubing. All copper tube joints to be brazed with silver solder. Coils shall have corrosion inhibiting coated fins and type 304 stainless steel coil casings and drain pan.
   4. Refrigerant: Refrigerant shall be R134a.
   5. Expansion Valve: Valves shall be specifically designed for heat pump use with field adjustable superheat feature. Expansion valve shall have MOP (Maximum Operating Pressure) type power element to effectively limit saturated suction temperature to 18C (65F).
   6. Compressor: Hermetic scroll type by Copeland Corp., suitable for high temperature operation with R134a refrigerant. Compressor shall be furnished with rotolock backseating service valves for suction and discharge connections.
   7. Compressor Controls: Compressor controls/accessories must include the following:
      a. High Pressure Safety Switch
      b. Low Pressure Safety Switch
      c. Multi-function Phase Failure Relay
      d. Indicator Lights for:
         1) Power On
         2) Hot Water Demand
3) High Pressure Fail
4) Low Pressure Fail

8. Condenser: Stainless steel brazed plate vented double wall type. Single wall condenser construction shall not be allowed. UL Listed and suitable for high temperature operation with potable water.
   a. Refrigerant Accessories:
      1) Filter-Driers: Sweat connection type.
      2) Site Glass: Moisture indicating type.
      3) Liquid Line Service Valve: Bronze quarter turn type.
      4) Discharge Check Valve: Copper magnetic in-line type.
      5) Liquid Line Solenoid Valve: Electrically actuated.
      6) Compressor Crankcase Heater: Belly band type.

9. Anti-Short Cycle Control: Units shall be factory wired to allow a maximum of twelve compressor starts per hour to prevent compressor short cycling and allow time for suction and discharge pressures to equalize permitting the compressor to start in an unloaded condition.

10. Water Circulating Pumps: Shall be in-line all bronze or stainless steel body centrifugal type able to deliver rated flow against the external head shown on the drawings.

11. Controls: The heat pump unit shall be factory wired for fully automatic operation. Safeties shall include compressor and fan motor thermal overload protection, manual reset pressure-stats, anti-cycling compressor relays, plus standard items recommended by the equipment manufacturer.

12. Constant Leaving Water Temperature Control. Heat pump shall be factory equipped with electronic temperature control valve (e-TCV) which automatically maintains constant leaving water temperature regardless of entering water temperature. Leaving water temperature is set by the heat pump operator/user via a field adjustable electronic temperature controller.

2.2 DOMESTIC HOT WATER STORAGE TANK (HWST)

A. Manufacturers:
   1. PVI: www.pvi.com
   2. Hubbell Water Heaters: www.hubbellheaters.com

B. Type: ASME Rated Hot Water Storage Tank (HWST)
   1. See Schedule for Basis for Design

C. Factory-Installed Storage-Tank Appurtenances:
   1. Anode Rod: Replaceable magnesium.
   2. Drain Valve: Corrosion-resistant metal complying with ASSE 1005.
   3. Insulation: Comply with ASHRAE/IESNA 90.1.
   7. Safety Controls: High-temperature-limit and low-water cutoff devices or systems.
   8. Relief Valves: ASME rated and stamped for combination temperature-and-pressure relief valves. Include one or more relief valves with total relieving capacity at least as great as heat input, and include pressure setting less than domestic-water heater working-pressure rating. Select one relief valve with sensing element that extends into storage tank.

D. Accessories:
   1. ANSI Z21.22, combination temperature and pressure relief valve
2. Piping-Type Heat Traps: Field-fabricated piping arrangement according to ASHRAE 90.1 or ASHRAE 90.2.
3. Provide electric resistance heating coil as indicated in the schedules.

E. Hot water output from tank shall pass through ASSE 1017 approved thermostatic master mixing valve before being sent to fixtures.

F. Provide factory diagram of dimensioned custom tank design indicating locations, size, and connection type of fittings within the tank.

G. Special Requirements: NSF 5 construction with legs for off-floor installation.

H. Capacity and Characteristics:
   1. Capacity:
      a. Refer to Schedules.
   2. Electrical Characteristics:
      a. Refer to Schedules.

2.3 CIRCULATOR PUMP (CP)

A. Manufacturers:
   1. Xylem: www.xyleminc.com
   2. Grundfos: www.us.grundfos.com
   3. ACT D’mand Kontrols Systems: www.gothotwater.com
   4. Bell & Gossett

B. Type: Electronically Commutated Permanent Magnet Motor
   1. See Schedule for Basis for Design

2.4 EXPANSION TANKS (ET)

A. Manufacturers:
   1. Amtrol: www.amtrol.com
   2. Wessels: www.westank.com

B. Type: ASME Rated Diaphragm Type
   1. Comply with ASME Section VIII, Division 1 Standards
   2. See Schedule for Basis for Design
   3. Pre-charged steel hydro-pneumatic tank with replaceable heavy-duty butyl bladder.
   4. NPT epoxy lined system connections and a 0.302”-32 charging valve connection (standard tire valve) to facilitate the on-site charging of the tank to meet system requirements. The tank must be constructed in accordance with most recent addendum of Section VIII Division 1 of the ASME Boiler and Pressure Vessel Code.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install plumbing equipment in accordance with manufacturer's instructions, as required by code, and complying with conditions of certification, if any.
B. Coordinate with plumbing piping and related piping work to achieve operating system.

C. Pumps:
1. Ensure pumps operate at specified system fluid temperatures without vapor binding and cavitation, are non-overloading in parallel or individual operation, and operate within 25 percent of midpoint of published maximum efficiency curve.
2. Install pumps with access for periodic maintenance, including removing motors, impellers, couplings, and accessories.
3. Support pumps and piping so weight of piping is not supported by pumps.
4. Suspend in-line pumps independent of piping. Use continuous-thread hanger rods and vibration isolation hangers of sufficient size to support pump weight. Fabricate brackets or supports as required.

3.2 CONNECTIONS

A. Pumps
1. Connect water distribution piping to pumps. Install suction and discharge pipe equal to or greater than size of pump nozzles.
2. Install shutoff valve and strainer on suction side of pumps, and check valve and throttling valve on discharge side of pumps. Install valves same size as connected piping.
3. Install pressure gages at suction and discharge of pumps. Install at integral pressure-gage tapping where provided or install pressure-gage connectors in suction and discharge piping around pumps.
4. Electrical wiring and connections are specified in Division 26.
5. Ground equipment.

3.3 FIELD QUALITY CONTROL

A. In addition to manufacturer's written installation and startup checks, perform the following:
1. Check for clear relief valve inlets, outlets, and drain piping.
2. Test operation of safety controls, relief valves, and devices.
3. Adjust operating controls.

B. Engage a factory-authorized service representative to train District's maintenance personnel to adjust, operate, and maintain fuel-fired, domestic water heaters. Refer to Division 1 Closeout Procedures/Demonstration and Training.

3.4 FIELD QUALITY CONTROL – HEAT PUMP WATER HEATER

A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.
1. Perform the following field tests and inspections:
   a. After installing air to water heat pumps and after electrical circuitry has been energized, test units for compliance with requirements.
   b. Inspect for and remove shipping bolts, blocks, and tie-down straps.
   c. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
   d. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
2. Heat pumps will be considered defective if they do not pass tests and inspections.
3. Prepare test and inspection reports.

3.5 STARTUP SERVICE – HEAT PUMP WATER HEATER

A. Engage a factory-authorized service representative to perform startup service.
   1. Complete installation and startup checks according to manufacturer's written instructions.
   2. Inspect for visible damage to unit casing.
   3. Inspect for visible damage to compressor and coils.
   4. Inspect internal insulation.
   5. Verify that labels are clearly visible.
   6. Verify that clearances have been provided for servicing.
   7. Verify that controls are connected and operable.
   8. Adjust vibration isolators.
   9. Start unit according to manufacturer's written instructions.
   10. Complete startup sheets and attach copy with Contractor's startup report.
   11. Inspect and record performance of interlocks and protective devices; verify sequences.
   12. Operate unit for an initial period as recommended or required by manufacturer.
   13. Verify thermostat calibration.
   14. Inspect controls for correct sequencing of heating, refrigeration, and normal and emergency shutdown.

3.6 ADJUSTING - HEAT PUMP WATER HEATER

A. Adjust initial temperature set points.
   1. Set field-adjustable switches and circuit-breaker trip ranges as indicated.
   2. Occupancy Adjustments: When requested within 12 months from date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to four visits to Project during other-than-normal occupancy hours for this purpose.
      a. Factory representative must participate in the Commissioning process. A minimum of two of these visits shall be dedicated to supporting functional testing of the equipment in the Commissioning process.

3.7 DEMONSTRATION - HEAT PUMP WATER HEATER

A. Engage a factory-authorized service representative to train City's maintenance personnel to adjust, operate, and maintain air-source unitary heat pumps.

END OF SECTION
SECTION 22 36 00 - REVERSE OSMOSIS WATER EQUIPMENT

PART 1 - GENERAL

1.1 SUMMARY

A. Related Documents:
   1. Drawings and general provisions of the contract, including general and supplemental conditions, and Division 01 sections apply to this Section.
   2. Review these documents for coordination with additional requirements and information that apply to work under this project.

1.2 REVERSE OSMOSIS WATER EQUIPMENT AND RELATED ACCESSORIES

A. Pre-treatment
B. RO unit
C. DI mixed beds
D. Storage Tank
E. Distribution System.
F. UV light
G. Loop Cooler
H. Controls.

1.3 RELATED SECTIONS:

A. Section 220529 "Hangers and Supports for Plumbing Piping and Equipment".
B. Section 226700 "Processed Water Systems for Laboratory Facilities"

1.4 SUBMITTALS

A. Operation and Maintenance Data:
B. Submit operation and maintenance data under provisions of Division 01 Section "General Requirements" Paragraph 1.8.H "Operation and Maintenance Data"
C. Submit under provisions of Division 22 Section "Common Results for Plumbing - Review of Materials" and Division 01 Section "General Requirements."
   1. Pumps.
   2. Tanks.
   3. Controls.
D. Shop Drawings: Diagram power, signal, and control wiring.
E. ASME certificates.
F. Operation and maintenance data.

1.5 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
   1. The first names manufacturer and product is the basis of design. Other manufacturers and/or products are considered as substitutions.
   2. If an assembly is UL-listed, then the assembly UL-listing takes precedent over component-level UL-listings.

B. In lieu of listing by an approved testing laboratory, consideration will be given to certified test reports of an adequately equipped, recognized independent test laboratory competent to perform such testing indicating conformance to requirements of the applicable Underwriter's Laboratories, Inc. standards.

C. Unless otherwise approved by the Project Manager, the materials to be furnished under this specification shall be the standard products of manufacturers regularly engaged in the production of such equipment equal to or superior to the material specified, and shall be the manufacturer's latest standard design that complies with the specification requirements.

1.6 APPROVAL OF MATERIALS:

A. Division 01 Section "General Requirements" requirements for "Materials and Equipment" and "Submittals".

B. A complete list of materials and equipment proposed shall be submitted to the Project Manager for approval. The list shall include for each item: the manufacturer, the manufacturer's catalog number, type or class, the rating, capacity, size, etc.

C. Before installation of the equipment, the Subcontractor shall submit for approval detailed construction drawings for each item of fabricated equipment required for installation. Drawings shall be to scale and fully dimensioned and shall provide sufficient detail to clearly indicate the arrangement of equipment and its components.

D. Installation of approved substituted equipment is the Subcontractor's responsibility, and changes required to work included under other divisions for installations of approved substituted equipment must be made to the satisfaction of the District and without change in contract price. Approval by the District of substituted equipment and/or dimension drawings does not waive these requirements.

1.7 START-UP TRAINING

A. Assist District in preparing a formal training program for operating staff prior to the scheduled start-up date. The program will consist of the design, start-up, and operation of the mechanical, plumbing, fire protection, and building automation systems. Coordinate the training program
with the production of the operation and maintenance manuals. Provide indexed binder and training materials to each participant.

B. Provide 16 hours (unless specified otherwise) of on-site training in the operation and maintenance for installed system and major piece of equipment. Systems include boilers and heating hot water system, chillers and chilled water system, plumbing, fire protection, air supply and exhaust systems, air conditioning units, balancing, and Facilities Monitoring and Control System. Trainers shall be experienced, manufacturer-approved personnel.
   1. Schedule training for each system in advance with the District.
   2. Include travel, per diem and incidental costs for personnel under contract to the Subcontractor.
   3. Operations and Maintenance data to be available for training sessions.

C. Refer to Division 1 “Demonstration and Training” and “General Commissioning Requirements” for additional requirements.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply for product selection:

B. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the manufacturers specified.

C. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified.

2.2 REVERSE OSMOSIS WATER EQUIPMENT

A. Manufacturers:
   1. Evoqua/Siemens.
   2. Marlo.
   3. Culligan.
   4. Refer to Plumbing Schedules.
   5. Substitution: See Division 01 Section “General Requirements”.

2.3 PRE-TREATMENT:

B. Cartridge Filter: Cartridge filter housing with hydrophilic cartridges for water filtration, 10 micron filtration. Provide pressure gauges upstream and downstream of filter.

C. Water Softener: SDI service exchangeable softener cylinder sized for the design flowrate. Provide spare cylinder mounted adjacent to active unit.

D. Carbon Filter: SDI service exchangeable activated carbon cylinder sized for the design flowrate. Provide spare cylinder mounted adjacent to active unit.
2.3 REVERSE OSMOSIS UNIT:

A. General Description:
   1. Reverse Osmosis unit shall be skid mounted, fully automatic, single pass system. Unit shall be pre-assembled, prewired, single-point connection with fault alarm connection to BMS and hydrostatically and functionally tested at the factory. RO unit recovery shall be 75% or greater. Skid frame shall be epoxy coated and designed to provide easy access for servicing, maintenance and monitoring of operation.
   2. Frame shall be seismically designed and shall offer maximum support and protection for system components.
   3. RO pre-filter shall be 5 micron absolute, sized for maximum 3 psi pressure drop at maximum RO design flow.
   4. Valves:
      a. Automatic, pneumatically actuated, non-metallic or stainless steel valve shall be provided in feed line.
      b. High pressure valves, including pump discharge throttling valve, reject throttling needle valve and reject throttling valve shall be 316 stainless steel.
      c. Actuated flush valve shall be provided on a bypass around reject throttling valve.
      d. Sample valves shall be provided on feed, product and reject lines. Individual sample valve on product tubing of pressure vessel shall be provided for analyzing system.
      e. Reject and reject recycle needle valves shall be mounted in close proximity to their respective flowrate indicators for ease of field adjustment.
   5. Pressure gauges shall be furnished to monitor RO inlet pressure, pump suction pressure, membrane feed pressure, membrane reject pressure and RO product pressure.
   6. Piping shall be designed for minimal removal during membrane loading.
   7. Nozzles shall be provided for connection of temporary lines for cleaning and sanitizing RO membranes and vessels.
   8. Pump shall be 316 stainless steel.
   9. Control System: Microprocessor or PLC based control system shall monitor and control operation of system and communicate with pretreatment and distribution tank level as required. Control panel shall be NEMA 12, fully programmed and integrity tested at the factory prior to shipment. Control panel shall provide all power requirements to all integrated/interconnected components. Water purification system shall operate automatically and send fault alarm signal to BMS.
   10. Electrical: RO unit shall have a single point connection for 480V/3 phase power. Transformers for devices requiring other voltages shall be provided integral to the skid.

2.4 MIXED BED DI COLUMNS - EXCHANGABLE:

A. SDI service exchangeable, mixed resin, ion exchange beds. Beds contain 60% anion / 40% cation resin mixture, premium grade.

B. Provide conductivity indicator downstream of exchange cylinder.

C. Provide pressure gauges upstream and downstream of each exchange cylinder.

2.5 STORAGE TANK:

A. Cone bottom, cylindrical, atmospheric, closed top with flanged and covered 17" manway, high density cross linked polyethylene, indoor seismic restraints with sub micron hydrophobic vent filter and with return line plastic or stainless steel sprayball.
B. Tank shall be one-piece, seamless construction.

C. Tank shall be totally drainable.

D. Support shall be plastic or epoxy coated (2 coats) steel and that bottom of tank nozzle shall be at least 18" above finished floor.

E. Tank shall have pressure and vacuum relief to protect tank in the event of vent filter blockage or overfilling due to level controls malfunction.

2.6 RO DISTRIBUTION:

A. Skid mounted, fully automatic, pre-assembled, prewired, single-point connection with fault alarm connection to BMS and hydrostatically and functionally test at the factory. Skid frame shall be epoxy coated and designed to provide easy access for servicing, maintenance and monitoring of operation.

B. Multi-stage, stainless steel centrifugal, single mechanical seal, TEFC, 480V / 3 phase, VFD compatible. VFD shall be provided by Purified Water equipment vendor.

C. Provide flow meter for circulation line.

D. O distribution skid shall include UV light, loop cooler, control panel and final filters.

E. Control System: Microprocessor or PLC based control system shall monitor and control operation of system. Control panel shall be NEMA 12, fully programmed and integrity tested at the factory prior to shipment. Control panel shall provide all power requirements to all integrated/interconnected components. Water purification system shall operate automatically and send fault alarm signal to BMS. Control system should be BACNet compatible.

F. Electrical: RO distribution skid shall have a single point connection for 480V/3 phase power. Transformers for devices requiring other voltages shall be provided integral to the skid.

2.7 UV LIGHT:

A. Inline, 254 nm bacterial reduction, 316L stainless steel wetted surface electropolished to 15 Ra surface finish and passivated.

B. Accessories: Two (2) “S” pattern light traps, one (1) each for inlet and outlet.

C. Instrumentation: Temperature sensor with shutdown interlock, local alarm and dry contacts, LED indicator, elapsed running time meter, remote start/stop capability.

D. Electrical: 120V / 1 phase.

2.8 LOOP COOLER:

A. Sanitary, double tube sheet, shell and tube heat exchanger.

B. Shell side shall be chilled water.
C. Control shall be manual.
D. Provide temperature gauge on chilled water return line.
E. Provide pressure relief valve on chilled water line at exchanger for thermal expansion relief.
F. Provide globe valve on outlet of chilled water.
G. Controls are not required.

PART 3 - EXECUTION

3.1 HOLD AND INSPECTION
A. Refer to provisions of Division 01 Section “Special Procedures” for hold points for inspection, witnessing testing, etc.

3.2 INSTALLATION
A. Install equipment per manufacturer’s requirements. Drawings show general piping arrangement only. Refer to installation requirements in other Division Sections.
B. All equipment shall be furnished by one manufacturer.
C. Install concrete housekeeping pad under all equipment.

3.3 FIELD QUALITY CONTROL
A. Prior to operation, clean and test RO piping in accordance with specification section 220813.
B. Repair or replace RO piping as required to eliminate leaks and retest to demonstrate compliance.
C. Cap and seal ends of piping when not connected to mechanical equipment.

3.4 START UP
A. Engage a factory-authorized representative to provide start-up and ensure proper system operation.
B. Refer to Division 1 “Demonstration and Training” and “General Commissioning Requirements” for additional requirements.

3.5 WARRANTY
A. Provide 5-year manufacturer’s warranty.
B. DEMONSTRATION
C. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain laboratory vacuum equipment. Minimum 2 hours on-site demonstration required. Refer to Closeout Procedures.

D. Refer to Division 1 “Demonstration and Training” and “General Commissioning Requirements” for additional requirements.

END OF SECTION
SECTION 22 42 00 – PLUMBING FIXTURES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Water closets.
   2. Urinals.
   3. Lavatories.
   4. Sinks.
   5. Showers.
   6. Drinking Fountains.

B. Related Requirements:
   1. Section 01 81 13 “Sustainable Design Requirements” for additional Leadership in Energy and Environmental Design (LEED®) certification-related references, definitions, documentation requirements, action plans, meetings, and performance requirements of products and systems.
   2. Section 22 11 16 “Domestic Water Piping”.
   3. Section 22 13 16 “Sanitary Waste and Vent Piping”.

1.3 DEFINITIONS

A. Effective Flush Volume: Average of two reduced flushes and one full flush per fixture.

B. Remote Water Closet: Located more than 30 feet (9.1 m) from other drain line connections or fixture and where less than 1.5 drainage fixture units are upstream of the drain line connection.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.
   1. Include construction details, material descriptions, dimensions of individual components and profiles, clearances, and finishes.
   2. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

B. Sustainable Design Submittals:
   1. LEED Submittal Requirements: Submit for Sustainability Consultant's review.
   2. A completed Green Building Material Certification Form (GBMCF), as specified in Section 01 81 13 Information to be supplied for this form shall include:
a. List of all adhesives and sealants installed on the project, within the LEED boundary that were included in the contract.
b. Cost breakdowns for the materials included in the Contractor or sub-contractor's work. Cost breakdowns shall include total cost plus itemized material costs.
c. A total estimated weight (lbs.) value of the material applied within the LEED project boundary.
d. IEQ credit 4, Low Emitting Materials: The VOC content in g/L or applicable certification label for each adhesives, sealants, coatings, paints, etc. per respective LEED requirement.

3. GBMCF Back-Up Documentation: These documents are used to validate the information provided on the GBMCF (except cost data). For each material listed on the GBMCF, provide documentation to certify the material's attributes, as applicable:
   a. IEQ credit 4, Low Emitting Materials: VOC content or applicable certification label proof in the form of a cutsheet, MSDS, or letter from the manufacturer.
   b. Product cut sheets for materials appearing in the GBMCF. Cut sheets shall be submitted with the Contractor or sub-contractor's stamp, as confirmation that the submitted products are the products installed on the Project.

4. Contractor is required to collect all LEED submittal documentation from the project's subcontractors and assemble into one (1) package per Section or trade, on the GBMCF provided, for review by the Sustainability Consultant. Submit GBMCF and Back-Up Documentation within 30 days of awarded contract. Incomplete or inaccurate LEED submittals may be used as the basis for rejecting the submitted products or assemblies.

C. Shop Drawings: Include diagrams for power, signal, and control wiring.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For flushometer valves to include in operation and maintenance manuals.

1.6 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that are packaged with protective covering for storage and identified with labels describing contents.
   1. Flushometer-Valve Repair Kits: Equal to 10 percent of amount of each type installed, but no fewer than one of each type.
   2. Faucet Washers and O-Rings: Equal to 10 percent of amount of each type and size installed, but no fewer than one of each type.
   3. Faucet Cartridges and O-Rings: Equal to 5 percent of amount of each type and size installed, but no fewer than one of each type.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

A. Materials:
   1. Vitreous china fixtures shall be of highest quality, non-absorbent, hard-burned, and vitrified throughout.
2. Enameled ware shall be quality cast iron of uniform thickness and density, glazed to uniform depth and high gloss rubbed smooth, without chips or flaws, craze, or cracks, and completely acid resisting.

3. Stainless steel fixtures shall be 302/304 types of non-corrosive steel, 18 gage (1.20 mm) self rim for cabinet sinks, 14 gage (2.0 mm) for free standing compartment type sinks. Sink material shall have satin finish and cover corners, with faucet holes punched to match specified faucet fitting.

4. Precast receptors and shower basins shall be ["terrazzo" concrete][molded "stone" inert base and plasticizer][stainless steel][built up base and tile]. Receptor and basin colors shall be standard colors unless otherwise noted. Assembly of drain to waste piping shall be made from floor level on which basin or receptor is installed.

5. Insulation for traps and supplies shall be molded closed cell vinyl insulation and shall meet ASTM E84 for flame and smoke spread. Insulation shall be vandal resistant.

B. NSF Standard: Comply with NSF/ANSI 61 Annex G, "Drinking Water System Components - Health Effects," for supply-fitting materials that will be in contact with potable water.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.2 WATER CLOSETS

A. All water closet and flushometer combinations shall have a Maximum Performance Test (MaP) score of 800 or greater when the flushometer is tested with the water closet.

B. Mounting Height: Handicapped/elderly according to ICC/ANSI A117.1.

C. Wall Hung or Floor Mounted:

1. Fixture: white vitreous china, siphon jet, elongated bowl, 1.28 gal (4.8 L) per flush, NPS 1-1/2 (DN 40) top inlet spud.
   a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      1) Zurn Industries, LLC.
      2) Kohler Co.
      3) TOTO USA, INC.

2. Flushometer Valve: chrome plated exposed sensor activated diaphragm flushometer, brass body with corrosion resistant components, integral check stop and backflow preventer, 125 psig (860 kPa) minimum pressure rating.
   a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      1) Sloan Valve Company.
      2) American Standard
      3) Zurn Industries, LLC.
      4) TOTO USA, INC.
   b. Standard: ASSE 1037.

a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1) Bemis Manufacturing Company.
   2) Church Seats; Bemis Manufacturing Company.
   3) Olsonite Seat Co.
   4) American Standard.
   5) Kohler Co.
   6) TOTO USA Inc.

4. Water Closet Carrier: Waste-fitting assembly, as required to match drainage piping material and arrangement with faceplates, couplings gaskets, and feet; bolts and hardware matching fixture. Include additional extension coupling, faceplate, and feet for installation in wide pipe space.

a. Manufacturers: Subject to compliance with requirements, provide products by the following:
   1) Zurn Industries, LLC.
   2) J.R. Smith
   3) MIFDA

b. Standard: ASME A112.6.1M.

2.3 LAVATORIES

A. Mounting Height: Handicapped/elderly according to ICC/ANSI A117.1.

B. Wall Mounted:
   1. Fixture: white vitreous china, oval 20-1/2" x 18-1/4", one hole top faucet punching.
      a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
         1) American Standard America.
         2) Kohler Co.
         3) Zurn Industries, LLC.
   2. Faucet: automatic type, battery powered, electronic sensor operated, mixing, solid brass valve, rigid spout with aerator. Maximum flow rate: 0.5 gpm (1.5 L/min). Include hot- and cold-water indicators; coordinate faucet inlets with supplies and fixture hole punchings; coordinate outlet with spout and fixture receptor.
      a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
         1) Delta
         2) Chicago Faucets; Geberit Company.
         3) American Standard
         4) Kohler Co.
         5) Sloan Valve Company.
         6) Speakman Company.
   3. Type II Lavatory Carrier:
2.4 SINKS

A. Mounting Height: Handicapped/elderly according to ICC/ANSI A117.1.

B. Service Basin, floor mounted:

1. Fixture: white terrazzo, square 24" x 24" (610 x 610 mm), height of 10 inches (255 mm), rim guard on front top surface, grid type drain with NPS 3 (DN 80) outlet, mounted flush to wall.

   a. Manufacturers: Subject to compliance with requirements, provide products by the following:

      1) Florestone Products Co., Inc.
      2) Fiat Products Co.
      3) Acorn Engineering Company.

2. Faucet: manual type, two-lever handle, cross four arm; rigid solid brass spout with wall brace. Maximum flow rate: 2.2 gpm (8.3 L/min). Include hot- and cold-water indicators; coordinate faucet inlets with supplies and fixture hole punchings; coordinate outlet with spout and fixture receptor. Include hose thread spout and vacuum breaker.

   a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

      1) Bradley Corporation.
      2) Speakman Company.
      3) T & S Brass and Bronze Works, Inc.
      4) Chicago Faucets; Geberit Company.

3. Type II Sink Carrier:

   a. Manufacturers: Subject to compliance with requirements, provide products by the following:
2) Watts; a Watts Water Technologies company.
3) Zurn Industries, LLC.
4) MIFAB

b. Standard: ASME A112.6.1M.

4. **Supply Fittings**: Chrome-plated-brass pipe or chrome-plated copper tube matching water-supply piping size. Include chrome-plated-brass or stainless-steel wall flange, chrome-plated-brass supply stops, one-quarter-turn, ball-type or compression valve with inlet connection matching supply piping.

5. **Waste Fittings**: grid type with NPS 1-1/2 (DN 40) offset and straight tailpiece, chrome-plated, two-piece, cast-brass trap and swivel elbow with 0.032-inch-thick brass tube to wall; and chrome-plated, brass or steel wall flange.

6. **Grout**: hydraulic cement, nonshrink, premixed, post-hardening and volume-adjusting, dry 5000 psi (34.5 MPa) 28 day compressive strength
   a. Standard: ASTM C 1107/C 1107M, Grade B.

2.5 **DRINKING FOUNTAINS**

A. **Wall-mounted**:

1. **Fixture**: stainless steel rectangular receptor with wall plate behind fountain, two bubblers with adjustable stream regulator, 0.5 gpm, vandal resistant, push button control, grid type drain with NPS 1-1/4 (DN 32) outlet, chrome-plated brass P-trap and waste fitting, NPS 3/8 (DN 10) supply with shutoff valve, with bottle filler.
   a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      1) Elkay Manufacturing Co.
      2) Oasis International.
      3) Stern-Williams Co., Inc.

2. **Type I Water Cooler Carrier**:
   a. Manufacturers: Subject to compliance with requirements, provide products by the following:
      2) Josam.
      3) Watts; a Watts Water Technologies company.
   b. Standard: ASME A112.6.1M.
PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine roughing-in of water supply and sanitary drainage and vent piping systems to verify actual locations of piping connections before installation.

B. Examine walls and floors for suitable conditions where fixtures will be installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General:

1. Install level and plumb according to roughing-in drawings.
2. Install accessible fixtures at mounting height for handicapped/elderly, according to ICC/ANSI A117.1.
3. Install fresh batteries in battery-powered, electronic-sensor mechanisms.
4. Install according to manufacturer’s instructions.

B. Water-Closet Installation:

1. Install floor-mounted water closets on bowl-to-drain connecting fitting attachments to piping or building substrate.
2. Support Installation:
   a. Install supports, affixed to building substrate, for floor-mounted, back-outlet water closets.
   b. Use carrier supports with waste-fitting assembly and seal.
   c. Install wall-mounted, back-outlet water-closet supports with waste-fitting assembly and waste-fitting seals; and affix to building substrate.
3. Flushometer-Valve Installation:
   a. Install flushometer-valve, water-supply fitting on each supply to each water closet.
   b. Attach supply piping to supports or substrate within pipe spaces behind fixtures.
   c. Install lever-handle flushometer valves for accessible water closets with handle mounted on open side of water closet.
   d. Install actuators in locations that are easy for people with disabilities to reach.
4. Install toilet seats on water closets.

C. Lavatory Installation:

1. Install supports, affixed to building substrate, for wall-mounted lavatories.
2. Install protective shielding pipe covers and enclosures on exposed supplies and waste piping of accessible lavatories. Comply with requirements in Section 22 07 19 "Plumbing Piping Insulation."

D. Sink Installation:

1. Install supports, affixed to building substrate, for wall-hung sinks.
2. Set floor-mounted sinks in leveling bed of cement grout.
3. Install water-supply piping with stop on each supply to each sink faucet.
a. Exception: Use ball valves if supply stops are not specified. Comply with valve requirements specified in Section 22 05 23 "General Duty Valves for Plumbing Piping".
b. Install stops in locations where they can be easily reached for operation.

E. Drinking Fountain Installation:
   1. Install recessed drinking fountains secured to blocking in wall construction.
   2. Install off-the-floor carrier supports, affixed to building substrate, for wall-mounted fixtures.
   3. Install water-supply piping with shutoff valve on supply to each fixture to be connected to domestic-water distribution piping. Use ball valve. Install valves in locations where they can be easily reached for operation. Valves are specified in Section 22 05 23 "General Duty Valves for Plumbing Piping".
   4. Install trap and waste piping on drain outlet of each fixture to be connected to sanitary drainage system.

F. Wall Flange and Escutcheon Installation:
   1. Install wall flanges or escutcheons at piping wall penetrations in exposed, finished locations and within cabinets and millwork.
   2. Install deep-pattern escutcheons if required to conceal protruding fittings.
   3. Comply with escutcheon requirements specified in Division 22.

G. Joint Sealing:
   1. Seal joints between water closets and walls and floors using sanitary-type, one-part, mildew-resistant silicone sealant.
   2. Match sealant color to water-closet color.
   3. Comply with sealant requirements specified in Division 07.

3.3 CONNECTIONS
A. Connect fixtures with water supplies and soil, waste, and vent piping. Use size fittings required to match water closets.
B. Comply with water piping requirements specified in Section 22 11 16 "Domestic Water Piping."
C. Comply with soil and waste piping requirements specified in Section 22 13 16 "Sanitary Waste and Vent Piping."
D. Where installing piping adjacent to fixtures, allow space for service and maintenance.

3.4 ADJUSTING
A. Operate and adjust fixtures and controls. Replace damaged and malfunctioning fixtures, fittings, and controls.
B. Adjust water pressure at flushometer valves to produce proper flow.
C. Install fresh batteries in battery-powered, electronic-sensor mechanisms.
3.5 CLEANING AND PROTECTION

A. Clean fixtures and fittings with manufacturers’ recommended cleaning methods and materials.

B. After installation and prior to occupancy, install protective covering for installed fixtures and fittings. Remove protection once Certificate of Occupancy is obtained.

C. Do not allow use of fixtures for temporary facilities unless approved in writing by Owner.

END OF SECTION
SECTION 22 45 00 - EMERGENCY PLUMBING FIXTURES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Emergency showers.
   2. Eyewash equipment.
   3. Combination units.
   4. Water-tempering equipment.

1.3 DEFINITIONS

A. Accessible Fixture: Emergency plumbing fixture that can be approached, entered, and used by people with disabilities.

B. Plumbed Emergency Plumbing Fixture: Fixture with fixed, potable-water supply.

D. Tepid: Moderately warm.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product indicated. Include flow rates and capacities, furnished specialties, and accessories.

B. Shop Drawings: Diagram power, signal, and control wiring.

1.5 INFORMATIONAL SUBMITTALS

A. Product Certificates: Submit certificates of performance testing specified in "Source Quality Control" Article.

B. Field quality-control test reports.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For emergency plumbing fixtures to include in operation and maintenance manuals.
1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Flushing-Fluid Solution: Separate lot and equal to at least 200 percent of amount of solution installed for each self-contained unit.

1.8 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
B. ANSI Standard: Comply with ANSI Z358.1, "Emergency Eyewash and Shower Equipment."
C. NSF Standard: Comply with NSF 61 Annex G, "Drinking Water System Components - Health Effects," for fixture materials that will be in contact with potable water.

PART 2 - PRODUCTS

2.1 EYEWASH EQUIPMENT

A. Sink, Swivel-Type, Plumbed Eyewash Unit:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      b. Guardian Equipment Co.
      c. Haws Corporation.
   2. Capacity: Not less than 0.4 gpm for at least 15 minutes.
   3. Supply Piping: Chrome-plated brass or stainless steel with flow regulator and stay-open control valve.
   4. Control-Valve Actuator: Movement of spray-head assembly to position over sink.
   5. Spray-Head Assembly: Two spray heads with offset piping.
   6. Mounting: Deck next to sink.

2.2 COMBINATION UNITS

A. Standard, Plumbed Emergency Shower with Eyewash Combination Units:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      b. Guardian Equipment Co.
      c. Haws Corporation.
   2. Piping:
      a. Supply Material: Galvanized steel or Chrome-plated brass or stainless steel.
      b. Unit Drain: Outlet at back or side near bottom.
   3. Shower:
      a. Capacity: Not less than 20 gpm for at least 15 minutes.
c. Control-Valve Actuator: Pull rod.
d. Shower Head: 8-inch-minimum diameter, chrome-plated brass or stainless steel.
e. Mounting: Pedestal.

4. Eyewash Unit:
   a. Capacity: Not less than 0.4 gpm for at least 15 minutes.
   d. Spray-Head Assembly: Two receptor-mounted spray heads.
   e. Receptor: Chrome-plated brass or stainless-steel bowl.
   f. Mounting: Attached shower pedestal.

B. Accessible, Plumbed Emergency Shower with Eyewash Combination Units:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      b. Guardian Equipment Co.
      c. Haws Corporation.
   2. Piping:
      a. Supply Material: Galvanized steel or Chrome-plated brass or stainless steel.
      b. Unit Drain: Outlet at back or side near bottom.
   3. Shower:
      a. Capacity: Not less than 20 gpm for at least 15 minutes.
      c. Control-Valve Actuator: Pull rod.
      d. Shower Head: 8-inch-minimum diameter, chrome-plated brass or stainless steel.
      e. Mounting: Pedestal.
   4. Eyewash Unit:
      a. Capacity: Not less than 0.4 gpm for at least 15 minutes.
      d. Spray-Head Assembly: Two receptor-mounted spray heads.
      e. Receptor: Chrome-plated brass or stainless-steel bowl.
      f. Mounting: Attached shower pedestal.

C. Standard, Plumbed Emergency Shower with Eye/Face Wash Combination Units:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      b. Guardian Equipment Co.
      c. Haws Corporation.
   2. Piping:
      a. Supply Material: Galvanized steel or Chrome-plated brass or stainless steel.
      b. Unit Drain: Outlet at back or side near bottom.
   3. Shower:
      a. Capacity: Not less than 20 gpm for at least 15 minutes.
      c. Control-Valve Actuator: Pull rod.
      d. Shower Head: 8-inch-minimum diameter, chrome-plated brass or stainless steel.
      e. Mounting: Pedestal.
   4. Eye/Face Wash Unit:
      a. Capacity: Not less than 3 gpm for at least 15 minutes.
      d. Spray-Head Assembly: Two or four receptor-mounted spray heads.
      e. Receptor: Chrome-plated brass or stainless-steel bowl.
f. Mounting: Attached shower pedestal.

D. Accessible, Plumbed Emergency Shower with Eye/Face Wash Combination Units:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      b. Guardian Equipment Co.
      c. Haws Corporation.
   2. Piping:
      a. Supply Material: Galvanized steel or Chrome-plated brass or stainless steel.
      b. Unit Drain: Outlet at back or side near bottom.
   3. Shower:
      a. Capacity: Not less than 20 gpm for at least 15 minutes.
      c. Control-Valve Actuator: Pull rod.
      d. Shower Head: 8-inch-minimum diameter, chrome-plated brass or stainless steel.
      e. Mounting: Pedestal.
   4. Eye/Face Wash Unit:
      a. Capacity: Not less than 3 gpm for at least 15 minutes.
      d. Spray-Head Assembly: Two or four receptor-mounted spray heads.
      e. Receptor: Chrome-plated brass or stainless-steel bowl.
      f. Mounting: Attached to shower pedestal.

2.3 WATER-TEMPERING EQUIPMENT

A. Hot- and Cold-Water, Water-Tempering Equipment:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      b. Guardian Equipment Co.
      c. Leonard Valve Company.
   2. Description: Factory-fabricated equipment with thermostatic mixing valve.
      a. Thermostatic Mixing Valve: Designed to provide 85 deg F tepid, potable water at emergency plumbing fixtures, to maintain temperature at plus or minus 5 deg F throughout required 15-minute test period, and in case of unit failure to continue cold-water flow, with union connections, controls, metal piping, and corrosion-resistant enclosure.
      b. Supply Connections: For hot and cold water.

2.4 SOURCE QUALITY CONTROL

A. Certify performance of emergency plumbing fixtures by independent testing organization acceptable to authorities having jurisdiction.
PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine roughing-in for water and waste piping systems to verify actual locations of piping connections before plumbed emergency plumbing fixture installation.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 EMERGENCY PLUMBING FIXTURE INSTALLATION

A. Assemble emergency plumbing fixture piping, fittings, control valves, and other components.

B. Install fixtures level and plumb.

C. Fasten fixtures to substrate.

D. Install shutoff valves in water-supply piping to fixtures. Use ball or gate valve if specific type valve is not indicated. Install valves chained or locked in open position if permitted. Install valves in locations where they can easily be reached for operation. Comply with requirements for valves specified in Section 220523.12 "Ball Valves for Plumbing Piping" and Section 220523.15 "Gate Valves for Plumbing Piping."

1. Exception: Omit shutoff valve on supply to emergency equipment if prohibited by authorities having jurisdiction.

E. Install shutoff valve and strainer in steam piping and shutoff valve in condensate return piping. Comply with requirements for steam and condensate piping specified in Section 232213 "Steam and Condensate Heating Piping" and Section 232216 "Steam and Condensate Piping Specialties."

F. Install dielectric fitting in supply piping to emergency equipment if piping and equipment connections are made of different metals. Comply with requirements for dielectric fittings specified in Section 221116 "Domestic Water Piping."

G. Install thermometers in supply and outlet piping connections to water-tempering equipment. Comply with requirements for thermometers specified in Section 220519 "Meters and Gages for Plumbing Piping."

H. Install trap and waste piping on drain outlet of emergency equipment receptors that are indicated to be directly connected to drainage system. Comply with requirements for waste piping specified in Section 221316 "Sanitary Waste and Vent Piping."

I. Install indirect waste piping on drain outlet of emergency equipment receptors that are indicated to be indirectly connected to drainage system. Comply with requirements for waste piping specified in Section 221316 "Sanitary Waste and Vent Piping."

J. Install escutcheons on piping wall and ceiling penetrations in exposed, finished locations. Comply with requirements for escutcheons specified in Section 220518 "Escutcheons for Plumbing Piping."

K. Fill self-contained fixtures with flushing fluid.
3.3 CONNECTIONS

A. Connect cold-water-supply piping to plumbed emergency plumbing fixtures not having water-tempering equipment. Comply with requirements for cold-water piping specified in Section 221116 "Domestic Water Piping."

B. Connect hot- and cold-water-supply piping to hot- and cold-water, water-tempering equipment. Connect output from water-tempering equipment to emergency plumbing fixtures. Comply with requirements for hot- and cold-water piping specified in Section 221116 "Domestic Water Piping."

C. Directly connect emergency plumbing fixture receptors with trapped drain outlet to sanitary waste and vent piping. Comply with requirements for waste piping specified in Section 221316 "Sanitary Waste and Vent Piping."

D. Indirectly connect emergency plumbing fixture receptors without trapped drain outlet to sanitary waste or storm drainage piping.

E. Where installing piping adjacent to emergency plumbing fixtures, allow space for service and maintenance of fixtures.

3.4 IDENTIFICATION

A. Install equipment nameplates or equipment markers on emergency plumbing fixtures and equipment and equipment signs on water-tempering equipment. Comply with requirements for identification materials specified in Section 220553 "Identification for Plumbing Piping and Equipment."

3.5 FIELD QUALITY CONTROL

A. Mechanical-Component Testing: After plumbing connections have been made, test for compliance with requirements. Verify ability to achieve indicated capacities.

B. Tests and Inspections:
   1. Perform each visual and mechanical inspection.
   2. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
   3. Operational Test: After electrical circuitry has been energized, start units to confirm proper unit operation.
   4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

C. Emergency plumbing fixtures and water-tempering equipment will be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports.

3.6 ADJUSTING

A. Adjust or replace fixture flow regulators for proper flow.

B. Adjust equipment temperature settings.
SECTION 22 62 13 - VACUUM PIPING FOR LABORATORY FACILITIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Laboratory high-vacuum piping, designated "laboratory high vacuum."

B. Related Requirements:
   1. Section 115313 "Fume Hoods and Other Air Containment Units" for vacuum inlets in laboratory fume hoods.
   2. Section 115310 "Laboratory Casework" for vacuum inlets in laboratory casework.
   3. Section 226219 "Vacuum Equipment for Laboratory Facilities" for vacuum producers and accessories.

1.3 DEFINITIONS

A. Nonmedical laboratory vacuum piping systems include laboratory low-vacuum and laboratory high-vacuum piping systems.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer and testing agency.

B. Material Certificates: Signed by Installer certifying that medical vacuum piping materials comply with requirements in NFPA 99.

C. Brazing certificates.

D. Field quality-control reports.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For vacuum piping specialties to include in emergency, operation, and maintenance manuals.
1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Quick-Coupler Service Connections: Furnish complete noninterchangeable medical vacuum suction inlets.

1.8 QUALITY ASSURANCE

A. Installer Qualifications:
   1. Pressure-Seal Joining Procedure for Copper Tubing: An authorized representative who is trained and approved by manufacturer.
   2. Extruded-Tee Outlet Procedure: An authorized representative who is trained and approved by manufacturer.
   3. Shape-Memory-Metal Coupling Joints: An authorized representative who is trained and approved by manufacturer.

B. Brazing: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code, Section IX, "Welding and Brazing Qualifications"; or AWS B2.2, "Standard for Brazing Procedure and Performance Qualification."

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Laboratory high vacuum operating at 22 in. Hg (560 mm Hg)

2.2 PIPES, TUBES, AND FITTINGS

A. Copper Medical Gas Tube: ASTM B 819, Type L, seamless, drawn temper that has been manufacturer cleaned, purged, and sealed for medical gas service.

B. Copper Water Tube: ASTM B 88, Type M (ASTM B 88M, Type C), seamless, drawn temper.

C. Wrought-Copper Fittings: ASME B16.22, solder-joint pressure type that has been manufacturer cleaned, purged, and sealed for medical gas service.

D. Copper Unions: ASME B16.22 or MSS SP-123, wrought-copper or cast-copper alloy.

E. Cast-Copper-Alloy Flanges: ASME B16.24, Class 150.
   1. Pipe-Flange Gasket Materials: ASME B16.21, nonmetallic, flat, asbestos-free, 1/8-inch (3.2-mm) maximum thickness, full-face type.
   2. Flange Bolts and Nuts: ASME B18.2.1, carbon steel.

F. Shape-Memory-Metal Couplings:
   1. Manufactures: Subject to compliance with requirements, provide products by one of the following:
      a. Aerofit Inc.
b. Cameron; a Schlumber Co.
c. Motion Industries
d. Smart Tap; Smart Technology.

2. Description: Cryogenic compression fitting made of nickel-titanium, shape-memory alloy, and that has been manufacturer cleaned, purged, and sealed for oxygen service according to CGA G-4.1.

G. Pressure-Seal Fittings:
1. Manufactures: Subject to compliance with requirements, provide products by one of the following:
   a. Nibco Inc
   b. Viega LLC.
2. NPS 2 (DN 50) and Smaller: Wrought-copper fitting with EPDM O-ring seal in each end.
3. NPS 2-1/2 to NPS 4 (DN 65 to DN 100): Bronze fitting with stainless-steel grip ring and EPDM O-ring seal in each end.

1. Manufactures: Subject to compliance with requirements, provide products by one of the following:
   a. T-DRILL Industries Inc.<Double click here to find, evaluate, and insert list of manufacturers and products.>

I. Flexible Pipe Connectors:
1. Manufactures: Subject to compliance with requirements, provide products by one of the following:
   a. Flex-Hose Co., Inc
   b. Flexicraft Industries
   c. Hyspan Precision Products
   d. Metraflex Company.
2. Description: Corrugated-bronze tubing with bronze wire-braid covering and ends brazed to inner tubing.
   a. Working-Pressure Rating: 250 psig (1725 kPa) minimum.
   b. End Connections: Plain-end copper tube.

2.3 JOINING MATERIALS
A. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.
B. Brazing Filler Metals: AWS A5.8/A5.8M, BCuP Series, copper-phosphorus alloys.
C. Threaded-Joint Tape: PTFE.
2.4 VALVES

A. General Requirements for Valves: Manufacturer cleaned, purged, and bagged according to CGA G-4.1 for oxygen service.

B. Copper-Alloy Ball Valves:
   1. Manufactures: Subject to compliance with requirements, provide products by one of the following:
      a. Nibco Inc.
      b. Tri-Tech Medical
      c. Allied Healthcare products
      d. BeaconMedaes
   3. Description: Three-piece body, brass or bronze.
   4. Pressure Rating: 300 psig (2070 kPa) minimum.
   5. Ball: Full-port, chrome-plated brass.
   6. Seats: PTFE or TFE.
   7. Handle: Lever
   8. Stem: Blowout proof with PTFE or TFE seal.
   9. Ends: Manufacturer-installed ASTM B 819, copper-tube extensions with pressure gauge on one copper-tube extension.

C. Check Valves:
   1. Manufactures: Subject to compliance with requirements, provide products by one of the following:
      a. Nibco Inc.
      b. Tri-Tech Medical
      c. Allied Healthcare products
      d. BeaconMedaes
   2. Description: In-line pattern, bronze.
   3. Pressure Rating: 300 psig (2070 kPa) minimum.

PART 3 - EXECUTION

3.1 PREPARATION

A. Cleaning of Medical Gas Tubing: If manufacturer-cleaned and -capped fittings or tubing is not available or if precleaned fittings or tubing must be re-cleaned because of exposure, have supplier or separate agency acceptable to authorities having jurisdiction perform the following procedures:
   1. Clean medical gas tube and fittings, valves, gages, and other components of oil, grease, and other readily oxidizable materials as required for oxygen service according to CGA G-4.1.
2. Wash medical gas tubing and components in hot, alkaline-cleaner-water solution of sodium carbonate or trisodium phosphate in proportion of 1 lb (0.453 kg) of chemical to 3 gal. (11.3 L) of water.
   a. Scrub to ensure complete cleaning.
   b. Rinse with clean, hot water to remove cleaning solution.

3.2 PIPING INSTALLATION

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of vacuum piping. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, vacuum producer sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on coordination drawings.

B. Comply with NFPA 99 for installation of vacuum piping.

C. Install piping concealed from view and protected from physical contact by building occupants unless otherwise indicated and except in equipment rooms and service areas.

D. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

E. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal and coordinate with other services occupying that space.

F. Install piping adjacent to equipment and specialties to allow service and maintenance.

G. Install vacuum piping with 1 percent slope downward in direction of flow.

H. Install nipples, unions, special fittings, and valves with pressure ratings same as or higher than piping pressure rating used in applications specified in "Piping Schedule" Article unless otherwise indicated.

I. Install eccentric reducers, if available, where vacuum piping is reduced in direction of flow, with bottoms of both pipes and reducer fitting flush.

J. Provide drain leg and drain trap at end of each main and branch and at low points.

K. Install thermometer and vacuum gage on inlet piping to each vacuum producer and on each receiver. Comply with requirements in Section 220519 "Meters and Gages for Plumbing Piping."

L. Install piping to permit valve servicing.

M. Install piping free of sags and bends.

N. Install fittings for changes in direction and for branch connections. Extruded-tee branch outlets in copper tubing may be made where specified.

O. Install medical vacuum piping from medical vacuum service connections specified in this Section, to equipment specified in Section 226219 "Vacuum Equipment for Laboratory and Healthcare Facilities," and to equipment specified in other Sections requiring medical vacuum service.
P. Piping Restraint Installation: Install seismic restraints on vacuum piping. Seismic-restraint devices are specified in Section 220548 "Vibration and Seismic Controls for Plumbing Piping and Equipment."

Q. Install medical vacuum service connections recessed in walls. Attach roughing-in assembly to substrate; attach finishing assembly to roughing-in assembly.

R. Install medical vacuum bottle bracket adjacent to each wall-mounted medical vacuum service connection suction inlet.

S. Connect vacuum piping to vacuum producers and to equipment requiring vacuum service.

T. Install unions in copper vacuum tubing adjacent to each valve and at final connection to each machine, specialty, and piece of equipment.

U. Install unions in PVC vacuum piping NPS 2 (DN 50) and smaller adjacent to each valve and at final connection to each machine, specialty, and piece of equipment.

V. Install flanges in PVC vacuum piping NPS 2-1/2 (DN 65) and larger adjacent to flanged valves and at final connection to each machine, specialty, and piece of equipment.

W. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in Section 220517 "Sleeves and Sleeve Seals for Plumbing Piping."

X. Install escutcheons for piping penetrations of walls, ceilings, and floors. Comply with requirements for escutcheons specified in Section 220518 "Escutcheons for Plumbing Piping."

3.3 VALVE INSTALLATION

A. Install shutoff valve at each connection to and from vacuum equipment and specialties.

B. Install check valves to maintain correct direction of vacuum flow to vacuum-producing equipment.

C. Install valve boxes recessed in wall and anchored to substrate. Single boxes may be used for multiple valves that serve same area or function.

D. Install zone valves and gages in valve boxes. Rotate valves to angle that prevents closure of cover when valve is in closed position.

E. Install flexible pipe connectors in suction inlet piping to each vacuum producer.

3.4 JOINT CONSTRUCTION

A. Ream ends of pipes and tubes and remove burrs.

B. Remove scale, slag, dirt, and debris from outside of cleaned tubing and fittings before assembly.

C. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.
D. Threaded Joints: Apply appropriate tape to external pipe threads.

E. Brazed Joints: Join copper tube and fittings according to CDA's "Copper Tube Handbook," "Brazed Joints" chapter. Do not use flux. Continuously purge joint with oil-free dry nitrogen during brazing.

F. Soldered Joints: Apply ASTM B 813, water-flushable flux to tube end. Join copper tube and fittings according to ASTM B 828.

G. Extruded-Tee Outlets: Form branches in copper tube according to ASTM F 2014, with tools recommended by tube manufacturer.

H. Flanged Joints:
   1. Copper Tubing: Install flange on copper tubes. Use pipe-flange gasket between flanges. Join flanges with gasket and bolts according to ASME B31.9 for bolting procedure.
   2. PVC Piping: Install PVC flange on PVC pipes. Use pipe-flange gasket between flanges. Join flanges with gasket and bolts according to ASME B31.9 for bolting procedure.

I. Pressure-Sealed Joints: Join copper tube and copper and copper-alloy fittings with tools recommended by fitting manufacturer.

J. Shape-Memory-Metal Coupling Joints: Join new copper tube to existing tube according to procedures developed by fitting manufacturer for installation of shape-memory-metal coupling joints.

K. Solvent-Cemented Joints: Clean and dry joining surfaces. Join PVC pipe and fittings according to the following:
   1. Comply with ASTM F 402 for safe-handling practice of cleaners, primers, and solvent cements.
   2. Apply primer and join according to ASME B31.9 and ASTM D 2672 for solvent-cemented joints.

3.5 HANGER AND SUPPORT INSTALLATION

A. Comply with requirements in Section 220548 "Vibration and Seismic Controls for Plumbing Piping and Equipment" for seismic-restraint devices.

B. Comply with requirements in Section 220529 "Hangers and Supports for Plumbing Piping and Equipment" for pipe hanger and support devices.

C. Vertical Piping: MSS Type 8 or Type 42, clamps.

D. Individual, Straight, Horizontal Piping Runs:
   1. 100 Feet (30 m) and Less: MSS Type 1, adjustable, steel, clevis hangers.
   2. Longer Than 100 Feet (30 m): MSS Type 43, adjustable, roller hangers.

E. Multiple, Straight, Horizontal Piping Runs 100 Feet (30 m) or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze. Comply with requirements in Section 220529 "Hangers and Supports for Plumbing Piping and Equipment" for trapeze hangers.

F. Base of Vertical Piping: MSS Type 52, spring hangers.

G. Support horizontal piping within 12 inches (300 mm) of each fitting and coupling.
H. Rod diameter may be reduced one size for double-rod hangers, with 3/8-inch- (10-mm-) minimum rods.

I. Install hangers for copper tubing with the following maximum horizontal spacing and minimum rod diameters:
   1. NPS 1/4 (DN 8): 60 inches (1500 mm) with 3/8-inch (10-mm) rod.
   2. NPS 3/8 and NPS 1/2 (DN 10 and DN 15): 72 inches (1800 mm) with 3/8-inch (10-mm) rod.
   3. NPS 3/4 (DN 20): 84 inches (2100 mm) with 3/8-inch (10-mm) rod.
   4. NPS 1 (DN 25): 96 inches (2400 mm) with 3/8-inch (10-mm) rod.
   5. NPS 1-1/4 (DN 32): 108 inches (2700 mm) with 3/8-inch (10-mm) rod.
   6. NPS 1-1/2 (DN 40): 10 feet (3 m) with 3/8-inch (10-mm) rod.
   7. NPS 2 (DN 50): 11 feet (3.4 m) with 3/8-inch (10-mm) rod.
   8. NPS 2-1/2 (DN 65): 13 feet (4 m) with 1/2-inch (13-mm) rod.
   9. NPS 3 (DN 80): 14 feet (4.3 m) with 1/2-inch (13-mm) rod.
  10. NPS 3-1/2 (DN 90): 15 feet (4.6 m) with 1/2-inch (13-mm) rod.
   11. NPS 4 (DN 100): 16 feet (4.9 m) with 1/2-inch (13-mm) rod.
   12. NPS 5 (DN 125): 18 feet (5.5 m) with 1/2-inch (13-mm) rod.
   13. NPS 6 (DN 150): 20 feet (6 m) with 5/8-inch (16-mm) rod.
   14. NPS 8 (DN 200): 23 feet (7 m) with 3/4-inch (19-mm) rod.

J. Install supports for vertical copper tubing every 10 feet (3 m).

K. Install identifying labels and devices for laboratory vacuum piping, valves, and specialties. Comply with requirements in Section 220553 "Identification for Plumbing Piping and Equipment."

3.6 FIELD QUALITY CONTROL FOR LABORATORY FACILITY NONMEDICAL VACUUM PIPING

A. Testing Agency: Engage qualified testing agency to perform field tests and inspections of vacuum piping in nonmedical laboratory facilities and to prepare test and inspection reports.

B. Tests and Inspections:
   1. Piping Leak Tests for Vacuum Piping: Test new and modified parts of existing piping. Cap and fill vacuum piping with oil-free, dry nitrogen. Isolate test source and let stand for four hours to equalize temperature. Refill system, if required, to test pressure; hold for two hours with no drop in pressure.
      a. Test Pressure for Copper Tubing 150 psig (1035 kPa)
   2. Repair leaks and retest until no leaks exist.
   3. Inspect filters for proper operation.

C. Remove and replace components that do not pass tests and inspections and retest as specified above.

3.7 PROTECTION

A. Protect tubing from damage.

B. Retain sealing plugs in tubing, fittings, and specialties until installation.

C. Clean tubing not properly sealed, and where sealing is damaged, according to "Preparation" Article.
3.8 PIPING SCHEDULE

A. Connect new copper tubing to existing copper tubing with memory-metal couplings.

B. Connect PVC pipe to copper tube with transition fittings.

C. Flanges may be used where connection to flanged equipment is required.

D. Laboratory High-Vacuum Piping: Use one of the following piping materials for each size range:
   1. NPS 4 (DN 100) and Smaller: Copper medical gas tube, press-type fittings, and pressure-sealed joints.
   2. All Sizes: Extruded-tee fittings and brazed joints may be used instead of standard tee fittings.

3.9 VALVE SCHEDULE

A. Shutoff Valves:
   1. Copper Tubing: Copper-alloy ball valve with manufacturer-installed ASTM B 819, copper-tube extensions.

B. Zone Valves: Copper-alloy ball valve with manufacturer-installed ASTM B 819, copper-tube extensions with pressure gage on one copper-tube extension.

END OF SECTION
SECTION 22 62 19 - VACUUM EQUIPMENT FOR LABORATORY FACILITIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Liquid-ring vacuum pumps.
   2. Rotary, dry-claw vacuum pumps.
   3. Rotary, sliding-vane vacuum pumps.

B. Related Requirements: Retain subparagraph below to cross-reference requirements Contractor might expect to find in this Section but are specified in other Sections.

1.3 DEFINITIONS

A. Actual Air: Air delivered at vacuum producer inlet. Flow rate is air measured in acfm.

B. Laboratory Vacuum Equipment: Vacuum producers and accessories for nonmedical laboratory facilities.

C. Standard Air: Free air at 68 deg F and 1 atmosphere before compression or expansion and measured in scfm.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: For vacuum producers.

   1. Include plans, elevations, sections, and mounting details.
   2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   3. Vibration Isolation Base Details: Detail fabrication including anchorages and attachments to structure and to supported equipment. Include adjustable motor bases, rails, and frames for equipment mounting.
   4. Include diagrams for power, signal, and control wiring.
1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer and testing agency.

B. Seismic Qualification Certificates: For vacuum producers, accessories, and components, from manufacturer.
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
   2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
   3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

C. Field quality-control reports.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For vacuum equipment to include in operation and maintenance manuals.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1.8 QUALITY ASSURANCE

A. Installer Qualifications:
   1. Laboratory Vacuum Equipment for Nonmedical Laboratory Facilities: An employer of workers trained and approved by manufacturer.

B. Testing Agency Qualifications: An independent testing agency, with the experience and capability to conduct the vacuum equipment testing indicated, that is an NRTL, and that is acceptable to authorities having jurisdiction.
   1. Qualify testing personnel according to ASSE 6020 for inspectors and ASSE 6030 for verifiers.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Vacuum producers and accessories shall withstand the effects of earthquake motions determined according to ASCE/SEI 7
1. The term "withstand" means "the vacuum producer and receiver will remain in place without separation of any parts when subjected to the seismic forces specified."

2. Component Importance Factor: 1.0.

2.2 GENERAL REQUIREMENTS FOR VACUUM PUMPS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. Comply with NFPA 99, "Health Care Facilities," for vacuum equipment and accessories for medical vacuum systems.

C. Comply with UL 544, "Medical and Dental Equipment," for medical vacuum equipment.

D. Description: Factory-assembled, -wired, -piped, and -tested; electric-motor-driven; air-cooled; continuous-duty vacuum pumps and receivers.

E. Control Panels: Automatic control station with load control and protection functions. Comply with NEMA ICS 2 and UL 508.
   1. Enclosure: NEMA ICS 6, Type 12 control panel unless otherwise indicated.
   3. Control Voltage: 120-V ac or less, using integral control power transformer.
   5. Starting Devices: Hand-off-automatic selector switch in cover of control panel, plus pilot device for automatic control.
   6. Automatic control switches to alternate lead-lag vacuum pumps for duplex vacuum pumps.
   7. Instrumentation: Include vacuum pump inlet and receiver vacuum gages, hour meter, vacuum pump discharge-air and coolant temperature gages, and control transformer.
   8. Alarm Signal Devices: For connection to alarm system to indicate when backup vacuum pump is operating. The fault alarm will be hard wired or routed over a COMM protocol (BACnet, ModBus, etc.).

F. Receivers: Steel tank constructed according to ASME Boiler and Pressure Vessel Code, Section VIII, Division 1; bearing appropriate code symbols.
   1. Interior Finish: Corrosion-resistant coating.
   2. Accessories: Include vacuum relief valve, vacuum gage, and drain.

G. Mounting Frames: Fabricate base and attachment to vacuum pump and components with reinforcement strong enough to resist movement during a seismic event when base is anchored to building structure.
2.3 ROTARY, SLIDING-VANE VACUUM PUMPS

A. Oil-Sealed, Rotary, Sliding-Vane Vacuum Pumps VAC-1

1. Manufacturer: Powerex
2. Description: Packaged unit.
   a. Cleanable inlet screens.
   b. Outlet silencers and oil-mist separators on discharge connections.

B. Capacities and Characteristics:

2. Vacuum Pump(s): Two.
4. Actual-Air Capacity of Each Vacuum Pump: 42 acfm expanded air delivered.
5. Vacuum Required: 24 in. Hg.
7. Motor (Each Vacuum Pump):
   a. Horsepower: 10 HP
   b. Speed: 1750 rpm.
8. Electrical Characteristics:
   a. Volts: 460V
   b. Phase(s): Three.
   c. Hertz: 60
   d. Full-Load Amperes: 27.6

PART 3 - EXECUTION

3.1 PREPARATION

A. Clean vacuum equipment, accessories, and components that have not been cleaned for oxygen service and sealed or that are furnished unsuitable for laboratory vacuum applications, according to CGA G4.1, "Cleaning Equipment for Oxygen Service."

3.2 VACUUM EQUIPMENT INSTALLATION

A. Install vacuum equipment for healthcare facilities according to ASSE 6010 and NFPA 99.
B. Equipment Mounting:
   1. Install vacuum producers on cast-in-place concrete equipment base(s). Comply with requirements for equipment bases and foundations specified in Section 033000 "Cast-in-Place Concrete."
   2. Comply with requirements for vibration isolation and seismic control devices specified in Section 220548 "Vibration and Seismic Controls for Plumbing Piping and Equipment."
   3. Comply with requirements for vibration isolation devices specified in Section 220548.13 "Vibration Controls for Plumbing Piping and Equipment."

C. Install vacuum equipment anchored to substrate.

D. Orient equipment so controls and devices are accessible for servicing.

E. Maintain manufacturer's recommended clearances for service and maintenance.

F. Install the following devices on vacuum equipment:
   1. Thermometer, Vacuum Gage, and Pressure Relief Valve: Install on each vacuum pump receiver.
   2. Drain Valves: Install on receivers. Discharge receiver condensate over nearest floor sink. Discharge separator oral evacuation fluids by direct connection into sanitary waste piping system.

3.3 CONNECTIONS

A. Comply with requirements for water-supply piping specified in Section 221116 "Domestic Water Piping." Drawings indicate general arrangement of piping, fittings, and specialties.

B. Comply with requirements for drain piping specified in Section 221316 "Sanitary Waste and Vent Piping." Drawings indicate general arrangement of piping, fittings, and specialties.

C. Comply with requirements for vacuum piping specified in Section 226213 "Vacuum Piping for Laboratory and Healthcare Facilities." Drawings indicate general arrangement of piping, fittings, and specialties.

D. Where installing piping adjacent to equipment, allow space for service and maintenance.

E. Connect vacuum piping to vacuum equipment, accessories, and specialties with shutoff valve and union or flanged connection.

F. Connect water supply to vacuum equipment that requires water. Include backflow preventer. Backflow preventers are specified in Section 221119 "Domestic Water Piping Specialties."

3.4 IDENTIFICATION

A. Identify nonmedical laboratory vacuum equipment system components. Comply with requirements for identification specified in Section 220553 "Identification for Plumbing Piping and Equipment."
B. Identify medical vacuum equipment system components. Comply with requirements for identification specified in Section 220553 "Identification for Plumbing Piping and Equipment." and with NFPA 99.

3.5 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.

1. Complete installation and startup checks according to manufacturer's written instructions.
2. Check for lubricating oil in lubricated-type equipment.
3. Check belt drives for proper tension.
4. Verify that vacuum producer outlet piping is clear.
5. Check for equipment vibration-control supports and flexible pipe connectors and verify that equipment is properly attached to substrate.
6. Check safety valves for correct settings.
7. Check for proper seismic restraints.
8. Drain receiver tank.
9. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
10. Test and adjust controls and safeties.
11. Minimum 2 hours on-site startup service by factory-authorized service representative.

B. Verify that vacuum equipment is installed and connected according to the Contract Documents.

C. Verify that electrical wiring installation complies with manufacturer's submittal and written installation requirements in electrical Sections.

D. Prepare written report documenting testing procedures and results.

3.6 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain vacuum producers. Minimum 2 hours on-site demonstration required.

B. Refer to Division 1 "Demonstration and Training" and "General Commissioning Requirements" for additional requirements.

END OF SECTION
SECTION 22 66 00 - LABORATORY-WASTE SYSTEMS FOR LABORATORY FACILITIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. Section 01 81 13 “Sustainable Design Requirements” for additional Leadership in Energy and Environmental Design (LEED®) certification-related references, definitions, documentation requirements, action plans, meetings, and performance requirements of products and systems.

1.2 SUMMARY

A. Section Includes:
   2. Piping specialties.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Sustainable Design Submittals:
   1. LEED Submittal Requirements: Submit for Sustainability Consultant's review.
   2. A completed GREEN BUILDING MATERIAL CERTIFICATION FORM (GBMCF), as specified in Section 01 81 13 Information to be supplied for this form shall include:
      a. List of all adhesives and sealants installed on the project, within the LEED boundary that were included in the contract.
      b. Cost breakdowns for the materials included in the Contractor or sub-contractor's work. Cost breakdowns shall include total cost plus itemized material costs.
      c. A total estimated weight (lbs.) value of the material applied within the LEED project boundary.
      d. IEQ credit 4, Low Emitting Materials: The VOC content in g/L or applicable certification label for each adhesives, sealants, coatings, paints, etc. per respective LEED requirement.
   3. GBMCF Back-Up Documentation: These documents are used to validate the information provided on the GBMCF (except cost data). For each material listed on the GBMCF, provide documentation to certify the material's attributes, as applicable:
      a. IEQ credit 4, Low Emitting Materials: VOC content or applicable certification label proof in the form of a cutsheet, MSDS, or letter from the manufacturer.
      b. Product cut sheets for materials appearing in the GBMCF. Cut sheets shall be submitted with the Contractor or sub-contractor's stamp, as confirmation that the submitted products are the products installed on the Project.
   4. Contractor is required to collect all LEED submittal documentation from the project's subcontractors and assemble into one (1) package per Section or trade, on the GBMCF provided, for review by the Sustainability Consultant. Submit GBMCF and Back-Up Documentation within 30 days of awarded contract. Incomplete or inaccurate LEED submittals may be used as the basis for rejecting the submitted products or assemblies.

C. Delegated-Design Submittal: For seismic restraints of aboveground piping.
1. Include design calculations for selecting seismic restraints.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Reflected ceiling plan(s) and other details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
   1. Pipe sizes, locations, and elevations.
   2. Other piping in same trench and clearances from sewerage system piping.
   3. Interface and spatial relationship between piping and proximate structures.

B. Field quality-control reports.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For chemical-waste specialties and to include in emergency, operation, and maintenance manuals.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver and store piping and specialties with sealing plugs in ends or with end protection.

B. Do not store plastic pipe or fittings in direct sunlight.

C. Protect pipe, fittings, and seals from dirt and damage.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. NFPA Compliance: Comply with NFPA 70.

2.2 PERFORMANCE REQUIREMENTS

A. Single-Wall Piping Pressure Rating: 5-psig air test pressure.

2.3 SINGLE-WALL PIPE AND FITTINGS

A. PE Drainage Pipe and Fittings: Comply with ASTM D 4976.
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      b. Performance Pipe.
      c. PolyPipe Brand; Dura-Line.

B. PP Drainage Pipe and Fittings: ASTM F 1412 pipe extruded and drainage-pattern fittings molded, with Schedule 40 dimensions and with fire-retardant additive complying with ASTM D 4101; with fusion-joint ends.
   1. Exception: Pipe and fittings made from PP resin without fire-retardant additive may be used for underground installation.
   2. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Georg Fischer Inc.
      b. IPEX USA LLC.
      c. Orion Fittings; a Watts Water Technologies company.

C. Adapters and Transition Fittings: Assemblies with combinations of clamps, couplings, adapters, and gaskets; compatible with piping and system liquid; made for joining different piping materials.

2.4 JOINING MATERIALS

A. Couplings: Assemblies with combinations of clamps, gaskets, sleeves, and threaded or flanged parts; compatible with piping and system liquid; and made by piping manufacturer for joining system piping.

B. Adapters and Transition Fittings: Assemblies with combinations of clamps, couplings, adapters, gaskets, and threaded or flanged parts; compatible with piping and system liquid; and made for joining different piping materials.

C. Flanges: Assemblies of companion flanges and gaskets complying with ASME B16.21 and compatible with system liquid, and bolts and nuts.

2.5 PIPING SPECIALTIES

A. Plastic Dilution Traps:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Georg Fischer Inc.
      b. IPEX USA LLC.
      c. Orion Fittings; a Watts Water Technologies company.
   3. End Connections: Mechanical joint.
   4. Dilution Tanks: 1-gal. capacity, with clear base unless colored base is indicated; with two NPS 1-1/2 top inlets and one NPS 1-1/2 side outlet.
   5. Small Dilution Jars: 1-pint capacity, with clear base unless colored base is indicated; with NPS 1-1/2 top inlet and NPS 1-1/2 side outlet.
   6. Large Dilution Jars: 1-quart capacity; with NPS 1-1/2 top inlet and NPS 1-1/2 side outlet.

B. PP Floor Drains:
   1. Body: With 7- to 9-inch top diameter, with flashing flange and weep holes; and with flashing clamp basket strainer and trap-primer connection.
2. Outlet: Bottom, to match connecting pipe, with NPS 2, NPS 3, NPS 4, or NPS 6 outlet as indicated.

C. Plastic Backwater Valves:
   1. Description: Full-port NPS 3 check valve, PP or PVDF, matching or compatible with system piping and compatible with system liquid, with EPDM seals and flanged ends.

D. High-Silicon-Iron Sink Outlets:
   1. Description: NPS 1-1/2, with clamping device and 4-, 6-, or 8-inch-high overflow fitting, as indicated.
   2. Manufacturers: Subject to compliance with requirements, provide products by the following:
      a. Flowserve Corporation

PART 3 - EXECUTION

3.1 EARTHWORK

   A. Comply with requirements in Section 312000 "Earth Moving" for excavating, trenching, and backfilling.

3.2 PIPING INSTALLATION

   A. Chemical-Waste Piping Inside the Building:
      1. Install piping next to equipment, accessories, and specialties to allow service and maintenance.
      2. Transition and special fittings with pressure ratings at least equal to piping pressure rating may be used unless otherwise indicated.
      3. Flanges may be used on aboveground piping unless otherwise indicated.
      4. Install underground fiberglass piping according to ASTM D 3839.
      5. Install piping in concealed locations unless otherwise indicated and except in equipment rooms and service areas.
      6. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.
      7. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.
      8. Install piping at indicated slopes.
      9. Install piping free of sags and bends.
     10. Install fittings for changes in direction and branch connections.
     11. Verify final equipment locations for roughing-in.
     12. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in Section 220517 "Sleeves and Sleeve Seals for Plumbing Piping."
     13. Install sleeve seals for piping penetrations of concrete walls and slabs. Comply with requirements for sleeve seals specified in Section 220517 "Sleeves and Sleeve Seals for Plumbing Piping."
3.3 PIPING SPECIALTY INSTALLATION

A. Embed floor drains in 4-inch minimum depth of concrete around bottom and sides. Comply with requirements in Section 033000 "Cast-in-Place Concrete" for concrete.

B. Fasten grates to drains if indicated.

C. Set floor drains with tops flush with pavement surface.

D. Install cleanouts and riser extension from sewer pipe to cleanout at grade. Use fittings of same material as sewer pipe at branches for cleanouts and riser extensions to cleanouts. Install piping so cleanouts open in direction of flow in pipe.
   1. Set cleanout bodies in earth in cast-in-place concrete block, 18 by 18 by 12 inches deep. Set with tops 1 inch above surrounding grade. Set cleanout plugs in concrete pavement, with tops flush with pavement surface. Comply with requirements in Section 033000 "Cast-in-Place Concrete" for formwork, reinforcement, and concrete requirements.

E. Install backwater valves in horizontal position. Include riser to cleanout at grade.

3.4 JOINT CONSTRUCTION

A. Chemical-Waste Piping Inside the Building:
   2. Dissimilar-Material Piping Joints: Make joints using adapters compatible with both system materials.

3.5 HANGER AND SUPPORT INSTALLATION

A. Pipe sizes in this article refer to aboveground single-wall pipiing.

B. Comply with requirements in Section 220548 "Vibration and Seismic Controls for Plumbing Piping and Equipment" for seismic-restraint devices.

C. Comply with requirements in Section 220529 "Hangers and Supports for Plumbing Piping and Equipment" for pipe hanger and support devices. Install the following:
   1. Vertical Piping: MSS Type 8 or MSS Type 42 riser clamps.
   2. Individual, Straight, Horizontal Piping Runs:
      a. 100 Feet and Less: MSS Type 1, adjustable, steel clevis hangers.
      b. Longer Than 100 Feet: MSS Type 43, adjustable roller hangers.
      c. Longer Than 100 Feet, if Indicated: MSS Type 49, spring cushion rolls.
   3. Multiple, Straight, Horizontal Piping Runs 100 Feet or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.
   4. Base of Vertical Piping: MSS Type 52 spring hangers.

D. Comply with requirements in Section 220529 "Hangers and Supports for Plumbing Piping and Equipment" for installation of supports.

E. Support horizontal piping and tubing within 12 inches of each fitting and coupling.
F. Support vertical piping and tubing at base and at each floor.

G. Rod diameter may be reduced one size for double-rod hangers, to minimum of 3/8 inch.

H. Install vinyl-coated hangers for PP piping with the following maximum horizontal spacing and minimum rod diameters:
   1. NPS 2: 33 inches with 3/8-inch rod.
   2. NPS 2-1/2 and NPS 3: 42 inches with 1/2-inch rod.
   3. NPS 4 and NPS 5: 48 inches with 5/8-inch rod.
   4. NPS 6: 48 inches with 3/4-inch rod.
   5. NPS 8: 48 inches with 7/8-inch rod.

I. Install supports for vertical PP piping every 72 inches.

J. Install hangers for high-silicon-iron piping with the following maximum horizontal spacing and minimum rod diameters:
   1. NPS 1-1/2 and NPS 2: 60 inches with 3/8-inch rod.
   2. NPS 3: 60 inches with 1/2-inch rod.
   3. NPS 4 and NPS 5: 60 inches with 5/8-inch rod.
   4. NPS 6: 60 inches with 3/4-inch rod.
   5. NPS 8 to NPS 12: 60 inches with 7/8-inch rod.
   6. NPS 15: 60 inches with 1-inch rod.
   7. Spacing for horizontal pipe in 84-inch lengths may be increased to 84 inches. Spacing for fittings is limited to 60 inches.

K. Install supports for vertical high-silicon-iron piping every 15 feet.

L. Support piping and tubing not listed above according to MSS SP-58.

3.6 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Make connections to existing piping, so finished Work complies as nearly as practical with requirements specified for new Work.

C. Use commercially manufactured wye fittings for sewerage piping branch connections. Remove section of existing pipe; install wye fitting into existing piping; and encase entire wye fitting plus 6-inch overlap, with not less than 6 inches of concrete with 28-day compressive strength of 3000 psi.

D. Protect existing piping to prevent concrete or debris from entering while making connections. Remove debris or other extraneous material that may accumulate.

E. Install piping adjacent to equipment to allow service and maintenance.

3.7 LABELING AND IDENTIFICATION

A. Comply with requirements in Section 220553 "Identification for Plumbing Piping and Equipment" for labeling of equipment and piping.
   1. Use warning tape or detectable warning tape over ferrous piping.
   2. Use detectable warning tape over nonferrous piping and over edges of underground structures.
3.8 FIELD QUALITY CONTROL

A. Inspect interior of sewerage piping to determine whether line displacement or other damage has occurred. Inspect after approximately 24 inches of backfill is in place and again at completion of Project.
   1. Defects requiring correction include the following:
      a. Alignment: Less than full diameter of inside of pipe is visible between inspection points.
      b. Deflection: Flexible piping with deflection that prevents passage of ball or cylinder of size not less than 92.5 percent of piping diameter.
      c. Crushed, broken, cracked, or otherwise damaged piping.
      d. Hydrostatic Tests for Drainage Piping:
         1) Allowable leakage is a maximum of 50 gal./inch of nominal pipe size per mile of pipe during 24-hour period.
         2) Close openings in system and fill with water.
         3) Purge air and refill with water.
         4) Disconnect water supply.
         5) Test and inspect joints for leaks.
      e. Air Tests for Drainage Piping: Comply with UNI-B-6.

B. Replace leaking sewerage piping using new materials, and repeat testing until leakage is within allowances specified.

C. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

D. Chemical-waste piping will be considered defective if it does not pass tests and inspections.

E. Prepare test and inspection reports.

3.9 CLEANING

A. Use procedures prescribed by authorities having jurisdiction or, if not prescribed, use procedures described below:
   1. Purge new piping and parts of existing piping that have been altered, extended, or repaired before using.
   2. Clean piping by flushing with potable water.

3.10 PIPING SCHEDULE

A. Transition and special fittings with pressure ratings at least equal to piping pressure rating may be used in applications below unless otherwise indicated.

B. Single-Wall, Chemical-Waste Sewerage Piping: Use any of the following piping materials for each size range:
   1. NPS 2 to NPS 4: High-silicon-iron, hub-and-plain-end pipe and fittings and caulked High-silicon-iron, mechanical-joint pipe and fittings and coupled joints.
   2. NPS 1-1/2 to NPS 4: PP drainage pipe and fittings and fusion joints.
   4. NPS 6: PP drainage pipe and fittings and fusion joints.
5. NPS 8 to NPS 12: High-silicon-iron, hub-and-plain-end pipe and fittings and calked joints.
6. NPS 8 to NPS 12: PP drainage pipe and fittings and fusion joints.

C. Underground, Double-Containment, Chemical-Waste Sewerage Piping: Use any of the following piping materials for each size range:
   1. NPS 2 to NPS 12: PP double-containment drainage pipe and fittings.

D. Aboveground Chemical-Waste Piping: Use any of the following piping materials for each size range:
   1. NPS 1-1/2 to NPS 6: PP drainage piping and fusion joints.
   2. NPS 1-1/2 to NPS 6: Use NPS 2 to NPS 6 high-silicon-iron piping with hub-and-plain ends and calked joints.
   3. NPS 1-1/2 to NPS 4: High-silicon-iron piping with mechanical-joint ends, mechanical couplings, and coupled joints.
   4. NPS 8 to NPS 12: High-silicon-iron piping with hub-and-plain ends and calked joints.

E. Under Slab-on-Grade, Indoor, Chemical-Waste Piping: Use any of the following piping materials for each size range:
   1. NPS 1-1/2 to NPS 6: PP drainage piping and fusion joints.
   2. NPS 1-1/2 to NPS 6: NPS 2 to NPS 4 high-silicon-iron piping with hub-and-plain ends and calked joints.
   3. NPS 8: High-silicon-iron piping with hub-and-plain ends and calked joints.

END OF SECTION
SECTION 22 67 00 - PROCESSED WATER SYSTEMS FOR LABORATORY AND HEALTHCARE FACILITIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
   A. Section includes deionized-water and reverse-osmosis-water piping.

1.3 PERFORMANCE REQUIREMENTS
   A. Minimum Working Pressure Ratings:
      1. Deionized-Water Piping: 150 psig unless otherwise indicated.
   B. Seismic Performance: Water piping shall withstand the effects of earthquake motions determined according to ASCE/SEI 7

1.4 ACTION SUBMITTALS
   A. Product Data: For each type of product indicated.
   B. Sustainable Design Submittals:
      1. Product Data for Credit IEQ 4.1: For solvent cements and adhesive primers, documentation including printed statement of VOC content.
      2. Laboratory Test Reports for Credit IEQ 4: For solvent cements and adhesive primers, documentation indicating that products comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

1.5 INFORMATIONAL SUBMITTALS
   A. Seismic Qualification Certificates: For water piping, accessories, and components, from manufacturer.
      1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
      2. Detailed description of piping anchorage devices on which the certification is based and their installation requirements.
   B. Welding certificates.
C. Field quality-control reports.

1.6 QUALITY ASSURANCE

A. Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."

PART 2 - PRODUCTS

2.1 PLASTIC PIPE AND FITTINGS

   1. Schedule 40, Pipe and Fittings: Pipe made to ASTM D 2447, Schedule 40 or SDR 11 dimensions; with socket- or butt-fusion fittings matching pipe dimensions.

   1. Schedule 80, Pipe and Fittings: Pipe made to ASTM D 2447, Schedule 80 dimensions; with socket fittings matching pipe dimensions.
   2. Electro-Fusion Fitting: Electrical-resistance heating coil for PP piping joints.

2.2 STAINLESS-STEEL TUBING

A. Stainless-Steel Tube: ASTM A 270, Grade TP304L or TP316L, seamless, sanitary tube of pharmaceutical quality, with wall thickness not less than ASTM A 312/A 312M, Schedule 5 unless otherwise indicated; with seamless, stainless-steel fittings matching tube thickness and grade, for welded joints.

B. Stainless-Steel Tube Fittings: Fabricated of same material and thickness as tubing for butt welding.

C. Finish on Inside Surface of Tubes and Fittings: Ra 20 micro-inch maximum roughness.

2.3 TRANSITION FITTINGS

A. Transition Fittings: Couplings, flanges, or other manufactured fittings; same size as, with pressure rating at least equal to and ends compatible with, piping to be joined.

2.4 PP VALVES

A. PP Ball Valves:
   1. Description:
      b. Pressure Rating: 150 psig at 73 deg F.
      d. Body Design: Union type.
e. End Connections: Detachable, butt or socket.
 g. Port: Full.
 h. Seats: PTFE.
 k. Handle: Tee shaped.

B. PP Butterfly Valves:
  1. Description:
     a. Pressure Rating: 150 psig at 73 deg F.
     c. Body Design: Lug or wafer type.
     d. Seat: FKM rubber.
     e. Disc: ASTM D 4101, PP resin
     f. Stem: Stainless steel.
     g. Stem Seals: FKM-rubber O-rings.
     h. Handle: Lever type with locking device.

C. PP Ball-Check Valves:
  1. Description:
     a. Pressure Rating: 150 psig at 73 deg F.
     d. End Connections: Detachable, socket.
     e. Ball: ASTM D 4101, PP resin.

D. PP Swing-Check Valves:
  1. Description:
     a. Pressure Rating: 150 psig at 73 deg F.
     d. End Connections: Flanged.
     f. Disc and Arm: ASTM D 4101, PP resin.
     g. Gasket and Seals: FKM rubber.

E. PP Diaphragm Valves:
  1. Description:
     a. Pressure Rating: 150 psig at 73 deg F.
     d. End Connections for NPS 2 and Smaller: Detachable, socket.
     e. End Connections for NPS 2-1/2 and NPS 3: Flanged.
     f. Diaphragm: FKM rubber.
     g. Seals: FKM-rubber O-rings.
     h. Handle: Wheel type.
PART 3 - EXECUTION

3.1 PIPING INSTALLATION

A. General Locations and Arrangements: Drawing plans and details indicate general location and arrangement of water piping. Location and arrangement of piping layout take design considerations into account. Install piping as indicated, to extent practical. Where specific installation is not indicated, follow piping manufacturer's written instructions.

B. Install seismic restraints on piping. Comply with requirements for seismic-restraint devices specified in Section 22 05 48 "Vibration and Seismic Controls for Plumbing Piping and Equipment."

C. Install piping concealed from view and protected from physical contact by building occupants unless otherwise indicated and except in equipment rooms and service areas.

D. Install piping indicated to be exposed and in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.

E. Install piping above accessible ceilings to allow sufficient space for removal of ceiling panel, and coordinate with other services occupying that space.

F. Where installing piping adjacent to equipment, allow space for service and maintenance of equipment.

G. Install piping to permit valve servicing.

H. Install nipples, unions, special fittings, and valves with pressure ratings the same as or higher than system pressure ratings unless otherwise indicated.

I. Install piping free of sags and bends.

J. Install fittings for changes in direction and branch connections.

K. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in Section 22 05 17 "Sleeves and Sleeve Seals for Plumbing Piping."

L. Install sleeve seals for piping penetrations of concrete walls and slabs. Comply with requirements for sleeve seals specified in Section 22 05 17 "Sleeves and Sleeve Seals for Plumbing Piping."

M. Install escutcheons for piping penetrations of walls, ceilings, and floors. Comply with requirements for escutcheons specified in Section 22 05 18 "Escutcheons for Plumbing Piping."

3.2 JOINT CONSTRUCTION

A. Where specific joint construction is not indicated, follow piping manufacturer's written instructions.

B. PP Piping Electro-Fusion Joints: Make according to ASTM F 1290.

C. PP Piping Heat-Fusion Joints: Make according to ASTM D 2657.
D. Join dissimilar pipe materials with transition fittings compatible with pipe materials being joined.

3.3 VALVE INSTALLATION

A. Install sectional valves close to mains on each branch and riser serving equipment.

B. Install shutoff valves with unions or flanges at each piece of equipment arranged to allow service, maintenance, and equipment removal without system shutdown.

C. Locate valves for easy access and provide separate support where necessary.

D. Install valves of same size as the pipe or tube in which they are installed unless otherwise indicated.

E. Install plastic valves of the same material as the plastic pipe in which they are installed.

F. Install stainless-steel valves in stainless-steel tubing.

G. Install valves in horizontal piping with stem at or above center of pipe.

H. Install valves in position to allow full movement of stem and lever handle.

I. Install ball-check valves in horizontal or vertical position so ball will unseat during normal flow.

J. Install swing-check valves in horizontal position with the hinge pin level.

3.4 HANGER AND SUPPORT INSTALLATION

A. Comply with requirements for seismic-restraint devices specified in Section 22 05 48 "Vibration and Seismic Controls for Plumbing Piping and Equipment."

B. Comply with requirements for pipe hanger and support devices and installation specified in Section 22 05 29 "Hangers and Supports for Plumbing Piping and Equipment."
   1. Install carbon-steel pipe hangers for horizontal piping in noncorrosive environments.
   2. Install stainless-steel pipe hangers for horizontal piping in corrosive environments.
   3. Install carbon-steel pipe support clamps for vertical piping in noncorrosive environments.
   4. Install stainless-steel pipe support clamps for vertical piping in corrosive environments.
   5. Clamps for Vertical Piping: MSS Type 8 or Type 42.
   6. Individual, Straight, Horizontal Piping Runs:
      a. 100 Feet and Less: MSS Type 1, adjustable clevis hangers.
      b. Longer Than 100 Feet: MSS Type 43, adjustable roller hangers.
      c. Longer Than 100 Feet if Indicated: MSS Type 49, spring cushion rolls.
   7. Multiple, Straight, Horizontal Piping Runs, 100 Feet or Longer: MSS Type 44, pipe rolls. Support pipe rolls on trapeze.
   8. Base of Vertical Piping: MSS Type 52, spring hangers.

C. Support horizontal piping and tubing within 12 inches of each fitting, valve, and coupling.

D. Support vertical piping and tubing at base and at each floor.

E. Rod diameter may be reduced one size for double-rod hangers, to minimum 3/8 inch.
F. Install padded hangers for PP piping with the following maximum horizontal spacing and minimum rod diameters:
   1. NPS 1 and Smaller: 32 inches with 3/8-inch rod.
   2. NPS 1-1/4 to NPS 2: 48 inches with 3/8-inch rod.
   3. NPS 2-1/2 and NPS 3: 48 inches with 1/2-inch rod.

G. Install padded supports for vertical PP piping NPS 2-1/2 and larger every 120 inches and midstory for NPS 2 and smaller.

H. Install hangers for stainless-steel tubing with the following maximum horizontal spacing and minimum rod diameters:
   1. NPS 1 and NPS 1-1/4: 72 inches with 3/8-inch rod.
   2. NPS 1-1/2 and NPS 2: 96 inches with 3/8-inch rod.
   3. NPS 2-1/2: 108 inches with 1/2-inch rod.
   4. NPS 3: 10 feet with 1/2-inch rod.

I. Install supports for vertical stainless-steel tubing every 10 feet.

J. Support piping and tubing not listed above according to MSS SP-69 and manufacturer's written instructions.

3.5 CONNECTIONS

A. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Where installing piping adjacent to equipment, allow space for service and maintenance of equipment.

C. Connect deionized-water piping to equipment and service outlets with unions or flanges.

3.6 IDENTIFICATION

A. Comply with requirements for identification specified in Section 22 05 53 "Identification for Plumbing Piping and Equipment."

3.7 FIELD QUALITY CONTROL

A. Test new piping, and parts of existing piping that have been altered, extended, or repaired, for leaks and defects.
   1. Schedule tests and their inspections by authorities having jurisdiction, with at least 24 hours' advance notice.
   2. Do not cover piping or put into service before inspection and approval.
   3. Test completed piping according to authorities having jurisdiction. If authorities having jurisdiction do not have published procedures, perform tests as follows:
      a. Hydrostatic Tests: Test piping at pressure not less than 1-1/2 times the maximum system operating pressure, but not less than 150 psig.
   4. Replace leaking joints with new materials and retest until no leaks exist.
   5. Submit separate reports for each test.
3.8 CLEANING

A. Use procedures prescribed by District or, if not prescribed, use procedures described below:
   1. Before using, purge new piping and parts of existing piping that have been altered, extended, or repaired.
   2. Clean piping by flushing with deionized water.

3.9 PIPING SCHEDULE

A. Transition and special fittings with pressure ratings at least equal to piping, and of same or compatible material, may be used in applications below.

B. Deionized-Water Piping: Use any of the following piping materials for each pipe size range:
   1. NPS 3 and Smaller: PP pipe and fittings and heat-fusion joints.
   2. NPS 3 and Smaller: PP pipe and fittings and electro-fusion joints.
   3. NPS 3 and Smaller: Stainless-steel sanitary tubing and welded joints.

3.10 VALVE SCHEDULE

A. Drawings indicate valve types to be used. Where specific valve types are not indicated, the following requirements apply:
   1. Shut off Duty: Install ball valves in piping NPS 2 and smaller. Install butterfly or diaphragm valves for NPS 3 piping.
   2. Throttling Duty: Install ball valves in piping NPS 2 and smaller. Install diaphragm valves for NPS 3 piping.

END OF SECTION
SECTION 23 00 00 – HVAC GENERAL REQUIREMENTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Division 01.

B. The requirements of the General Conditions and Supplementary Conditions.

1.2 SUMMARY

A. Furnish and install a complete (fully tested, adjusted, and ready for operation) mechanical system and fully automatic indoor space thermal conditioning and ventilation (commonly “HVAC”) system with associated controls as described by the Contract Drawings and Specifications.

B. The HVAC systems and design described in the Project documents reflect a building designed for low consumption of energy and water and minimum environmental footprint. Any modifications to the systems described herein shall maintain or improve on the sustainability and energy efficiency features of the project.

C. All design modifications that pertain to system selection, system energy efficiency and energy use, material selection and indoor air quality issues shall require the approval of Integral Group.

D. Include incidental details not usually shown or specified, but necessary for proper installation and operation.

E. Check, verify, and coordinate Work with Contract Drawings and Specifications prepared by all other trades. Include modifications, relocations, and adjustments necessary to complete work or avoid interference with other trades.

F. Where architectural features govern location of Work, refer to Architectural Drawings.

G. Contractor may install additional piping, fittings, and valves, not shown on the drawings, for testing purposes or convenience of installation. Where such materials are installed, they shall comply with the specifications and shall be properly sized for the system and operation. Remove such installed materials when they interfere with design conditions or as directed by the Architect.

H. LEED: This building shall be LEED certified. Contractor and their subs shall provide all relevant support documentation pertaining to the LEED credits that relate to their work.

I. Commissioning: The scope of work for the Contractor shall not include the duties of the Commissioning Authority (CxA). Contractor will be required, however, to include in their scope of work duties relevant to the commissioning process, including but not limited to training of owner's personnel in the operation of the HVAC equipment, providing manufacturer's startup and pre functional checklists and contractor-provided pre-functional and startup checklists to Commissioning Authority, performing and documenting pre-functional tests for HVAC equipment, performing and documenting functional tests for HVAC equipment, supporting DDC Contractor and Test and Balance Contractor in the performance of their duties, and providing operations and maintenance manuals.
1.3 CODES AND STANDARDS

A. All work and materials shall be in full accordance with the latest local rules and regulations, applicable sections of the California Code of Regulations, Title 24, State Fire Marshal, the Safety Orders of the Division of Industrial Safety, the California Electric Code and applicable State requirements. Nothing in these Plans and Specifications is to be construed to permit work not conforming to these requirements.

B. Wherever the Specifications call for or describe materials or construction of better quality or larger sizes than are required by the above rules and regulations, these Specifications shall govern. Should there be any direct conflict between the above rules and regulations and the Specifications the rules shall govern.

C. Equipment shall have UL label listing.

1.4 DRAWINGS

A. Layout of the equipment and work is diagrammatic, unless specifically dimensioned. Drawings and details shall be checked for interferences before installing the work. Any interference noted between different drawings, and between drawings and actual field conditions shall be brought to the attention of the Architect and Engineer of Record for a decision. The right is reserved to make any reasonable change in location of equipment without additional expense to the Owner.

B. For purposes of clarity and legibility, drawings are diagrammatic to the extent that many offsets, bends, special fittings, exact locations of items are not indicated, unless specifically dimensioned. Exact routing of piping and ductwork and locations of equipment shall be governed by structural conditions and obstructions. Contractor shall make use of all data in Contract Drawings and Specifications and field conditions.

C. In the event a major re-routing of a system appears necessary, Contractor shall prepare and submit for approval, shop drawings of the proposed rearrangement. Because of the diagrammatic nature and small scale of the Contract Drawings, all necessary offsets, adjustments, and transitions required for the complete installation are not shown. Contractor shall carefully investigate the structural and finish conditions affecting all the Work and shall arrange such Work accordingly, furnishing such fittings, equipment, accessories, etc., as may be required to meet such conditions, at no increase in Contract Sum.

D. The construction documents for this project were prepared by the design team using BIM (Building Information Modeling). Using this software by the design team does not relieve the Contractor from performing the necessary coordination to provide complete, code compliant and operational building systems. The plans and sections provided are diagrammatic and show the design intent, these are not intended to be used for fabrication or installation. Contractor is responsible for generating shop drawings for fabrication that meet the design intent as shown on the Contract Documents. The exact location of the piping, ductwork, electrical and support components are to be determined by the Contractor. All building sections and details provided are for information only and do not relieve the Contractor from performing final coordination. Contractor is responsible for coordinating with all other trades.

E. All dimensions and locations of equipment, doors, partitions, etc., are to be taken from the architectural plans but shall be verified at the site.
1.5 MECHANICAL SUBMITTAL PROCEDURES

A. See Division 01 “Administrative Requirements”, for submittal procedures.

B. Mechanical and related submittals are, in addition, subject to the requirements of this Article. In the event of a conflict between the requirements of Division 01 and this Article, the requirements of this Article shall supersede and take precedence over those of Division 01.

C. For DDC Building Automation Systems, see also SUBMITTALS in Part 1 of Section 255000 for additional submittal requirements and a detailed submittal schedule.

D. Engineer of Record will review submittals and provide comments within the following timeframe after receipt by the Engineer:
   1. For typical submittals, allow 10 working days.
   2. For large or complex submittals, allow 15 working days. Determination of “large and complex” submittal shall be at the discretion of the Engineer of Record.
   3. Do not send Engineer of Record more than 10 submittals in a contiguous period of 5 working days. If excess submittals are received, review period will be extended as necessary to perform proper review. Submittals will be reviewed in priority determined by Engineer of Record in consultation with Architect and Contractor.
   4. These submittal review periods supersede and take precedence over periods defined in Division 01, unless Division 01 allows for longer review periods.
   5. Submittal review periods shall not be reduced from the times herein except by agreement with the reviewing entity, in advance and in writing.

E. Submittal documentation and drawings shall consistently use the same abbreviations, symbols, nomenclature and identifiers. Use the same identifiers (e.g. equipment tags) used in Contract Drawings.

F. Submittals shall be provided in digital format.
   1. Provide a separate file for each submittal. For submittal packages, provide a separate file for each subsection (e.g. hardware cutsheets and shop drawings for the same Section shall be provided as separate files).
   2. Product cutsheets, test forms and other text documents shall be provided in word searchable digital format. Acceptable formats are MS Word, PDF (generated from another electronic document and word-searchable; scans of paper documents are not acceptable), and HTML; other formats require approval prior to submission.
   3. Drawings and schematics shall be provided in PDF format and in AutoCAD compatible format.
   4. Scanned paper documents are not acceptable
      a. Exception: original signed documents, such as qualifications, inspection certificates, and warranty documents.
   5. Hardcopy (paper) submittals are not acceptable and shall not be provided except as noted elsewhere.
   6. Submittals provided in the wrong format will be returned without action.

G. Submission and Resubmission Procedure
   1. Optional Pre-Submittals: At Contractor’s option, material may be submitted unofficially via email directly to the Engineer of Record for review and comment prior to formal submission. Comments provided by the Engineer are not official and may be changed or additional comments may be provided on the formal submittal. The intent of pre-
submittals is to reduce paperwork and review time, and to provide a venue to discuss technologies, products, designs or implementation strategies that are novel or unique.

2. Each submittal shall have a unique serial number that includes the associated Specification Section followed by a number for each sub-part of the submittal for that Specification Section, such as SUBMITTAL 230000-01. There is no requirement to assign particular serial numbers to any specific submittals – serial number assignment is arbitrary. The only requirements are that the serial numbers be sequential (to avoid confusing gaps) and, most importantly, consistent across all submittal correspondence.

3. Each resubmittal shall have the original unique serial number plus unique revision number such as SUBMITTAL 230000-01 REVISION 1.

4. Submit one copy of submittal in electronic format. Submissions made in the wrong format will be returned without action.

5. Include with each submittal and resubmittal a copy of the relevant specification section(s) noting on each paragraph and sub-paragraph(s) the following:
   a. CONFORMS: Contractor has verified that the submitted product conforms to the noted requirement(s).
   b. CONFORMS AS NOTED: Contractor has verified that the submitted product conforms to the noted requirement(s) by means of being equal to or higher quality and / or performance.
   c. NON-CONFORM: Contractor has verified that the submitted product does not conform to the noted requirement(s) and delineates each deviation from the specification requirements.
   d. NOT APPLICABLE: Contractor has verified that the noted requirement(s), in their opinion do not apply to this product, delineating the reasons for this decision.
   e. Include with each submittal and resubmittal a copy of the relevant specification section(s) the printed name of the contractor reviewer, their signature, the company name, and date of review.

6. Revise submittal
   a. Respond to all comments:
      1) Revise initial submittal to resolve review comments and corrections.
      2) Provide complete responses to comments or suggestions which are not practical to implement in the opinion of the Contractor.
   b. Indicate any changes that have been made other than those requested.
   c. Clearly identify resubmittal by original submittal number and revision number.
   d. Resubmittals that are not responsive to all comments will be returned without action.

7. Resubmit revised submittals until no exceptions are taken.

8. Once submittals are accepted with “No Exceptions Taken” or “Approved As Noted”, provide:
   a. Complete submittal of all accepted drawings and products in a single electronic file.
   b. Copies for coordination with other trades, if and as required by the General Contractor or Owner’s Representative.

H. Submit shop drawings, a list of proposed material and equipment manufacturers and the names of Subcontractors.

I. Shop drawings shall be provided for all mechanical systems for all floors of the building. Mechanical shop drawings shall also be provided for the underslab systems (under the foundation slab) and slab-embedded systems such as hydronic radiant loops and controls.

J. Materials and methods with which the words “for approval” or “approved” are used, and materials and methods which differ from those specified, shall be submitted.
K. Prepare and submit shop drawings, sections, details and diagrams to minimum scale \( \frac{1}{4}" = 1' - 0" \). Pump rooms and mechanical rooms shall be \( \frac{1}{2}" = 1' - 0" \) minimum scale. Drawings shall be coordinated, dimensioned and indicate equipment, pipe, duct, fire protection, and electrical in relation to architectural and structural features. Include minor piping, drains, air vents, etc. Indicate exact locations and elevations of valves, piping specialties, access doors, dampers, etc. Electronic submittal is encouraged.

L. Submit manufacturer’s specifications, product source, data sheets, certified equipment drawings and installation instructions, including installation dimensions, clearances, weights, materials, finishes, color selection, accessories, acoustical characteristics, capacity and full load and part load performance curves; complete with electrical data, motor horse power, KW; motor efficiency, amperage, voltage phases and wiring diagrams. Identify the particular specification section number, paragraph and equipment identification number per equipment schedule. Note that suppliers (wholesalers and distributors) data sheets are not acceptable unless they are also manufacturers of the product being submitted.

M. Fan and pump systems, with equipment in parallel, shall have performance curves noting single equipment operation and all iterations of additional equipment.

N. Certified Equipment Drawings (8-1/2" x 11" sheets) shall be indexed in accordance with Specification Section. Drawings to be submitted at a later date shall be marked with a page as a placeholder for insertion when submitted. The original submittal shall note which shop drawings will be submitted later. Marked-up catalogs are not acceptable and will be returned without action. Electronic submittal is required.

O. Engineer of Record’s review of submittals is for limited purpose of verifying conformance with information given and design concept expressed in Contract Drawings and Specifications. Engineer’s review is not for purpose of determining accuracy or completeness of items such as dimensions and quantities, which remain responsibility of Contractor.

P. Contractor shall not commence with fabrication or installation of any equipment or system until the associated submittals have been approved by the Engineer of Record and returned with “no exceptions” taken. Contractor shall be solely liable for any costs incurred from starting fabrication before approved submittals are returned.

Q. All final approved submittals and equipment datasheets shall be provided, in PDF format, to the owner as part of the as-built drawing set and shall be text searchable.

1.6 COORDINATION DRAWINGS

A. Utilize the latest version of 3D AutoCAD, Navisworks, and/or Revit software for the Coordination Drawings. No proprietary software of any kind shall be used other than that indicated. Drawing paper size shall not be larger than FULL SIZED Contract Drawings, and in no case larger than 30” x 42”. Coordinate available space with ALL other trades involved.

B. Provide Coordination Drawings in digital electronic format. Provide both native file format (AutoCAD, Navisworks, or Revit) and PDF format files. Hardcopy drawings are not acceptable.

C. These drawings are to show registers, grilles, diffusers, duct sizes, elevation of bottom of duct, pipe sizes, valves and accessories, elevation of bottom of pipe, all elevations of materials and/or systems throughout each floor inclusive of hanger components, seismic bracing if applicable, and any component of construction that impacts vertical and/or horizontal space. In addition, the locations of all valves, dampers, and other items requiring access for service and maintenance are to be shown. The drawings are to also show electrical, structural beams,
architectural bracing, structural bracing, ceiling heights, access doors, walls, floor to floor dimensions, columns, doors and other major architectural and structural features as shown on the architectural and structural drawings. Where the routing of work differs from that indicated on the Contract Drawings, such areas are to be indicated by highlighting with a note describing the reason for the change.

D. Rerouting of any system or part thereof shall be submitted separately in order to obtain concurrence of the Engineer of Record. Submitted rerouting must include fully documented proposed solutions with all trades coordinated. Contractor is fully responsible for coordination of systems included herein. Any effort by Engineer of Record beyond answering Contractor’s questions will be at Contractor’s expense, including attending coordination meetings, review of interim plans, or review of incomplete questions (routing issues without suggested solutions).

E. The Contractor and subcontractors are responsible to review and resolve any real or apparent interferences or conflicts as indicated by the coordination drawings produced by each trade.

F. After all conflicts or interferences are resolved, develop a final composite drawing showing the agreed upon routing, layout and juxtaposition of all duct work, conveyers, piping, major conduit, valves, panels, lighting fixtures and all other major mechanical, plumbing and electrical installations. In the preparation of all the final Coordination Drawings, large scale details as well as cross and longitudinal sections are required to fully delineate all conditions.

G. Submit the Coordination Drawings as digital electronic files to Engineer of Record for review and comment, as indicated under "Shop Drawings" above. Coordination Drawings shall be digitally signed-off by all other trades.

H. Contractor shall not commence with fabrication or installation of any equipment or system until the associated shop drawings have been reviewed and returned by the Engineer of Record. Engineer’s review of shop drawings shall not be taken as approval of their contents. Contractor shall be solely liable for any costs incurred due to deviations from the Contract Drawings.

I. No extra compensation will be paid for relocating any duct, pipe, conduit, or other material that has been installed without proper coordination between all trades involved. If any improperly coordinated work, or installed work that is not in accordance with the approved coordination composites, or is specifically noted by the Architect or Engineer of Record for a valid reason, necessitates additional work by the other trades, the costs of all such additional work is to be borne solely by the Contractor.

J. All changes in the scope of work due to revisions formally issued and approved are to be shown on both the individual subcontractor's Shop Drawings and the Coordination Drawings.

1.7 REQUESTS FOR INTERPRETATION AND CLARIFICATION

A. See Division 01 “Project Management”, for RFI procedures and forms.

B. Mechanical RFIs are, in addition, subject to the requirements of this Article. In the event of a conflict between the requirements of Division 01 and this Article, the requirements of this Article shall supersede and take precedence over those of Division 01.

C. Limit each RFI to a single issue or group of related issues.

D. Each RFI shall include a workable no-cost or lowest cost solution recommendation by Contractor.
E. Allow 3 working days from time of RFI receipt by Engineer of Record for review and response.

F. Do not send Engineer of Record more than 10 RFIs in a contiguous period of 5 working days. If excess RFIs are received, review period will be extended as necessary to provide a professional response. RFIs will be reviewed in priority determined by Engineer of Record in consultation with Architect and Contractor.

1.8 MATERIALS AND SUBSTITUTIONS

A. Comply with Division 01 “Product Requirements”.

B. Requests for product or equipment substitution shall be accompanied by a marked up copy of the Engineer of Record’s original specification. For each specified product feature or requirement, Contractor shall note the equivalent feature or attribute of the proposed substitute product or equipment.

C. Shop drawings of proposed material and equipment that differ from the specified materials and equipment, shall be accompanied by drawings that define changes. These drawings shall show modifications of architectural, plumbing, electrical and mechanical work required by the proposed materials and equipment, such as relocation of flues, drains, revised electrical circuits, relocation of roof or wall penetrations, revised foundations, etc.

1.9 COORDINATION WITH OTHER WORK

A. Contractor performing Work under this Section shall become thoroughly familiar with the Drawings and Specifications. Contractor shall adjust the Work to conform with the conditions shown on these drawings to provide the best possible assembly of the combined Work.

B. Obtain necessary information from the other trades regarding location of their work in order that the Work in this Section may be placed in correct position.

C. The inclusion and proper location of supports, pads, sleepers, openings, anchorages, etc. provided by others is the responsibility of the Contractor under this Section. Cutting and/or boring shall be permitted under this Section only with the written approval of the Architect.

D. It shall be the Contractor’s responsibility to coordinate and have provided by other trades where not covered by the Contractor’s scope of work, all electrical wiring and power to equipment, controls and devices, and any other work from other trades as required to provide fully functioning HVAC systems per the Contract Drawings and Specifications.

E. Electrical Characteristics for Mechanical Equipment: Equipment of higher electrical characteristics may be furnished provided such proposed equipment is approved in writing and connecting electrical services, circuit breakers, and conduit sizes are appropriately modified. If minimum energy ratings or efficiencies are specified, equipment shall comply with requirements.

1.10 MANUFACTURER’S DIRECTIONS

A. Manufacturer’s directions shall be followed in cases where the manufacturers of articles used in this contract furnish directions covering points not shown in the Contract Drawings and Specifications.
1.11 **PROTECTION OF WORK**

A. Equipment and materials shall be stored on dunnage and remain wrapped at all times until installed.

B. Duct and piping shall be remain capped during delivery and storage.

C. During installation, all installed duct and piping shall be capped and protected at the end of each working day.

D. Equipment shall be protected from weather and stored in an enclosed, indoor location.

E. Until final acceptance of the work, protect materials from damage and provide adequate and proper storage facilities. Replace damaged or defective work, material, and equipment before requesting final acceptance.

1.12 **WORKMANSHIP**

A. Equipment and materials shall be installed in a neat and workmanlike manner. Materials and equipment not so installed shall, upon order of the Architect or Engineer of Record, be removed and replaced in a satisfactory manner, without change in Contract Sum or additional cost to the Owner.

1.13 **CLOSING IN UNINSPECTED WORK**

A. Do not allow or cause any work to be covered up or enclosed until it has been inspected, tested, and accepted by the Architect, Engineer of Record, and/or Commissioning Authority.

B. Any work enclosed or covered-up prior to inspection and testing shall be uncovered. After the work has been tested, inspected and accepted, repair such materials as may be necessary to restore disturbed work to its original and proper condition at no extra cost to the Owner.

1.14 **EQUIPMENT ANCHORING**

A. Equipment shall be securely anchored to the building structure to prevent shifting or overturning during earthquakes.

1.15 **PRELIMINARY OPERATION**

A. Under this section, Contractor shall supervise and direct preliminary operation of systems should the Owner demand that any portion of the plant, apparatus, or equipment be operated previous to the final completion and acceptance of the work. Expenses for such preliminary operation will be paid by the Owner. Such preliminary operation or payment shall not be construed as an acceptance of the work.

1.16 **"AS-BUILT" DRAWINGS**

A. Comply with Section Division 01 “Project Closeout”.

Contra Costa Community College District
Contra Costa College
C-4016 New Science Building – DSA Backcheck
B. For DDC Building Automation systems, see also COMPLETION REQUIREMENTS in Part 1 of Section 255000 for additional as-built and closeout submittal requirements.

C. As-built drawings shall be furnished in an electronic format. Provide in drafting software (AutoCAD or Revit) native format and also in PDF format.

1.17 FINAL INSPECTION
A. At the time of final inspection, a service representative shall be available to make final adjustments.

1.18 FINAL OPERATION
A. After acceptance of the installation, instruct the Owner's Representative in operation and maintenance, for a period of three (3), non-consecutive working days at a time requested by the Owner during the first year of warranty.

B. At the beginning of the instruction period, deliver to the Owner three (3) copies of a durable binder as described under “Operating Instructions”.

1.19 OPERATING INSTRUCTIONS
A. The following O&M manual requirements do not replace O&M manual documentation requirements elsewhere in these Specifications.

B. Division 23 shall compile and prepare documentation for all equipment and systems covered in Division 23 and deliver this documentation to the General Contractor for inclusion in the O&M manuals prior to the training of Owner personnel.

C. In addition, DDC Contractor shall provide O&M material as required by “Completion Requirements” in Part 1 of Section 255000.

D. Provide a summary of operating sequences (start-up, normal run, and shut-down), and control shop drawings in the main mechanical room.

E. Provide three (3) complete sets of Operating Instructions. These instructions shall include brochures, diagrams, maintenance, and operating instructions and parts lists.

F. Provide a copy of the O&M manuals to the Commissioning Authority for review.

1.20 TRAINING OF OWNER PERSONNEL
A. The General Contractor shall be responsible for training coordination and scheduling and ultimately to ensure that training is completed.

B. The Commissioning Authority (CxA) shall be responsible for overseeing and approving the content and adequacy of the training of Owner personnel for commissioned equipment.

C. The Mechanical Contractor shall have the following training responsibilities:
   1. Provide the CxA with a training plan two weeks before the planned training.
2. Provide designated Owner personnel with comprehensive orientation and training in the understanding of the systems and the operation and maintenance of each piece of HVAC equipment including, but not limited to, pumps, air conditioning units, air handling units, fans, boilers, terminal units, controls, water treatment systems, etc.

3. Training shall normally start with classroom sessions followed by hands-on training on each piece of equipment, which shall illustrate the various modes of operation, including startup, shutdown, fire/smoke alarm, power failure, etc.

4. During any demonstration, should the system fail to perform in accordance with the requirements of the O&M manual or sequence of operations, the system will be repaired or adjusted as necessary and the demonstration repeated.

5. The appropriate trade or manufacturer's representative shall provide the instructions on each major piece of equipment. This person may be the start-up technician for the piece of equipment, the installing contractor or manufacturer's representative. Practical building operating expertise as well as in-depth knowledge of all modes of operation of the specific piece of equipment are required. More than one party may be required to execute the training.

6. The DDC Contractor shall attend sessions other than the DDC System training, as requested, to discuss the interaction of the DDC System as it relates to the equipment being discussed.

7. The training sessions shall follow the outline in the Table of Contents of the operation and maintenance manual and illustrate whenever possible the use of the O&M manuals for reference.

8. Training shall include:
   a. Use of the printed installation, operation and maintenance instruction material included in the O&M manuals.
   b. A review of the written O&M instructions emphasizing safe and proper operating requirements, preventative maintenance, special tools needed and spare parts inventory suggestions. The training shall include start-up, operation in all modes possible, shut-down, seasonal changeover and any emergency procedures.
   c. Discussion of relevant health and safety issues and concerns.
   d. Discussion of warranties and guarantees.
   e. Common troubleshooting problems and solutions.
   f. Explanatory information included in the O&M manuals and the location of all plans and manuals in the facility.
   g. Discussion of any peculiarities of equipment installation or operation.
   h. Instruction in the use of equipment controls that are integral to equipment or are provided by the equipment manufacturer, such as VRF System controls. This is in addition to and separate from DDC System training (see below) and does not replace or satisfy the requirement for such training, if specified. Equipment controls training shall include at least the following:
      1) Specific hardware configuration of installed systems in this building and specific instruction for operating the installed system and any interface with security and communication systems.
      2) Security levels, alarms, system start-up, shut-down, power outage and restart routines, changing setpoints and alarms and other typical changed parameters, overrides, freeze protection, manual operation of equipment, optional control strategies that can be considered, energy savings strategies and set points that if changed will adversely affect energy consumption, energy accounting, procedures for obtaining vendor assistance, etc.
      3) If system supports trending, all trending and monitoring features (values, change of state, totalization, etc.), including setting up, executing, downloading, viewing both tabular and graphically and printing trends. Trainees will actually set-up trends in the presence of the trainer.
      4) Every screen shall be completely discussed, allowing time for questions.
5) Use of keypad or plug-in laptop computer for mobile control access.
6) Use of remote access to the system via phone lines or networks, if applicable.
7) Graphics generation, if applicable.
8) Point database entry and modifications, if applicable

   j. Classroom sessions shall include the use of overhead projections, slides, video/audio-taped material as might be appropriate. A video record of the training session is suggested but not required.

9. Hands-on training shall include start-up, operation in all modes possible, including manual, shut-down and any emergency procedures and preventative maintenance for all pieces of equipment.
10. The Mechanical Contractor shall fully explain and demonstrate the operation, function and overrides of any local packaged controls, not controlled by the central control system.
11. Training shall occur after functional testing is complete, unless approved otherwise by the Project Manager.

D. DDC Contractor.

   1. See TRAINING in Part 3 of Section 255000 for DDC System training requirements and DDC Contractor obligations.
   2. DDC Contractor shall coordinate with Mechanical Contractor and Commissioning Authority regarding training on equipment-integrated or manufacturer-supplied control systems as described above. Such training is the responsibility of Mechanical Contractor but may be adopted by DDC Contractor by mutual agreement, to facilitate a more integrated training experience.

E. Test and Balance (TAB) Contractor. The TAB Contractor shall have the following training responsibilities:

   1. TAB Contractor shall meet with facility staff after completion of TAB and instruct them on the following:

      a. Go over the final TAB report, explaining the layout and meanings of each data type.
      b. Discuss any outstanding deficient items in control, ducting or design that may affect the proper delivery of air or water.
      c. Identify and discuss any terminal units, duct runs, diffusers, coils, fans and pumps that are close to or are not meeting their design capacity.
      d. Discuss any temporary settings and steps to finalize them for any areas that are not finished.
      e. Other salient information that may be useful for facility operations, relative to TAB.

1.21 WARRANTY

A. In accordance with Division 01 Project Closeout requirements, Guarantees, Warranties, Bonds, Service & Maintenance Contracts and as follows.

B. Contractor shall leave entire installation in complete working order and free from defects in material, workmanship, or finish.
C. Warranty all materials, equipment, apparatus, and workmanship to be free of defective materials and faulty workmanship for a minimum period of one (1) year from date of Certificate of Occupancy, or per Division 01, whichever is longer.

D. Warranty also services including instructions, adjusting, testing, noise, balancing, etc.

E. For each piece of equipment or device with a manufacturer's warranty in excess of one year, Contractor shall furnish certificate of manufacturer's warranty and contact information for manufacturer's warranty service. Contractor shall also provide a list or table of all equipment with warranties exceeding one (1) year in duration.

F. Provide new materials, equipment, apparatus, labor and/or service, and support to correct or replace that determined by the Owner to be defective or faulty.

G. The Owner reserves the right to make temporary repairs as necessary to keep equipment in operating condition without voiding the guarantees or relieving responsibility during the guarantee period.

H. For DDC System, see WARRANTY and WARRANTY MAINTENANCE in Part 1 of Section 255000. DDC System warranty commences upon the acceptance of COMPLETION REQUIREMENTS described in Part 1 of that Section, which may occur after the Certificate of Occupancy.

I. After a period of 90 calendar days from date of acceptance of systems by Owner, provide, at no cost to the Owner, one service mechanic for an 8-hour period over as many working days as required to repair, replace any latent deficiency.

1.22 SUBMITTALS

A. Welding certificates.

1.23 ACTION SUBMITTALS

A. Product Data: For each type of product in Part 2.

1.24 QUALITY ASSURANCE

A. Steel Support Welding: Qualify processes and operators according to AWS D1.1, "Structural Welding Code--Steel."

B. Steel Pipe Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."
   1. Comply with provisions in ASME B31 Series, "Code for Pressure Piping."
   2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.
PART 2 - PRODUCTS

2.1 JOINING MATERIALS

A. Refer to individual Division 23 piping Sections for special joining materials not listed below.

B. Pipe-Flange Gasket Materials: ASME B16.21, nonmetallic, flat, asbestos-free, 1/8-inch maximum thickness unless thickness or specific material is indicated.

C. Plastic, Pipe-Flange Gasket, Bolts, and Nuts: Type and material recommended by piping system manufacturer, unless otherwise indicated.

D. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.

E. Brazing Filler Metals: AWS A5.8, BCuP Series or BAg1, unless otherwise indicated.

2.2 SLEEVES

A. Galvanized-Steel Sheet: 0.0239-inch minimum thickness; round tube closed with welded longitudinal joint.

B. Steel Pipe: ASTM A 53, Type E, Grade B, Schedule 40, galvanized, plain ends.

C. Cast Iron: Cast or fabricated "wall pipe" equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop, unless otherwise indicated.

D. Stack Sleeve Fittings: Manufactured, cast-iron sleeve with integral clamping flange. Include clamping ring and bolts and nuts for membrane flashing.
   1. Underdeck Clamp: Clamping ring with set screws.

E. Molded PE or PP: Reusable, tapered-cup shaped, and smooth-outer surface with nailing flange for attaching to wooden forms.

2.3 SLEEVE SEAL SYSTEMS

A. Description:
   1. Modular sealing-element unit, designed for field assembly, for filling annular space between piping and sleeve.
   2. Designed to form a hydrostatic seal of 20-psig.
   3. Sealing Elements: EPDM-rubber interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size.
   4. Pressure Plates: Carbon steel.
   5. Connecting Bolts and Nuts: Carbon steel, with corrosion-resistant coating, ASTM B 633 of length required to secure pressure plates to sealing elements.
2.4 SLEEVE SEAL FITTINGS

A. Description:
1. Manufactured plastic, sleeve-type, waterstop assembly, made for imbedding in concrete slab or wall.
2. Plastic or rubber waterstop collar with center opening to match piping OD.

2.5 ESCUTCHEONS

A. Description: Manufactured wall and ceiling escutcheons and floor plates, with an ID to closely fit around pipe, tube, and insulation of insulated piping and an OD that completely covers opening. Polished chrome-plated finish.
1. One-Piece, Deep-Pattern Type: Deep-drawn, box-shaped brass.
2. One-Piece, Cast-Brass Type: With set screw.

2.6 GROUT

A. Description: ASTM C 1107, Grade B, nonshrink and nonmetallic, dry hydraulic-cement grout.
2. Design Mix: 5000-psi, 28-day compressive strength.

PART 3 - EXECUTION

3.1 SLEEVE INSTALLATION

A. Install sleeves for piping passing through penetrations in floors, partitions, roofs, and walls.

B. For sleeves that will have sleeve-seal system installed, select sleeves of size large enough to provide 1-inch annular clear space between piping and concrete slabs and walls.

C. Install sleeves in concrete floors, concrete roof slabs, and concrete walls as new slabs and walls are constructed.
1. Permanent sleeves are not required for holes in slabs formed by molded-PE or -PP sleeves.
2. Cut sleeves to length for mounting flush with both surfaces.
   a. Exception: Extend sleeves installed in floors of mechanical equipment areas or other wet areas 4 inches above finished floor level.
3. Using grout, seal space outside of sleeves in slabs and walls without sleeve-seal system.

D. Install sleeves for pipes passing through interior partitions.
1. Cut sleeves to length for mounting flush with both surfaces.
2. Install sleeves that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation.
3. Seal annular space between sleeve and piping or piping insulation; use sealants appropriate for size, depth, and location of joint.

E. Fire-Resistance-Rated Penetrations, Horizontal Assembly Penetrations, and Smoke-Barrier Penetrations: Maintain indicated fire or smoke rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with fire- and smoke-stop materials. Comply with requirements for fire-stopping and fill materials specified in Division 07.

3.2 SLEEVE-SEAL-SYSTEM INSTALLATION

A. Install sleeve-seal systems in sleeves in exterior concrete walls and slabs-on-grade at service piping entries into building.

B. Select type, size, and number of sealing elements required for piping material and size and for sleeve ID or hole size. Position piping in center of sleeve. Center piping in penetration, assemble sleeve-seal-system components, and install in annular space between piping and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make a watertight seal.

3.3 SLEEVE-SEAL-FITTING INSTALLATION

A. Install sleeve-seal fittings as new walls and slabs are constructed.

B. Assemble fitting components of length to be flush with both surfaces of concrete slabs and walls. Position water stop flange to be centered in concrete slab or wall.

C. Secure nailing flanges to concrete forms.

D. Using grout, seal space around outside of sleeve-seal fittings.

3.4 SLEEVE AND SLEEVE-SEAL SCHEDULE

A. Use sleeves and sleeve seals for the following piping-penetration applications:

1. Exterior Concrete Walls Above Grade: Cast-iron sleeves or Galvanized Steel pipe sleeves.
2. Exterior Concrete Walls Below Grade: Cast-iron pipe sleeves with sleeve-seal system or Galvanized Steel pipe sleeves with sleeve-seal system.
   a. Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.
3. Concrete Slabs-on-Grade: Piping Smaller Than: Cast-iron pipe sleeves with sleeve-seal system or galvanized Steel pipe sleeves with sleeve-seal system.
   a. Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.
4. Concrete Slabs Above Grade:
   a. Piping Smaller Than NPS 6: Galvanized Steel pipe sleeves or Sleeve-seal fittings.
   b. Piping NPS 6 and Larger: Galvanized Steel pipe sleeves.
3.5 ESCUTCHEON INSTALLATION
   A. Install escutcheons for penetrations of walls, ceilings, and floors.

3.6 CUTTING AND OPENINGS
   A. Comply with Division 01 “Cutting and Patching”.

3.7 EQUIPMENT INSTALLATION
   A. Install equipment to minimize pressure drop and allow adequate access headroom unless specific mounting heights are indicated.

   B. Install equipment level and plumb, parallel and perpendicular to other building systems and components in exposed interior spaces, unless otherwise indicated in drawings (note that in some cases non-parallel installation is indicated in the drawing to reduce pressure drop).

   C. Install mechanical equipment to facilitate service, maintenance, and repair or replacement of components. Connect equipment for ease of disconnecting, with minimum interference to other installations. Extend grease fittings to accessible locations.

   D. Install equipment to allow right of way for piping installed at required slope.

3.8 CONCRETE BASES
   A. Concrete Bases: Equipment shall be anchored as detailed on the drawings.

      1. Construct concrete bases of dimensions indicated, but not less than 4 inches larger in both directions than supported unit.

      2. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of the base.

      3. Install anchor bolts for supported equipment that extend through concrete base, and anchor into structural concrete floor.

      4. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

      5. Install anchor bolts to elevations required for proper attachment to supported equipment.

      6. Install anchor bolts according to anchor-bolt manufacturer's written instructions.

      7. Use 3000-psi, 145 PCF, concrete and reinforcement as specified in Division 03 Section "Cast-in-Place Concrete."

3.9 ERECTION OF METAL SUPPORTS AND ANCHORAGES
   A. Refer to Division 05 Section for structural steel.

   B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor mechanical materials and equipment.

   C. Field Welding: Comply with AWS D1.1.
3.10 ERECTION OF WOOD SUPPORTS AND ANCHORAGES

A. Cut, fit, and place wood grounds, nailers, blocking, and anchorages to support, and anchor mechanical materials and equipment.

B. Select fastener sizes that will not penetrate members if opposite side will be exposed to view or will receive finish materials. Tighten connections between members. Install fasteners without splitting wood members.

C. Attach to substrates as required to support applied loads.

3.11 GROUTING

A. Mix and install grout for mechanical equipment base bearing surfaces, pump and other equipment base plates, and anchors.

B. Clean surfaces that will come into contact with grout.

C. Provide forms as required for placement of grout.

D. Avoid air entrapment during placement of grout.

E. Place grout, completely filling equipment bases.

F. Place grout on concrete bases and provide smooth bearing surface for equipment.

G. Place grout around anchors.

H. Cure placed grout.

END OF SECTION
SECTION 230413 - COMMON SUBMITTAL REQUIREMENTS FOR HVAC

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Supplementary administrative and procedural requirements for submitting Shop Drawings, Product Data, Samples, and other submittals specific to the work of this Division.

B. Related Requirements:
   1. Division 01 submittal requirements.

1.3 DEFINITIONS

A. Contractor: Refers to an entity in direct Contract with the Owner to furnish and/or perform any portion of the Work of the Contract.
   1. Contractor shall review and approve Product Submittals prior to forwarding them to the Architect.

B. Product Submittals: In general, Product Submittals show characteristics of the proposed construction in one of the following forms:
   1. Shop Drawings.
   2. Product Data.
   3. Samples.

C. Action Submittals: Written and graphic information and physical samples that require Architect/Engineer's responsive action. Action submittals are those submittals indicated in individual Specification Sections as "action submittals."

D. Sustainable Design Submittals: Submittals required by Section 01813 "Sustainable Design Requirements." Submit documentation for products and materials contributing to achievement of LEED rating indicated. Sustainable Design Submittals are in addition to other submittal requirements.

E. Informational Submittals: Written and graphic information and physical samples that do not require Architect/Engineer's responsive action. Submittals may be rejected for not complying with requirements. Informational submittals are those submittals indicated in individual Specification Sections as "informational submittals."

F. Submittal Review Sheet: Specific form required to accompany each submittal. Obtain Submittal Review Sheet from the SmithGroup Project Manager.
1.4 SUBMITTAL ADMINISTRATIVE REQUIREMENTS

A. Requirements specified for submittals are intended to provide efficient handling, while permitting review responsibilities to be carried out.

B. Avoidable Resubmittals: The first two reviews of each specified submittal will be processed without cost to the Contractor. After the second review, the Owner may charge the Contractor for the cost of such additional processing, unless the processing results from approved Change Orders causing revisions to previously approved submittals.

C. Coordination: Coordinate preparation and processing of submittals with performance of construction activities.
   1. Coordinate each submittal with fabrication, purchasing, testing, delivery, other submittals, and related activities that require sequential activity.
   2. Submit all submittal items required for each Specification Section concurrently unless partial submittals for portions of the Work are indicated on approved submittal schedule.
   3. Submit action submittals and informational submittals required by the same Specification Section as separate packages under separate transmittals.
   4. Coordinate transmittal of different types of submittals for related parts of the Work so processing will not be delayed because of need to review submittals concurrently for coordination.
      a. Architect and Engineer reserve the right to withhold action on a submittal requiring coordination with other submittals until related submittals are received.

D. Processing Time: Allow time for submittal review, including time for resubmittals, as follows. Time for review shall commence on Architect's receipt of submittal. No extension of the Contract Time will be authorized because of failure to transmit submittals enough in advance of the Work to permit processing, including resubmittals.
   1. Refer to Section 01330 for quantity of days allowed for review.
   2. When a large volume of submittal materials is scheduled, additional review time may be required. Similarly, a particular submittal may require review completion in less than the agreed normal time. Due to variations in submittal volume and processing needs, agreed review time is not intended to apply to extreme conditions.

E. Maintain at the Project Site ready access to the latest reviewed Shop Drawings and Product Data, and one set of samples.

PART 2 - PRODUCTS

2.1 SUSTAINABLE DESIGN REQUIREMENTS

A. The District requires the Contractor to implement practices and procedures to meet the project's environmental performance goals. The Contractor shall ensure that the minimum requirements related to these goals, as defined in Section 01813 "Sustainable Design Requirements" are implemented to the fullest extent possible. Specific materials and systems have been selected to this end. Substitutions, or other changes to the work proposed by the Contractor or their Subcontractors, shall not be allowed if such changes compromise the aforementioned environmental goals and LEED certification.
B. Specific material goals, beyond inherently designed facility service systems, that may impact this area of work include: use of products with third-party verified Environmental Product Declaration, use of products with Health Product Declarations, use of products from manufacturers with publicly disclosed Corporate Sustainability Reports, use of products with recycled-content materials; use of locally-purchased, manufactured and extracted materials; use of FSC certified wood; use of low-emitting materials; construction waste recycling; and the implementation of a construction indoor air quality management plan.

PART 3 - EXECUTION

3.1 CONTRACTOR'S REVIEW

A. Project Closeout and Maintenance Material Submittals: See requirements in Division 01.

B. Be responsible for quantities, weights, and dimensions to be confirmed and correlated at the site; for information that pertains solely to the fabrication processes and to the means, methods, techniques, sequences, and procedures of construction; and for coordination of the work of every trade, supplier, and subcontractor.

C. Be responsible for each submittal to be in conformance with information given and the design intent expressed in the Contract Documents.

D. Provide with each submittal specific written notice of any variation from the requirements of the Contract Documents by causing a specific notation to be made on the Submittal Review Sheet and Submittal Transmittal. Changes to the approved construction documents are subject to DSA review and approval, submitted by the Architect as a CCD per DSA IR A-6.

3.2 ARCHITECT/ENGINEER'S AND GENERAL CONTRACTOR'S ACTION

A. General: Architect will not review submittals that do not include the Submittal Review Sheet.

B. Action Submittals: Architect's staff and consultants will review the submittal, and mark the Submittal Review Sheet with an action code. The code meanings are described below.

C. Additional codes may be provided within comments or as an electronic submittal review stamp and shall be used in help indicating return of partial submittals.

E. Review Code meanings are as follows:

1. Action Codes Permitting Use:
   a. When an action code permitting use is assigned to a submittal, it does not authorize work that does not comply with the requirements of the Contract Documents. Acceptance of the Work will depend on compliance.
   b. Code AP - Approved: The Work covered by the submittal item may proceed, provided it complies with Contract Document requirements.
   c. Code AN - Approved as Noted: The Work covered by the submittal item may proceed, provided it complies with the Architect's notations and Contract Document requirements.
d. Code AN-R - Approved as Noted - Resubmit: Do not deliver or install the related work until the resubmittal has received Code AP or AN. However, fabrication and other off-site work covered by the submittal item may proceed, at the Contractor's risk, provided it complies with the Architect's notations and Contract Document requirements.

2. Action Code Prohibiting Use:
   a. Action Code REJ - Not Approved: The Work covered by the submittal item, including purchasing, fabrication, delivery, and other activity, shall not proceed. Revise the submittal item or prepare a new item in accordance with the Architect's notations. Resubmit the corrected or new item without delay; do not permit submittal items marked "Not Approved" to be used. Work incorporating such items will be rejected.

3. Action Code for Items Not Required:
   a. Action Code X - Not Requested by Contract Documents: The submittal item is not called for by the Contract Documents and is being returned unreviewed by the Architect except to the extent necessary to determine its status.

F. Informational Submittals: For Architect's information only. Architect will review each submittal and will not return it, or will return it if it does not comply with requirements. Architect will forward each submittal to appropriate party.

1. Action Code for Information Only:
   a. Action Code INF - Information Only - Received: The submittal item is not called for a return with a reviewed action code by the Contract Documents and is being returned un-reviewed by the Architect except to the extent necessary to determine its status.

G. Partial submittals prepared for a portion of the Work will be reviewed when use of partial submittals has received prior approval from Architect.

H. Incomplete submittals are not acceptable, will be considered non-responsive, and will be returned without review.

I. Architect will return without review or discard submittals received from sources other than the Contractor.

J. Submittals not required by the Contract Documents may be returned by the Architect without action.

1. Do not submit Material Safety Data Sheets. They will be returned without review or discarded.

3.3 SUBMITTAL TRANSMITTAL REQUIREMENTS

A. Submittal Transmittal shall be a PDF file in electronic format. It is recommended, to expedite the submittal review, the electronic form be emailed for review to the Architect as early as possible.

1. Submittal Numbering: See below.
2. Contact Information: Full Name, Phone Number and Email Address.

B. Submittal Definition

1. Each submittal consists of items from only ONE Specifications section.
2. Complete Submittal: If ALL the items required by the Specifications section are listed on one Submittal Form (including continuation sheet), it is a complete submittal.

3. Partial Submittals: If it is necessary to divide the required items of a given Specifications section into two or more submittals to meet schedule or handling requirements, the separate submittals are partial submittals. All partial submittals have the same submittal number, and are differentiated by sequential P-numbers (see below).

4. All items in each submittal, whether complete or partial, will be processed together: Individual items will not be 'broken out' for special handling. Arrange submittals accordingly.

C. Submittal Numbering
1. Number submittals as described below to assist tracking.
2. Number each submittal in the format nnnnnn-nn.
   a. The 6-digit number is the number of the section that requires the submittal. For example, 044200.
   b. The 2-digit number is based on the numerical sequence of submittals from that section. In other words, for each section, the first submittal is 01, the second is 02, and so on. The 2-digit number does not change for partial or re-submittals, so that the submittal can be tracked.
   c. P-Number for Partial Submittals: Number each partial submittal in the pee space, beginning with P1, and increasing by one for each partial submittal of that submittal. If the submittal is a complete submittal, leave the P space blank.
   d. R-Number for Re-submittals: Number each re-submittal in the arr space, beginning with R1, and increasing by one for each re-submittal of that submittal. Do not include an R-Number for the initial submittal.
   e. Examples:

3.4 SUBMITTAL REVIEW SHEET REQUIREMENTS

A. Provide Submittal Review Sheet in PDF format. Submit as the page after the Submittal Transmittal.

B. When attached, the Submittal Review Sheet shall not obscure information contained in the submittal.

C. Do not edit any of the information contained within the Submittal Review Sheet except as follows:
   1. Submittal Number: See Submittal Numbering in Submittal Transmittal Requirements paragraph.

D. The Contractor shall submit the PDF file in a manner that will allow editing of the Submittal Review Sheet fields by SmithGroup and its consultants.

END OF SECTION
SECTION 23 05 13 - COMMON MOTOR REQUIREMENTS FOR HVAC EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
   A. Section includes general requirements for single-phase and polyphase, general-purpose, horizontal, small and medium, squirrel-cage induction motors for use on ac power systems up to 600 V and installed at equipment manufacturer's factory or shipped separately by equipment manufacturer for field installation.
   
   B. Related Sections include the following:
      1. Section 230514 “Variable-Frequency Drives”.
      2. Section 232123 “Hydronic Pumps”.
      3. Section 233400 “HVAC Fans”.

1.3 COORDINATION
   A. Coordinate features of motors, installed units, and accessory devices to be compatible with the following:
      1. Motor controllers.
      2. Torque, speed, and horsepower requirements of the load.
      3. Ratings and characteristics of supply circuit and required control sequence.
      4. Ambient and environmental conditions of installation location.

PART 2 - PRODUCTS

2.1 GENERAL MOTOR REQUIREMENTS
   A. Comply with NEMA MG 1 unless otherwise indicated.
   
   B. Duty: Continuous duty at ambient temperature of 104 deg°F (40 deg C) and at altitude of 3300 feet above sea level.
   
   C. Capacity and Torque Characteristics: Sufficient to start, accelerate, and operate connected loads at designated speeds, at installed altitude and environment, with indicated operating sequence, and without exceeding nameplate ratings or considering service factor.
   
   D. Motors for submersible pumps shall be hermetically sealed.
   
   E. Motors 3/4 HP or greater shall be polyphase unless otherwise indicated.
F. Minimum Motor Service Factor: 1.15.

G. Motors associated with kitchen exhaust systems shall be located outside the exhaust airstream.

2.2 MOTOR ENCLOSURES

A. Totally Enclosed, Fan Cooled (TEFC) for motors located outdoors, or in unconditioned or unventilated indoors areas, or in air streams unless otherwise indicated.

B. Open Dripproof (ODP) for other cases unless otherwise indicated.

2.3 POLYPHASE MOTORS

A. Description: NEMA MG 1, Design B, medium induction motor.

B. Efficiency: Premium efficiency, as defined in NEMA MG 1.

C. Polyphase motors shall be suitable for use with Variable-frequency Motor Controllers.

D. Construction:
   1. Windings: Copper magnet wire with moisture-resistant insulation varnish, designed and tested to resist transient spikes to 1600 volts, high frequencies, and short time rise pulses produced by pulse-width modulated inverters.
   2. Thermal Protection: Comply with NEMA MG 1 requirements for thermally protected motors.
   3. Provide motor shaft grounding ring.
   5. Bearings: Regreasable, shielded, antifriction ball bearings suitable for radial and thrust loading.

E. Multispeed Motors: Separate winding for each speed.

F. Wiring Terminations:
   1. Provide terminal lugs to match branch circuit conductor quantities, sizes, and materials indicated. Enclose terminal lugs in terminal box sized to NFPA 70, threaded for conduit.
   2. For fractional horsepower motors where connection is made directly, provide threaded conduit connection in end frame.

2.4 SINGLE-PHASE MOTORS

A. Single-phase motors larger than 1/20 HP shall be Electronically Commutated (ECM) unless not offered by the manufacturer.

B. Electronically Commutated Motors (ECM)
   1. Motor shall be brushless DC type specifically designed for HVAC applications with heavy duty ball bearings and Electronic Commutation. It shall contain internal circuitry that converts single phase power into a DC signal. Speed control is achieved through a 0-10 volt DC control signal input through the pre-wired controls wires.
2. The motor shall be speed controllable down to 20% of full speed and 85% efficient at all speeds.

C. Non-ECM
   1. Motors shall be one of the following, to suit starting torque and requirements of specific motor application (listed in order of preference):
      a. Permanent-split capacitor.
      b. Capacitor start, capacitor run.
      c. Capacitor start, inductor run.
      d. Split phase.
   3. Bearings: Prelubricated, antifriction ball bearings or sleeve bearings suitable for radial and thrust loading.
   4. Thermal Protection: Internal protection to automatically open power supply circuit to motor when winding temperature exceeds a safe value calibrated to temperature rating of motor insulation. Thermal-protection device shall automatically reset when motor temperature returns to normal range.

D. Motors 1/20 HP and Smaller: Shaded-pole type.

PART 3 - EXECUTION (NOT APPLICABLE)

END OF SECTION
SECTION 23 05 14 - VARIABLE FREQUENCY DRIVES FOR HVAC EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
   A. This Section includes solid-state, PWM, Variable Frequency Drives for speed control of three-phase, squirrel-cage induction motors.
   B. Related Sections include the following:
      1. Section 230513 “Common Motor Requirements for HVAC Equipment”.
      2. Division 26 for monitoring and control of motor circuits.

1.3 DEFINITIONS
   A. ASD: Adjustable Speed Drive.
   B. BAS: Building automation system.
   C. DDC: Direct digital control.
   D. EMI: Electromagnetic interference.
   E. IGBT: Insulated-gate bipolar transistor.
   F. LAN: Local area network.
   G. LED: Light-emitting diode.
   H. OCPD: Overcurrent protective device.
   I. PID: Control action, proportional plus integral plus derivative.
   J. PWM: Pulse-width modulated.
   K. RFI: Radio-frequency interference.
   L. VFC: Variable frequency controller.
   M. VFD: Variable frequency drive.
1.4 ACTION SUBMITTALS

A. See Division 01 and Section 230000 “HVAC General Requirements” for submittal procedures. Also may be submitted as Variable-Frequency Controller (VFC), Adjustable Speed Drive (ASD), or similar.

B. Product Data: For each type and rating of VFD indicated.
   1. Include dimensions and finishes.
   2. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
   3. Include short circuit interrupting capacities in compliance with Division 26.
   4. Include electrical power monitoring information in compliance with Division 26.

C. Shop Drawings: For each VFD indicated.
   1. Include mounting and attachment details.
   2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   3. Include diagrams for power, signal, and control wiring.
   4. Include certification that VFD selection has been coordinated with equipment being served.
   5. Include ventilation means, points of connection, and air path.

1.5 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Floor plans, drawn to scale, showing dimensioned layout on which the following items are shown and coordinated with each other, using input from installers of the items involved:
   1. Required working clearances and required area above and around VFDs.
   2. Show VFD layout and relationships between electrical components and adjacent structural and mechanical elements.
   3. Show support locations, type of support, and weight on each support.
   4. Indicate field measurements.

B. Qualification Data: For testing agency.

C. Seismic Qualification Certificates: For each VFD, accessories, and components, from manufacturer.
   2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
   3. Detailed description of equipment anchorage devices on which the certification is based, and their installation requirements.

D. Product Certificates: For each VFD from manufacturer.

F. Source quality-control reports.

G. Field quality-control reports.
H. Sample Warranty: For special warranty.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For VFDs to include in emergency, operation, and maintenance manuals.

1. In addition to items specified in Division 01 "Operation and Maintenance Data," include the following:
   a. Manufacturer's written instructions for testing and adjusting thermal-magnetic circuit breaker and motor-circuit protector trip settings.
   b. Manufacturer's written instructions for testing, adjusting, and reprogramming microprocessor control modules.
   c. Manufacturer's written instructions for setting field-adjustable timers, controls, and status and alarm points.
   d. Routine maintenance requirements for VFDs and all installed components.
   e. Load-Current and Overload-Relay Heater List: Compile after motors have been installed, and arrange to demonstrate that selection of heaters suits actual motor nameplate, full-load currents.
   f. Load-Current and List of Settings of Adjustable Overload Relays: Compile after motors have been installed, and arrange to demonstrate that switch settings for motor-running overload protection suit actual motors to be protected.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Power Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than two of each size and type.
2. Control Power Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than two of each size and type.
3. Indicating Lights: Two of each type and color installed.

1.8 QUALITY ASSURANCE

A. Testing Agency Qualifications: An independent agency, with the experience and capability to conduct the testing indicated, that is a member company of the International Electrical Testing Association or is a nationally recognized testing laboratory (NRTL) as defined by OSHA in 29 CFR 1910.7, and that is acceptable to authorities having jurisdiction.

B. Source Limitations: Obtain VFDs of a single type through one source from a single manufacturer.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Deliver VFDs covered and protected, in shipping splits of lengths that can be moved past obstructions in delivery path.
B. Store VFDs indoors on dunnage in clean, dry space with uniform temperature to prevent condensation. Protect VFDs from exposure to dirt, fumes, water, corrosive substances, and physical damage.

1.10 PROJECT CONDITIONS

A. Environmental Limitations: Rate equipment for continuous operation, capable of driving full load without derating, under the following conditions, unless otherwise indicated:
   1. Ambient Temperature: 0 to 40 deg C.
   2. Humidity: Less than 90 percent (noncondensing).
   3. Altitude: Not exceeding 1000 feet.

1.11 COORDINATION

A. Coordinate layout and installation of VFDs with other construction including conduit, piping, equipment, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

B. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

C. Coordinate features, accessories, and functions of each VFD and each installed unit with ratings and characteristics of supply circuit, motor, control circuits, required control sequence, and duty cycle of motor and load.

1.12 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace VFDs that fail in materials or workmanship within specified warranty period.

B. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Subject to compliance with requirements, provide products by one of the following:
   1. ABB Low Voltage Drives.
   2. Cerus Industrial, Inc.
   3. Danfoss Inc.
   4. Eaton.
   5. Emerson Industrial Automation.
   7. Rockwell Automation, Inc.
   8. Schneider Electric USA, Inc.
   10. Yaskawa Electric America, Inc.
2.2 VARIABLE FREQUENCY DRIVES

A. Description: Variable-frequency motor drive / controller, consisting of power converter that employs pulse-width-modulated inverter, factory built and tested in an enclosure, with integral disconnecting means and overcurrent and overload protection; listed and labeled by an NRTL as a complete unit; arranged to provide self-protection, protection, and variable-speed control of one or more three-phase induction motors by adjusting output voltage and frequency.

1. IGBT, PWM; NEMA ICS 2, UL 508A listed and labeled as a complete unit and arranged to provide variable speed of an NEMA MG 1, Design A and B, premium efficiency 3-phase induction motor by adjusting output voltage and frequency.
2. Listed and labeled for integrated short-circuit current (withstand) rating by an NRTL acceptable to authorities having jurisdiction.

B. Application: Variable torque.

C. Design and Rating: Match load type such as fans, blowers, and pumps; and type of connection used between motor and load such as direct or through a power-transmission connection.

D. Output Rating:
   1. Three phase; 10 to 60 Hz, with voltage proportional to frequency throughout voltage range.

E. Unit Operating Requirements:
   1. Input AC Voltage Tolerance of 380 to 500 V, plus or minus 15 percent.
   2. Input AC Voltage Unbalance: Not exceeding 3 percent.
   3. Input Frequency Tolerance of 50/60 Hz, plus or minus 3 percent.
   4. Minimum Efficiency: 97 percent at 60 Hz, full load.
   7. Overload Capability: 1.1 times the base load current for 60 seconds; 2.0 times the base load current for 3 seconds.
   8. Starting Torque: 100 percent of rated torque or as indicated.
   9. Speed Regulation: Plus or minus 5 percent.
   10. Output Carrier Frequency: Selectable; 0.5 to 15 kHz.

F. Inverter Logic: Microprocessor based, 32 bit, isolated from all power circuits.

G. Isolated control interface to allow controller to follow control signal over a 40:1 speed range.
   1. Electrical Signal: 4 to 20 mA at 24 V.

H. Internal Adjustability Capabilities:
   1. Minimum Speed: 5 to 25 percent of maximum rpm.
   2. Maximum Speed: 80 to 100 percent of maximum rpm.
   3. Acceleration: 0.1 to 999.9 seconds.
   4. Deceleration: 0.1 to 999.9 seconds.
   5. Current Limit: 30 to a minimum of 150 percent of maximum rating.

I. Self-Protection and Reliability Features:
   1. Input transient protection by means of surge suppressors.
   2. Loss of Input Signal Protection: Selectable response strategy, including speed default to a percent of the most recent speed, a preset speed, or stop; with alarm.
   3. Under- and overvoltage trips; inverter overtemperature, overload, and overcurrent trips.
   4. Critical frequency rejection, with three selectable, adjustable deadbands.

7. Instantaneous line-to-line and line-to-ground overcurrent trips.

10. Short-circuit protection.

11. Motor overtemperature fault.

J. Multiple-Motor Capability: Drive suitable for service to multiple motors and having a separate overload relay and protection for each controlled motor. Overload relay shall shut off controller and motors served by it when overload relay is tripped.

K. Automatic Reset/Restart: Attempts three restarts after fault or on return of power after an interruption and before shutting down for manual reset or fault correction. Bidirectional autospeed search shall be capable of starting into rotating loads spinning in either direction and returning motor to set speed in proper direction, without damage to drive, motor, or load.

L. Power-Interruption Protection: To prevent motor from re-energizing after a power interruption until motor has stopped.

M. Torque Boost: Automatically varies starting and continuous torque to at least 1.5 times the minimum torque to ensure high-starting torque and increased torque at slow speeds.

N. Motor Temperature Compensation at Slow Speeds: Adjustable current fall-back based on output frequency for temperature protection of self-cooled, fan-ventilated motors at slow speeds.

O. Integral Input Disconnecting Means and OCPD: UL 489, thermal-magnetic circuit breaker with pad-lockable, door-mounted handle mechanism.

1. Disconnect Rating: Not less than 115 percent of NFPA 70 motor full-load current rating or VFD input current rating, whichever is larger.

2. Auxiliary contacts "a" and "b" arranged to activate with circuit-breaker handle.

3. Normally open alarm contact that operates only when circuit breaker has tripped.

2.3 CONTROLS AND INDICATION

A. Status Lights: Door-mounted LED indicators shall indicate the following conditions:

1. Power on.

2. Run.

3. Overvoltage.

4. Line fault.

5. Overcurrent.

1. Keypad: In addition to required programming and control keys, include keys for HAND, OFF, and AUTO modes.

2. Security Access: Provide electronic security access to controls through identification and password with at least three levels of access: View only; view and operate; and view, operate, and service.
3. Control Authority: Supports at least four conditions: Off, local manual control at VFD, local automatic control at VFD, and automatic control through a remote source.

C. Historical Logging Information and Displays:
   1. Real-time clock with current time and date.
   2. Running log of total power versus time.
   3. Total run time.
   4. Fault log, maintaining last four faults with time and date stamp for each.

D. Indicating Devices: Meters or digital readout devices and selector switch, mounted flush in drive door and connected to indicate the following parameters:
   1. Output frequency (Hz).
   5. Motor torque (percent).
   6. Fault or alarming status (code).
   7. PID feedback signal (percent).
   8. DC-link voltage (VDC).
   9. Set-point frequency (Hz).
   10. Motor output voltage (V).

E. Control Signal Interface:
   1. Electric Input Signal Interface: A minimum of two analog inputs (0 to 10 V or 0/4-20 mA) and 6 programmable digital inputs.
   2. Remote Signal Inputs: Capability to accept any of the following speed-setting input signals from the BMS or other control systems:
      a. 0 to 10-V dc.
      b. 0-20 or 4-20 mA.
      c. Potentiometer using up/down digital inputs.
      d. Fixed frequencies using digital inputs.
      e. RS485.
   3. Output Signal Interface:
      a. A minimum of 1 analog output signal (0/4-20 mA), which can be programmed to any of the following:
         1) Output frequency (Hz).
         2) Output current (load).
         3) DC-link voltage (VDC).
         4) Motor torque (percent).
         5) Motor speed (rpm).
         6) Set-point frequency (Hz).
         7) Instantaneous power consumption
   4. Remote Indication Interface: A minimum of 2 dry circuit relay outputs (120-V ac, 1 A) for remote indication of the following:
      a. Motor running.
      b. Set-point speed reached.
      c. Fault and warning indication (overtemperature or overcurrent).
      d. PID high- or low-speed limits reached.
F. Communications: Provide an RS485 interface allowing VFD to be used with an external system within a multidrop LAN configuration. Interface shall allow all parameter settings of VFD to be programmed via BMS control. Provide capability for VFD to retain these settings within the nonvolatile memory.

2.4 LINE CONDITIONING AND FILTERING

A. Input Line Conditioning: Based on the manufacturer’s harmonic analysis study and report, provide input filtering, as required, to limit total demand (harmonic current) distortion and total harmonic voltage demand at the defined point of common coupling to meet IEEE 519 recommendations.

2.5 ENCLOSURES

A. VFD Enclosures: NEMA 250, to comply with environmental conditions at installed location.
   1. Dry and Clean Indoor Locations: Type 1.
   2. Outdoor Locations: Type 3R.
   4. Other Wet or Damp Indoor Locations: Type 4.
   5. Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids: Type 12.

B. Plenum Rating: UL 1995; NRTL certification label on enclosure, clearly identifying VFD as "Plenum Rated."

2.6 OPTIONAL FEATURES

A. Remote Indicating Circuit Terminals: Mode selection, status, and fault.

2.7 ACCESSORIES

A. Devices shall be factory installed in enclosure, unless otherwise indicated.

C. Stop and Lockout Push-Button Station: Momentary-break, push-button station with a factory-applied hasp arranged so padlock can be used to lock push button in depressed position with control circuit open.

D. Control Relays: Auxiliary and adjustable solid-state time-delay relays.

E. Current-Sensing, Phase-Failure Relays for Bypass Controller: Solid-state sensing circuit with isolated output contacts for hard-wired connection; arranged to operate on phase failure, phase reversal, current unbalance of from 30 to 40 percent, or loss of supply voltage; with adjustable response delay.

F. Supplemental Digital Meters:
   1. Elapsed-time meter.
   2. Kilowatt meter.
G. Breather and drain assemblies, to maintain interior pressure and release condensation in NEMA 250, Type 4 enclosures installed outdoors or in unconditioned interior spaces subject to humidity and temperature swings.

H. Space heaters, with NC auxiliary contacts, to mitigate condensation in NEMA 250, Type 3R enclosures installed outdoors or in unconditioned interior spaces subject to humidity and temperature swings.

I. Cooling Fan and Exhaust System: For NEMA 250; UL 508 component recognized: Supply fan, with intake and exhaust grills and filters.

J. Sun shields installed on fronts, sides, and tops of enclosures installed outdoors and subject to direct and extended sun exposure.

K. Spare control-wiring terminal blocks; wired.

2.8 SOURCE QUALITY CONTROL

A. Testing: Test and inspect VFDs according to requirements in NEMA ICS 61800-2.
   1. Test each VFD while connected to its specified motor.
   2. Verification of Performance: Rate VFDs according to operation of functions and features specified.

B. VFDs will be considered defective if they do not pass tests and inspections.

C. Prepare test and inspection reports.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas, surfaces, and substrates to receive VFDs for compliance with requirements, installation tolerances, and other conditions affecting performance.

B. Examine roughing-in for conduit systems to verify actual locations of conduit connections before VFD installation.

C. Examine VFD before installation. Reject VFDs that are wet, moisture damaged, or mold damaged.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 APPLICATIONS

A. Select features of each VFD to coordinate with ratings and characteristics of supply circuit and motor; required control sequence; and duty cycle of motor, controller, and load.

B. Select horsepower rating of controllers to suit motor controlled.
3.3 INSTALLATION

A. VFDs to be mounted by Mechanical Contractor and connected by the Electrical Contractor unless noted otherwise. Electrical Contractor to confirm need for disconnect switch in addition to VFD and provide if necessary.

B. Wall-Mounting: Install with tops at uniform height and with disconnect operating handles not higher than 79 inches above finished floor, unless otherwise indicated, and by bolting units to wall or mounting on lightweight structural-steel channels bolted to wall.

C. Free Standing: Install with tops at uniform height and with disconnect operating handles not higher than 79 inches above finished floor, unless otherwise indicated, and by bolting units to Unistrut or similar support system.

D. Roof-Mounting: Install on roofs with tops at uniform height and with disconnect operating handles not higher than 79 inches above finished roof surface unless otherwise indicated, and by bolting units to curbs or mounting on freestanding, lightweight, structural-steel channels bolted to curbs. Seal roof penetrations after raceways are installed.

E. Comply with mounting and anchoring requirements specified in Division 26.

F. Controller Fuses: Install fuses in each fusible switch. Comply with requirements in Division 26.

3.4 IDENTIFICATION

A. Identify VFDs, components, and control wiring according to Section 230553 "Identification for HVAC Piping and Equipment."

3.5 CONTROL WIRING INSTALLATION

A. Install wiring between VFDs and remote devices and facility's central-control system. Comply with requirements in Division 26.

B. Bundle, train, and support wiring in enclosures.

C. Connect selector switches and other automatic-control devices where applicable.
   1. Connect selector switches to bypass only those manual- and automatic-control devices that have no safety functions when switches are in manual-control position.
   2. Connect selector switches with control circuit in both manual and automatic positions for safety-type control devices such as low- and high-pressure cutouts, high-temperature cutouts, and motor-overload protectors.

3.6 CONNECTIONS

A. Conduit installation requirements are specified in Division 26. Drawings indicate general arrangement of conduit, fittings, and specialties.

B. Ground equipment according to Division 26.
3.7 FIELD QUALITY CONTROL

A. Perform tests and inspections with the assistance of a factory-authorized service representative.

B. Acceptance Testing Preparation:
   1. Test insulation resistance for each VFD element, bus, component, connecting supply, feeder, and control circuit.
   2. Test continuity of each circuit.

C. Tests and Inspections:
   1. Inspect VFD, wiring, components, connections, and equipment installation. Test and adjust controllers, components, and equipment.
   2. Test insulation resistance for each VFD element, component, connecting motor supply, feeder, and control circuits.
   3. Test continuity of each circuit.
   4. Verify that voltages at VFD locations are within 10 percent of motor nameplate rated voltages. If outside this range for any motor, notify Construction Manager before starting the motor(s).
   5. Test each motor for proper phase rotation.
   7. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
   8. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.
   9. VFDs will be considered defective if they do not pass tests and inspections.
   10. Prepare test and inspection reports, including a certified report that identifies the VFD and describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations made after remedial action.

3.8 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.
   1. Complete installation and startup checks according to manufacturer's written instructions.

3.9 ADJUSTING

A. Program microprocessors for required operational sequences, status indications, alarms, event recording, and display features. Clear events memory after final acceptance testing and prior to Substantial Completion.

B. Set the taps on reduced-voltage autotransformer controllers.

C. Set field-adjustable circuit-breaker trip ranges as specified in Division 26.

D. Set field-adjustable pressure switches.
3.10 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, reprogram, and maintain VFDs.

END OF SECTION
SECTION 23 05 16 - EXPANSION FITTINGS AND LOOPS FOR HVAC PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
   A. Drawings and general provisions of the Contract, including General and Supplementary
      Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
   A. Section Includes:
      1. Flexible-hose seismic expansion joints.
      2. Alignment guides and anchors.
      3. Pipe loops and swing connections.

1.3 ACTION SUBMITTALS
   A. Product Data: For each type of product. Indicate type, manufacturer’s number, size, material,
      pressure rating, end connections, and location for each expansion joint.

1.4 INFORMATIONAL SUBMITTALS
   A. Welding certificates.

1.5 CLOSEOUT SUBMITTALS
   A. Maintenance Data: For expansion joints to include in maintenance manuals.

1.6 QUALITY ASSURANCE
   A. Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M,
      "Structural Welding Code - Steel."
   B. Pipe and Pressure-Vessel Welding Qualifications: Qualify procedures and operators according
      to ASME Boiler and Pressure Vessel Code.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS
   A. Compatibility: Products shall be suitable for piping service fluids, materials, working pressures,
      and temperatures.
   B. Capability: Products to absorb 200 percent of maximum axial movement between anchors.
2.2 SEISMIC EXPANSION JOINTS

A. Flexible-Hose Seismic Expansion Joints:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Flex Pression Ltd.
   b. Flexicraft Industries.
   c. Mason Industries, Inc.
   d. Metraflex Company (The).

2. Description: Manufactured assembly with inlet and outlet elbow fittings and two flexible-metal-hose legs joined by long-radius, 180-degree return bend or center section of flexible hose.

3. Flexible Hose: Corrugated-metal inner hoses and braided outer sheaths.

4. Expansion Joints for Copper Tubing NPS 2 and Smaller: Copper-alloy fittings with threaded-joint end connections.
   a. Bronze hoses and single-braid bronze sheaths with 450 psig at 70 deg F and 340 psig at 450 deg F ratings.

5. Expansion Joints for Steel Piping NPS 2 and Smaller: Carbon-steel fittings with threaded end connections.
   a. Stainless-steel hoses and single-braid, stainless-steel sheaths with 450 psig at 70 deg F and 325 psig at 600 deg F ratings.

   a. Stainless-steel hoses and single-braid, stainless-steel sheaths with 200 psig at 70 deg F and 145 psig at 600 deg F ratings.

   a. Stainless-steel hoses and double-braid, stainless-steel sheaths with 165 psig at 70 deg F and 120 psig at 600 deg F ratings.

8. Accessories:
   a. Seismic breakaway coupling, with disengagement rating of 140 percent of static supported weight.
   b. Tether cable.

2.3 ALIGNMENT GUIDES AND ANCHORS

A. Alignment Guides:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Advanced Thermal Systems, Inc.
   b. Flex-Hose Co., Inc.
   c. Hyspan Precision Products, Inc.
   d. Mason Industries, Inc.
   e. Metraflex Company (The).
2. Description: Steel, factory-fabricated alignment guide, with bolted two-section outer cylinder and base for attaching to structure; with two-section guiding slider for bolting to pipe.

B. Anchor Materials:
1. Steel Shapes and Plates: ASTM A36/A36M.
2. Bolts and Nuts: ASME B18.10 or ASTM A183, steel hex head.
4. Mechanical Fasteners: Insert-wedge-type stud with expansion plug anchor for use in hardened portland cement concrete, with tension and shear capacities appropriate for application.
5. Chemical Fasteners: Insert-type stud, bonding-system anchor for use with hardened portland cement concrete, with tension and shear capacities appropriate for application.
   a. Bonding Material: ASTM C881/C881M, Type IV, Grade 3, two-component epoxy resin suitable for surface temperature of hardened concrete where fastener is to be installed.

PART 3 - EXECUTION

3.1 EXPANSION JOINT INSTALLATION

A. Install expansion joints of sizes matching sizes of piping in which they are installed.

3.2 ALIGNMENT-GUIDE AND ANCHOR INSTALLATION

A. Install alignment guides to guide expansion and to avoid end-loading and torsional stress.

B. Install two guide(s) on each side of pipe expansion fittings and loops. Install guides nearest to expansion joint not more than four pipe diameters from expansion joint.

C. Attach guides to pipe, and secure guides to building structure.

D. Install anchors at locations to prevent stresses from exceeding those permitted by ASME B31.9 and to prevent transfer of loading and stresses to connected equipment.

E. Anchor Attachments:
2. Anchor Attachment to Copper Tubing: Attach with pipe hangers. Use MSS SP-69, Type 24; U bolts bolted to anchor.
F. Fabricate and install steel anchors by welding steel shapes, plates, and bars. Comply with ASME B31.9 and AWS D1.1/D1.1M.
   1. Anchor Attachment to Steel Structural Members: Attach by welding.
   2. Anchor Attachment to Concrete Structural Members: Attach by fasteners. Follow fastener manufacturer's written instructions.

G. Use grout to form flat bearing surfaces for guides and anchors attached to concrete.

END OF SECTION
SECTION 23 05 19 – METERS GAUGES FOR HVAC PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Pressure gauges and pressure gauge taps.
   2. Thermometers
   3. Thermometer wells (thermowells).
   4. Test plugs and test plug kits.

B. Related Sections:
   1. Section 232113 "Hydronic Piping".

1.3 REFERENCE STANDARDS

A. ASME B40.100 – Pressure Gauges and Gauge Attachments; The American Society of Mechanical Engineers; 2013.

1.4 ACTION SUBMITTALS

A. See Division 01 and Section 230000 "HVAC General Requirements" for submittal procedures.

B. Product Data: Provide table that indicates use, operating range, total range and location for manufactured components.

C. Project Record Documents: Record actual locations of components and instrumentation.

1.5 INFORMATIONAL SUBMITTALS

A. Product Certificates: for each type of gauge, thermowell, test plug, and test plug kit from manufacturer.
1.6 CLOSEOUT SUBMITTALS
   A. Operation and Maintenance Data: for each type of gauge, thermowell, test plug, and test plug kit to include in operation and maintenance manuals.

1.7 MAINTENANCE MATERIAL SUBMITTALS
   A. Extra Temperature and Pressure Gauges: one of each type, range, and size.

1.8 FIELD CONDITIONS
   A. Do not install instrumentation when areas are under construction, except for required rough-in, taps, supports and test plugs.

PART 2 - PRODUCTS

2.1 PRESSURE GAUGES
   A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      1. Dwyer Instruments, Inc.
      2. Moeller Instrument Co., Inc.
      3. Omega Engineering, Inc.
   B. Direct-Mounted, Dial-Type Pressure Gauges: ASME B40.100, UL 393 drawn steel or cast aluminum case, phosphor bronze bourdon tube, brass or stainless pressure connection with NPS 1/2 threads, rotary brass movement, brass socket, with front recalibration adjustment, black scale on white background.
      1. Dial: Black scale on white background with etched scale markings graduated in psi (kPa).
      2. Size: 4-1/2 inch diameter.
      3. Accuracy: Grade A, plus or minus 1 percent of middle half of scale range.
      4. Provide dedicated isolation valve for each insertion well.
   C. Pressure gauge tappings:
      1. Gauge Cock: Tee or lever handle, brass or stainless steel, NPS 1/2 connection for maximum 150 psig.
      2. Needle Valve: Brass or stainless steel, NPS 1/2 connection for minimum 150 psig.
      3. Pulsation Damper: Pressure snubber, brass, ASME B40.100, NPS 1/2 connection, include extensions for use on insulated piping where required.

2.2 THERMOMETERS
   A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      1. Dwyer Instruments, Inc.
      2. Omega Engineering, Inc.
      3. Weksler Glass Thermometer Corp.
   1. Stem length: 3-1/2 inch.
   2. Accuracy: 1 percent of full range or .1 deg F (0.5 deg C), whichever is greater.

C. Thermometer Supports:
   1. Socket: Brass separable sockets for thermometer stems with or without extensions as required, and with cap and chain.
   2. Flange: 3 inch (75-mm) outside diameter reversible flange, designed to fasten to sheet metal air ducts, with brass perforated stem.

2.3 THERMOWELLS

A. Description: Pressure-tight, socket-type fitting made for insertion into piping tee fitting.
   2. Type: Stepped shank unless straight or tapered shank is indicated.
   4. External Threads: NPS 1/2, NPS 3/4, or NPS 1, ASME B1.20.1 pipe threads.
   5. Internal Threads: 1/2, 3/4, and 1 inch, with ASME B1.1 screw threads.
   6. Bore: Diameter required to match thermometer bulb or stem.
   7. Insertion Length: Length required to match thermometer bulb or stem.
   8. Lagging Extension: Include on thermowells for insulated piping and tubing.
   9. Bushings: For converting size of thermowell’s internal screw thread to size of thermometer connection.
   10. Strength: Thermowell shall be designed for a minimum of 35 FPS fluid velocity.

2.4 TEST PLUGS AND TEST PLUG KITS

A. Test Plugs: NPS 1/4 or NPS 1/2 brass or stainless fitting and cap for receiving 1/8 inch outside diameter pressure or temperature probe with neoprene or EPDM core for 500 psig pressure rating at 200 deg F. Include extended stem where installed on insulated piping.

B. Test Kit: Carrying case, internally padded and fitted containing one 2-1/2 inch diameter pressure gauges, one gauge adapters with 1/8 inch probes, two 1 inch dial thermometers.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install in accordance with manufacturer’s instructions.

B. Install meters and gauges adjacent to machines and equipment to allow service and maintenance of meters, gauges, machines, and equipment.

C. Provide one pressure gauge per pump, installing taps before strainers and on suction and discharge of pump. Pipe to gauge.
D. Install pressure gauges with pulsation dampers. Provide gauge cock to isolate each gauge. Extend nipples and siphons to allow clearance from insulation.

E. Install thermometers in piping systems in sockets in short couplings. Enlarge pipes smaller than 2-1/2 inch (64 mm) for installation of thermometer sockets as necessary. Ensure sockets allow clearance from insulation.

F. Install thermometers in air duct systems on flanges.

G. Install thermometer sockets adjacent to controls systems thermostat, transmitter, or sensor sockets. Where thermometers are provided on local panels, duct or pipe mounted thermometers are provided on local panels, duct or pipe mounted thermometers are not required.

H. Install thermowells of sizes required to match thermometer connectors. Include bushings if required to match sizes. Ensure thermowells allow clearance from insulation.

I. Fill thermowells with heat-transfer medium.

J. Locate duct mounted thermometers minimum 10 feet downstream of mixing dampers, coils, or other devices causing air turbulence.

K. Coil and conceal excess capillary on remote element instruments.

L. Install gauges and thermometers in locations where they are easily read from normal operating level. Install vertical to 45 degrees off vertical.

M. Locate test plugs adjacent to thermometers and thermometer sockets. Install test plugs in piping tees.

3.2 ADJUSTING

A. After installation, calibrate meters and gauges according to manufacturer’s written instructions.

B. Adjust faces of meters and gauges to proper angle for best visibility.

3.3 GAUGE SCHEDULE

A. Unless noted otherwise, provide each gauge so that its range exceeds the full operating range of the system it is associated with by 1.5 to 2 times and so that the expected minimum and maximum operating points are within the gauge range.

END OF SECTION
SECTION 23 05 23 - VALVES FOR HVAC PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Ball valves.
   2. Butterfly valves.
   3. Check valves.

B. Related Sections:
   1. Section 230553 “Identification for HVAC Piping and Equipment”.
   2. Section 232113 “Hydronic Piping”.

1.3 DEFINITIONS

A. CWP: Cold working pressure.

B. EPDM: Ethylene propylene-diene terpolymer rubber.

C. PTFE: Polytetrafluoroethylene

1.4 ACTION SUBMITTALS

A. See Division 01 and Section 230000 “HVAC General Requirements” for submittal procedures.

B. Product Data: For each type of valve.
   1. Certification that products that come into contact with potable water comply with NSF 61 Annex G and NSF 372.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: for each type of valve to include in operation and maintenance manuals.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Prepare valves for shipping as follows:
   1. Protect internal parts against rust and corrosion.
2. Protect threads, flange faces, soldered ends, and grooves.
4. Set butterfly valves closed or slightly open.

B. Use the following precautions during storage:
   1. Maintain valve end protection.
   2. Store valves indoors and maintain at higher-than-ambient-dew-point temperature. If outdoor storage is necessary, store valves off the ground in watertight enclosures.

C. Use sling to handle large valves; rig sling to avoid damage to exposed parts. Do not use hand wheels or stems as lifting or rigging points.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS FOR VALVES

A. Source Limitations for Valves: Obtain each type of valve from single source from single manufacturer.

B. Valves shall be manufactured in the United States.

C. Coordinate joint connection with Valve schedule in Part 3 and piping system specifications.
   1. ASME Compliance:
   2. ASME B1.20.1 for threaded end valves.
   3. ASME B16.1 for flanges on iron valves.
   4. ASME B16.5 for flanges on steel valves.
   5. ASME B16.10 and ASME B16.34 for ferrous valve dimensions and design criteria.
   7. ASME B31.9 for building service piping valves.

D. AWWA Compliance: Comply with AWWA C606 for grooved-end connections.

F. Bronze valves shall be made with dezincification-resistant materials. Bronze valves made with copper alloy (brass) containing more than 15 percent zinc are not permitted.

G. Valve Actuator Types:
   1. Gear Actuator: For valves NPS 8 and larger.

H. Valves in Insulated Piping: With 2-inch stem extensions; operating handles of nonthermal-conductive material and protective sleeves that allow operation of valves without breaking vapor seals or disturbing insulation.

I. All plumbing components including but not limited to valves and other wetted parts shall be lead free.
2.2 BALL VALVES

A. Two-Piece, Bronze Ball Valves with Full Port:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. NIBCO INC.
      b. Hammond Valve.
      c. Milwaukee Valve Company.
   2. Description: Two-Piece bronze body, chrome-plated brass ball, bronze trim, PTFE seat, steel handle with plated plastisol coating, 600 psig CWP rating.

B. Steel Ball Valves with Full Port:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. NIBCO INC.
      b. Hammond Valve.
      c. Milwaukee Valve Company.
   2. Description: Carbon steel (ASTM A216) split body, stainless steel ball and stem, PTFE seat.

2.3 BUTTERFLY VALVES

A. Iron, Single-Flange Butterfly Valves:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. NIBCO INC.
      b. Conbraco Industries, Inc.
      c. Hammond Valve.
      d. Milwaukee Valve Company.
      e. DeZURIK.
   2. Description: Cast iron (ASTM A126) or ductile iron (ASTM A536) lug type body, suitable for bidirectional dead-end service at rated pressure without use of downstream flange, EPDM seat, one or two piece stainless steel stem, nickel-plated ductile iron disc.
   3. Standard: MSS SP-67, Type I.

B. Iron, Grooved-End Butterfly Valves:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Victaulic Company.
      b. Kennedy Valve Company; a division of McWane, Inc.
      c. Tyco Fire Products LP.
   2. Description: Coated ductile iron body, EPDM seal, two-piece stainless steel stem, coated ductile iron disc.
   3. Standard: MSS SP-67, Type I.
2.4 CHECK VALVES

A. Bronze, Swing Check Valves:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. NIBCO INC.
      b. Hammond Valve.
      c. Milwaukee Valve Company.
   2. Description: Bronze (ASTM B62) body, spring loaded, bronze disc.

B. Iron Swing Check Valves:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Crane.
      b. NIBCO INC.
      c. Hammond Valve.
      d. Milwaukee Valve Company.
   2. Description: Gray iron (ASTM A126) body with bolted bonnet, clear or full waterway, spring-loaded, asbestos free gasket, bronze trim, PTFE disc
   3. Standard: MSS SP-71, Type I.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine valve interior for cleanliness, freedom from foreign matter, and corrosion. Remove special packing materials, such as blocks, used to prevent disc movement during shipping and handling.

B. Operate valves in positions from fully open to fully closed. Examine guides and seats made accessible by such operations.

C. Examine mating flange faces for damage. Check bolting for proper size, length, and material. Verify that gasket is of proper size, that its material composition is suitable for service, and that it is free from defects and damage.

D. Do not attempt to repair defective valves; replace with new valves.

3.2 INSTALLATION

A. Install valves with unions or flanges at each piece of equipment arranged to allow service, maintenance, and equipment removal without system shutdown.

B. Locate valves for easy access and provide separate support where necessary.

C. Install valves in horizontal piping with stem at or above center of pipe.

D. Install valves in position to allow full stem movement.
E. Install valve tags. Comply with requirements in Section 230553 “Identification for HVAC Piping and Equipment” for valve tags and schedules.

3.3 ADJUSTING

A. Adjust or replace valve packing after piping systems have been tested and put into service but before final adjusting and balancing. Replace valves if persistent leaking occurs.

3.4 VALVE SCHEDULE

A. Refer to piping system sections for valve schedules.

B. Coordinate Class or CWP rating with associated piping system rating.
   1. If valves with specified CWP ratings are unavailable, the same types of valves with higher CWP ratings may be substituted.

C. Valve Sizes: Same as upstream piping unless otherwise indicated.

END OF SECTION
SECTION 23 05 29 - HANGERS AND SUPPORTS FOR HVAC PIPING AND EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Metal pipe hangers and supports.
   2. Trapeze pipe hangers.
   3. Metal framing systems.
   4. Thermal-hanger shield inserts.
   5. Fastener systems.
   6. Equipment supports.

B. Related Requirements:
   1. Division 05 for structural-steel shapes and plates for trapeze hangers for pipe and equipment supports.
   2. Section 230000 “HVAC General Requirements” for grout.
   3. Section 230516 “Expansion Fittings and Loops for HVAC Piping” for pipe guides and anchors.
   4. Section 230548 “Vibration and Seismic Controls for HVAC” for vibration isolation devices.
   5. Section 233100 “Metal Ducts” for duct hangers and supports.

1.3 DEFINITIONS

A. MSS: Manufacturers Standardization Society of The Valve and Fittings Industry Inc.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product indicated.

B. Shop Drawings: Signed and sealed by a qualified professional engineer. Show fabrication and installation details and include calculations for the following; include Product Data for components:
   1. Trapeze pipe hangers.
   2. Metal framing systems.
   3. Pipe stands.
   4. Equipment supports.

C. For equipment that is contractor supplied or is substituted for those that are specified, provide structural calculations for equipment anchorage to the structure, sealed and signed by a civil engineer registered in the State of California, demonstrating conformance with section 13.6 of...
ASCE 7-10 (American Society of Civil Engineers) “Minimum Design Loads of Buildings and Other Structures”. Revised equipment anchorage is subject to the review and approval of DSA and shall be submitted by the architect as a Category A CCD.

1.5 INFORMATIONAL SUBMITTALS

A. Welding certificates.

1.6 QUALITY ASSURANCE

B. Pipe Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code.

PART 2 - PRODUCTS

2.1 METAL PIPE HANGERS AND SUPPORTS

A. Carbon-Steel Pipe Hangers and Supports:
   1. Description: MSS SP-58, Types 1 through 58, factory-fabricated components.
   2. Galvanized Metallic Coatings: Pregalvanized or hot dipped.
   3. Nonmetallic Coatings: Plastic coating, jacket, or liner.
   4. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion to support bearing surface of piping.

B. Stainless-Steel Pipe Hangers and Supports:
   1. Description: Type 304 Stainless Steel, MSS SP-58, Types 1 through 58, factory-fabricated components.
   2. Padded Hangers: Hanger with fiberglass or other pipe insulation pad or cushion to support bearing surface of piping.

2.2 TRAPEZE PIPE HANGERS

A. Description: MSS SP-69, Type 59, shop- or field-fabricated pipe-support assembly made from structural carbon-steel shapes with MSS SP-58 carbon-steel hanger rods, nuts, saddles, and U-bolts.

2.3 METAL FRAMING SYSTEMS

A. Metal Framing Systems:
   1. Description: Shop- or field-fabricated pipe-support assembly made of steel channels, accessories, fittings, and other components for supporting multiple parallel pipes.
3. Channels: Continuous slotted steel channel with inturned lips.
4. Channel Nuts: Formed or stamped steel nuts or other devices designed to fit into channel slot and, when tightened, prevent slipping along channel.

2.4 THERMAL-HANGER SHIELD INSERTS

A. Manufacturers:
   1. Pipe Shields Inc.

B. Insulation-Insert Material for Heat Trace Piping: Water-repellent treated, ASTM C533, Type I calcium silicate with 100-psig minimum compressive strength.

C. For Clevis or Band Hangers: Insert and shield shall cover lower 180 degrees of pipe.

D. Insert Length: Extend 2 inches beyond sheet metal shield for piping operating below ambient air temperature.

2.5 FASTENER SYSTEMS

A. Mechanical-Expansion Anchors: Insert-wedge-type, zinc-coated steel anchors, for use in hardened portland cement concrete; with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

2.6 EQUIPMENT SUPPORTS

A. Description: Welded, shop- or field-fabricated equipment support made from structural carbon-steel shapes.

2.7 MISCELLANEOUS MATERIALS

A. Structural Steel: ASTM A36/A36M, carbon-steel plates, shapes, and bars; black and galvanized.

PART 3 - EXECUTION

3.1 HANGER AND SUPPORT INSTALLATION

A. Metal Pipe-Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Install hangers, supports, clamps, and attachments as required to properly support piping from the building structure.

B. Metal Trapeze Pipe-Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Arrange for grouping of parallel runs of horizontal piping, and support together on field-fabricated trapeze pipe hangers.
   1. Pipes of Various Sizes: Support together and space trapezes for smallest pipe size or install intermediate supports for smaller diameter pipes as specified for individual pipe hangers.
2. Field fabricate from ASTM A36/A36M, carbon-steel shapes selected for loads being supported. Weld steel according to AWS D1.1/D1.1M.

C. Metal Framing System Installation: Arrange for grouping of parallel runs of piping, and support together on field-assembled metal framing systems.

D. Thermal-Hanger Shield Installation: Install in pipe hanger or shield for insulated piping.

E. Install mechanical-expansion anchors in concrete after concrete is placed and completely cured. Install fasteners according to manufacturer’s written instructions.

F. Install hangers and supports complete with necessary attachments, inserts, bolts, rods, nuts, washers, and other accessories.

H. Install hangers and supports to allow controlled thermal and seismic movement of piping systems, to permit freedom of movement between pipe anchors, and to facilitate action of expansion joints, expansion loops, expansion bends, and similar units.

I. Install lateral bracing with pipe hangers and supports to prevent swaying.

J. Install building attachments within concrete slabs or attach to structural steel. Install additional attachments at concentrated loads, including valves, flanges, and strainers, NPS 2-1/2 and larger and at changes in direction of piping. Install concrete inserts before concrete is placed; fasten inserts to forms and install reinforcing bars through openings at top of inserts.

K. Load Distribution: Install hangers and supports so that piping live and dead loads and stresses from movement will not be transmitted to connected equipment.

L. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes and to not exceed maximum pipe deflections allowed by ASME B31.9 for building services piping.

M. Insulated Piping:
   1. Attach clamps and spacers to piping.
      a. Piping Operating above Ambient Air Temperature: Clamp may project through insulation.
      b. Piping Operating below Ambient Air Temperature: Use thermal-hanger shield insert with clamp sized to match OD of insert.
      c. Do not exceed pipe stress limits allowed by ASME B31.9 for building services piping.
   2. Install MSS SP-58, Type 39, protection saddles if insulation without vapor barrier is indicated. Fill interior voids with insulation that matches adjoining insulation.
      a. Option: Thermal-hanger shield inserts may be used. Include steel weight-distribution plate for pipe NPS 4 and larger if pipe is installed on rollers.
   3. Install MSS SP-58, Type 40, protective shields on cold piping with vapor barrier. Shields shall span an arc of 180 degrees.
      a. Option: Thermal-hanger shield inserts may be used. Include steel weight-distribution plate for pipe NPS 4 and larger if pipe is installed on rollers.
   4. Shield Dimensions for Pipe: Not less than the following:
      a. NPS 1/4 to NPS 3-1/2: 12 inches long and 0.048 inch thick.
      b. NPS 4: 12 inches long and 0.06 inch thick.
c. NPS 5 and NPS 6: 18 inches long and 0.06 inch thick.
d. NPS 8 to NPS 14: 24 inches long and 0.075 inch thick.
e. NPS 16 to NPS 24: 24 inches long and 0.105 inch thick.

5. Pipes NPS 8 and Larger: Include wood or reinforced calcium-silicate-insulation inserts of length at least as long as protective shield.

6. Thermal-Hanger Shields: Install with insulation same thickness as piping insulation.

3.2 EQUIPMENT SUPPORTS

A. Fabricate structural-steel stands to suspend equipment from structure overhead or to support equipment above floor.

B. Grouting: Place grout under supports for equipment and make bearing surface smooth.

C. Provide lateral bracing, to prevent swaying, for equipment supports.

3.3 METAL FABRICATIONS

A. Field Welding: Comply with AWS D1.1/D1.1M procedures for shielded, metal arc welding; appearance and quality of welds; and methods used in correcting welding work; and with the following:

1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
2. Obtain fusion without undercut or overlap.
3. Remove welding flux immediately.
4. Finish welds at exposed connections so no roughness shows after finishing and so contours of welded surfaces match adjacent contours.

3.4 ADJUSTING

A. Hanger Adjustments: Adjust hangers to distribute loads equally on attachments and to achieve indicated slope of pipe.

B. Trim excess length of continuous-thread hanger and support rods to 1-1/2 inches.

3.5 PAINTING

A. Touchup: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.

1. Apply paint by brush or spray to provide a minimum dry film thickness of 2.0 mils.

B. Touchup: Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint on miscellaneous metal are specified in Division 09.

C. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A780.
3.6 **HANGER AND SUPPORT SCHEDULE**

A. Specific hanger and support requirements are in Sections specifying piping systems and equipment.

B. Comply with MSS SP-69 for pipe-hanger selections and applications that are not specified in piping system Sections.

C. Use hangers and supports with galvanized metallic coatings for piping and equipment that will not have field-applied finish.

D. Use nonmetallic coatings on attachments for electrolytic protection where attachments are in direct contact with copper tubing.

E. Use carbon-steel pipe hangers and supports and attachments for general service applications.

F. Use stainless-steel pipe hangers and supports for underground piping.

G. Use thermal-hanger shield inserts for insulated piping and tubing.

H. **Horizontal-Piping Hangers and Supports:** Unless otherwise indicated and except as specified in piping system Sections, install the following types:

1. **Adjustable, Steel Clevis Hangers (MSS Type 1):** For suspension of noninsulated or insulated, stationary pipes NPS 1/2 to NPS 30.
2. **Carbon- or Alloy-Steel, Double-Bolt Pipe Clamps (MSS Type 3):** For suspension of pipes NPS 3/4 to NPS 36, requiring clamp flexibility and up to 4 inches of insulation.
3. **Steel Pipe Clamps (MSS Type 4):** For suspension of cold and hot pipes NPS 1/2 to NPS 24 if little or no insulation is required.
4. **Pipe Hangers (MSS Type 5):** For suspension of pipes NPS 1/2 to NPS 4, to allow off-center closure for hanger installation before pipe erection.
5. **Adjustable, Swivel Split- or Solid-Ring Hangers (MSS Type 6):** For suspension of noninsulated, stationary pipes NPS 3/4 to NPS 8.
6. **Adjustable, Steel Band Hangers (MSS Type 7):** For suspension of noninsulated, stationary pipes NPS 1/2 to NPS 8.
7. **Adjustable Band Hangers (MSS Type 9):** For suspension of noninsulated, stationary pipes NPS 1/2 to NPS 8.
8. **Adjustable, Swivel-Ring Band Hangers (MSS Type 10):** For suspension of noninsulated, stationary pipes NPS 1/2 to NPS 8.
9. **Split Pipe Ring with or without Turnbuckle Hangers (MSS Type 11):** For suspension of noninsulated, stationary pipes NPS 3/8 to NPS 8.
10. **Extension Hinged or Two-Bolt Split Pipe Clamps (MSS Type 12):** For suspension of noninsulated, stationary pipes NPS 3/8 to NPS 3.
11. **U-Bolts (MSS Type 24):** For support of heavy pipes NPS 1/2 to NPS 30.
12. **Clips (MSS Type 26):** For support of insulated pipes not subject to expansion or contraction.
13. **Pipe Saddle Supports (MSS Type 36):** For support of pipes NPS 4 to NPS 36, with steel-pipe base stanchion support and cast-iron floor flange or carbon-steel plate.
14. **Pipe Stanchion Saddles (MSS Type 37):** For support of pipes NPS 4 to NPS 36, with steel-pipe base stanchion support and cast-iron floor flange or carbon-steel plate, and with U-bolt to retain pipe.
15. **Adjustable Pipe Saddle Supports (MSS Type 38):** For stanchion-type support for pipes NPS 2-1/2 to NPS 36 if vertical adjustment is required, with steel-pipe base stanchion support and cast-iron floor flange.
16. **Single-Pipe Rolls (MSS Type 41):** For suspension of pipes NPS 1 to NPS 30, from two rods if longitudinal movement caused by expansion and contraction might occur.
17. Adjustable Roller Hangers (MSS Type 43): For suspension of pipes NPS 2-1/2 to NPS 24, from single rod if horizontal movement caused by expansion and contraction might occur.
18. Complete Pipe Rolls (MSS Type 44): For support of pipes NPS 2 to NPS 42 if longitudinal movement caused by expansion and contraction might occur but vertical adjustment is not necessary.
19. Pipe Roll and Plate Units (MSS Type 45): For support of pipes NPS 2 to NPS 24 if small horizontal movement caused by expansion and contraction might occur and vertical adjustment is not necessary.
20. Adjustable Pipe Roll and Base Units (MSS Type 46): For support of pipes NPS 2 to NPS 30 if vertical and lateral adjustment during installation might be required in addition to expansion and contraction.

I. Vertical-Piping Clamps: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Extension Pipe or Riser Clamps (MSS Type 8): For support of pipe risers NPS 3/4 to NPS 24.
2. Carbon- or Alloy-Steel Riser Clamps (MSS Type 42): For support of pipe risers NPS 3/4 to NPS 24 if longer ends are required for riser clamps.

J. Hanger-Rod Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Steel Turnbuckles (MSS Type 13): For adjustment up to 6 inches for heavy loads.
2. Steel Clevises (MSS Type 14): For 120 to 450 deg F piping installations.

K. Building Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
1. Steel or Malleable Concrete Inserts (MSS Type 18): For upper attachment to suspend pipe hangers from concrete ceiling.
2. Top-Beam C-Clamps (MSS Type 19): For use under roof installations with bar-joist construction, to attach to top flange of structural shape.
3. Side-Beam or Channel Clamps (MSS Type 20): For attaching to bottom flange of beams, channels, or angles.
4. Center-Beam Clamps (MSS Type 21): For attaching to center of bottom flange of beams.
5. Welded Beam Attachments (MSS Type 22): For attaching to bottom of beams if loads are considerable and rod sizes are large.
6. C-Clamps (MSS Type 23): For structural shapes.
7. Top-Beam Clamps (MSS Type 25): For top of beams if hanger rod is required tangent to flange edge.
8. Side-Beam Clamps (MSS Type 27): For bottom of steel I-beams.
9. Steel-Beam Clamps with Eye Nuts (MSS Type 28): For attaching to bottom of steel I-beams for heavy loads.
10. Linked-Steel Clamps with Eye Nuts (MSS Type 29): For attaching to bottom of steel I-beams for heavy loads, with link extensions.
11. Malleable-Beam Clamps with Extension Pieces (MSS Type 30): For attaching to structural steel.
12. Welded-Steel Brackets: For support of pipes from below or for suspending from above by using clip and rod. Use one of the following for indicated loads:
   a. Light (MSS Type 31): 750 lb.
   b. Medium (MSS Type 32): 1500 lb.
   c. Heavy (MSS Type 33): 3000 lb.
13. Side-Beam Brackets (MSS Type 34): For sides of steel or wooden beams.
14. Plate Lugs (MSS Type 57): For attaching to steel beams if flexibility at beam is required.
15. Horizontal Travelers (MSS Type 58): For supporting piping systems subject to linear horizontal movement where headroom is limited.

L. Saddles and Shields: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Thermal-Hanger Shield Inserts: For supporting insulated pipe.
   2. Spring Hangers and Supports: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   3. Restraint-Control Devices (MSS Type 47): Where indicated to control piping movement.
   4. Spring Cushions (MSS Type 48): For light loads if vertical movement does not exceed 1-1/4 inches.
   5. Spring-Cushion Roll Hangers (MSS Type 49): For equipping Type 41, roll hanger with springs.
   6. Spring Sway Braces (MSS Type 50): To retard sway, shock, vibration, or thermal expansion in piping systems.
   7. Variable-Spring Hangers (MSS Type 51): Preset to indicated load and limit variability factor to 25 percent to allow expansion and contraction of piping system from hanger.
   8. Variable-Spring Base Supports (MSS Type 52): Preset to indicated load and limit variability factor to 25 percent to allow expansion and contraction of piping system from base support.
   9. Variable-Spring Trapeze Hangers (MSS Type 53): Preset to indicated load and limit variability factor to 25 percent to allow expansion and contraction of piping system from trapeze support.
   10. Constant Supports: For critical piping stress and if necessary to avoid transfer of stress from one support to another support, critical terminal, or connected equipment. Include auxiliary stops for erection, hydrostatic test, and load-adjustment capability. These supports include the following types:
       a. Horizontal (MSS Type 54): Mounted horizontally.
       b. Vertical (MSS Type 55): Mounted vertically.
       c. Trapeze (MSS Type 56): Two vertical-type supports and one trapeze member.

M. Comply with MSS SP-69 for trapeze pipe-hanger selections and applications that are not specified in piping system Sections.

N. Comply with MFMA-103 for metal framing system selections and applications that are not specified in piping system Sections.

O. Use mechanical-expansion anchors instead of building attachments where required in concrete construction.

END OF SECTION
SECTION 23 05 48 - VIBRATION AND SEISMIC CONTROLS FOR HVAC PIPING AND EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Isolation pads.
   2. Isolation mounts.
   3. Restrained elastomeric isolation mounts.
   4. Freestanding and restrained spring isolators.
   5. Housed spring mounts.
   6. Elastomeric hangers.
   7. Spring hangers.
   8. Spring hangers with vertical-limit stops.
   9. Pipe riser resilient supports.
  10. Resilient pipe guides.
  11. Seismic snubbers.
  12. Restraining braces and cables.
  13. Steel and inertia, vibration isolation equipment bases.

B. Related Sections:
   1. Section 220548 “Vibration and Seismic Controls for Plumbing”.
   2. Section 232113 “Hydronic Piping”.

1.3 REFERENCE STANDARDS

1.4 ACTION SUBMITTALS

A. See Division 01 and Section 230000 “HVAC General Requirements” for submittal procedures.

B. Product Data: Provide schedule of vibration isolator type with location, rated load, rated deflection, load/deflection curve, and overload capacity for each isolation device. Submit
catalog information indicating materials, acoustical performance (if applicable), and dimensional data. Denote exact model number that is to be used cross referenced against equipment tag.

C. For equipment that is contractor supplied or is substituted for those that are specified, provide structural calculations for equipment anchorage to the structure, sealed and signed by a civil engineer registered in the State of California, demonstrating conformance with section 13.6 of ASCE 7-10 (American Society of Civil Engineers) "Minimum Design Loads of Buildings and Other Structures". Revised equipment anchorage is subject to the review and approval of DSA and shall be submitted by the architect as a Category A CCD.

D. Shop Drawings: Indicate inertia bases and locate vibration isolators, with static and dynamic load on each. Indicate seismic control measures. Signed and sealed by a qualified professional structural engineer. Include the following:
1. Riser Supports: Include riser diagrams and calculations showing anticipated expansion and contraction at each support point, initial and final loads on building structure, spring deflection changes, and seismic loads. Include certification that riser system has been examined for excessive stress and that none will exist.
2. Vibration Isolation Base Details: Detail fabrication, including anchorages and attachments to structure and to supported equipment. Include auxiliary motor slides and rails, base size and weight, equipment static loads, power transmission, component misalignment, and cantilever loads.
3. Seismic-Restraint Details: Detail fabrication and attachment of seismic restraints and snubbers. Show anchorage details and indicate quantity, diameter, and depth of penetration of anchors.
4. Details for Interlocking Snubbers: Include load deflection curves up to 1/2-inch deflection in x, y, and z planes.

E. Manufacturer’s Instructions: Indicate installation instructions with special procedures and setting dimensions.

1.5 INFORMATIONAL SUBMITTALS
A. Field quality-control reports.
B. Welding certificates.

1.6 CLOSEOUT SUBMITTALS
A. Operation and Maintenance Data: for each device to include in operation and maintenance manuals.
B. Project Record Documents: Record actual locations of equipment and vibration isolation treatments defined in this section. Record actual locations of hangers including attachment points, loads and static deflection at time of building handover.

1.7 MAINTENANCE MATERIAL SUBMITTALS
A. Extra Temperature and Pressure Gauges: one of each type, range, and size.
1.8 QUALITY ASSURANCE

A. Perform design and installation in accordance with applicable codes.

B. Designer Qualifications: Perform design under direct supervision of a Professional Engineer experienced in design of this type of work and registered and licensed in the State in which the Project is located.

C. Manufacturer Qualifications: Company specializing in manufacturing products specified in this section, with not less than three years of documented experience.

D. Installer Qualifications: Company specializing in performing Work of this section with not less than three years of documented experience.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Kinetics Noise Control, Inc.

B. Mason Industries.

C. Vibration Mountings & Controls, Inc.

2.2 PERFORMANCE REQUIREMENTS

A. All vibration isolators, base frames and inertia bases to conform to all uniform deflection and stability requirements under all operating loads.

B. Steel springs shall function without undue stress or overloading.

C. All equipment mounted on vibration isolated bases to have minimum operating clearance of 2 inches between the base and floor or support beneath unless noted otherwise.

2.3 EQUIPMENT SUPPORT BASES

A. Structural Bases [SB]:
   1. Construction: Engineered, structural steel frames with welded brackets for side mounting of the isolators.
   2. Frames: Square, rectangular or T-shaped.
   3. Design: Sufficiently rigid to prevent misalignment or undue stress on machine, and to transmit design loads to isolators and snubbers.

B. Concrete Inertia Bases [CIB]:
   1. Mass: Minimum of 1.5 times weight of isolated equipment.
2. Construction: Structured steel channel perimeter frame, with gusset brackets and anchor bolts, adequately reinforced, concrete filled.
3. Connecting Point: Reinforced to connect isolators and snubbers to base.
4. Concrete: Reinforced 3,000 psi (20 MPa) concrete.
5. Bases for pumps shall be large enough to provide support for suction and discharge elbows.
6. The base depth shall be a minimum of 1/12th of the longest dimension of the base, but not less than 6 inches. The base depth need not exceed 12 inches unless specifically recommended by the base manufacturer for mass or rigidity.
7. Forms shall include minimum concrete reinforcement consisting of half-inch bars or angles welded in place on 6 inch centers running both ways in a layer 1-1/2 inches above the bottom, or additional steel members to hold anchor-bolt sleeves when the anchor bolts fall in concrete locations.
8. Height saving brackets shall be employed in all mounting locations to maintain a minimum 2 inch clearance below the base.
9. Basis of design: Mason “K”.

2.4 VIBRATION ISOLATORS

A. Neoprene Pad Isolators [NP]:
   1. Rubber or neoprene-waffle pads.
   2. Durometer to achieve static deflection as specified.
   3. Minimum 1/2 inch thick.
   4. Maximum loading 40 psi
   5. Height of ribs: not to exceed 0.7 times width.
   6. Configuration: 1/2 inch thick waffle pads bonded each side of 1/4 inch (6 mm) thick steel plate.
   7. Basis of design: Mason “WM”.

B. Open Free-Standing Spring Isolators [FS]:
   1. For Exterior and Humid Areas: Furnish hot dipped galvanized housings and neoprene coated springs.
   2. Color code springs for load carrying capacity.
   3. Springs: Minimum horizontal stiffness equal to 100 percent vertical stiffness, with working deflection between 0.3 and 0.6 of maximum deflection.
   4. Free standing and laterally stable spring isolators (single or multiple steel springs) without any housing and complete with 1/4 inch neoprene acoustical pads between the base plate and the support.
   5. Spring diameter shall be no less than 0.8 of the compressed height of the spring at design load.
   6. Spring Mounts: Furnish with leveling devices, minimum 0.25 inch thick neoprene sound pads, and zinc chromate plated hardware.
   7. Sound Pads: Size for minimum deflection of 0.05 inch; meet requirements for neoprene pad isolators.
   8. Provide all mountings with leveling bolts, rigidly bolted to the equipment.
   9. Provide height saving mounting brackets where applicable, height adjustment bolts.
   10. Basis of design: Mason “SLF”.

C. Restrained Spring Isolators [RS]:
   1. For Exterior and Humid Areas: Furnish hot dipped galvanized housings and neoprene coated springs.
   2. Color code springs for load carrying capacity.
   3. Springs: As in type FS.
4. Spring Mounts: As in type FS.
5. Sound Pads: As in type FS.
6. Restraint: Furnish mounting frame and limit stops. A minimum 1/2 inch clearance shall be maintained around the restraint bolts, housings, and springs so as not to interfere with the spring action.
7. Basis of design: Mason “SLR”.

D. Riser Clamp Pad [RP]:
1. Resilient pad between riser clamp and support structure to eliminate rigid contact.
2. Basis of Design: Regufoam, Armaflex or approved equivalent.

E. Spring Hanger [SH]
1. For Exterior and Humid Areas: Furnish hot dipped galvanized housings and neoprene coated springs.
2. Color code springs for load carrying capacity.
5. Misalignment: Capable of 30 degree arc before contacting hanger housing.
6. Basis of design: Mason “30N”.

F. Neoprene Hangers [NH]:
1. Molded neoprene units in a steel hanger frame.
2. Double deflection types with static deflection range from 0.3 to 0.5 inch.
3. Designed to preclude contact of hanger rods with frame (30 degrees misalignment). Insert neoprene bushing where rod passes through housing.
4. Basis of design: Mason “HD”.

G. Thrust Restraints:
1. Thrust restraint shall consist of a spring element in series with a neoprene pad. The unit shall be designed to have the same deflection as specified for the isolators supporting the equipment. The spring element shall be contained within a steel frame and be designed so it can be preset at the factory for thrust and be adjusted in the field to allow for a maximum of 1/4 inch movement during starting or stopping of the equipment.
2. The assembly shall be furnished complete with rods and angle brackets for attachment to both the equipment and the adjacent fixed structural anchor.
3. Thrust restraints shall be provided for all equipment as follows:

<table>
<thead>
<tr>
<th>Spring Isolator Deflection</th>
<th>Thrust</th>
</tr>
</thead>
<tbody>
<tr>
<td>3 inches or more</td>
<td>Greater than 5% of equipment weight</td>
</tr>
<tr>
<td>2 inches</td>
<td>Greater than 10% of equipment weight</td>
</tr>
<tr>
<td>1 inch</td>
<td>Greater than 15% of equipment weight</td>
</tr>
</tbody>
</table>

Note: Equipment weight includes all isolated items including vibration isolation base.
4. Height saving brackets shall be employed in all mounting locations to maintain a minimum 2 inch clearance below the base.
5. Basis of design: Mason “WB”.

2.5 SEISMIC SNUBBER ASSEMBLIES

A. Comply with:
1. ASHRAE Handbook – HVAC Applications
2. SMACNA – Seismic Duct Restraint Manual
B. All Directional External:
   1. Application: Minimum three (3) snubbers are required for each equipment installation, oriented properly to restrain isolated equipment in all directions.
   2. Construction: Interlocking steel construction attached to the building structure and equipment in a manner consistent with anticipated design loads.
   3. Performance: Equipment movement at each snubber location limited to a maximum of 0.25 inches in any direction without significantly degrading the vibration isolation capability of the isolator during normal operating conditions.
   4. Resilient Pad: Minimum 0.25 inch thick cushions any impact and prevents metal-to-metal contact.

C. Lateral External:
   1. Application: Minimum three (3) snubbers are required for each stable equipment installation, oriented properly to restrain isolated equipment in all lateral directions where uplift forces are zero or addressed by other restraints.
   2. Construction: Steel construction attached to the building structure and equipment in a manner consistent with anticipated design loads.
   3. Performance: Equipment movement at each snubber location limited to a maximum of 0.25 inches in any direction without significantly degrading the vibration isolation capability of the isolator during normal operating conditions.
   4. Resilient Pad: Minimum 0.25 inch thick cushions any impact and prevents metal-to-metal contact.

2.6 SEISMIC RESTRAINTS FOR SUSPENDED COMPONENTS AND EQUIPMENT

A. Comply with:
   1. ASHRAE Handbook – HVAC Applications
   2. SMACNA – Seismic Duct Restraint Manual

B. Cable Restraints:
   1. Wire Rope: Steel wire strand cables sized to resist seismic loads in all lateral directions.
   3. Size: Based on the lesser of cable capacity or anchor load taking into account bracket geometry.
   4. Connections:
   5. Use overlapping wire rope U clips, cable clamping bolts, swaged sleeves or seismically rated tool-less wedge insert lock connectors.
   6. Internally brace clevis hanger bracket cross bolt to prevent deformation.
   7. Vertical Suspension Rods: Attach required bracing of sufficient strength to prevent rod buckling from vertical compression forces utilizing series of attachment clips.

C. Rigid Restraints:
   1. Structural Element: Sized to resist seismic loads in all lateral directions and carry both compressive and tensile loading.
   2. Size: Based on the lesser of cable capacity or anchor load taking into account bracket geometry.
   3. Connections: Internally brace clevis hanger bracket cross bolt to prevent deformation.
   4. Static Support System: Anchorage capable of carrying additional tension loads generated by the vertical component of the rigid brace compression which is additive to any static load requirements on the system.
   5. Vertical Suspension Rods: Attached required bracing of sufficient strength to prevent rod buckling from vertical compression forces utilizing series of attachment clips.
2.7 ACCESSORIES

A. Flexible pipe connectors:
   1. Manufacturers:
      a. Metraflex.
      b. Keflex.
      c. Mason.
   2. Steel Piping:
      a. Inner Hose: Carbon Steel
      c. Pressure Rating: 125 psig WSP and 450 deg F.
      d. Joint: Flanged.
      e. Size: Match pipe-size.
      f. Maximum offset: 1 inch on each side of installed centerline.
   3. Copper Piping:
      a. Inner Hose: Bronze
      b. Exterior Sleeve: Braided bronze.
      c. Pressure Rating: 125 psig WSP and 450 deg F.
      d. Joint: Threaded with brass fittings.
      e. Size: Match pipe size.
      f. Maximum offset: 1 inch on each side of installed center line.
   4. Pipework flexible connections shall be manufactured of multiple plies of nylon tire cord fabric and neoprene both molded and cured in hydraulic rubber presses. No steel wire or rings shall be used as pressure reinforcement. 1-1/2 in. Straight connectors shall have two spheres. Connectors up to and including 1-1/2 in. diameter may have threaded ends. Connectors 2 in. and larger shall be manufactured with floating galvanized flanges recessed to lock the connector’s raised face neoprene flanges.
   5. Hoses shall be installed on the equipment side of the shut valves.
   6. Basis of Design: Elbows shall be Mason-Flex “MFNEC”, straight connectors shall be Mason-Flex “MFTFU” or “MFTNC”, and control cable assemblies Mason “ACC”.

PART 3 - EXECUTION

3.1 INSTALLATION – GENERAL

A. Install in accordance with manufacturer’s instructions.
B. Adjust equipment level.
C. Install spring hangers without binding.
D. Provide a minimum of 1” clearance between the building structure (walls, floors, and ceilings) and vibration isolated supports, ducts, pipes, and equipment.
E. Prior to making piping connections to equipment with operating weights substantially different from installed weights, block up equipment with temporary shims to final height. When full load is applied, adjust isolators to load to allow shim removal.
F. Provide pairs of thrust restraint horizontal limit springs on fans based on static pressure as scheduled.

G. Do not use vibration isolation components to straighten or connect misaligned sections of piping or ductwork.

H. Adjust all leveling bolts and hanger rod bolts so that the isolated equipment is level and in proper alignment with connecting ducts or pipes.

I. The installation or use of vibration isolators must not cause any change in position of equipment, piping, or ducts that result in stresses in any connections or misalignment of shafts or bearings. Equipment shall be maintained in a rigid position during installation. The load shall not be transferred to the isolators until the installation is complete and in operational condition.

J. Do not install any mechanical equipment, ducts, or piping that makes rigid contact with the “building” unless it is approved in this specification or by the Engineer. “Building” includes, but is not limited to, slabs, beams, columns, walls, partitions, ceilings, studs, ceiling framing, and suspension systems. Resiliently-isolated piping shall not contact building construction or other equipment or items.

K. Align isolation hanger rods to clear the hanger box under all operating conditions.

L. Level vibration isolated equipment under rated design operating conditions while maintaining the isolation criteria. Isolators shall be plumb and aligned to preclude misalignment or undesired contact during operation.

3.2 INSTALLATION – SEISMIC

A. Seismic Snubbers:
   1. Provide on all isolated equipment, piping and ductwork.
   2. Provide minimum of four seismic snubbers located close to isolators.
   3. Snub equipment designated for post-disaster use to 0.05 inch maximum clearance.
   4. Snub all other equipment between 0.15 inch and 0.25 inch clearance.

B. Floor and Base-Mounted Equipment, Vibration Isolated Equipment and associated Vibration and Seismic Controls for Connections:
   1. Install equipment anchorage items designed to resist seismic design force in any direction.
   2. Install vibration and seismic controls designed to include base and isolator requirements.
   3. Provide flexible connections between equipment and interconnected piping.
   4. Provide isolators and restraints designed for amplified code forces per ASCE 7 and with demonstrated ability to resist required forces including gravity, operational and seismic forces.

C. Suspended Mechanical Equipment:
   1. Provide supports and bracing to resist seismic design force in any direction.
   2. Provide flexible connections between equipment and interconnected piping.
   3. Brace equipment hung from spring mounts using cable or other bracing that will not transmit vibration to the structure.
4. Use of proprietary restraint systems with a certificate of compliance, verified and listed by an accredited inspection body is acceptable (pending shop drawing approval), as an alternative to project specific seismic bracing design.

D. Wall mounted Mechanical Equipment:
1. Provide support and bracing to resist seismic design force in any direction.
2. Install backing plates or blocking as required to deliver load to primary wall framing members.
3. Anchoring to gypsum wallboard, plaster or other wall finish that has not been engineered to resist imposed loads is not permitted.

E. Piping:
1. Provide seismic bracing in accordance ASC 7.
2. Provide supports, braces, and anchors to resist gravity and seismic design forces.
3. Provide flexible connections between floor-mounted equipment and suspended piping; between unbraced piping and restrained suspended items; as required for thermal movement; at building separations and seismic joints; and wherever relative differential movements could damage pipe in an earthquake.
4. Brace resiliently supported pipe with cable bracing or alternate means designed to prevent transmission of vibrations and noise to the structure.
5. Brace every run 5.0 feet or more in length with two transverse and one longitudinal bracing locations.
6. Pipes and Connections Constructed of Ductile Materials (copper, ductile iron, steel or aluminum and brazed, welded or screwed connections):
   a. Provide transverse bracing at spacing not more than 40.0 feet on center.
   b. Provide longitudinal bracing at spacing not more than 80.0 feet on center.
7. Pipes and Connections Constructed of Non Ductile Materials (cast iron, no-hub, plastic or non-UL Listed grooved coupling pipe):
   a. Provide transverse bracing at spacing not more than 20.0 feet on center.
   b. Provide longitudinal bracing at spacing not more than 40.0 feet on center.
   c. Provide lateral restraint for risers at not more than 30 feet on center or as required for horizontal runs, whichever is less.
8. Piping Explicitly Exempt from Seismic Bracing Requirements:
   a. Provide flexible connections between piping and connected equipment, including in-line devices such as VAV boxes and reheat coils.
   b. Install piping consistent with ASCE 7, such that swinging of the pipes will not cause damaging impact with adjacent components, finishes, or structural framing while maintaining clear horizontal distance of 67 percent of the hanger length between subject components.
   c. Provide swing restraints as required to control potential impact due to limited space between subject components.
9. Use of proprietary restraint systems with a certificate of compliance, verified and listed by an accredited inspection body is acceptable (pending shop drawing approval), as an alternative to project specific seismic bracing design.

F. Ductwork:
1. Provide seismic bracing for ducts with cross sectional area greater than 6 sq ft (independent of duct contents).
2. Provide seismic bracing for all ducts containing hazardous materials.
3. Provide supports, braces, and anchors to resist gravity and seismic design forces.
4. Independently support in-line devices weighing more than 20 pounds.
5. Independently support and brace all in-line devices weighing more than 75 pounds.  
6. Provide unbraced piping attached to braced in-line equipment with adequate flexibility to accommodate differential displacements.  
7. Positively attach dampers, louvers, diffusers and similar appurtenances to ductwork with mechanical fasteners.  
8. Install duct supports designed to resist not less than 150 percent of the duct weight.  
9. The use of power driven fasteners is prohibited in the hanging of ducts weighing over 10 pounds per lineal foot for seismic design categories D, E, and F.  
10. Use of proprietary restraint systems with a certificate of compliance, verified and listed by an IAS AC172 accredited inspection body or otherwise accepted by applicable codes is acceptable (pending shop drawing approval), as an alternative to project specific seismic bracing design.

G. Tanks:  
1. Install tank anchorage, tank legs and/or supporting structure designed to resist design force.  
2. Provide flexible connections between tank and interconnected piping.

3.3 INSTALLATION – VIBRATION ISOLATING EQUIPMENT

A. Flexible Pipe Connections:  
1. Install flexible pipe connectors on pipes connected to equipment supported by vibration isolation. Provide line size flexible connectors.  
2. Use flexible double sphere neoprene pipe connectors for connections to pumps on vibration isolators.  
3. Use flexible wire braided connectors on branch connections to heat transfer equipment.  
4. Install flexible connectors to accommodate displacement. Install one end immediately adjacent to isolated equipment and anchor other end. Install in horizontal plane unless indicated otherwise.

B. Pipe and Duct Supports:  
1. Isolate all pipes & ducts attached to the inlet and discharge of spring-isolated equipment and pressure-reducing valves using the same isolator type and static deflection as the equipment isolators within the mechanical room or 50 feet (whichever is greater) from the inlet and discharge.  
2. Isolate the remainder of horizontal pipe runs 2-in in diameter and greater using Type NM or NH isolators.  
3. All vertical risers for piping 2-in diameter or greater shall be isolated from the building structure by means of guides, supports, and spring isolators. The support systems shall be an engineered solution taking into account pipe movement, expansion and vibration isolation.  
4. All vertical risers for piping less than 2-in diameter shall be isolated from the building structure by Type NM neoprene mount below flanges or pipe clamps. Where fixing to structure is required, neoprene isolator bushings shall be used to provide resilient support.

C. Bases:  
1. Coordinate the location of embedded connection hardware with supported equipment attachment and mounting points and with requirements for concrete reinforcement and formwork specified in Division 03.  
2. Set steel bases for 1 inch clearance between housekeeping pad and base.  
3. Set concrete inertia bases for 2 inch clearance between housekeeping pad and base.
D. Install isolation for motor driven equipment.

3.4 FIELD QUALITY CONTROL
A. Inspect isolated equipment after installation and submit report. Include static deflections.
B. Inspect isolator seismic-restraint clearance.
C. Test isolator deflection.
D. Inspect minimum snubber clearances.

3.5 ADJUSTING
A. Adjust isolators after piping systems have been filled and equipment is at operating weight.
B. Adjust limit stops on restrained spring isolators to mount equipment at normal operating height. After equipment installation is complete, adjust limit stops so they are out of contact during normal operation.
C. Attach thrust limits at centerline of thrust and adjust to a maximum of 1/4-inch movement during start and stop.

END OF SECTION
SECTION 23 05 53 - IDENTIFICATION FOR HVAC PIPING AND EQUIPMENT

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
A. Section Includes:
   1. Equipment labels.
   2. Warning signs and labels.
   3. Pipe labels.
   4. Duct labels.
   5. Stencils.
   6. Valve tags.
   7. Warning tags.

1.3 ACTION SUBMITTALS
A. Product Data: For each type of product.
B. Equipment Label Schedule: Include a listing of all equipment to be labeled with the proposed content for each label.
C. Valve numbering scheme.
D. Valve Schedules: For each piping system to include in maintenance manuals.

PART 2 - PRODUCTS

2.1 EQUIPMENT LABELS
A. Metal Labels for Equipment:
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. Brady Corporation.
      b. Kolbi Pipe Marker Co.
      c. Seton Identification Products.
   2. Material and Thickness: Brass, 0.032-inch minimum thickness, and having predrilled or stamped holes for attachment hardware.
   4. Background Color: Black.
5. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.
6. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-quarters the size of principal lettering.

B. Plastic Labels for Equipment:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Brady Corporation.
   b. Kolbi Pipe Marker Co.
   c. Seton Identification Products.
2. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, 1/8 inch thick, and having predrilled holes for attachment hardware.
4. Background Color: Black.
5. Maximum Temperature: Able to withstand temperatures up to 160 deg F.
6. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.
7. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-quarters the size of principal lettering.

C. Label Content: Include equipment’s Drawing designation or unique equipment number, Drawing numbers where equipment is indicated (plans, details, and schedules), and the Specification Section number and title where equipment is specified.

D. Equipment Label Schedule: For each item of equipment to be labeled, on 8-1/2-by-11-inch bond paper. Tabulate equipment identification number, and identify Drawing numbers where equipment is indicated (plans, details, and schedules) and the Specification Section number and title where equipment is specified. Equipment schedule shall be included in operation and maintenance data.

2.2 WARNING SIGNS AND LABELS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Brady Corporation.
   2. Marking Services Inc.

B. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, 1/8 inch thick, and having predrilled holes for attachment hardware.

C. Letter Color: Black.

D. Background Color: Yellow.
E. Maximum Temperature: Able to withstand temperatures up to 160 deg F.

F. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.

G. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-quarters the size of principal lettering.

I. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.

J. Label Content: Include caution and warning information plus emergency notification instructions.

2.3 PIPE LABELS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Brady Corporation.
   2. Kolbi Pipe Marker Co.

B. General Requirements for Manufactured Pipe Labels: Preprinted, color-coded, with lettering indicating service, and showing flow direction.

C. Pretensioned Pipe Labels: Precoiled, semirigid plastic formed to cover full circumference of pipe and to attach to pipe without fasteners or adhesive.

D. Pipe Label Contents: Include identification of piping service using same designations or abbreviations as used on Drawings; also include pipe size and an arrow indicating flow direction.
   1. Flow-Direction Arrows: Integral with piping-system service lettering to accommodate both directions or as separate unit on each pipe label to indicate flow direction.
   2. Lettering Size: Size letters according to ASME A13.1 for piping and at least 1/2 inch for viewing distances up to 72 inches and proportionately larger lettering for greater viewing distances.

2.4 DUCT LABELS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Brady Corporation.
   2. Kolbi Pipe Marker Co.

B. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, 1/8 inch thick, and having predrilled holes for attachment hardware.

C. Maximum Temperature: Able to withstand temperatures up to 140 deg F.
D. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.

E. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-quarters the size of principal lettering.

F. Fasteners: Stainless-steel self-tapping screws.

G. Duct Label Contents: Include identification of duct service using same designations or abbreviations as used on Drawings; also include an arrow indicating flow direction.
   1. Flow-Direction Arrows: Integral with duct system service lettering to accommodate both directions or as separate unit on each duct label to indicate flow direction.

2.5 STENCILS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Brimar Industries, Inc.
   2. Kolbi Pipe Marker Co.
   3. Marking Services Inc.

B. Lettering Size: Size letters according to ASME A13.1 for piping and at least 1/2 inch for viewing distances up to 72 inches and proportionately larger lettering for greater viewing distances.

C. Stencil Material: Brass.

D. Stencil Paint: Exterior, gloss, acrylic enamel in colors complying with recommendations in ASME A13.1 unless otherwise indicated. Paint may be in pressurized spray-can form.

E. Identification Paint: Exterior, acrylic enamel in colors according to ASME A13.1 unless otherwise indicated. Paint may be in pressurized spray-can form.

2.6 VALVE TAGS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Brady Corporation.
   2. Kolbi Pipe Marker Co.

B. Valve Tags: Stamped or engraved with 1/4-inch letters for piping system abbreviation and 1/2-inch numbers.
   1. Tag Material: Brass, 0.032-inch anodized aluminum, 0.032-inch minimum thickness, and having predrilled or stamped holes for attachment hardware.
   2. Fasteners: Brass wire-link chain or beaded chain or S-hook.

C. Valve Schedules: For each piping system, on 8-1/2-by-11-inch bond paper. Tabulate valve number, piping system, system abbreviation (as shown on valve tag), location of valve (room or space), normal-operating position (open, closed, or modulating), and variations for identification. Mark valves for emergency shutoff and similar special uses.
1. Valve-tag schedule shall be included in operation and maintenance data.

2.7 WARNING TAGS

A. Description: Preprinted or partially preprinted accident-prevention tags of plasticized card stock with matte finish suitable for writing.
   1. Size: Approximately 4 by 7 inches.
   2. Fasteners: Brass grommet and wire.
   3. Nomenclature: Large-size primary caption such as “DANGER,” “CAUTION,” or “DO NOT OPERATE.”

PART 3 - EXECUTION

3.1 PREPARATION

A. Clean piping and equipment surfaces of substances that could impair bond of identification devices, including dirt, oil, grease, release agents, and incompatible primers, paints, and encapsulants.

3.2 GENERAL INSTALLATION REQUIREMENTS

A. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.

B. Coordinate installation of identifying devices with locations of access panels and doors.

C. Install identifying devices before installing acoustical ceilings and similar concealment.

3.3 EQUIPMENT LABEL INSTALLATION

A. Install or permanently fasten labels on each major item of mechanical equipment.

B. Locate equipment labels where accessible and visible.

3.4 PIPE LABEL INSTALLATION

A. Piping Color Coding: Painting of piping is specified in Division 09.

B. Stenciled Pipe Label Option: Stenciled labels may be provided instead of manufactured pipe labels, at Installer’s option. Install stenciled pipe labels, complying with ASME A13.1, with painted, color-coded bands or rectangles on each piping system.
   1. Identification Paint: Use for contrasting background.
C. **Pipe Label Locations:** Locate pipe labels where piping is exposed or above accessible ceilings in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior exposed locations as follows:

1. Near each valve and control device.
2. Near each branch connection, excluding short takeoffs for fixtures and terminal units. Where flow pattern is not obvious, mark each pipe at branch.
3. Near penetrations and on both sides of through walls, floors, ceilings, and inaccessible enclosures.
4. At access doors, manholes, and similar access points that permit view of concealed piping.
5. Near major equipment items and other points of origination and termination.
6. Spaced at maximum intervals of 50 feet along each run. Reduce intervals to 25 feet in areas of congested piping and equipment.

D. **Directional Flow Arrows:** Arrows shall be used to indicate direction of flow in pipes, including pipes where flow is allowed in both directions.

E. **Pipe Label Color Schedule:** follow ASME A13.1.

### 3.5 DUCT LABEL INSTALLATION

A. Install plastic-laminated duct labels with permanent adhesive on air ducts in the following color codes:

1. Blue: For supply ducts.
2. Yellow: For exhaust ducts.

B. **Stenciled Duct Label Option:** Stenciled labels showing service and flow direction may be provided instead of plastic-laminated duct labels, at Installer’s option.

C. Locate labels near points where ducts enter into and exit from concealed spaces and at maximum intervals of 50 feet in each space where ducts are exposed or concealed by removable ceiling system.

### 3.6 VALVE-TAG INSTALLATION

A. Install tags on valves and control devices in piping systems, except check valves, valves within factory-fabricated equipment units, shutoff valves, faucets, convenience and lawn-watering hose connections, and HVAC terminal devices and similar roughing-in connections of end-use fixtures and units. List tagged valves in a valve schedule.

B. **Valve-Tag Application Schedule:** Tag valves according to size, shape, and color scheme and with captions similar to those indicated in the following subparagraphs:

1. **Valve-Tag Size and Shape:** 1-1/2 inches, round.
2. **Valve-Tag Colors:** follow ASME A13.1.
3.7  WARNING-TAG INSTALLATION

A. Write required message on, and attach warning tags to, equipment and other items where required.

END OF SECTION
SECTION 230593 - TESTING, ADJUSTING AND BALANCING FOR HVAC

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Testing, adjustment, and balancing of air systems.
B. Testing, adjustment, and balancing of hydronic systems.
C. Testing, adjustment, and balancing of refrigeration systems.
D. Measurement of final operating condition of HVAC systems.
E. Measuring electrical performance of HVAC equipment.
F. Setting quantitative performance of HVAC equipment.
G. Verifying that automatic control devices are functioning properly.
H. Sound measurement of equipment operating conditions.
I. Vibration measurement of equipment operating conditions.
J. Reporting results of activities and procedures specified in this Section.
K. Commissioning activities.

1.2 REFERENCE STANDARDS

1.3 DEFINITIONS

B. CAV: Constant air volume.
C. cfm: Cubic feet per minute.
E. NC: Noise criteria.
F. TAB: Testing, adjusting, and balancing.
G. VAV: Variable air volume.

1.4 SUBMITTALS

A. See Division 01 for submittal procedures.

B. LEED Submittals:
   1. Air-Balance Report for Prerequisite IEQ 1: Documentation indicating that work complies with ASHRAE 62.1, Section 7.2.2 - "Air Balancing."
   2. TAB Report for Prerequisite EA 2: Documentation indicating that work complies with ASHRAE/IESNA 90.1, Section 6.7.2.3 - "System Balancing."

C. TAB Plan: Submit a written plan indicating the testing, adjusting, and balancing standard to be followed and the specific approach for each system and component.
   1. Submit to the Commissioning Authority.
   2. Submit six weeks prior to starting the testing, adjusting, and balancing work.
   3. Include certification that the plan developer has reviewed the contract documents, the equipment and systems, and the control system with the Architect and other installers to sufficiently understand the design intent for each system.
   4. Include at least the following in the plan:
      a. List of all air flow, water flow, sound level, system capacity and efficiency measurements to be performed and a description of specific test procedures, parameters, formulas to be used.
      b. Copy of field checkout sheets and logs to be used, listing each piece of equipment to be tested, adjusted and balanced with the data cells to be gathered for each.
      c. Discussion of what notations and markings will be made on the duct and piping drawings during the process.
      d. Final test report forms to be used.
      e. Detailed step-by-step procedures for TAB work for each system and issue, including:
         1) Terminal flow calibration (for each terminal type).
         2) Diffuser proportioning.
         3) Branch/submain proportioning.
         4) Total flow calculations.
         5) Rechecking.
         6) Diversity issues.
      f. Expected problems and solutions, etc.
      g. Criteria for using air flow straighteners or relocating flow stations and sensors; analogous explanations for the water side.
      h. Details of how TOTAL flow will be determined; for example:
         1) Air: Sum of terminal flows via control system calibrated readings or via hood readings of all terminals, supply (SA) and return air (RA) pitot traverse, SA or RA flow stations.
         2) Water: Pump curves, circuit setter, flow station, ultrasonic, etc.
i. Specific procedures that will ensure that both air and water side are operating at the lowest possible pressures and methods to verify this.

j. Confirmation of understanding of the outside air ventilation criteria under all conditions.

k. Method of verifying and setting minimum outside air flow rate will be verified and set and for what level (total building, zone, etc.).

l. Method of checking building static and exhaust fan and/or relief damper capacity.

m. Methods for making coil or other system plant capacity measurements, if specified.

n. Time schedule for TAB work to be done in phases (by floor, etc.).

o. Description of TAB work for areas to be built out later, if any.

p. Time schedule for deferred or seasonal TAB work, if specified.

q. False loading of systems to complete TAB work, if specified.

r. Exhaust fan balancing and capacity verifications, including any required room pressure differentials.

s. Interstitial cavity differential pressure measurements and calculations, if specified.

t. Procedures for field technician logs of discrepancies, deficient or uncompleted work by others, contract interpretation requests and lists of completed tests (scope and frequency).

u. Procedures for formal progress reports, including scope and frequency.

v. Procedures for formal deficiency reports, including scope, frequency and distribution.

D. Field Logs: Submit at least twice a week to Commissioning Authority.

E. Control System Coordination Reports: Communicate in writing to the controls installer all setpoint and parameter changes made or problems and discrepancies identified during TAB that affect, or could affect, the control system setup and operation.

F. Progress Reports.

1. As Work progresses, prepare reports to describe completed procedures, procedures in progress, and scheduled procedures. Include a list of deficiencies and problems found in systems being tested and balanced. Prepare a separate report for each system and each building floor for systems serving multiple floors.

G. Final Report: Indicate deficiencies in systems that would prevent proper testing, adjusting, and balancing of systems and equipment to achieve specified performance.

1. Submit under provisions of Division 01.

2. Submit to the Commissioning Authority within two weeks after completion of testing, adjusting, and balancing.

3. Revise TAB plan to reflect actual procedures and submit as part of final report.

4. Submit draft copies of report for review prior to final acceptance of Project. Provide final copies for Architect and for inclusion in operating and maintenance manuals.

5. Provide reports in soft cover, letter size, 3-ring binder manuals, complete with index page and indexing tabs, with cover identification at front and side. Include set of reduced drawings with air outlets and equipment identified to correspond with data sheets, and indicating thermostat locations.

6. Include actual instrument list, with manufacturer name, serial number, and date of calibration.

7. Include a certification sheet in front of binder signed and sealed by the certified testing and balancing agent.

8. Form of Test Reports: Where the TAB standard being followed recommends a report format use that; otherwise, follow ASHRAE Std. 111.

9. Units of Measure: Report data in both I-P (inch-pound) and SI (metric) units.

10. Include the following on the title page of each report:

a. Name of Testing, Adjusting, and Balancing Agency.
b. Address of Testing, Adjusting, and Balancing Agency.
c. Telephone number of Testing, Adjusting, and Balancing Agency.
d. Project name.
e. Project location.
f. Project Architect.
g. Project Engineer.
h. Project Contractor.
i. Project altitude.
j. Report date.

11. In addition to certified field report data, include the following:
   a. Pump curves.
   b. Fan curves.
   c. Manufacturers’ test data.
   d. Field quality-control test reports prepared by system and equipment installers.
   e. Other information relative to equipment performance, but do not include approved Shop Drawings and Product Data.

12. Signature of testing, adjusting, and balancing Agent who certifies the report.

13. Summary of contents, including the following:
   a. Design versus final performance.
   b. Notable characteristics of systems.
   c. Description of system operation sequence if it varies from the Contract Documents.

14. Notes to explain why certain final data in the body of reports vary from design values.

15. Test conditions for fans and pump performance forms, including the following:
   a. Settings for outside-, return-, and exhaust-air dampers.
   b. Conditions of filters.
   c. Cooling coil, wet- and dry-bulb conditions.
   d. Face and bypass damper settings at coils.
   e. Fan drive settings, including settings and percentage of maximum pitch diameter.
   f. Settings for supply-air, static-pressure controller.
   g. Other system operating conditions that affect performance.

16. System Diagrams: Include schematic layouts of air and hydronic distribution systems. Present with single-line diagrams and include the following:
   a. Quantities of outside, supply, return, and exhaust airflows.
   b. Water flow rates.
   c. Duct, outlet, and inlet sizes.
   d. Pipe and valve sizes and locations.
   e. Terminal units.
   f. Balancing stations.

17. Noise and Vibration Measurement Tests: Performed in accordance with ASHRAE handbook guidelines and only after air and water balance is complete. Noise measurements should be reported in octave bands and overall NC rating by space.

18. Title 24 Acceptance Tests: Perform all functions and tests required by Title 24 acceptance tests. Identify and make any system adjustments to achieve acceptance testing objectives. Complete acceptance testing forms and submit to Engineer and General Contractor.

H. Project Record Documents: Record actual locations of flow measuring stations and balancing valves and rough setting.
PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 QUALITY ASSURANCE

A. Agent Qualifications: Engage a testing, adjusting, and balancing agent certified by AABC.

B. Certification of Testing, Adjusting, and Balancing Reports: Certify testing, adjusting, and balancing field data reports. This certification includes the following:
   1. Review field data reports to validate accuracy of data and to prepare certified testing, adjusting, and balancing reports.
   2. Certified that testing, adjusting, and balancing team complied with approved testing, adjusting, and balancing plan and procedures specified and referenced in this Specification.

C. Testing, Adjusting, and Balancing Reports: Use standard forms from AABC’s “National Standards or Testing, Adjusting and Balancing.”

D. Instrumentation Type, Quantity and Accuracy: As described in AABC national standards.

E. Instrumentation Calibration: Calibrate instruments at least every six months or more frequently if required by the instrument manufacturer.

3.2 PROJECT CONDITIONS

A. Partial Owner Occupancy: The Owner may occupy completed areas of the building before Substantial Completion. Cooperate with the Owner during testing, adjusting, and balancing operations to minimize conflicts with the Owner’s operations.

3.3 COORDINATION

A. Coordinate efforts of factory-authorized service representatives for systems and equipment, HVAC controls installers, and other mechanics to operate HVAC systems and equipment to support and assist testing, adjusting, and balancing activities.

B. Perform testing, adjusting, and balancing after leakage and pressure tests on air and water distribution systems have been satisfactorily completed.

C. If another round of pressure testing of the raised floor assembly is required after the first testing, verify that all trades have completed their work to mitigate areas of leakage before commencing additional test.

3.4 WARRANTY

A. National Project Performance Guarantee: Provide a guarantee on AABC’S “National Standards” forms stating that AABC will assist in completing the requirements of the Contract Documents if the testing, adjusting, and balancing Agent fails to comply with the Contract Documents. Guarantee includes the following provisions:
B. Special Guarantee: Provide a guarantee on NEBB forms stating that NEBB will assist in completing the requirements of the Contract Documents if the testing, adjusting, and balancing Agent fails to comply with the Contract Documents. Guarantee includes the following provisions:

1. The certified Agent has tested and balanced systems according to the Contract Documents.
2. Systems are balanced to optimum performance capabilities within design and installation limits.

3.5 GENERAL REQUIREMENTS

A. Perform total system balance in accordance with one of the following:

1. AABC MN-1, AABC National Standards for Total System Balance.
5. Maintain at least one copy of the standard to be used at project site at all times.

B. Begin work after completion of systems to be tested, adjusted, or balanced and complete work prior to Substantial Completion of the project.

C. Where HVAC systems and/or components interface with life safety systems, including fire and smoke detection, alarm, and control, coordinate scheduling and testing and inspection procedures with the authorities having jurisdiction.

D. TAB Agency Qualifications:

1. Company specializing in the testing, adjusting, and balancing of systems specified in this section.
2. Having minimum of three years documented experience.

E. TAB Supervisor and Technician Qualifications: Certified by same organization as TAB agency.

F. TAB Supervisor Qualifications: Professional Engineer licensed in California.

3.6 EXAMINATION

A. Verify that systems are complete and operable before commencing work. Ensure the following conditions:

1. Examine the Contract Documents to become familiar with project requirements and to discover conditions in systems’ designs that may preclude proper testing, adjusting, and balancing of systems and equipment.
2. Verify that balancing devices, such as test ports, gage cocks, thermometer wells, flow-control devices, balancing valves and fittings, and manual volume dampers, are properly installed, and their locations are accessible and appropriate for effective balancing and for efficient system and equipment operation. Verify that quantities and locations of these balancing devices are accessible and appropriate for effective balancing and for efficient system and equipment operation.
3. Examine systems for functional deficiencies that cannot be corrected by adjusting and balancing.
4. Examine terminal units, such as variable-air-volume boxes and mixing boxes, to verify that they are accessible and their controls are connected and functioning.
5. Examine plenum ceilings, utilized for supply air, to verify that they are airtight. Verify that pipe penetrations and other holes are sealed.

6. Systems are started and operating in a safe and normal condition.

7. Temperature control systems are installed complete and operable.

8. Proper thermal overload protection is in place for electrical equipment.

9. Final filters are clean and in place. If required, install temporary media in addition to final filters.

10. Duct systems are clean of debris.

11. Fire and volume dampers are in place and open.

12. Air coil fins are cleaned and combed.

13. Examine open-piping-system pumps to ensure absence of entrained air in suction piping.

14. Examine equipment for installation and for properly operating safety interlocks and controls.

15. Access doors are closed and duct end caps are in place.

16. Air outlets are installed and connected.

17. Duct system leakage is minimized.

18. Hydronic systems are flushed, filled, and vented.

19. Pumps are rotating correctly.

20. Proper strainer baskets are clean and in place.

21. Service and balance valves are open.

22. Examine equipment performance data, including fan and pump curves. Relate performance data to Project conditions and requirements, including system effects that can create undesired or unpredicted conditions that cause reduced capacities in all or part of a system. Calculate system effect factors to reduce performance ratings of HVAC equipment when installed under conditions different from those presented when equipment was performance tested at the factory. To calculate system effects for air systems, use tables and charts found in AMCA 201, “Fans and Systems,” Sections 7 through 10; or in SMACNA’s “HVAC Systems--Duct Design,” Sections 5 and 6. Compare this data with design data and installed conditions.

23. Examine automatic temperature system components to verify the following:

   a. Dampers, valves, and other controlled devices operate by the intended controller.
   b. Dampers and valves are in the position indicated by the controller.
   c. Integrity of valves and dampers for free and full operation and for tightness of fully closed and fully open positions. This includes dampers in multizone units, mixing boxes, and variable-air-volume terminals.
   d. Automatic modulating and shutoff valves, including two-way valves and three-way mixing and diverting valves, are properly connected.
   e. Thermostats and humidistats are located to avoid adverse effects of sunlight, drafts, and cold walls.
   f. Sensors are located to sense only intended conditions.
   g. Sequence of operation for control modes is according to the Contract Documents.
   h. Controller set points are set at design values. Observe and record system reactions to changes in conditions. Record default set points if different from design values.
   i. Interlocked systems are operating.
   j. Changeover from heating to cooling mode occurs according to design values

B. Examine installed raised floor assembly prior to testing. Identify and key areas that are likely to cause excessive air leakage and report deficiencies discovered before and during performance of air leakage testing. Repeat examination prior to start of any additional pressure testing. Perform similar examination of mockup prior to start of pressure testing of mock-up.

C. Submit field reports. Report defects and deficiencies that will or could prevent proper system balance.

D. Beginning of work means acceptance of existing conditions.
3.7 PREPARATION

A. Hold a pre-balancing meeting at least one week prior to starting TAB work.
   1. Require attendance by all installers whose work will be tested, adjusted, or balanced.

B. Provide instruments required for testing, adjusting, and balancing operations. Make instruments available to Architect to facilitate spot checks during testing.

C. Provide additional balancing devices as required.

D. Complete system readiness checks and prepare system readiness reports. Verify the following:
   1. Permanent electrical power wiring is complete.
   2. Hydronic systems are filled, clean, and free of air.
   3. Automatic temperature-control systems are operational.
   4. Equipment and duct access doors are securely closed.
   5. Balance, smoke, and fire dampers are open.
   6. Isolating and balancing valves are open and control valves are operational.
   7. Ceilings are installed in critical areas where air-pattern adjustments are required and access to balancing devices is provided.
   8. Windows and doors can be closed so design conditions for system operations can be met

3.8 ADJUSTMENT TOLERANCES

A. Air Handling Systems: Adjust to within plus or minus 5 percent of design for supply systems and plus or minus 10 percent of design for return and exhaust systems.

B. Air Outlets and Inlets: Adjust total to within plus 10 percent and minus 5 percent of design to space. Adjust outlets and inlets in space to within plus or minus 10 percent of design.

C. Hydronic Systems: Adjust to within plus or minus 10 percent of design.

3.9 RECORDING AND ADJUSTING

A. Field Logs: Maintain written logs including:
   1. Running log of events and issues.
   2. Discrepancies, deficient or uncompleted work by others.
   4. Lists of completed tests.

B. Ensure recorded data represents actual measured or observed conditions.

C. Permanently mark settings of valves, dampers, and other adjustment devices allowing settings to be restored. Set and lock memory stops.

D. After adjustment, take measurements to verify balance has not been disrupted or that such disruption has been rectified.

E. Leave systems in proper working order, replacing belt guards, closing access doors, closing doors to electrical switch boxes, and restoring thermostats to specified settings.
F. At final inspection, recheck random selections of data recorded in report. Recheck points or areas as selected and witnessed by the Owner.

G. Check and adjust systems approximately six months after final acceptance and submit report.

3.10 GENERAL PROCEDURES

A. Cut insulation, ducts, pipes, and equipment cabinets for installation of test probes to the minimum extent necessary to allow adequate performance of procedures. After testing and balancing, close probe holes and patch insulation with new materials identical to those removed. Restore vapor barrier and finish according to the insulation Specifications for this Project.

B. Mark equipment settings with paint or other suitable, permanent identification material, including damper-control positions, valve indicators, fan-speed-control levers, and similar controls and devices, to show final settings.

3.11 AIR SYSTEM PROCEDURE

A. Adjust air handling and distribution systems to provide required or design supply, return, and exhaust air quantities at site altitude.

B. Make air quantity measurements in ducts by Pitot tube traverse of entire cross sectional area of duct.

C. Measure air quantities at air inlets and outlets.

D. Adjust distribution system to obtain uniform space temperatures free from objectionable drafts and noise.

E. Use volume control devices to regulate air quantities only to extend that adjustments do not create objectionable air motion or sound levels. Effect volume control by duct internal devices such as dampers and splitters.

F. Vary total system air quantities by adjustment of fan speeds. Provide drive changes required. Vary branch air quantities by damper regulation.

G. Provide system schematic with required and actual air quantities recorded at each outlet or inlet.

H. Measure static air pressure conditions on air supply units, including filter and coil pressure drops, and total pressure across the fan. Make allowances for 50 percent loading of filters.

I. Adjust outside air automatic dampers, outside air, return air, and exhaust dampers for design conditions.

J. Measure temperature conditions across outside air, return air, and exhaust dampers to check leakage.

K. Where modulating dampers are provided, take measurements and balance at extreme conditions. Balance variable volume systems at maximum air flow rate, full cooling, and at minimum air flow rate, full heating.
L. Measure building static pressure and adjust supply, return, and exhaust air systems to provide required relationship between each to maintain approximately 0.05 inches positive static pressure near the building entries.

M. Check multi-zone units for motorized damper leakage. Adjust air quantities with mixing dampers set first for cooling, then heating, then modulating.

N. For variable air volume system powered units set volume controller to air flow setting indicated. Confirm connections properly made and confirm proper operation for automatic variable air volume temperature control.

O. On fan powered VAV boxes, adjust air flow switches for proper operation.

3.12 WATER SYSTEM PROCEDURE

A. Adjust water systems to provide required or design quantities.

B. Use calibrated Venturi tubes, orifices, or other metered fittings and pressure gauges to determine flow rates for system balance. Where flow metering devices are not installed, base flow balance on temperature difference across various heat transfer elements in the system.

C. Adjust systems to provide specified pressure drops and flows through heat transfer elements prior to thermal testing. Perform balancing by measurement of temperature differential in conjunction with air balancing.

D. Effect system balance with automatic control valves fully open to heat transfer elements.

E. Effect adjustment of water distribution systems by means of balancing cocks, valves, and fittings. Do not use service or shut-off valves for balancing unless indexed for balance point.

F. Where available pump capacity is less than total flow requirements or individual system parts, full flow in one part may be simulated by temporary restriction of flow to other parts.

G. Hydronic system flows shall be balanced at the pump by setting the appropriate frequency on the Variable Frequency Drive. Under no circumstances shall it be acceptable to balance a pump or system flow by throttling or turning down an isolation valve at the pump. Hydronic system balancing shall occur with pump isolation valves at their full 100 percent open position.

H. Flow across control valves shall be measured by means of two sample ports (Pete’s Plugs) located immediately adjacent to the inlet and outlet, respectively, of the control valve. These ports shall be used to obtain the pressure drop across the control valve at its full open position. The control valve Cv shall then be used to calculate the flow rate through the valve. The manual shutoff valve shall be used to provide balance throttling only where necessary and required by the design, with the balanced position noted by a permanent mark spanning from the valve handle to stationary valve body.

3.13 SOUND AND VIBRATION TESTS

A. Perform sound and vibration tests after air and water balance is complete. Measurements should be performed with HVAC and plumbing equipment on and HVAC and plumbing equipment off.
### 3.14 ADDITIONAL TESTS

A. Within 90 days of completing testing, adjusting, and balancing, perform additional testing and balancing to verify that balanced conditions are being maintained throughout and to correct unusual conditions.

B. Seasonal Periods: If initial testing, adjusting, and balancing procedures were not performed during near-peak summer and winter conditions, perform additional inspections, testing, and adjusting during near-peak summer and winter conditions.

### 3.15 COMMISSIONING

A. Perform prerequisites prior to starting commissioning activities.

B. Fill out Prefunctional Checklists for:
   1. Air side systems.
   2. Water side systems.

C. Furnish to the Commissioning Authority, upon request, any data gathered but not shown in the final TAB report.

D. Re-check minimum outdoor air intake flows and maximum and intermediate total airflow rates for all of the air handlers.
   1. Original TAB agency shall execute the re-checks, witnessed by the Commissioning Authority.
   2. Use the same test instruments as used in the original TAB work.
   3. Failure of more than 10 percent of the re-checked items of a given system shall result in the rejection of the system TAB report; rebalance the system, provide a new system TAB report, and repeat random re-checks.
   4. For purposes of re-check, failure is defined as follows:
      a. Air Flow of Supply and Return: Deviation of more than 10 percent of instrument reading.
      b. Minimum Outside Air Flow: Deviation of more than 20 percent of instrument reading; for inlet vane or VFD OSA compensation system using linear proportional control, deviation of more than 30 percent at intermediate supply flow.
      c. Temperatures: Deviation of more than one deg F.
      d. Air and Water Pressures: Deviation of more than 10 percent of full scale of test instrument reading.
   5. For purposes of re-check, a whole system is defined as one in which inaccuracies will have little or no impact on connected systems; for example, the air distribution system served by one air handler or the hydronic chilled water supply system served by a chiller or the condenser water system.

E. In the presence of the Commissioning Authority, verify that:
   1. Final settings of all valves, splitters, dampers and other adjustment devices have been permanently marked.
   2. The air system is being controlled to the lowest possible static pressure while still meeting design loads, less diversity; this shall include a review of TAB methods, established control setpoints, and physical verification of at least one leg from fan to diffuser having all balancing dampers wide open and that during full cooling of all terminal units taking off
downstream of the static pressure sensor, the terminal unit on the critical leg has its damper 90 percent or more open.

3. The water system is being controlled to the lowest possible pressure while still meeting design loads, less diversity; this shall include a review of TAB methods, established control setpoints, and physical verification of at least one leg from the pump to the coil having all balancing valves wide open and that during full cooling the cooling coil valve of that leg is 90 percent or more open.

F. No seasonal tests are required.

G. No further monitoring is required.

H. No deferred testing is required.

3.16 MINIMUM DATA TO BE REPORTED

A. General:

1. A certification sheet at the front of the report's binder, signed and sealed by the certified testing and balancing engineer.
2. A list of instruments used for procedures, along with proof of calibration.
3. Nomenclature sheets for each item of equipment.
4. Notes to explain why certain final data in the body of reports vary from indicated values.
5. Description of system operation sequence if it varies from the Contract Documents.
7. Design and actual values for measurements below.

B. Testing Instruments:

1. Instrument type and make.
2. Serial number.
3. Application.
4. Dates of use.
5. Dates of calibration.

C. Air Handling Units:

1. Total airflow rate in cfm.
2. Total system static pressure in inches wg.
3. Fan rpm.
4. Discharge static pressure in inches wg.
5. Filter static-pressure differential in inches wg.
7. Outdoor airflow in cfm.
8. Return airflow in cfm.
10. Return-air damper position.

D. Electric Motors:

1. Model/Frame
2. HP/BHP
3. Phase, voltage, amperage; nameplate, actual, no load
4. RPM
5. Service factor
6. Starter size, rating, heater elements
7. Sheave Make/Size/Bore

E. V-Belt Drives:
   1. Identification/location
   2. Required driven RPM
   3. Driven sheave, diameter and RPM
   4. Belt, size and quantity
   5. Center to center distance, maximum, minimum, and actual

F. Ducts:
   1. System and air-handling-unit number.
   2. Location and zone.
   3. Traverse air temperature in deg F.
   4. Duct static pressure in inches wg.
   5. Duct size in inches.
   6. Duct area in sq. ft.
   7. Airflow rate in cfm.
   8. Velocity in fpm.

G. Pumps:
   1. Identification/number
   2. Manufacturer
   3. Size/model
   4. Impeller
   5. Service
   6. Design flow rate, pressure drop, BHP
   7. Actual flow rate, pressure drop, BHP
   8. Discharge pressure
   9. Suction pressure
   10. Total operating head pressure
   11. Shut off, discharge and suction pressures
   12. Shut off, total head pressure

H. Vibration Tests

I. Other Equipment:
   1. Model number
   2. Serial number
   3. Rated capacity

END OF SECTION
SECTION 230713 - HVAC DUCT INSULATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary
Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Duct insulation.
   2. Fire-rated insulation.
   3. Insulation jackets.

B. Related Sections:
   2. Division 07 - Firestopping.
   3. Division 09 - Painting and Coating: Painting insulation jackets.
   4. Section 230553 - Identification for HVAC Piping and Equipment.
   5. Section 233100 – HVAC Metal Ducts

1.3 REFERENCE STANDARDS

D. ASTM C553 - Specification for Mineral Fiber Blanket Thermal Insulation for Commercial and
Industrial Applications; 2013.

E. ASTM C612 - Standard Specification for Mineral Fiber Block and Board Thermal Insulation;
2014.

F. ASTM C916 - Standard Specification for Adhesives for Duct Thermal Insulation; 1985
(Reapproved 2007).

G. ASTM C1071 - Standard Specification for Fibrous Glass Duct Lining Insulation (Thermal and
Sound Absorbing Material); 2012.

H. ASTM C1290 - Standard Specification for Flexible Fibrous Glass Blanket Insulation Used to
Externally Insulate HVAC Ducts; 2011.

1.4 ACTION SUBMITTALS

A. See Division 01 and Section 230000 “HVAC General Requirements” for submittal procedures.

B. Product Data: Provide product description, thermal characteristics, list of materials and thickness for each service, and locations.

C. LEED Submittals: Product Data for compliance with VOC content.

D. Manufacturer's Instructions: Indicate installation procedures which ensure acceptable workmanship and installation standards will be achieved. Include details for removable insulation sections at access panels.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified Installer.

1.6 QUALITY ASSURANCE

A. Manufacturer Qualifications: Company specializing in manufacturing products of the type specified in this section with not less than three years of documented experience.

B. Applicator Qualifications: Company specializing in performing the type of work specified in this section, with minimum five (5) years of experience and approved by manufacturer.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Accept materials on site in original factory packaging, labelled with manufacturer's identification, including product density and thickness.

B. Protect insulation from weather and construction traffic, dirt, water, chemical, and mechanical damage, by storing in original wrapping. Any insulation subjected to moisture shall not be used.

C. Maintain ambient temperatures and conditions required by manufacturers of adhesives, mastics, and insulation cements. Maintain temperature during and after installation for minimum period of 24 hours.
PART 2 - PRODUCTS

2.1 INSULATION MATERIALS

A. Requirements for all products of this section:
1. Surface Burning Characteristics:
   a. Indoor insulation: Flame spread/Smoke developed index of 25/50, maximum, when tested in accordance with ASTM E 84, NFPA 255, or UL 723.
   b. Outdoor insulation: Flame spread/Smoke developed index of 75/150, maximum, when tested in accordance with ASTM E 84, NFPA 255, or UL 723.
2. Products shall not contain PVC, asbestos, lead, mercury, or mercury compounds.
3. Products that come in contact with stainless steel shall have a leachable chloride content of less than 50 ppm when tested according to ASTM C 871.
4. Insulation materials for use on austenitic stainless steel shall be qualified as acceptable according to ASTM C 795.
5. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process.

B. Glass fiber, flexible:
1. Manufacturer:
   a. Knauf Insulation.
   c. Owens Corning Corporation.
   d. CertainTeed Corporation.
2. Insulation: ASTM C553; flexible, noncombustible blanket with a thermosetting resin.
   a. Density / Thermal Conductivity ('K' value):
      1) 0.75 pcf / K = 0.36 at 75 degrees F, when tested in accordance with ASTM C518.
      2) 1.5 pcf / K = 0.31 at 75 degrees F, when tested in accordance with ASTM C518.
   c. Maximum Water Vapor Sorption: 5.0 percent by weight.

C. Glass fiber, rigid:
1. Manufacturer:
   a. Knauf Insulation.
   c. Owens Corning Corp.
   d. CertainTeed Corporation.
2. Insulation: ASTM C612; rigid, noncombustible board.
   a. Density / Thermal Conductivity ('K' value):
      1) 1.6 pcf / K = 0.24 at 75 degrees F, when tested in accordance with ASTM C518.
      2) 6.0 pcf / K = 0.22 at 75 degrees F, when tested in accordance with ASTM C518.
   b. Maximum service temperature: 450 degrees F.
c. Maximum Water Vapor Sorption: 5.0 percent.

2.2 FIRE-RATED INSULATION

A. Fire-Rated Blanket: High-temperature, flexible, blanket insulation with FSK jacket that is tested and certified to provide a fire rating by an NRTL acceptable to authorities having jurisdiction.

B. Fire-Rated Board: Structural-grade, press-molded, xonolite calcium silicate, fireproofing board suitable for operating temperatures up to 1700 deg F. Comply with ASTM C 656, Type II, Grade 6. Tested and certified to provide a fire rating by an NRTL acceptable to authorities having jurisdiction.

C. Fire Rating: to suit architectural assembly, refer to Architectural Drawings.

2.3 JACKETS

A. All Service Jacket (ASJ): ASTM C1136.
   1. Vapor retarder laminate of reinforced bleached white kraft / foil.
   2. Moisture Vapor Permeability: 0.02 perm inch, when tested in accordance with ASTM E96/E96M.

   1. Vapor retarder laminate of foil / scrim / kraft construction.
   2. Moisture Vapor Permeability: 0.02 perm inch, when tested in accordance with ASTM E96/E96M.

   1. Thickness: 0.016 inch sheet.
   2. Finish: Stucco embossed.
   4. Fittings: 0.016 inch thick die shaped fitting covers with factory attached protective liner.

D. Aluminum Outdoor Jacket (Alum Outdoor).
   2. UV-resistant.

E. Accessories:
   2. Weld-Attached Anchor Pins and Washers: Copper-coated steel pin for capacitor discharge welding and galvanized speed washer. Pin length sufficient for insulation thickness indicated.
   3. Adhesive-Attached Anchor Pins and Speed Washers: Galvanized steel plate, pin, and washer manufactured for attachment to duct and plenum with adhesive. Pin length sufficient for insulation thickness indicated.
PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that ducts have been pressure tested before applying insulation materials.

B. Verify that surfaces are clean, foreign material removed, and dry.

3.2 INSTALLATION

A. Install in accordance with manufacturer's instructions.

B. Install in accordance with NAIMA National Insulation Standards.

C. Use accessories compatible with insulation materials and suitable for the service. Use accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.

D. Seal joints and seams with vapor-retarder mastic on insulation indicated to receive a vapor retarder.

E. Apply insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by the insulation material manufacturer.

F. Apply insulation with the least number of joints practical.

G. Apply insulation over fittings and specialties, with continuous thermal and vapor-retarder integrity, unless otherwise indicated. Where service access is required, provide removable insulation sections that allow for removal and replacement without damaging surrounding insulation. At nameplates, bevel and seal ends of insulation.

H. Hangers and Anchors: Where vapor retarder is indicated, seal penetrations in insulation at hangers, supports, anchors, and other projections with vapor-retarder mastic. Apply insulation continuously through hangers and around anchor attachments.

I. Hangar Inserts.

1. For support points of rectangular or oval ducts supported by trapeze hangers, place weight supporting insulation at bottom of duct over trapeze. Weight supporting insulation shall be rigid glass fiber insulation having minimum of 6 pcf density and 200 lb/ft compression strength at 10% deformation and minimum 6" long with same thickness as insulation specified. Weight supporting inserts similar to HAMFAB H-block by ICA Inc. may be used for rectangular ducts less than 18". Follow manufacturer's recommendation for number of inserts.

2. For support points of round ducts smaller than 16" diameter, weight supporting insulation is not required for either rigid or flexible glass fiber insulation.

3. For support points of round ducts 16" diameter and larger, place weight supporting insulation between duct and strap or trapeze.

4. Flexible glass fiber insulation may be installed outside of support for round ducts 24" diameter or smaller, provided vapor barrier integrity is maintained at rod / strap penetration.
J. Insulation Terminations: For insulation application where vapor retarders are indicated, seal ends with a compound recommended by the insulation material manufacturer to maintain vapor retarder.

K. Roof Penetrations: Apply insulation for interior applications to a point even with top of roof flashing.

L. Interior Wall and Partition Penetrations: Apply insulation continuously through walls and partitions, except fire-rated walls and partitions.

M. Fire-Rated Wall and Partition Penetrations: Terminate insulation at fire/smoke damper sleeves for fire-rated wall and partition penetrations.

N. Floor Penetrations: Terminate insulation at underside of floor assembly and at floor support at top of floor.

O. External Duct Insulation Application:
   1. Secure insulation with vapor barrier and seal jacket joints with vapor barrier adhesive or tape to match jacket.
   2. Secure insulation without vapor barrier with staples or tape.
   3. Install without sag on underside of duct. Use adhesive or mechanical fasteners where necessary to prevent sagging. Lift duct off trapeze hangers and insert spacers.
   4. Seal vapor barrier penetrations by mechanical fasteners with vapor barrier adhesive.
   5. Stop and point insulation around access doors and damper operators to allow operation without disturbing wrapping.

3.3 SCHEDULES

A. Items Not Insulated:
   1. Double-wall metal ducts which comply with energy code and ASHRAE/IESNA 90.1.
   2. Factory-insulated flexible ducts.
   3. Factory-insulated plenums and casings.
   4. Flexible connectors.
   5. Vibration-control devices.
   6. Factory-insulated access panels and doors.
   7. Transfer air ducts.

B. Location definitions:
   1. Concealed: ductwork in ceilings and shafts.
   2. Exposed: ductwork that is not concealed, but also not in occupied spaces such as ductwork in mechanical rooms.
   3. Occupied: ductwork in occupied rooms.

END OF SECTION
SECTION 230700 – HVAC PIPING AND EQUIPMENT INSULATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Pipe and equipment insulation.
   2. Pipe and Equipment jackets.

B. Related Sections:
   1. Division 01 – Volatile Organic Compound (VOC) Content Restrictions.
   2. Division 07 – Firestopping.
   3. Division 09 – Painting and Coating: Painting insulation jackets.
   4. Section 230553 – Identification for HVAC Piping and Equipment.
   5. Section 232113 – Hydronic Piping.

1.3 REFERENCE STANDARDS

1.4 ACTION SUBMITTALS

A. See Division 01 and Section 230000 “HVAC General Requirements” for submittal procedures.

B. Product Data: Provide product description, thermal characteristics, list of materials and thickness for each service, and locations.

C. Manufacturer’s Instructions: Indicate installation procedures which ensure acceptable workmanship and installation standards will be achieved. Include details for removable insulation sections at access panels.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified Installer.

B. Field quality-control reports.

1.6 QUALITY ASSURANCE

A. Manufacturer Qualifications: Company specializing in manufacturing products of the type specified in this section with not less than three years of documented experience.

B. Applicator Qualifications: Company specializing in performing the type of work specified in this section, with minimum five (5) years of experience and approved by manufacturer.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Accept materials on site in original factory packaging, labelled with manufacturer’s identification, including product density and thickness.

B. Protect insulation from weather and construction traffic, dirt, water, chemical, and mechanical damage, by storing in original wrapping. Any insulation subjected to moisture shall not be used.

C. Maintain ambient temperatures and conditions required by manufacturers of adhesives, mastics, and insulation cements. Maintain temperature during and after installation for minimum period of 24 hours.

PART 2 - PRODUCTS

2.1 PIPE AND EQUIPMENT INSULATION

A. Requirements for all products of this section:

1. Surface Burning Characteristics:
   a. Indoor insulation: Flame spread/Smoke developed index of 25/50, maximum, when tested in accordance with ASTM E84, NFPA 255, or UL 723.
   b. Outdoor insulation: Flame spread/Smoke developed index of 75/150, maximum, when tested in accordance with ASTM E84, NFPA 255, or UL 723.

2. Products shall not contain PVC, asbestos, lead, mercury, or mercury compounds.
3. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process.

B. Flexible Elastomeric Insulation: Closed-cell, sponge- or expanded-rubber materials. Comply with ASTM C534, Type I for tubular materials.
   1. Manufacturers:
      a. Aeroflex USA.
      b. Armacell LLC.
      c. K-Flex USA LLC.
      d. Armstrong World Industries.

C. Mineral Fiber Blanket Insulation: Mineral or glass fibers bonded with a thermosetting resin. Comply with ASTM C553, Type II and ASTM C1290, Type II. Maximum moisture absorption: 0.2 percent by volume.
   1. Manufacturers:
      a. Knauf Insulation.
      c. Owens Corning Corporation.
   2. CertainTeed Corporation.

D. Mineral Fiber Board Insulation: Mineral or glass fibers bonded with a thermosetting resin. Semirigid board complying with ASTM C1393, Type II or Type IIIA Category 2, or with properties similar to ASTM C612, Type IB. Nominal density is 2.5 lb/cu. ft. or more. Thermal conductivity (k-value) at 100 deg F is 0.29 Btu x in./h x sq. ft. x deg F or less.
   1. Manufacturers:
      a. Knauf Insulation.
      c. Owens Corning Corporation.
   2. CertainTeed Corporation.

2.2 PIPE AND EQUIPMENT JACKETS

A. Aluminum Jacket: ASTM B209 formed aluminum sheet. Thickness 0.016 inch; smooth finish, longitudinal slip joints and 2 inch laps, 0.016 inch thick die shaped fitting covers with factory-attached protective liner; stainless steel bands.
   1. Moisture Barrier for Indoor Applications: 1 mil- thick, heat-bonded polyethylene and kraft paper.
   2. Moisture Barrier for Outdoor Applications: 3 mil- thick, heat-bonded polyethylene and kraft paper.
   3. Factory-Fabricated Fitting Covers:
      a. Same material, finish, and thickness as jacket.
      b. Preformed 2 piece or gore, 45 and 90 degree, short- and long-radius elbows.
      c. Tee covers.
      d. Flange and union covers.
      e. End caps.
      f. Beveled collars.
      g. Valve covers.
      h. Field fabricate fitting covers only if factory-fabricated fitting covers are not available.
B. All Service Jacket (ASJ): ASTM C291, laminated glass-fiber-reinforced, flame retardant kraft paper and aluminum foil. Moisture permeability: 0.002 perm inch, maximum, when tested in accordance with ASTM E96.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that ducts have been pressure tested before applying insulation materials.

B. Verify that surfaces are clean, foreign material removed, and dry.

3.2 PIPE AND EQUIPMENT INSULATION INSTALLATION

A. Install in accordance with manufacturer’s instructions.

B. Install in accordance with NAIMA National Insulation Standards.

C. Surface Preparation: Clean and dry surfaces to receive insulation. Remove materials that will adversely affect insulation application.

D. Use accessories compatible with insulation materials and suitable for the service. Use accessories that do not corrode, soften, or otherwise attack insulation or jacket in either wet or dry state.

E. Apply insulation with tight longitudinal seams and end joints. Bond seams and joints with adhesive recommended by the insulation material manufacturer.

F. Apply insulation with the least number of joints practical.

G. Apply insulation over fittings and specialties, with continuous thermal and vapor-retarder integrity, unless otherwise indicated.

H. Hangers and Anchors: Where vapor retarder is indicated, seal penetrations in insulation at hangers, supports, anchors, and other projections with vapor-retarder mastic. Apply insulation continuously through hangers and around anchor attachments.

I. Insulation Terminations: For insulation application where vapor retarders are indicated, seal ends with a compound recommended by the insulation material manufacturer to maintain vapor retarder.

J. Interior Wall and Partition Penetrations: Apply insulation continuously through walls and partitions, except fire-rated walls and partitions.

K. Floor Penetrations: Terminate insulation at underside of floor assembly and at floor support at top of floor.

L. Exposed Piping and equipment: Locate insulation and cover seams in least visible locations.
M. Insulated pipes: Insulate entire system including fittings, valves, unions, flanges, strainers, flexible connections, pump bodies, and expansion joints with molded insulation of like material and thickness as adjacent pipe.

N. For hot piping, do not insulate flanges and unions at equipment, but bevel and seal ends of insulation.

O. Inserts and Shields:
   1. Application: Piping 1-1/2 inches diameter or larger.
   2. Shields: Galvanized steel between pipe hangers or pipe hanger rolls and inserts.
   3. Insert location: Between support shield and piping and under the finish jacket.
   4. Insert configuration: Minimum 6 inches long, of same thickness and contour as adjoining insulation; may be factory fabricated.
   5. Insert material: Hydrous calcium silicate insulation or other heavy density insulating material suitable for the planned temperature range.

P. Continue insulation through walls, sleeves, pipe hangers, and other pipe penetrations. Finish at supports, protrusions, and interruptions. At fire separations, refer to Division 07.

Q. Equipment Requiring Access for Maintenance, Repair, or Cleaning: Install insulation so it can be easily removed and replaced without damage.

R. Finish insulation at supports, protrusions, and interruptions.

S. Nameplates and ASME Stamps: Bevel and seal insulation around; do not insulate over.

3.3 FIELD QUALITY CONTROL

A. Inspect work, randomly selected by Architect, by removing field-applied jacket and insulation in layers in reverse order of their installation. Extent of inspection shall include all equipment and be limited to one location for each duct or pipe system.

B. All insulation applications will be considered defective Work if sample inspection reveals noncompliance with requirements.

3.4 SCHEDULES

A. Pipe Items Not Insulated:
   1. Drainage piping located in crawl spaces.
   2. Chrome-plated piping and fittings.

B. Location definitions:
   1. Concealed: located in ceilings and shafts.
   2. Exposed: not concealed, but also not in occupied spaces such as in mechanical rooms.
   3. Occupied: located in occupied rooms.

Note 1: minimum thickness may be adjusted for alternate insulating materials, but must still meet all applicable codes.

Note 2: all outdoor piping and equipment shall be provided with an aluminum jacket rated for outdoor use.

END OF SECTION
SECTION 230800 – COMMISSIONING OF MECHANICAL SYSTEMS

PART 1 - GENERAL

1.1. RELATED DOCUMENTS

A. The General Conditions, Supplementary Conditions and Division 01 are fully applicable to this Section, as if repeated herein.

1.2. RELATED WORK SPECIFIED ELSEWHERE

A. Division 01, Section 01910, General Commissioning Requirements

B. All Division 23 Sections.

1.3. REFERENCES

A. USGBC:
   1. LEED v4.0 Reference Guide for Building Design and Construction:
      a. Energy and Atmosphere Prerequisite: Fundamental Commissioning and Verification.

B. California Energy Commission:
   1. Title 24, Part 6, 2016, Building Energy Efficiency Standards, Section 10-103 and Section 120.8-Building Commissioning

C. ASHRAE:
   1. ASHRAE Guideline 0-2013: The Commissioning Process
   2. ASHRAE Guideline 1.1-2007 HVAC&R Technical Requirements for the Commissioning Process

1.4. DEFINITIONS

A. Basis of Design (BOD): The documentation of design criteria and assumptions for systems, components, and methods chosen to meet the Owner’s Project Requirements and applicable regulatory requirements, standards, and guidelines. The document includes narrative descriptions of the systems to be commissioned. The BOD is prepared by the Design Professionals.

B. Building Automation System (BAS): The automated building system providing control and user interaction with select building systems, such as the HVAC, domestic hot water and lighting systems. Also, often referred to as building management system (BMS), energy management system (EMS), or an energy management and control system (EMCS).

C. Commissioning (Cx): A quality-focused process to verify and document that building systems are installed and perform as intended per the OPR, BOD and design documents.
D. Commissioning Authority (CxA): An independent agent hired directly by the Owner and not otherwise associated with the Design Professionals or the General Contractor. The CxA is the authority on commissioning results and other commissioning program elements completion, and assists the General Contractor with coordinating commissioning activities and witnesses the activities on behalf of the Owner.

E. Commissioning Issue: A condition that affects, prevents or inhibits commissioning, and must be resolved to complete the commissioning process.

F. Commissioning Issues & Recommendations Log (Cx Log): A log maintained by the CxA listing and describing all Cx issues and recommendations documented during the commissioning process, including providing the status, recommended action, contractor updates and resolution, and associated dates. All Cx issues require action, correction and closure.

G. Commissioning Report (Cx Report): The final report issued at the conclusion of the commissioning process. The report will include an executive summary abbreviating the outcome of the commissioning process and identifying all outstanding issues. The report also contains all commissioning documentation collected throughout all phases of the project.

H. Commissioning Plan (Cx Plan): A document that outlines the organization, coordination, and requirements of the commissioning process in more detail and contains project specific commissioning forms.

I. General Contractor (GC): The contractor directly contracted to the Owner with overall responsibility for the project and all commissioning activities described herein.

J. Commissioning Coordinator (CxC): Individual within the GC firm who plans, schedules, directs and coordinates all the Trade Subcontractor’s commissioning activities, and serves as the CxA’s single point of contact for all administrative, documentation and coordination functions.

K. Deferred Testing: Testing performed at a later time, due to partial occupancy, equipment, load, seasonal requirements, design or other site conditions that disallow the test from being performed prior to substantial completion.

L. Deficiency: A condition in the installation, function or performance of a component, equipment or system that is not in compliance with the contract documents and design. A deficiency will be considered a Cx issue and documented on the Cx Log.

M. Design Professional (DP): Architects, engineers and other consultants involved in the design of the project.

N. Functional Performance Test (FPT): A test of the dynamic function, operation and control of the equipment and systems to verify system performance to the fullest extent. Systems are tested under various operating modes and control sequences including failure modes. The FPTs are performed using manual (direct observation) or monitoring methods. The FPTs can include sequence of operation tests, performance tests, verification tests, integrated systems tests, and trend analysis.

O. HVAC&R: Heating, ventilation, air conditioning and refrigeration.

P. Installation Verification (IV): Field verification and documentation of proper installation of system equipment, assemblies and components, per design documents and manufacturer requirements. The IV process is typically complete when systems are ready for startup or operation. IV is organized and documented under the System Readiness Checklist (SRC) forms.
Q. Monitoring: The recording of parameters (temperature, flow, current, status, pressure, etc.) of equipment operation, which shall be completed using data-loggers or the trending capabilities of BAS or control systems.

R. Owner’s Project Requirements (OPR): A document describing the operational and functional requirements of a project, the expectations of how the facility will be used and operated, and the equipment and system expectations and requirements, as defined by the Owner. This document provides an explanation of the ideas, concepts, goals, success criteria, and supporting information for the project.

S. Percent Sampling: Witnessing the startup, checkout or testing of a selected fraction of the total number of identical or near-identical pieces of equipment or systems.

T. Pre-Functional Checks and Tests (PFCT): These are various checks and tests performed on a piece of equipment or system before, during, or after the initial startup and operation, but prior to the FPT phase. They are performed to confirm the system equipment and individual components were installed correctly and are working properly and meeting applicable performance requirements and specifications. For mechanical HVAC systems, examples during the system installation prior to equipment startup include: pipe system hydrostatic pressure tests, checking completion of the pipe system clean and flush, and duct leakage tests. Examples during equipment startup and operation include: checking fan rotation and measuring and checking operating temperatures, pressures and motor electrical parameters. Examples after equipment startup include: the BAS / control system point to point checks, sensor calibrations or accuracy checks, actuator testing; and system TAB. They are all organized and documented under the SRC forms and are to be completed prior to FPTs.

U. Startup: Initial starting or activating of equipment usually performed by the Trade Subcontractor or the Manufacturer’s authorized representative.

V. Systems Manual: A manual that provides the operating staff the information needed to understand and optimally operate the commissioned systems. It expands upon the scope of traditional operating and maintenance documents and is compiled of multiple documents such as the final BOD, single line diagrams, and as-built controls drawings and sequences of operation.

W. System Readiness Checklist (SRC): A construction checklist, typically one or two pages, listing the necessary commissioning tasks and required documentation to verify a system is ready for FPTs, or system operation if no FPTs are performed. The tasks covered in the SRC include IV, Startup and PFCT, and the Trade Subcontractor completed forms for these tasks are attached to the specific SRC. The SRC must be completed and signed by the GC prior to conducting the FPTs.

X. TAB: Testing, Adjusting, and Balancing (TAB) work on the HVAC&R air and water systems to ensure design flow, pressure and temperature conditions are met. Performed by the TAB Trade Subcontractor.

Y. Trade Subcontractor: Typically a subcontractor to the GC who provides and installs specific building components and systems and/or provides certain services.

Z. Trending: Monitoring using the BAS or a control system, to aid in functional testing and to verify system operation and performance under actual operating conditions.

AA. Warranty Phase: The phase of the project immediately after the initiation of the building equipment warranty which spans the entire length of the project warranty.
1.5. DESCRIPTION OF WORK

A. Systems and equipment to be commissioned:
   1. HVAC equipment, controls and the BAS

B. Process equipment are not included in the commissioning scope of work.

C. The work includes the completion and documentation of formal commissioning procedures by the GC and Trade Subcontractors.
   1. The GC and Trade Subcontractors shall provide the quality control for the installation, startup, checkout and testing of the systems. The commissioning process provides independent review throughout the process and qualitative functional performance testing in order to formally observe and document the quality control efforts are completed.
   2. Refer to Section 01910, General Commissioning Requirements for summary description of the general commissioning process and requirements.
   3. The Trade Subcontractors and the factory authorized service representatives shall be responsible for participation in the commissioning process as outlined in this specification and Section 01910, General Commissioning Requirements.

1.6. COMMISSIONING PROCESS

A. Submittal Reviews by the CxA
   1. The CxA will review pertinent Trade Subcontractor submittals for the appropriate systems in the commissioning scope, concurrently with the Design Professionals and will provide review comments to the Design Professionals.
   2. The GC shall provide a submittal log to the CxA for referencing the requested submittals to be reviewed by the CxA (for which the GC shall issue to the CxA concurrently with the submission to the Design Professionals). Alternatively, the GC shall include the CxA on the distribution of all Trade Subcontractor submittals issued to the Design Professionals, for systems applicable to this specification.
   3. The GC shall issue the requested submittals to the CxA for review at the same time they issue the submittals to the Design Professionals.
   4. The CxA will also use the information from the submittals to develop commissioning forms and test procedures.

B. Cx Plan and Form Development
   1. The CxA prepares a Preliminary Cx Plan either during the project final design phase or early construction phase. The Cx Plan provides guidance in the execution of the commissioning process during construction and will contain the project specific commissioning forms.
   2. Commissioning during construction begins with a kickoff meeting conducted by the CxA where the CxA reviews the commissioning process and responsibilities with the appropriate team members. The CxA presents the Preliminary Cx Plan and discusses the project specific requirements.
   3. The CxA develops the SRC forms, which list the commissioning tasks and the associated IV, Startup, and PFCT documentation required for each system and equipment to be commissioned.
   4. The CxA provides the SRC forms to the GC and Trade Subcontractors for review and comment.
   5. The CxC shall submit to the CxA, for review and approval, the representative blank IV, Startup, and PFCT forms and plans for completing all IV, Startup, and PFCT tasks, prior to conducting any of these tasks.
Contra Costa Community College District
Contra Costa College
C-4016 New Science Building – DSA Increment 2

C. System Readiness (Pre-Functional) Activities

1. Meetings will be conducted throughout construction with commissioning team members, as required, to plan, coordinate, and schedule commissioning activities, review documentation, and resolve Cx issues.

2. The Trade Subcontractors shall perform the IV, Startup and PFCT tasks for all systems and equipment (no sampling allowed), unless the contract or design documents allow for sampling of the pre-functional tests (as example, if sampling were allowed for pre-functional HVAC system duct leakage tests).

a. In general, the GC and Trade Subcontractors should complete IV prior to Startup, but where appropriate and approved by the CxA, they can combine IV and Startup into one activity (and Startup is not performed if there are deficiencies identified from the IV).

3. The Trade Subcontractors and the CxC shall document completion of the IV, Startup and PFCT tasks on the IV, Startup, PFCT and SRC forms, and shall complete the SRC forms and attach the completed IV, Startup, and PFCT forms to the SRCs forms.
a. The intent of the SRC forms is for the GC and Trade Subcontractors to certify that the HVAC systems, controls and instrumentation, equipment and assemblies have been installed, started, calibrated and are operating per the contract and design documents.

4. The CxA will review the completed IV, Startup, PFCT and SRC forms. The CxA will also perform various field observations and reviews, and witness a sample of the Startup and PFCT activities (some PFCT witnessing may be performed as back-checks after PFCT task are completed, e.g., BAS pre-functional checks and TAB).

a. The Trade Subcontractor shall resolve any IV and PFCT results deemed unacceptable by the CxA. And the Trade Subcontractor shall execute a new sample of the PFCT to be witnessed by the CxA. The CxA shall deem the PFCT acceptable after resolution of all issues and any witnessed sampling results in no issues.

5. The CxC shall submit all completed SRC forms to the CxA for review prior to conducting the FPTs. The CxA shall deem the SRCs acceptable after all SRC forms and supporting IV, Startup and PFCT forms are complete and any issues have been addressed.

D. Functional Performance Testing

1. FPTs are to test the dynamic function, performance and control of the equipment and systems under various modes of operation. These tests verify the correct implementation of the sequences of operation and the system performance meets the design criteria. The FPTs are performed using manual (direct observation) or monitoring methods. FPTs include the following types of tests, where applicable:

a. Sequence of Operation Tests
   1) Sequence of operation tests are witnessed by the CxA for each unique sequence of operation but may not necessarily be repeated across identical systems, equipment or spaces, if the contractor has verified the same programmed sequence of operation code (as tested) has been programmed across multiple identical systems, equipment or spaces, based sample verification tests witnessed by the CxA (see below).

b. Verification Tests.
   1) Verification tests are often less detailed tests than the sequence of operation tests and are typically witnessed by the CxA at a higher sample rate. Examples of verification tests include:
      a) verifying the programmed sequence of operation code is the same as the as-tested code per the sequence of operation tests,
      b) verifying the alarm points are configured per the sequence of operation tests (without having to repeat the actual sequence tests),
      c) reviewing and confirming control point displays on system graphics and required setpoints (for example verifying the BAS VAV min, max cool, max heat airflow setpoints are correct per design),
      d) testing certain critical or important sequences with a higher sample rate across identical systems, equipment or spaces, beyond the individual sequence of operation tests.

c. Performance Tests.
   1) Performance tests are to be performed after the sequence of operation and verifications tests, and are focused on testing and verifying performance (i.e., HVAC system air and water flow rates, temperatures, pressures are achieved at both minimum and near maximum load conditions). Performance tests are typically witnessed by the CxA at a lower sample rate. Examples include:
a) testing VAV terminal unit maximum airflow rates and reheat coil airside
temperature rise are achieved per design (at design air handler static
pressure and hot water temperature and differential pressure),
b) testing AHU minimum outside air ventilation rates per design are
achieved at both minimum and maximum supply airflows,
c) testing the AHU supply airflow and temperature performance at
simulated high cooling load conditions per design.
d) Testing the chilled water system flow and cooling capacity performance
at simulated high cooling load conditions per design.

d. Integrated Systems Tests.

1) Integrated systems tests verify the operation and performance of multiple
systems together operating in a coordinated, stable and efficient manner. Often
the integrated systems tests are combined with the performance tests.
Examples include verifying the operation and performance of the central
heating and chilled water systems with the performance of terminal and/or air
handling units, from simulated minimum to near maximum load conditions,
including staging up and down of central equipment (chiller, boilers, pumps,
etc.).

e. Trend Analysis

2. The CxA will develop FPT forms that contain:

a. Specific step-by-step procedures to execute the test in a clear, sequential and
repeatable format, including any control system point value or setpoint overrides
required to simulate a test condition or sequence mode.
b. The expected system response and acceptance criteria of proper performance with a
Yes/No check box to allow for clearly marking whether or not proper performance of
each part of the test was achieved.
c. A section for recording actual system response, notes and comments.

3. Once the SRC forms are complete, the Trade Subcontractors shall execute the FPTs, with
the FPTs witnessed by the CxA.

a. The GC and Trade Subcontractors are responsible for ensuring all systems are
installed, operating and performing per the requirements of the contract and design
documents, and are ready for the FPTs.
b. The Trade Subcontractors shall determine what level of pre-testing is appropriate in
order to prepare for the CxA witnessed FPTs.
c. The CxA recommends the Trade Sub-Contractors complete the Title 24 acceptance
testing and forms (see paragraph f below) as part of the contractor’s pre-testing and
readiness for the CxA witnessed FPTs.
d. A percent sampling approach shall be used for executing the FPTs of identical
systems and equipment. The approximate system sampling rates for the manual
(direct observation) FPTs are defined in Part 3 of this specification and/or in the Cx
Plan.
e. The acceptance criteria for the FPT sampling shall be zero, meaning, any FPTs that
do not pass shall require the Trade Subcontractor to resolve the issue for all
applicable systems and equipment (even those specifically not in the original sample)
and new sample rates selected for a re-test executed by the Trade Subcontractor
and witnessed by the CxA. The CxA shall deem the FPTs acceptable after all FPTs,
including re-tests, have passed and resolution of all issues completed.
f. The CxA will document the results of all FPTs on the associated FPT forms created
by the CxA, unless indicated otherwise on the FPTs, and excluding completion of the
Title 24 Certificate of Acceptance forms.
1) Completion of the Title 24 Certificate of Acceptance forms (contained in Appendix A of the Title 24, Part 6 Compliance Manual) is a contractor responsibility, not the CxA responsibility.

2) The responsible Division 22, 23, 25 and 26 Trade Subcontractors are also responsible for providing qualified and certified "Field Technicians" (per Title 24, Part 6 requirements, where applicable when the minimum threshold of state certified technicians has been met) to perform and document the results of the acceptance tests on the applicable Title 24, Part 6 Certificate of Acceptance forms.

4. The Cx Plan will define any required seasonal or deferred testing.

E. Cx Issues and Recommendations

1. Throughout the process, the CxA records Cx issues and recommendations on the Cx Log and distributes the Cx List to the team. The GC and Trade Subcontractors shall correct Cx issues and recheck or retest the system(s) without delay at no additional cost to the Owner. The CxA will verify the completion of the issues and recommendations, and make all amendments to the Cx Log.

F. Training Verification and Final Documentation

1. The GC shall submit a comprehensive Training Plan (with specific training agendas provided by the Trade Subcontractors) for review by the Design Professionals, CxA and Owner, prior to conducting any training. The Training Plan shall meet the specific requirements in the contract documents and specifications for each applicable system to be commissioned and the LEED Enhanced Commissioning requirements, and may include both operations and maintenance (O&M) staff training and building occupant training. The GC shall coordinate with the Owner and/or Owner’s Representatives, as needed, regarding any specific requirements for occupant training.

2. The CxA will verify completion of the training by witnessing some training sessions and receiving a copy of all training class sign-in sheets and any training materials / handouts, to be provided by the CxC or Trade Subcontractors.

3. The CxA will develop the Systems Manual (per the LEED requirements), including the current facility requirements, preventative maintenance information and an ongoing Cx plan, with assistance from the GC and Trade Subcontractors.

4. The CxA will complete the Commissioning Report and all associated documentation for the Owner with assistance from the GC and Trade Subcontractors.

G. Post-Occupancy Warranty Phase Commissioning

1. The CxA will report any identified operational or performance issues (identified by the building O&M staff or warranty phase Cx activities) to the CxC via a Warranty Phase Cx Log for resolution by the GC and Trade Subcontractors during or prior to the end of the warranty period.

2. The Trade Subcontractors shall execute any defined seasonal or deferred FPTs, witnessed by the CxA.

3. The CxA may review and analyze trend data during the Warranty Phase and will report any identified issues and recommendations for system improvements from the trend analysis.

4. No later than either 10 months after substation completion or two months prior to the expiration of the first 12-month warranty period of building occupancy, the CxA will return to the facility to interview facility O&M staff, walk the facility and review systems operation and trend data where applicable. Key representatives from the GC and Trade Subcontractors shall attend a site walk-through and meeting, as determined by the CxA.

1.7. COMMISSIONING TEAM
A. The Commissioning Team is responsible for performing the process and achieving successful commissioning results. The Commissioning Team is comprised of the following:

1. Owner and Owner’s Representatives
2. Commissioning Authority (CxA).
3. Design Professionals
4. General Contractor (GC)
5. GC’s Commissioning Coordinator (CxC)
6. Trade Subcontractors responsible for systems covered in this section include:
   a. Mechanical Contractor
   b. BAS / HVAC Controls Contractor
   c. TAB Contractor
7. Manufacturer Representatives supplying equipment, materials, components and controls for the systems to be commissioned.

1.8. RESPONSIBILITIES

A. General.
   1. The Commissioning Team and all others involved in the commissioning process shall follow the Commissioning Plan, attend the commissioning kickoff meeting, and attend additional commissioning meetings as necessary.

B. Commissioning Authority (CxA)
   1. See Section 01910, General Commissioning Requirements.

C. General Contractor:
   1. See Section 01910, General Commissioning Requirements.

D. Trade Subcontractors – General Requirements:
   1. Provide and submit for CxA review, the representative blank forms and plans for completing all IV, Startup, and PFCT tasks, including manufacturer’s installation checks and startup procedures. Electronic files are acceptable.
   2. Provide any equipment and construction submittals and shop drawings, including detailed sequences of operation, and any other requested contract documentation for systems to be commissioned, as requested by the CxA. Electronic files are acceptable.
   3. Attend commissioning meetings as directed by the CxA and GC’s CxC to facilitate the commissioning process.
   4. Assign personnel with expertise and authority to act on behalf of the Trade Subcontractor and schedule them to participate in and perform assigned commissioning tasks.
   5. Ensure that any required manufacturer factory tests are performed and provide the factory test data and results where required.
      a. Perform IV, Startup and PFCT tasks for all systems and equipment (no sampling), unless the contract or design documents allow for sampling of these tasks.
      b. Complete all IV, Startup and PFCT documentation clearly and legibly.
      c. Submit all completed IV, Startup and PFCT forms to the CxC and CxA, as part of completing the SRC forms, for review by the CxA.
   7. Provide a schedule and access for the CxA to witness any equipment Startup and PFCT tasks. Notify the CxC and CxA at least 10 days in advance of Startup and PFCT tasks.
   8. Ensure that any required manufacturer’s representative field tests and on-site IV, startup and checkout of selected equipment are performed per the contract documents. Provide
completed manufacturer documentation and commissioning forms for these activities to the CxC.

9. Address applicable Cx issues promptly. All IV, Startup and PFCT issues must be resolved before the FPTs can proceed.

10. Assist the CxA in preparing the FPT procedures, clarifying the operation and control of commissioned equipment where the specifications, control drawings or equipment documentation are not sufficient for writing detailed testing procedures.

11. Review the FPT procedures to ensure feasibility, safety and equipment protection, and provide necessary written alarm limits, setpoint changes and overrides to be used during the tests.

12. Setup any additional control system software points, global commands, overrides of any sensor values or relays, and overrides of any setpoints or schedules, to simulate certain conditions and operating modes, in order to conduct the FPTs.

13. Perform the FPTs, with the FPTs witnessed by the CxA. Provide at least 10 days advance notice to the CxC and CxA for scheduling the FPTs.

14. The Division 23 and 25 Trade Subcontractors (Mechanical, TAB and BAS) are responsible for providing qualified and certified "Field Technicians" (per Title 24, Part 6 requirements, where applicable) to perform and document the results of the acceptance procedures (Acceptance Tests) on Certificate of Acceptance forms per Title 24, Part 6.

   a. The GC or the responsible Trade Subcontractor shall be the designated "Responsible Person" per Title 24, Part 6, for certification of the acceptance testing/verification on the Certificate of Acceptance forms (contained in Appendix A of the Title 24, Part 6 Compliance Manual).

15. Setup the BAS and any other control system trends and provide all requested Trend data for the FPTs and post-occupancy warranty phase commissioning review to the CxA.

   a. As an Owner approved alternative, the Trade Subcontractors may provide the CxA remote access to the BAS and any other control system, with the Owner's permission, which will allow the CxA to easily and directly download the trend data files.

16. Prepare a training agenda for each training class for the equipment and systems to be commissioned.

17. Coordinate with the GC and Owner to schedule and plan training. Execute training of Owner’s personnel per approved training agenda and schedule. Provide copies of training class sign-in sheets and materials / handouts.

18. Prepare O&M Manuals according to the Contract Documents.

19. Assist the CxA in developing the Systems Manual, including providing as-built drawings, controls sequences, setpoints, single-line diagrams, etc., necessary for the Systems Manual.

E. Trade Subcontractors – Specific Mechanical System Requirements

1. In addition to the general Trade Subcontractor responsibilities outlined above, the Mechanical Trade Subcontractor responsibilities during commissioning shall include, but are not limited to:

   a. Provide approved submittals, including shop drawings, control drawings, points list and detailed sequences of operation for each piece of equipment and system to be controlled (including any local, stand-alone controls independent of the BAS controls). The system sequence of operation shall fully describe their equipment components and functionality, including setpoints, failure modes and alarm functions. The detailed sequence of operation shall be provided regardless of the completeness and clarity of the sequences in the controls specification and/or drawings. Electronic files are acceptable.
b. Provide a list of any test metering and sensors to be used for sensor and device calibration purposes. All test meter and sensors shall have been calibrated within a year and have calibration documentation.

c. Submit the Duct Leakage Test Plan(s), for review by the CxA, at least 4 weeks in advance of conducting any required duct leakage pre-functional tests. The Plan shall include the following items:

   1) Floor plan drawings showing the duct section(s) to be tested.
   2) The total duct square footage for each duct section to be tested. Provide supporting calculations showing how the square footage was calculated for each duct section.
   3) The SMACNA duct leakage class for each duct section to be tested, per the project specifications or the SMACNA Duct Leakage Test Manual if not defined in the specifications.
   4) The intended test static pressure for each duct section.
   5) The calculated allowable leakage rate (cfm) for each duct section to be tested, based on the allowable leakage rate (per 100 square feet) from the SMACNA Duct Leakage Test Manual Figure 4-1 at the intended test pressure.
   6) Test fan orifice certificate of calibration sheet and chart showing the orifice pressure drop and airflow (cfm).

d. Submit any applicable Underfloor Air Distribution (UFAD) Leakage Test Plan(s), for review by the CxA, at least 4 weeks in advance of conducting any required UFAD leakage pre-functional tests. The Plan shall include the following items:

   1) Floor plan drawings showing the UFAD plenum(s) to be tested.
   2) For each UFAD plenum to be tested, provide the following:
      a) The plenum dimensions and calculated area (square footage).
      b) The acceptable maximum leakage criteria (cfm per square foot) for any required Category 1, Category 2 and Total Category 1 + 2 leakage, per the project specifications, and the associated absolute leakage rates (cfm) for each plenum. If the project specifications do not define the leakage criteria, the CxA shall define the leakage criteria with the Owner's approval.
   3) The specific tests procedures for each type of test (Category 1 or Total Category 1 + 2), including any associated temporary test taping or sealing to be performed prior to the tests, the plenum test static pressure, the plenum pressure measurement locations and manometers to be used, and any diagnostic procedures (such as smoke testing) to be performed upon tests not passing.
   4) Test fan orifice certificate of calibration sheet and chart showing the orifice pressure drop and airflow (cfm).

e. Submit a Hydronic Pipe System Pressure / Leak Test Plan for all applicable hydronic systems, for review by the CxA, at least 4 weeks in advance of conducting any required tests. The Test Plan shall include the section of pipe to be tested, and the test methods, pressures and durations.

f. Submit a Refrigeration Pipe Test Plans for all applicable refrigeration systems, for review by the CxA, at least 4 weeks in advance of conducting any required tests. The Plan shall include the refrigeration piping to be tested, methods and procedures, equipment and gases to be used, pressures and durations.

g. Submit a Clean, Flush and Treatment Plan for all applicable hydronic systems, for review by the CxA, at least 4 weeks in advance of filling any hydronic systems. The Plan shall include the following:

   1) The intended minimum durations for all pipe cleaning and flushing, and the associated cleaning agents and corrosion inhibitors to be used.
2) An outline of the water chemical treatment, analysis and testing to be performed after cleaning and flushing is complete. At a minimum, the following shall be included:

a) the proposed chemicals, corrosion inhibitors and biocides, to be added as part of the water treatment,

b) outlining the water chemistry analysis and corrosion testing to be conducted,

c) and the intended final water chemistry limits or ranges (including steel, iron and copper levels) to be achieved, in order to meet the specifications and any specific manufacturer requirements.

3) The timing for submitting the Water Treatment Analysis Reports for review by the Design Professional and CxA.

h. Submit Plans for all other applicable mechanical systems pre-functional testing, per the project specifications, for review at least 4 weeks in advance of any required tests.

i. Participate in any applicable integrated whole building tests under emergency power. This test is initiated by disconnecting the utility power to the building, and it will involve multiple disciplines. All Trade Subcontractors shall participate in the FPTs as required for operation of the inter-related systems.

F. Trade Subcontractors – Specific BAS and HVAC Controls Requirements

1. For the BAS and HVAC&R system controls (inclusive any local equipment factory provided controls or local stand-alone controls not part of the BAS), in addition to the general Trade Subcontractor responsibilities outlined above, the Mechanical and/or BAS Trade Subcontractor responsibilities during commissioning shall include, but are not limited to:

a. Provide approved submittals, including shop drawings, control drawings, points list and detailed sequences of operation for each piece of equipment and system to be controlled. The system sequence of operation shall fully describe their equipment components and functionality, including setpoints, failure modes and alarm functions. The detailed sequence of operation shall be provided regardless of the completeness and clarity of the sequences in the controls specification and/or drawings. Electronic files are acceptable.

b. Provide a complete control points list in MS Excel or other pre-approved format (for all BAS, local equipment provided, and local stand-alone control points). Points list shall include point name, point description, display units (i.e. degrees F, percent, psi), panel identification, point type (AI, AO, BI, BO, virtual/software), field device controlled (through network, dry contact, actuator limit switch or other specific equipment), BAS application or energy management function associated with point, and associated alarm points and parameters, etc. The BAS Trade Subcontractor shall make all points available for continuous trending.

c. Provide control system diagrams showing all control points, sensor locations, actuators, and controllers.

d. Provide a list of any test metering and sensors to be used for sensor and device verification and calibration purposes. The list shall include test meter and sensor accuracy for comparison to the BAS and local control system sensor accuracy requirements specified in contract documents. All test meter and sensors shall have been calibrated within a year and have calibration documentation.

e. Submit representative blank forms for conducting all BAS and HVAC System Controls IV and PFCT tasks to be conducted by the Trade Subcontractors, for review by the CxA, at least 4 weeks in advance of performing any controls related Controls IV and PFCT tasks. For local HVAC equipment factory provided or local stand-alone HVAC controls, these forms can be included in the equipment specific IV and Startup forms (for example, as part of the mechanical contractor’s or the manufacturer
representative’s IV and Startup forms for the specific equipment inclusive of all local controls). The forms shall include:

1) Installation verification checks of the control input and output points (sensors, actuators, relays, etc.) to verify all points have been installed per the points list and the physical installation of each point has been verified.

2) Control system program setup checks, e.g., point type, range/scale, etc.

3) Point-to-point checks with the BAS operating system software graphics or local controller display interface or graphics.

4) Sensor accuracy checks or calibration results:
   a) For analog input sensors that are factory calibrated (no field calibration is required per the Specifications):
      i. The control system program setup (as noted above) shall be verified and recorded in the PFCT forms for all sensors, and all sensor readings on the BAS graphics or local controller display shall be recorded on the PFCT forms and shall be checked by verifying the BAS reading is within the expected range.
      ii. Sensor readings that are questionable or outside the expected range shall be checked by the BAS or Mechanical Trade Subcontractor using a hand-held sensor of equal accuracy.
   b) For sensors that require field calibration, follow the manufacturer requirements for calibration and record the calibration results in the PFCT forms, including any readings using a hand-held sensor of equal accuracy.

5) Actuator checks:
   a) At a minimum, all actuators shall be physically checked at commanded full open position (100% open), commanded half-open position (50% open) and commanded fully closed position (0% open), and documented on the PFCT forms.

6) Verification of all local equipment control points integrated to the BAS via network interface communications (e.g., BACnet, Modbus, etc.), including both read only and writable points.

f. Submit the completed BAS and HVAC System Controls IV and PFCT forms for review by the CxA.

g. The BAS and/or the Mechanical Trade Subcontractor shall support commissioning by participating in the BAS and HVAC System Controls IV and PFCT Field Review & Back-check, in which the BAS and/or the Mechanical Trade Subcontractor reviews and demonstrates specified results to the CxA, after completing and submitting the BAS and HVAC System Controls IV and PFCT forms.

1) The BAS and HVAC System Controls IV and PFCT Field Review & Back-check shall include field review of the control system sensor / device installations and live readings, and also field demonstrations (back-check) of the pre-functional checks and tests performed by the Trade Subcontractors and witnessed by the CxA, for an approximate 10% to 30% sample, to be selected by the CxA for each major system, or what can be accomplished in 1 full day.

2) Any Cx issues reported by the CxA shall be reviewed and addressed by the BAS and Mechanical Trade Subcontractors, and if required, the PFCT forms shall be revised and resubmitted, prior to performing any FPTs.

h. The BAS Controls and Mechanical Trade Subcontractor shall configure all BAS or local control graphics and programming logic for the sequence of operations and associated setpoints, schedules, and alarms and verify the system operation, including the control loop tuning, prior to starting FPTs.
Prior to conducting the CxA witnessed FPTs, place the systems and controls into the operating modes intended for testing. Check all control system safety cutouts, alarms, and interlocks with smoke control and fire-life safety during each mode of operation prior to functional testing. Ensure all systems are operating and performing per the requirements of the contract and design documents, and have been pre-tested per the FPTs, and are ready for the CxA witnessed FPTs.

1) The Trade Subcontractors shall determine the appropriate level of pre-testing, to prepare for the CxA witnessed FPTs.

j. The BAS Trade Subcontractors shall provide any necessary control system global or system level commands and setpoint adjustments necessary to conduct the testing as called out in the FPT procedures.

k. The BAS Trade Subcontractor shall set up the appropriate trends per the Trend Setup Verification forms provided by the CxA and shall provide trend data into a usable electronic format files, such as a text, CSV or Excel format, to the CxA. The CxA will analyze and review the trend data as part of the FPT. These trends shall be setup prior to conducting any sequence of operation functional tests.

1) The trend points list may include both hardware (inputs, outputs) and virtual / software points.
2) The appropriate trend intervals and minimum duration will be provided by the CxA either in a Trend Setup Verification form or in the FPT forms.
3) As an Owner approved alternative, the BAS Trade Subcontractor may provide the CxA remote access to the control system, with Owner permission, that will allow the CxA to easily and directly download the trend data files.

l. The BAS Trade Subcontractor shall also provide trend data to the CxA during the post-occupancy warranty phase for review by the CxA, where required.

m. Participate in any applicable integrated whole building tests under emergency power. This test is initiated by disconnecting the utility power to the building, and it will involve multiple disciplines. All Trade Subcontractors shall participate in the FPTs as required for operation of the inter-related systems.

G. Trade Subcontractors – Specific TAB Requirements

1. In addition to the Trade Subcontractor responsibilities outlined above, the TAB Trade Subcontractor responsibilities during commissioning shall include, but are not limited to:

a. Submit a TAB Plan and Qualifications to the Design Professional and CxA for review, at least 4 weeks in advance of conducting any required TAB work, in addition to any other submittal requirements per the specifications. Electronic files are acceptable. The TAB Plan and Qualifications shall include the following:

1) An outline of the TAB procedures and approach for each system type. The TAB procedures and approach shall satisfy the contract documents and TAB specifications. If TAB procedures and approach are not defined in the contract documents or TAB specifications, then the TAB procedures and approach shall meet the requirements of NEBB Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems Section 7.3 (Preliminary TAB Procedures) and/or AABC National Standards Section 20.4 (Procedures).
2) A project specific list of the BAS control sequence of operation setpoints that will be determined by TAB, and the associated specific procedures to determine the BAS setpoints. The TAB Trade Subcontractor shall coordinate with the BAS Trade Subcontractor to obtain and review the sequence of operation.
3) The associated TAB forms and the drawings to be used in the TAB work. It’s recommended that the forms be pre-filled with all available project, site, and design parameters.
4) TAB contractor qualification certificates.
5) TAB instrument calibration certificates.

b. Provide access for the CxA to witness TAB work. Notify the CxC and CxA at least 10 days in advance of TAB work.
   1) Immediately report any issues and deficiencies discovered which may affect or delay the commissioning process.

c. Submit a Draft / Preliminary TAB Report with the completed field forms and data to the Design Professional and CxA for review, within 72 hours following completion of the TAB, and prior to any TAB Field Review & Back-check conducted with the CxA, and prior to conducting the FPTs. Respond to and address comments provided by the DP and CxA.

d. The TAB Trade Contractor shall support commissioning by participating in the commissioning TAB Field Review & Back-check, in which the TAB Trade Contractor demonstrates specified results to the CxA, after completion of the Draft TAB Report.
   1) The TAB Field Review & Back-check shall include field demonstrations of any final setpoints and back-check measurements of the air-side and water-side systems, performed by the TAB Trade Contractor and witnessed by the CxA and/or the Design Professional, for an approximate 10% to 30% sample to be selected by the CxA, or what can be accomplished in 1 full day.
   2) If the back-checks yield results that are outside the TAB tolerances for more than 10% of the sample, the TAB shall be considered incomplete.
   3) The TAB Field Review & Back-check measurements shall be recorded on the Final TAB Report or a separate form or appendix attached to the Final TAB Report, for documentation purposes.

e. Submit the Final TAB Report to the Design Professional and CxA for review after review of the Draft TAB Report and completion of TAB Field Review.

1.9. SUBMITTAL REQUIREMENTS FOR COMMISSIONING

A. Trade Subcontractor Commissioning Forms. The Trade Subcontractors shall submit to the CxA all applicable representative, blank forms and plans for IV, Startup and PFCT tasks for the project (as listed in 1.8 Trade Subcontractor Responsibilities), at least 4 weeks in advance of performing any of these tasks.
   1. The draft SRC forms issued by the CxA will list the required IV, Startup and PFCT forms and plans, required for this project. The Trade Subcontractor shall review the draft SRCs to ensure all applicable, representative IV, Startup and PFCT forms and plans have been submitted for the CxA review.
   2. The CxA will review these submitted commissioning forms including whether all project specific requirements are included.
   3. The CxA may request additional data, changes and/or additions to these forms to confirm application prior to their use. If the Trade Subcontractor cannot submit sufficient forms, the CxA will provide forms based on the construction documents and specifications, manufacturer installation manuals and procedures, and/or industry standards or guidelines.

B. Training Agenda. The Trade Subcontractors shall develop a Training Agenda for each training session, per the requirements of the contract documents and specifications, and the LEED Enhanced Commissioning requirements, and may include both operations and maintenance (O&M) staff training and occupant training. The Training Agenda shall be included in the comprehensive Training Plan to be submitted by the GC for review by the CxA, Design Professionals, and/or the Owner (see Section 01910, General Commissioning Requirements). The GC and Trade Subcontractors shall coordinate to fully develop the comprehensive Training Plan with input from the Owner.
1. The Training Agenda for each training session shall include the following:
   a. equipment and/or systems covered;
   b. recommended attendees;
   c. proposed location;
   d. estimated duration;
   e. level of instruction to be provided and an outline of the training topics and subjects to be covered;
   f. list of any materials and handouts to be provided (or provided in advance);
   g. company to provide the training and the instructor’s name and qualifications.

PART 2 - PRODUCTS – NOT USED

PART 3 - EXECUTION

3.1. MEETINGS, SCHEDULING AND COORDINATION
   A. See Section 01910, General Commissioning Requirements.

3.2. DOCUMENTATION
   A. The Trade Subcontractors have specific responsibilities for assisting in the development of equipment check, test and verification procedures and forms, and in performing and documenting commissioning tests, as directed by the CxC and as overseen by the CxA.
   B. The Trade Subcontractors shall provide, wherever the Contract Documents require, system checks and testing, test reports, factory test data and reports, checklists, operational verifications and demonstration, etc., whether specified or not in the commissioning sections.

3.3. TEST EQUIPMENT
   A. The Trade Subcontractor shall provide all test equipment in sufficient quantities to execute all Pre-Functional and Functional Performance Tests in an expedient fashion.
   B. The test equipment shall be of industrial quality and suitable for testing and calibration with accuracy within the tolerance necessary to demonstrate system performance per the Contract Documents. If not otherwise specified, the following minimum requirements apply:
      1. Temperature sensors and digital thermometers shall have a certified calibration within the past year to an accuracy of 0.5 degree F and a resolution to + or – 0.1 degree F.
      2. Pressure sensors shall have an accuracy of + or – 2.0 percent of the value range being measured (not full range of meter) and have been calibrated within the last year.
   C. The test equipment shall have calibration certification per equipment manufacturer’s interval level or within one year if not otherwise specified. The calibration tags shall be affixed or certificates readily available for all test equipment.

3.4. SYSTEM READINESS: INSTALLATION VERIFICATION, STARTUP, PRE-FUNCTIONAL CHECKS & TESTS
A. The Trade Subcontractors shall conduct all startup procedures and tests without compromise to human or equipment safety. The GC and Trade Subcontractors shall be responsible for the liability and safety of conducting all startup, checks and tests.

B. The Trade Subcontractors shall clearly identify and list any issues and deficiencies resulting from the IV, Startup and PFCT tasks on the associated forms and immediately notify the CxA. The CxA will additionally document the issues on the Cx Log. Once issues and deficiencies are corrected and verified, the associated forms shall be updated and resubmitted, and any necessary field review, back-checks or re-tests witnessed by the CxA.

C. The CxC and Trade Subcontractors shall provide a minimum 10 days’ notice to the CxA for witnessing equipment Startup and PFCT tasks.
   1. The sample rates for the CxA witnessing of duct and pipe system PFCT tasks and equipment startups, will be defined in the Cx Plan. For most tasks, the CxA will witness the first test for any applicable duct and/or supply plenum leakage testing and the first startup for each main equipment type.
   2. For the BAS Pre-Functional Checks and for TAB, the CxA will witness a Field Review & Back-check of each, as described in Part 1, Paragraph 1.8.

D. The GC and Trade Subcontractors shall ensure the completion of the SRC forms. Review and approval of the completed SRC forms by the CxA is required prior to conducting the FPTs.

3.5. FUNCTIONAL PERFORMANCE TESTS

A. The Trade Subcontractors shall perform all FPTs per the final FPT forms and complete the Title 24 Part 6 acceptance test requirements and Certificate of Acceptance forms, for all systems and equipment in the scope of commissioning. The FPTs shall be witnessed by the CxA. The Trade Subcontractors may need to complete off hours or weekend work in order to complete the FPTs.

B. The CxA will document all testing results on the FPT forms, not including the Title 24 Certificate of Acceptance forms. The completion of the Title 24 Certificate of Acceptance forms is a contractor responsibility.

C. As outlined in the Part 1 general commissioning process, a sampling approach shall be used for the FPTs of identical systems and equipment, using the sample rates as defined in the Cx Plan, with the specific systems and equipment selected by the CxA.

D. The Trade Subcontractors shall determine what level of pre-testing is appropriate in order to prepare for the CxA witnessed FPTs.

E. The CxC and Trade Subcontractors shall coordinate all FPTs with the CxA, and provide a minimum of 10 days’ notice prior to conducting each test.

F. The GC and Trade Subcontractors shall have responsibility for the liability and safety of conducting all functional performance tests.

G. The Trade Subcontractor executing the test shall provide all necessary materials, system modifications, etc. to produce the necessary flows, pressures, temperatures, etc. to execute the test according to the test procedures.
   1. The Trade Subcontractors shall provide any necessary control system global or system level commands and setpoint adjustments necessary to conduct the testing as called out in the FPT procedures. For example, globally adjusting the space temperature setpoints for
all terminal units on a floor or AHU or the building. Or as another example, globally overriding the economizer status command for all AHUs.

H. At completion of the test, the Trade Subcontractor shall return all affected building equipment and systems to their pre-test normal condition.

3.6. FUNCTIONAL PERFORMANCE TESTS – TREND ANALYSIS

A. The CxA may conduct trend analysis as part of the FPT process, after completion of the onsite field conducted FPTs and correction of all issues and deficiencies, to verify integrated system operation and performance.

B. The CxA will prepare a BAS trend points list including the trend interval. The BAS Trade Contractor shall set up the trend log definitions prior to the start of the sequence of operation FPTs.

C. The BAS Trade Subcontractor shall provide the trend to the CxA in an electronic format, either a text file, CSV file or Excel file, with related system parameters grouped together. The estimated duration for the trend data is 1 to 3 weeks (with a minimum of 1 weeks' worth of data).

D. If the CxA discovers any control or performance issues during trend analysis, the Trade Subcontractors shall correct the issues and provide new trend data for analysis verification by the CxA.

3.7. COMMISSIONING ISSUES, BACK-CHECKS AND RE-TESTS

A. When Cx issues are identified during testing, the CxA will discuss with the executing Trade Subcontractor and/or CxC and determine whether or not testing can proceed. The CxA may allow immediate correction of minor issues and deficiencies identified during testing. The Cx issue and any identified resolution will be documented on the test form in use in addition to the Cx Log.

B. The CxA will maintain and update the Cx Log, and document the issue resolution process. Copies will be distributed to the GC, Owner, and Trade Subcontractors as appropriate. The Trade Subcontractors shall provide updates and comments regarding issue status and resolution.

C. The Trade Subcontractors shall promptly correct all Cx issues. The responsible party shall correct the issue and inform the CxC and CxA of the resolution and completion date, and update the Cx Log accordingly (in the fields assigned for contractor updates).

D. The CxA will record completion on the Cx Log after a successful witnessed re-test, field review, back-check, verification obtained through appropriate documentation or photographs, or acceptance by the Design Professional or Owner. The CxC shall reschedule any applicable re-testing with the CxA and Trade Subcontractor. The Trade Subcontractor shall retest until achievement of passing performance or Owner acceptance of the noted issue.

1. Where sampling is used for the PFCTs and FPTs, the results shall be deemed acceptable once all noted issues are resolved and any new sample tests or checks have passed.

E. Additional parties may require input during a dispute regarding a Cx issue. Regardless of the validity or responsibility of the issue, the CxA will have the final interpretive authority on Cx issues and the Owner will have the final approval authority.

F. The CxA may recommend solutions to Cx issues. However, the GC and Trade Subcontractors ultimately have the burden of responsibility to solve, correct and perform required retests.
G. Back-checks, Verifications and Re-testing:
   1. The CxA will witness one (1) re-test or will perform one (1) field back-check or verification of any Cx issue.
   2. The CxA’s total onsite time for re-test witnessing and field verification or back-check of Cx issues will be limited to no more than 2 work days (full 8-hour work days) for all applicable systems in the commissioning scope.
   3. The Owner may back-charge the GC for any additional fees from the CxA, resulting from any additional re-testing or field back-checks or verification beyond this allocated total time.
   4. The CxC must provide a minimum 48 hours’ notice for scheduling any re-testing, though the CxA will attempt to accommodate a shorter timeframe if feasible.
   5. Any required re-testing shall not be considered a justified reason for a claim of delay or for a time extension.

H. For any re-testing required, the CxA will determine if the entire test must be re-tested or if it is acceptable to re-test specific portions of the test that had failed.

3.8. DEFERRED & SEASONAL TESTING

A. Before or during the end of the first year warranty period, the Trade Subcontractor shall complete any seasonal or deferred testing, required per the design specifications and as defined in the Cx Plan. The Trade Subcontractors shall complete tests in the same manner as all other commissioning tests, including CxA witnessing.

B. The CxC and Trade Subcontractor shall coordinate with CxA and Owner and schedule all deferred and seasonal testing.

3.9. TRAINING VERIFICATION

A. The CxC and Trade Subcontractors shall coordinate and schedule the training for the Owner’s facility and operations personnel, and building occupants. The CxC shall ensure that training is completed per the requirements of the contract documents and specifications.

B. Trade Subcontractors responsible for specific equipment and system training shall submit to the CxC, a written training agenda for each training class for the equipment and systems to be commissioned. The GC shall submit a comprehensive Training Plan, including the specific training agendas, to Owner, Design Professionals and CxA for review and approval. See also Section 01910, General Commissioning Requirements.

C. The CxA will review the Training Plans for commissioning verification prior to conducting the actual training.

D. For verification of actual training conducted, the CxC shall submit to CxA ‘attendee signed’ attendance sheets for each training session conducted and a copy of any final training presentations or handout materials.

3.10. COMMISSIONING ACCEPTANCE, CLOSE-OUT AND REPORTING

A. Completion of the main commissioning activities (system readiness checks, functional performance testing, and training) shall be accomplished as a prerequisite for substantial completion. Completion of any re-testing shall be completed prior to final acceptance of commissioning.
B. After completion of the main commissioning activities and following review of the completed commissioning documents, test results and the current Cx Log with the Owner, the Owner will indicate whether they accept completion of the project construction phase commissioning or if not, the requirements for acceptance. Upon Owner acceptance, any remaining open Cx issues will be transferred to the warranty phase Cx Log for tracking resolution and completion as part of the warranty phase commissioning.

C. Upon completion of all commissioning activities, the CxA will prepare and submit to the Owner a Cx Report detailing all completed commissioning activities and documentation. The CxC shall support this effort by providing all GC and Trade Subcontractor commissioning documentation.

D. The CxA will complete a Systems Manual for the systems and equipment commissioned, following the LEED requirements, with assistance provided by the CxC and Trade Subcontractors. The Systems Manual will provide the operating staff the information needed to understand and optimally operate the commissioned systems. It will also include the current facility requirements, O&M preventative maintenance information, and an ongoing commissioning plan. Per LEED enhanced commissioning requirements, the Systems Manual will contain the following sections and detail:

1. Current facility requirements including the final version of the BOD and systems narrative.
2. Final equipment list.
3. Systems single line diagrams or schematics.
4. Final as-built sequence of operations, control drawings (P&IDs), points lists and setpoints.
5. Additional operating instructions for key systems or integrated building systems such as water-side and air-side HVAC systems and controls, lighting controls, etc.
6. Recommended schedule of major preventative maintenance requirements and frequency.
7. Ongoing Cx Plan
   a. Definition of the ongoing commissioning process, defined roles and responsibilities, a recommended schedule for recommissioning the systems;
   b. Recommended schedule for retesting of commissioned systems with blank test forms from the Final Commissioning Plan.
   c. Recommended schedule for calibrating sensors and actuators.

3.11. POST-OCCUPANCY WARRANTY PHASE COMMISSIONING

A. The Trade Subcontractors shall execute any defined seasonal or deferred FPTs, witnessed by the CxA.

B. The CxA may review BAS trend data during the Warranty Phase. The BAS Trade Contractor shall be responsible for providing post-occupancy trend data to the CxA.

C. The CxA will report any identified issues and recommendations to the CxC via a Warranty Phase Cx Log for review and resolution by the GC and Trade Subcontractors prior to the end of the warranty period, for any issues or recommendations identified either by the CxA or the Owner. The CxC shall work with the Trade Subcontractors and O&M staff to make corrections and adjustments as required to address the issues and recommendations.

D. Key representatives from the GC and Trade Subcontractors shall attend a near end of warranty commissioning review meeting, to be scheduled with the Owner’s facility staff and the CxA, no later than either 10 months after substation completion or two months prior to the expiration of the first 12-month warranty period of building occupancy.

1. During this meeting, the operation of the systems will be discussed with the Owner’s staff, the results of any commissioning trend analysis will be reviewed and the Warranty Phase
Cx Log will be reviewed. If needed, a walk-through of the systems with the Owner’s staff will be conducted.

2. Next steps and actions items for any open Cx issues and recommendations will be discussed and documented via meeting minutes or a field report issued by the CxA. The intent is to resolve any open Cx issues prior to the end of the warranty phase.

E. After correcting noted Warranty Phase Cx issues, the CxC shall notify the CxA, and the CxA will back-check and verify resolution of the issues and recommendations.

F. Issues identified during the warranty period will remain warranty phase Cx issues until satisfactory completion by Trade Subcontractors, even if the warranty period expires during the correction and back-check period.

END OF SECTION
SECTION 232113 - HYDRONIC PIPING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. SECTION INCLUDES

1. Chilled and Heating Hot Water piping, above grade.
2. Chilled and Heating Hot Water piping, buried.
3. Pipe hangers and supports.
4. Unions, flanges, mechanical couplings, and dielectric connections.

B. Related Requirements:

1. Section 230523 “General Duty Valves for HVAC Piping”.
2. Section 232116 “Hydronic Piping Specialties”.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of the following:

1. Pipe.
2. Fittings.

B. Sustainable Design Submittals:

1. Product Data: For adhesives, indicating VOC content.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Piping layout, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:

1. Suspended ceiling components.
2. Other building services.
3. Structural members.
4. Interior wall and soffit framing

B. Qualification Data: For Installer.

C. Welding certificates.

D. Field quality-control reports.
1.5 QUALITY ASSURANCE

A. Installer Qualifications:
   1. Installers of Pressure-Sealed Joints: Installers shall be certified by pressure-seal joint
      manufacturer as having been trained and qualified to join piping with pressure-seal pipe
      couplings and fittings.

B. Steel Support Welding: Qualify procedures and personnel according to AWS D1.1/D1.1M,
   "Structural Welding Code - Steel."

C. Pipe Welding: Qualify procedures and operators according to ASME Boiler and Pressure Vessel
   Code: Section IX.
   1. Comply with ASME B31.9, "Building Services Piping," for materials, products, and
      installation.
   2. Certify that each welder has passed AWS qualification tests for welding processes involved
      and that certification is current.
   3. Certificate described above is not valid unless it has been issued while welder was working
      for his current employer, and unless welder has performed type of work described by
      certificate in preceding 3 months.

D. The Owner's Representative reserves the right to test the work of any welder employed on the
   project, at the Owner's expense. If the work of the welder is found to be unsatisfactory, the welder
   shall be prevented from doing further welding on the project and all defective welds replaced.

E. The Owner may, at the Owner's expense, initially x-ray inspect welds in accordance with ANSI
   B31.9. Welds not in conformance will be replaced by the contractor at his expense. Costs of x-
   raying the new weld will be borne by the contractor.

1.6 WARRANTY

A. Manufacturer shall warrant pipe and fittings for 10 years to be free of defects in materials or
   workmanship.

B. Warranty shall cover labor and material costs of repairing and/or replacing defective materials
   and repairing any incidental damage caused by failure of the piping system due to defects in
   materials or workmanship.

PART 2 - PRODUCTS

2.1 HYDRONIC SYSTEM REQUIREMENTS

A. Comply with ASME B31.9 and applicable federal, state, and local regulations.

B. Piping: Provide piping, fittings, hangers and supports as required, as indicated, and as follows:
   1. Where more than one piping system material is specified, provide joining fittings that are
      compatible with piping materials and ensure that the integrity of the system is not
      jeopardized.
   2. Use non-conducting dielectric connections whenever jointing dissimilar metals.
   3. Provide pipe hangers and supports in accordance with ASME B31.9 or MSS SP-58 unless
      indicated otherwise.
4. Pipe elbows shall be long radius (1.5 diameter fittings).

C. Pipe-to-Valve and Pipe-to-Equipment Connections: Use flanges, unions, or grooved couplings to allow disconnection of components for servicing; do not use direct welded, soldered, or threaded connections.

D. Valves: Provide valves where indicated.

E. Piping shall be made in America.

F. Hydronic piping components and installation shall be capable of withstanding the following minimum working pressure and temperature unless otherwise indicated:
   1. Heating Hot Water Heating Piping: 125 psig at 200 deg F.
   2. Chilled Water Piping: 150 psig at 120 deg F.
   3. Condensate-Drain Piping: 120 deg F.
   4. Air-Vent Piping: 200 deg F.
   5. Safety-Valve-Inlet and -Outlet Piping: Equal to the pressure of the piping system to which it is attached.

2.2 COPPER TUBE AND FITTINGS

A. Drawn-Temper Copper Tubing: ASTM B 88, Type L (ASTM B 88M, Type B).

B. Annealed-Temper Copper Tubing: ASTM B 88, Type K (ASTM B 88M, Type A).

C. DWV Copper Tubing: ASTM B 306, Type DWV.

D. Wrought-Copper Fittings and Unions: ASME B16.22.

2.3 STEEL PIPE AND FITTINGS

A. Steel Pipe: ASTM A 53/A 53M, black steel with plain ends; welded and seamless, Grade B, and wall thickness as indicated in "Piping Applications" Article.

B. Cast-Iron Threaded Fittings: ASME B16.4; Classes 125 and 250 as indicated in "Piping Applications" Article.

D. Malleable-Iron Unions: ASME B16.39; Classes 150, and 300 as indicated in "Piping Applications" Article.

E. Cast-Iron Pipe Flanges and Flanged Fittings: ASME B16.1, Classes 125, and 250; raised ground face, and bolt holes spot faced as indicated in "Piping Applications" Article.

F. Wrought-Steel Fittings: ASTM A 234/A 234M, wall thickness to match adjoining pipe.

G. Wrought Cast- and Forged-Steel Flanges and Flanged Fittings: ASME B16.5, including bolts, nuts, and gaskets of the following material group, end connections, and facings:
   2. End Connections: Butt welding.
2.4 JOINING MATERIALS

A. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.
   1. ASME B16.21, nonmetallic, flat, asbestos free, 1/8-inch maximum thickness unless otherwise indicated.
      a. Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.
      b. Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.

B. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.

C. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.

D. Welding Filler Metals: Comply with AWS D10.12M/D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

2.5 UNIONS, FLANGES, MECHANICAL COUPLINGS, AND DIELECTRIC CONNECTIONS

A. Unions for Pipe 2 inches and Under:

B. Flanges for Pipe Over 2 inches:

C. Mechanical Couplings for Grooved and Shouldered Joints: Two or more curved housing segments with continuous key to engage pipe groove, circular C-profile gasket, and bolts to secure and compress gasket.
   1. Dimensions and Testing: In accordance with AWWA C606.
   2. Mechanical Couplings: Comply with ASTM F1476.
   4. When pipe is field grooved, provide coupling manufacturer’s grooving tools.

D. Dielectric Connections: Red brass dielectric nipple.

PART 3 - EXECUTION

3.1 PREPARATION

A. Ream pipe and tube ends. Remove burrs. Bevel plain end ferrous pipe.

B. Prepare pipe for grooved mechanical joints as required by coupling manufacturer.

C. Remove scale and dirt on inside and outside before assembly.

D. Prepare piping connections to equipment using jointing system specified.

E. Keep open ends of pipe free from scale and dirt. Protect open ends with temporary plugs or caps.
3.2 INSTALLATION

A. Install in accordance with manufacturer’s instructions.

B. Pipe elbows shall be long radius (1.5 diameter fittings).

C. Route piping in orderly manner, parallel to building structure, and maintain gradient.

D. Install piping to conserve building space and to avoid interfere with use of space.

E. Group piping whenever practical at common elevations.

F. Slope piping and arrange to drain at low points.

G. Install piping to permit valve servicing.

H. Install piping to allow application of insulation.

I. Select system components with pressure rating equal to or greater than system operating pressure.

J. Install unions in piping, NPS 2-1/2 and smaller, adjacent to valves, at final connections of equipment, and elsewhere as indicated.

K. Install flanges in piping, NPS 3 and larger, at final connections of equipment and elsewhere as indicated.

L. Install dielectric fittings in piping at connections of dissimilar metal piping and tubing.

M. Install shutoff valve immediately upstream and downstream of each dielectric fitting.

N. Comply with requirements in Section 230516 "Expansion Fittings and Loops for HVAC Piping" for installation of expansion loops, expansion joints, anchors, and pipe alignment guides.

O. Comply with requirements in Section 230553 "Identification for HVAC Piping and Equipment" for identifying piping.

P. Provide access where valves and fittings are not exposed. Coordinate size and location of access doors with Division 01.

Q. Install sleeves for piping penetrations of walls, ceilings, and floors. Comply with requirements for sleeves specified in Section 230000.

R. Install sleeve seals for piping penetrations of concrete walls and slabs. Comply with requirements for sleeve seals specified in Section 230000.

S. Install escutcheons for piping penetrations of walls, ceilings, and floors. Comply with requirements for escutcheons specified in Section 230000.
3.3 TERMINAL EQUIPMENT CONNECTIONS

A. Sizes for supply and return piping connections shall be the same as or larger than equipment connections.

B. Install control valves in accessible locations close to connected equipment.

C. Install ports for pressure gages and thermometers at coil inlet and outlet connections. Comply with requirements in Section 230519 "Meters and Gauges for HVAC Piping."

3.4 ADJUSTING

A. Mark calibrated nameplates of pump discharge valves after hydronic system balancing has been completed, to permanently indicate final balanced position.

B. Perform these adjustments before operating the system:
   1. Open valves to fully open position. Close coil bypass valves.
   2. Check pump for proper direction of rotation.
   3. Set automatic fill valves for required system pressure.
   4. Check air vents at high points of system and determine if all are installed and operating freely (automatic type), or bleed air completely (manual type).
   5. Set temperature controls so all coils are calling for full flow.
   6. Check operation of automatic bypass valves.
   7. Check and set operating temperatures of boilers, chillers, and cooling towers to design requirements.
   8. Lubricate motors and bearings.

3.5 HANGERS AND SUPPORTS

A. Comply with requirements in Section 230529 "Hangers and Supports for HVAC Piping and Equipment" for hanger, support, and anchor devices. Comply with the following requirements for maximum spacing of supports.

B. Comply with requirements in Section 230548 "Vibration and Seismic Controls for HVAC" for seismic restraints.

C. Install the following pipe attachments:
   1. Adjustable steel clevis hangers for individual horizontal piping less than 20 feet long.
   2. Adjustable roller hangers and spring hangers for individual horizontal piping 20 feet or longer.
   3. Pipe Roller: MSS SP-58, Type 44 for multiple horizontal piping 20 feet or longer, supported on a trapeze.
   4. Spring hangers to support vertical runs.
   5. Provide copper-clad hangers and supports for hangers and supports in direct contact with copper pipe, or steel hangers with felt insert.

D. Install hangers for steel piping with the following maximum spacing 3/8 inch minimum rod size:
   1. NPS 3/4: Maximum span, 10 feet.
   2. NPS 1: Maximum span, 12 feet.
   3. NPS 1-1/2: Maximum span, 12 feet.
   4. NPS 2: Maximum span, 12 feet.
5. NPS 2-1/2: Maximum span, 12 feet.
6. NPS 3 and Larger: Maximum span, 12 feet.

E. Install hangers for drawn-temper copper piping with the following maximum spacing and 3/8 inch minimum rod sizes:
   1. NPS 3/4: Maximum span, 6 feet.
   2. NPS 1: Maximum span, 6 feet.
   3. NPS 1-1/4: Maximum span, 6 feet.
   4. NPS 1-1/2: Maximum span, 6 feet.
   5. NPS 2: Maximum span, 10 feet.
   6. NPS 2-1/2: Maximum span, 10 feet.
   7. NPS 3 and Larger: Maximum span, 10 feet.

3.6 CLEANING

A. Flush hydronic piping systems with clean water. Remove and clean or replace strainer screens. After cleaning and flushing hydronic piping systems, but before balancing, remove disposable fine-mesh strainers in pump suction diffusers.

3.7 FIELD QUALITY CONTROL

A. Prepare hydronic piping according to ASME B31.9 and as follows:
   1. Leave joints, including welds, uninsulated and exposed for examination during test.
   2. Provide temporary restraints for expansion joints that cannot sustain reactions due to test pressure. If temporary restraints are impractical, isolate expansion joints from testing.
   3. Isolate equipment from piping. If a valve is used to isolate equipment, its closure shall be capable of sealing against test pressure without damage to valve. Install blinds in flanged joints to isolate equipment.
   4. Install safety valve, set at a pressure no more than one-third higher than test pressure, to protect against damage by expanding liquid or other source of overpressure during test.

B. Perform the following tests on hydronic piping:
   1. Use ambient temperature water as a testing medium unless there is risk of damage due to freezing. Another liquid that is safe for workers and compatible with piping may be used.
   2. While filling system, use vents installed at high points of system to release air. Use drains installed at low points for complete draining of test liquid.
   3. Isolate expansion tanks and determine that hydronic system is full of water.
   4. Subject piping system to hydrostatic test pressure that is not less than 1.5 times the system's working pressure. Test pressure shall not exceed maximum pressure for any vessel, pump, valve, or other component in system under test. Verify that stress due to pressure at bottom of vertical runs does not exceed 90 percent of specified minimum yield strength or 1.7 times the "SE" value in Appendix A in ASME B31.9, "Building Services Piping."
   5. After hydrostatic test pressure has been applied for at least 10 minutes, examine piping, joints, and connections for leakage. Eliminate leaks by tightening, repairing, or replacing components, and repeat hydrostatic test until there are no leaks.
   6. Prepare written report of testing.

C. Perform the following before operating the system:
   1. Open manual valves fully.
   2. Inspect pumps for proper rotation.
3. Set makeup pressure-reducing valves for required system pressure.
4. Inspect air vents at high points of system and determine if all are installed and operating freely (automatic type), or bleed air completely (manual type).
5. Set temperature controls so all coils are calling for full flow.
6. Inspect and set operating temperatures of hydronic equipment, such as boilers, chillers, cooling towers, to specified values.
7. Verify lubrication of motors and bearings.

END OF SECTION
**SECTION 232116 - HYDRONIC PIPING SPECIALTIES**

**PART 1 - GENERAL**

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes special-duty valves and specialties for the following:
   2. Relief valves.
   3. Air vents.
   4. Air separators.
   5. Expansion tanks.
   7. Strainers.
   8. Pressure-temperature test plugs.
   9. Connectors.

B. Related Requirements:
   1. Section 230523 “General Duty Valves for HVAC Piping”.
   2. Section 232113 “Hydronic Piping”.
   3. Division 25 for automatic control valve and sensor specifications, installation requirements, and locations.

1.3 ACTION SUBMITTALS

A. Operation and Maintenance Data: to include in emergency, operation, and maintenance manuals.

1.4 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: to include in emergency, operation, and maintenance manuals.

1.5 QUALITY ASSURANCE

A. Pipe Welding: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code: Section IX.
   1. Safety valves and pressure vessels shall bear the appropriate ASME label. Fabricate and stamp air separators and expansion tanks to comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
PART 2 - PRODUCTS

2.1 BALANCING VALVES

A. Manufacturers:
   1. Armstrong International, Inc
   2. ITT Bell & Gossett
   3. Taco, Inc.

B. Bronze, Calibrated-Orifice, Balancing Valves:
   1. Body: Bronze, ball or plug type with calibrated orifice or venturi.
   2. Ball: Brass or stainless steel.
   3. Plug: Resin.
   4. Seat: PTFE.
   5. End Connections: Threaded or socket.
   7. Handle Style: Lever, with memory stop to retain set position.
   8. CWP Rating: Minimum 125 psig.
   9. Maximum Operating Temperature: 250 deg F.

C. Cast-Iron or Steel, Calibrated-Orifice, Balancing Valves:
   1. Body: Cast-iron or steel body, ball or butterfly pattern with calibrated orifice or venturi.
   2. Ball: Brass or stainless steel.
   4. Disc: Glass and carbon-filled PTFE.
   5. Seat: PTFE.
   6. End Connections: Flanged or grooved.
   8. Handle Style: Lever, with memory stop to retain set position.
  10. Maximum Operating Temperature: 250 deg F.

2.2 RELIEF VALVES

   1. Manufacturers:
      a. Tyco Flow Control.
      b. Armstrong International, Inc.
      c. ITT Bell & Gossett.
   2. Body: Bronze or brass.
   3. Disc: Glass and carbon-filled PTFE.
   5. Stem Seals: EPDM O-rings.
   6. Diaphragm: EPT.
   9. Valve Size, Capacity, and Operating Pressure: Comply with ASME Boiler and Pressure Vessel Code: Section IV, and selected to suit system in which installed, with operating pressure and capacity factory set and field adjustable.
2.3 AIR VENTS

A. Manufacturers:
   1. Armstrong International, Inc
   2. ITT Bell & Gossett
   3. Taco, Inc.

B. Manual Air Vents:
   1. Body: Bronze.
   2. Internal Parts: Nonferrous.
   3. Operator: Screwdriver or thumbscrew.
   4. Inlet Connection: NPS 1/2.
   7. Maximum Operating Temperature: 225 deg F.

C. Automatic Air Vents:
   1. Body: Bronze or cast iron.
   2. Internal Parts: Nonferrous.
   4. Inlet Connection: NPS 1/2.
   7. Maximum Operating Temperature: 240 deg F.

2.4 EXPANSION TANKS:

A. Bladder-Type Expansion Tanks:
   1. Manufacturers:
      a. Amtrol Inc.
      b. ITT Bell & Gossett.
      c. Taco, Inc.
   2. Tank: Welded steel, rated for 125-psig working pressure and 375 deg F maximum operating temperature. Factory test after taps are fabricated and supports installed and are labeled according to ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
   3. Bladder: Securely sealed into tank to separate air charge from system water to maintain required expansion capacity.
   5. Tank drain.

2.5 BUFFER TANKS

A. Manufacturers:
   1. Wessels.
   2. Niles Steel Tank.

B. Tank: Welded steel, rated for 125-psig working pressure. Factory test after taps are fabricated and supports installed and are labeled according to ASME Boiler and Pressure Vessel Code: Section VIII, Division 1.
1. Provide drain.

C. Supports: Factory-fabricated steel legs or steel skirt, welded to tank before testing and labeling. Fabricate supports and attachments to tank with reinforcement strong enough to resist tank movement during seismic event when tank supports are anchored to building structure. Lifting lugs.

2.6 AIR SEPARATORS:

A. In-Line Air Separators:
1. Manufacturers:
   b. ITT Bell & Gossett.
   c. Taco, Inc.
2. Tank: One-piece cast iron with an integral weir constructed to decelerate system flow to maximize air separation.
4. Maximum Operating Temperature: Up to 300 deg F.

2.7 STRAINERS

A. Y-Pattern Strainers:
1. Body: ASTM A126, Class B, cast iron with bolted cover and bottom drain connection.
2. End Connections: Threaded ends for NPS 2 and smaller; flanged ends for NPS 2-1/2 and larger.
4. CWP Rating: 175 psi.

B. Grooved Joint Strainers:
1. Body: ASTM A536, ductile iron with access cap.
2. Coupling Gasket: Grade E EPDM.
3. Strainer Screen: Type 304 stainless-steel perforated screen.
4. CWP Rating: 750 psi.
5. Horizontal or vertical mounting.
6. Use with Grooved Joint System only.

2.8 PRESSURE-TEMPERATURE TEST PLUGS

A. Construction: Brass body designed to receive temperature or pressure probe with removable protective cap, and EPDM rated for minimum 200 deg F.

B. Use extended length plugs to clear insulated piping.

2.9 CONNECTORS

A. Stainless-Steel Bellow, Flexible Connectors:
2. End Connections: Threaded or flanged to match equipment connected.
4. CWP Rating: 150 psig.
5. Maximum Operating Temperature: 250 deg F.

PART 3 - EXECUTION

3.1 VALVE APPLICATIONS

A. Install safety valves at hot-water generators and elsewhere as required by ASME Boiler and Pressure Vessel Code. Install drip-pan elbow on safety-valve outlet and pipe without valves to the outdoors; pipe drain to nearest floor drain or as indicated on Drawings. Comply with ASME Boiler and Pressure Vessel Code: Section VIII, Division 1, for installation requirements.

3.2 HYDRONIC SPECIALTIES INSTALLATION

A. Install manual air vents at high points in piping, at heat-transfer coils, and elsewhere as required for system air venting.

B. Install automatic air vents at high points of system piping in mechanical equipment rooms only. Install manual vents at heat-transfer coils and elsewhere as required for air venting.

C. Install piping from boiler air outlet, air separator, or air purger to expansion tank with a 2 percent upward slope toward tank.

D. Install expansion tanks on the floor. Vent and purge air from hydronic system, and ensure that tank is properly charged with air to suit system Project requirements.

E. Install flexible connectors on suction and discharge sides of base-mounted pumps between pump casing and valves.

F. Install strainers on supply side of each control valve, pressure reducing valve, solenoid valve, in-line pump, and elsewhere as indicated. Install NPS ¾ nipple and ball valve in blow-down connection of strainers NPS 2 and larger. Match size of strainer blow-off connection for strainers smaller than NPS 2.

END OF SECTION
SECTION 232123 - HYDRONIC PUMPS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
   A. Section Includes:
   B. Related Requirements:
      1. Section 230523 “General Duty Valves for HVAC Piping”.
      2. Section 232113 “Hydronic Piping”.
      3. Section 232116 “Hydronic Piping Specialties”.

1.3 ACTION SUBMITTALS
   A. Product Data: For each type of pump. Include certified performance curves and rated capacities, operating characteristics, furnished specialties, final impeller dimensions, and accessories for each type of product indicated. Indicate pump’s operating point on curves.
   B. Shop Drawings: For each pump.
      1. Show pump layout and connections.
      2. Include setting drawings with templates for installing foundation and anchor bolts and otheranchorages.
      3. Include diagrams for power, signal, and control wiring.

1.4 CLOSEOUT SUBMITTALS
   A. Operation and Maintenance Data: For pumps to include in emergency, operation, and maintenance manuals.

1.5 MAINTENANCE MATERIAL SUBMITTALS
   A. Furnish extra materials described below that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
      1. Mechanical Seals: One mechanical seal(s) for each pump.
PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

A. Manufacturers:
   1. Armstrong Pumps Inc.
   2. ITT Bell & Gossett.
   3. Taco.

B. Provide pumps that operate at specified system fluid temperatures without vapor binding and cavitation, are non-overloading in parallel or individual operation, and operate within 25 percent of midpoint of published maximum efficiency curve.

C. Listed and classified by UL or testing agency acceptable to authority having jurisdiction as suitable for the purpose specified and indicated.

D. Motors: Include built-in, thermal-overload protection and grease-lubricated ball bearings. Select each motor to be nonoverloading over full range of pump performance curve. See Section 23 05 13 “General Motor Requirements for HVAC”.

E. Coupling: Where a variable frequency drive is specified, provide a pump coupling rated for reduction in operational speed down to 25% (15 Hz).

2.2 CLOSE-COUPLED, END-SUCTION CENTRIFUGAL PUMPS

A. Description: Factory-assembled and tested, centrifugal, overhung-impeller, close-coupled, end-suction pump as defined in HI 1.1-1.2 and HI 1.3; designed for installation with pump and motor shafts mounted horizontally.

B. Pump Construction:
   1. Casing: Radially split, cast iron, with drain plug at bottom and air vent at top of volute, threaded gage tappings at inlet and outlet, and flanged connections.
   2. Impeller: ASTM B584, cast bronze; statically and dynamically balanced, keyed to shaft, and secured with a locking cap screw.
   4. Seal: Mechanical seal, 225 deg F maximum continuous operating temperature.
   5. Pump Bearings: Permanently lubricated ball bearings.
   6. Baseplate: Cast iron or fabricated steel with integral drain rim.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine equipment foundations and anchor-bolt locations for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for piping systems to verify actual locations of piping connections before pump installation.
C. Examine foundations and inertia bases for suitable conditions where pumps are to be installed.
D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PUMP INSTALLATION
A. Install pumps to provide access for periodic maintenance including removing motors, impellers, couplings, and accessories.
B. Independently support pumps and piping so weight of piping is not supported by pumps and weight of pumps is not supported by piping.
C. Equipment Mounting:
   1. Install pumps on cast-in-place concrete equipment bases. Comply with requirements for equipment bases and foundations specified in Division 03.
   2. Comply with requirements for vibration isolation and seismic control devices specified in Section 230548 “Vibration and Seismic Controls for HVAC.”

3.3 CONNECTIONS
A. Where installing piping adjacent to pump, allow space for service and maintenance.
B. Connect piping to pumps. Install valves that are same size as piping connected to pumps.
C. Install suction and discharge pipe sizes equal to or greater than diameter of pump nozzles.
D. Install flexible connectors on suction and discharge sides of base-mounted pumps between pump casing and valves.
E. Install pressure gages on pump suction and discharge or at integral pressure-gage tapping, or install single gage with multiple-input selector valve.
F. Ground equipment according to Division 26.
G. Connect wiring according to Division 26.

3.4 STARTUP SERVICE
A. Perform startup service
   1. Complete installation and startup checks according to manufacturer’s written instructions.
   2. Check piping connections for tightness.
   3. Clean strainers on suction piping.
   4. Perform the following startup checks for each pump before starting:
      a. Verify bearing lubrication.
      b. Verify that pump is free to rotate by hand and that pump for handling hot liquid is free to rotate with pump hot and cold. If pump is bound or drags, do not operate until cause of trouble is determined and corrected.
      c. Verify that pump is rotating in the correct direction.
   5. Prime pump by opening suction valves and closing drains, and prepare pump for operation.
7. Open discharge valve slowly.

3.5 DEMONSTRATION

A. Train Owner’s maintenance personnel to adjust, operate, and maintain hydronic pumps.

END OF SECTION
SECTION 232500 - HVAC WATER TREATMENT

PART 1 – GENERAL

1.1 SUMMARY
   A. Section includes the following HVAC water-treatment systems:
      1. Chemical-feed equipment and controls.

1.2 ACTION SUBMITTALS
   A. Product Data: Include rated capacities, operating characteristics, and furnished specialties and accessories for chemical treatment equipment, materials, and chemicals.
   B. Shop Drawings: Pretreatment and chemical treatment equipment showing tanks, maintenance space required, and piping connections to HVAC systems. Include plans, elevations, sections, attachment details and diagrams for power and control wiring.

1.3 INFORMATIONAL SUBMITTALS
   A. Water Analysis Provider Qualifications: Verification of experience and capability of HVAC water-treatment service provider.
   B. Field quality-control reports.
   C. Other Informational Submittals:
      1. Water-Treatment Program: Written sequence of operation on an annual basis for the application equipment required to achieve water quality defined in "Performance Requirements" Article.

1.4 CLOSEOUT SUBMITTALS
   A. Operation and Maintenance Data: For chemical treatment system to include in emergency, operation, and maintenance manuals.

1.5 QUALITY ASSURANCE
   A. HVAC Water-Treatment Service Provider Qualifications: An experienced HVAC water-treatment service provider capable of analyzing water qualities, installing water-treatment equipment, and applying water treatment as specified in this Section.

1.6 WARRANTY
   A. Warranty Period: Two years from date of Substantial Completion on equipment.
PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Water quality for HVAC systems shall minimize corrosion, scale buildup, and biological growth for optimum efficiency of HVAC equipment without creating a hazard to operating personnel or to the environment.

B. Base HVAC water treatment on quality of water available at Project site, HVAC system equipment material characteristics and functional performance characteristics, operating personnel capabilities, and requirements and guidelines of authorities having jurisdiction.

C. Closed hydronic systems:
   1. Sequestering agent to reduce deposits and adjust pH; polyphosphate.
   2. Corrosion inhibitors; boron-nitrite, sodium nitrite and borax, sodium tolyltriazole, low molecular weight polymers, phosphonates, sodium molybdate, or sulphites.
   3. Conductivity enhancers; phosphates or phosphonates.

2.2 CHEMICAL-FEED EQUIPMENT

A. Bypass Feeders: Steel, with corrosion-resistant exterior coating. Quarter turn or threaded fill cap with gasket seal and diaphragm to lock the top on the feeder when exposed to system pressure in the vessel.

2.3 CHEMICALS

A. Chemicals shall be as recommended by water-treatment system manufacturer that are compatible with piping system components and connected equipment and that can attain water quality specified in "Performance Requirements" Article.

PART 3 - EXECUTION

3.1 WATER ANALYSIS

A. Perform an analysis of supply water to determine quality of water available at Project site.

3.2 INSTALLATION

A. Install chemical application equipment on concrete bases level and plumb. Maintain manufacturer's recommended clearances. Arrange units so controls and devices that require servicing are accessible. Anchor chemical tanks and floor-mounting accessories to substrate.

B. Install seismic restraints for equipment and floor-mounting accessories and anchor to building structure. See Section 230548 "Vibration and Seismic Controls for HVAC" for seismic restraints.
C. Install water-testing equipment on wall near water-chemical-application equipment.

D. Install interconnecting control wiring for chemical treatment controls and sensors.

E. Bypass Feeders: Install in closed hydronic systems and equipped with the following:
   1. Install bypass feeder in a bypass circuit around circulating pumps unless otherwise indicated on Drawings.
   2. Install water meter in makeup-water supply.
   3. Install test-coupon assembly in bypass circuit around circulating pumps unless otherwise indicated on Drawings.
   4. Install a gate or full-port ball isolation valves on inlet, outlet, and drain below feeder inlet.
   5. Install a swing check on inlet after the isolation valve.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Sections. Drawings indicate general arrangement of piping, fittings, and specialties.

B. Where installing piping adjacent to equipment, allow space for service and maintenance.

C. Make piping connections between HVAC water-treatment equipment and dissimilar-metal piping with dielectric fittings. Dielectric fittings are specified in Section 232113 "Hydronic Piping."

D. Install shutoff valves on HVAC water-treatment equipment inlet and outlet.

E. See Division 22 for backflow preventers required in makeup-water connections to potable-water systems.

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

B. Perform the following tests and inspections with the assistance of a factory-authorized service representative:
   1. Inspect field-assembled components and equipment installation, including piping and electrical connections.
   2. Inspect piping and equipment to determine that systems and equipment have been cleaned, flushed, and filled with water, and are fully operational before introducing chemicals for water-treatment system.
   3. Place HVAC water-treatment system into operation and calibrate controls during the preliminary phase of HVAC system's startup procedures.
   4. Do not enclose, cover, or put piping into operation until it is tested and satisfactory test results are achieved.
   5. Test for leaks and defects. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.
   6. Leave uncovered and unconcealed new, altered, extended, and replaced water piping until it has been tested and approved. Expose work that has been covered or concealed before it has been tested and approved.
   7. Cap and subject piping to static water pressure of 50 psig above operating pressure, without exceeding pressure rating of piping system materials. Isolate test source and
allow test pressure to stand for four hours. Leaks and loss in test pressure constitute defects.

8. Repair leaks and defects with new materials and retest piping until no leaks exist.

C. Equipment will be considered defective if it does not pass tests and inspections.

D. Prepare test and inspection reports.

E. At six-week intervals following Substantial Completion, perform separate water analyses on hydronic systems to show that automatic chemical-feed systems are maintaining water quality within performance requirements specified in this Section. Submit written reports of water analysis advising Owner of changes necessary to adhere to "Performance Requirements" Article.

3.5 MAINTENANCE SERVICE

A. Scope of Maintenance Service: Provide chemicals and service program to maintain water conditions required above to inhibit corrosion, scale formation, and biological growth. Services and chemicals shall be provided for a period of one year from date of Substantial Completion and shall include the following:

1. Initial water analysis and HVAC water-treatment recommendations.
2. Startup assistance for Contractor to flush the systems, clean with detergents, and initially fill systems with required chemical treatment prior to operation.
3. Periodic field service and consultation.
5. Analyses and reports of all chemical items concerning safety and compliance with government regulations.

END OF SECTION
SECTION 233100 – HVAC METAL DUCTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Ducts and fittings.
   2. Sheet metal materials.
   3. Casings.
   4. Flexible Ducts.
   5. Duct liner.
   7. Hangers and supports.
   9. Duct leakage testing.

B. Related Sections:
   1. Section 230593 "Testing, Adjusting, and Balancing for HVAC" for testing, adjusting, and balancing requirements for metal ducts.
   2. Section 230713 "HVAC Duct Insulation".
   3. Section 233300 "Air Duct Accessories" for dampers, duct silencers, duct-mounting access doors and panels, turning vanes, and flexible connections.

1.3 PERFORMANCE REQUIREMENTS

A. Duct system has been design for low friction drop, both through straight duct and through fittings. Fitting types or duct sizes may be substituted only for those of equal to or lesser pressure drop, with written permission from engineer of record. Maximum duct aspect ratio shall be 3:1.
   a. Design pressure drop criteria:
      1) Supply, Return, Outside, and Transfer Air Ducts: maximum 0.05 in wg per 100 feet.
      2) Exhaust Air Ducts: maximum 0.08 in wg per 100 feet.
   b. Design velocity criteria:
      1) Outdoor ductwork or ductwork within a mechanical room: maximum 1,800 feet per minute.
      2) Ductwork in a shaft: 1,500 feet per minute.
      3) Indoor ductwork not within a mechanical room or shaft: maximum 1,200 feet per minute.
      4) Acoustical Consultant’s recommendations, which supersede above criteria.
      5) Exhaust ductwork: minimum 1,000 feet per minute or as required if fumes or particulate are being conveyed.
B. Structural Performance: Duct hangers and supports and seismic restraints shall withstand the effects of gravity and seismic loads and stresses within limits and under conditions described in SMACNA’s "HVAC Duct Construction Standards - Metal and Flexible", ASCE/SEI 7, and SMACNA’s "Seismic Restraint Manual: Guidelines for Mechanical Systems."

C. Casing Structural Performance:
   1. Casings shall be fabricated to withstand 133 percent of the indicated static pressure without structural failure. Wall and roof deflection at the indicated static pressure shall not exceed 1/8 inch per foot (1 mm per meter) of width.
   2. Fabricate outdoor casings to withstand wind load of 15 lbf/sq. ft. (720 N/sq. m) and snow load of 30 lbf/sq. ft. (1440 N/sq. m).

D. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of the following products:
   1. Flexible ducts.
   2. Liners and adhesives.
   3. Sealants and gaskets.

B. LEED Submittals:
   1. Product Data for Prerequisite IEQ 1: Documentation indicating that duct systems comply with ASHRAE 62.1, Section 5 - “Systems and Equipment.”
   2. Product Data for Prerequisite EA 2: Documentation indicating that duct systems comply with ASHRAE/IESNA 90.1, Section 6.4.4 - ”HVAC System Construction and Insulation.”
   3. Leakage Test Report for Prerequisite EA 2: Documentation of work performed for compliance with ASHRAE/IESNA 90.1, Section 6.4.4.2.2 - “Duct Leakage Tests.”
   4. Duct-Cleaning Test Report for Prerequisite IEQ 1: Documentation of work performed for compliance with ASHRAE 62.1, Section 7.2.4 - ”Ventilation System Start-up.”
   5. Product Data for Credit IEQ 4.1: For adhesives and sealants, documentation including printed statement of VOC content.
   6. Laboratory Test Reports for Credit IEQ 4: For adhesives and sealants, documentation indicating that products comply with the testing and product requirements of the California Department of Health Services’ "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers.”

C. Shop Drawings:
   1. Fabrication, assembly, and installation, including plans, elevations, sections, components, and attachments to other work.
   2. Factory- and shop-fabricated ducts, casings, and fittings.
   3. Duct layout indicating sizes, configuration, liner material, and static-pressure classes.
   4. Elevation of top of ducts.
   5. Dimensions of main duct runs from building grid lines.
   6. Fittings.
   7. Reinforcement details and spacing.
   8. Seam and joint construction and sealing.
   9. Penetrations through fire-rated and other partitions.
   10. Equipment installation based on equipment being used on Project.
11. Locations for duct accessories, including dampers, turning vanes, flexible connectors, and access doors and panels.
12. Hangers and supports, including methods for duct and building attachment, seismic restraints, and vibration isolation.

D. Test Reports: Indicate pressure tests performed. Include date, section tested, test pressure, and leakage rate, following SMACNA (LEAK) – HVAC Air Duct Leakage Test Manual.
1. Design Calculations: Calculations, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation for selecting hangers and supports and seismic restraints.

1.5 INFORMATIONAL SUBMITTALS
A. Welding certificates.
B. Field quality-control reports.

1.6 QUALITY ASSURANCE
A. Manufacturer Qualifications: Company specializing in manufacturing the type of products specified in this section, with minimum three years of documented experience.
B. Welding Qualifications: Qualify procedures and personnel according to the following:
C. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and System Start-up."
D. ASHRAE/IESNA Compliance: Applicable requirements in ASHRAE/IESNA 90.1, Section 6.4.4 - "HVAC System Construction and Insulation."
E. REGULATORY REQUIREMENTS
   1. Construct ductwork to NFPA 90A standards.
F. FIELD CONDITIONS
   1. Do not install duct sealants when temperatures are less than those recommended by sealant manufacturers.
   2. Maintain temperatures within acceptable range during and after installation of duct sealants.
   3. Ductwork shall be transported to the site in enclosed vehicles or with ends capped.
   4. Do not store ductwork directly on ground or floor.
   5. Ductwork stored or stacked on site shall be capped.
   6. Installed duct shall be capped at the end of the day. Duct found uncapped after the end of the day shall be cleaned.
1.7 COORDINATION

A. Coordinate sizes and locations of concrete bases with casings and plenums. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

PART 2 - PRODUCTS

2.1 DUCTS AND FITTINGS

A. General Fabrication Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" based on indicated static-pressure class unless otherwise indicated.

B. Transverse Joints: Select joint types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
   1. Transverse Joints in round ducts larger than 60 Inches (1524 mm) in Diameter: Flanged.

C. Longitudinal Seams: Select seam types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
   1. Fabricate round ducts larger than 90 inches (2286 mm) in diameter with butt-welded longitudinal seams.
   2. Fabricate flat-oval ducts larger than 72 inches (1830 mm) in width (major dimension) with butt-welded longitudinal seams.

D. Elbows, Transitions, Offsets, Branch Connections, and Other Duct Construction: Select types and fabricate according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 4, "Fittings and Other Construction," for static-pressure class, applicable sealing requirements, materials involved, duct-support intervals, and other provisions in SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

2.2 MATERIALS

A. General Material Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods unless otherwise indicated. Sheet metal materials shall be free of pitting, seam marks, roller marks, stains, discolorations, and other imperfections.

B. Galvanized Sheet Steel: Comply with ASTM A 653/A 653M.
   1. Galvanized Coating Designation (except as noted below): G60 (Z180).
   2. Galvanized Coating Designation for outside air intake ductwork, outdoor unjacketed ductwork, and as otherwise noted: G90 (Z275).
   3. Finishes for Surfaces Exposed to View: Mill phosphatized.
C. Stainless-Steel Sheets: Comply with ASTM A 480/A 480M, Type 304 or 316, as indicated in the "Duct Schedule" Article; cold rolled, annealed, sheet. Exposed surface finish shall be No. 2B, No. 2D, No. 3, or No. 4 as indicated in the "Duct Schedule" Article.

D. Aluminum Sheets: Comply with ASTM B 209 (ASTM B 209M) Alloy 3003, H14 temper; with mill finish for concealed ducts, and standard, one-side bright finish for duct surfaces exposed to view. Aluminum Connectors and Bar Stock: Alloy 6061-T651 or of equivalent strength.

E. Reinforcement Shapes and Plates: ASTM A 36/A 36M, steel plates, shapes, and bars; black and galvanized.
   1. Where black- and galvanized-steel shapes and plates are used to reinforce aluminum ducts, isolate the different metals with butyl rubber, neoprene, or EPDM gasket materials.

F. Tie Rods: Galvanized steel, 1/4-inch (6-mm) minimum diameter for lengths 36 inches (900 mm) or less; 3/8-inch (10-mm) minimum diameter for lengths longer than 36 inches (900 mm).

G. Duct Closure Film: Mold-resistant, self-adhesive film to keep debris out of ducts during transportation and construction.
   1. Product: DynAir Duct Protection Film or equivalent.
   2. High tack water-based adhesive.
   3. Thickness: 2 mils.
   4. UV stability.
   5. VOC content: zero.
   6. Elongation before break: minimum 325%.

2.3 CASINGS

A. Description: Double-wall, insulated, pressurized equipment casing or plenum.

B. Wall Thickness: 2 inches (50 mm).

C. General Material Requirements: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 9, "Equipment and Casings," for acceptable materials, material thicknesses, and casing construction methods unless otherwise indicated. Sheet metal materials shall be free of pitting, seam marks, roller marks, stains, discolorations, and other imperfections.
   1. Fabricate casings with more than 3-inch wg (750-Pa) negative static pressure according to SMACNA's "Rectangular Industrial Duct Construction Standards."
   2. Casings with more than 2-inch wg (500-Pa) positive static pressure may be fabricated according to SMACNA's "Rectangular Industrial Duct Construction Standards."

D. Penetrations: Seal all penetrations airtight. Cover with escutcheons and gaskets, or fill with suitable compound so there is no exposed insulation. Provide shaft seals where fan shafts penetrate casing.

E. Access Doors: Fabricate access doors according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 9-15, "Casing Access Doors - 2-inch wg (500 Pa)," and Figure 9-16, "Casing Access Doors - 3-10-inch wg (750-2500 Pa); and according to pressure class of the plenum or casing section in which access doors are to be installed.
   1. Size: 24 by 54 inches (600 by 1370 mm).
3. Hinges: Piano or butt hinges and latches, number and size according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."
4. Latches: Minimum of two wedge-lever-type latches, operable from inside and outside.
5. Neoprene gaskets around entire perimeters of door frames.
6. Reinforce door frames with steel angles tied to horizontal and vertical casing supporting angles.
7. Doors shall open against air pressure.
8. On doors of casings or plenums of 4 inch w.g. pressure or greater, provide sign reading “CAUTION – DOOR CLOSES WITH AIR PRESSURE”.

2.4 FLEXIBLE DUCTS

A. Noninsulated, Flexible Duct: UL 181, Class 1, 2-ply vinyl film supported by helically wound, spring-steel wire.
   1. Manufacturers:
      a. Casco L-181M.
      b. Flexmaster USA 1NI.
      c. Thermaflex MC.
   2. Pressure Rating: 10-inch wg (2500 Pa) positive and 1.0-inch wg (250 Pa) negative.
   3. Maximum Air Velocity: 4000 fpm (20 m/s).
   4. Temperature Range: Minus 10 to plus 160 deg F (Minus 23 to plus 71 deg C).
   5. Surface-Burning Characteristics: Maximum flame-spread index of 25 and maximum smoke-developed index of 50 when tested according to UL 723; certified by an NRTL.
   6. NFPA 90A and NFPA 90B compliant.

B. Acoustically Rated, Insulated, Flexible Duct: UL 181, Class 1, black polymer film supported by helically wound, spring-steel wire; fibrous-glass insulation; vapor-barrier film.
   1. Manufacturers:
      a. Casco SF-181M.
      b. Flexmaster USA 1B.
      c. Thermaflex M-KE.
   2. Pressure Rating: 4-inch wg (1000 Pa) positive and 0.5-inch wg (125 Pa) negative.
   3. Maximum Air Velocity: 4000 fpm (20 m/s).
   4. Temperature Range: Minus 20 to plus 175 deg F (Minus 29 to plus 79 deg C).
   5. Water Vapor Permeance: maximum 0.17 perms (ASTM E 96, Procedure A).
   6. Insulation R-Value: R-4.2 minimum at 70 deg F.
   7. Surface-Burning Characteristics: Maximum flame-spread index of 25 and maximum smoke-developed index of 50 when tested according to UL 723; certified by an NRTL.
   8. NFPA 90A and NFPA 90B compliant.

C. Flexible Duct Attachment:
   1. Clamps: Stainless-steel band with cadmium-plated hex screw to tighten band with a worm-gear action in sizes 3 through 18 inches (75 through 460 mm), to suit duct size.
2.5 DUCT LINER

A. General Requirements:
1. No fiberglass duct liner is allowed.
2. Service temperature: -20 deg F to 250 deg F.
3. Surface-Burning Characteristics: Maximum flame-spread index of 25 and maximum smoke-developed index of 50 when tested according to UL 723; certified by an NRTL.
4. NFPA 90A and NFPA 90B compliant.
5. Shop Application of Duct Liner: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Figure 7-11, "Flexible Duct Liner Installation."

B. Polyester Duct Liner:
1. Manufacturers:
   a. Ductmate - PolyArmor.
   b. Or engineer-approved equivalent.
2. K value: ASTM C518, 0.24 at 75 deg F; R-value per inch: 4.2.
3. Minimum Noise Reduction Coefficient (NRC): 0.65 at 1 inch thickness.
4. Maximum moisture sorption: 2% by weight.
5. Minimum 25% recycled content.
7. Water-Based Liner Adhesive.

C. Polyamide Foam Duct Liner:
1. Manufacturers:
   b. Or engineer-approved equivalent.
2. K value: ASTM C518, 0.30 at 75 deg F; R-value per inch: 3.3.
3. Minimum Noise Reduction Coefficient (NRC): 0.70 at 1 inch thickness.
4. Maximum moisture sorption: 2% by weight.
5. Mechanical Fasteners:
   a. Suitable for attachment to duct without damaging liner as recommended by manufacturer.
   b. Pin length: as required. Pin shall project no more than 1/8 inch (3 mm) into air stream.

2.6 SEALANT AND GASKETS

A. General Sealant and Gasket Requirements: Surface-burning characteristics for sealants and gaskets shall be a maximum flame-spread index of 25 and a maximum smoke-developed index of 50 when tested according to UL 723 (ASTM E84); certified by an NRTL.

B. Water-Based Joint and Seam Sealant:
1. Application Method: Brush on or spray on.
2. Solids Content: Minimum 65 percent.
5. Mold and mildew resistant.
6. Volatile Organic Content (VOC): Maximum 75 g/L (less water).
7. Maximum Static-Pressure Class: 10-inch wg (2500 Pa), positive and negative.
8. Service: Indoor or outdoor.

C. Flanged Joint Sealant: Single-component, acid-curing, silicone, elastomeric. Comply with ASTM C 920, Type S, Grade NS, Class 25, Use O.
   1. For indoor applications, sealant shall have a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
   2. Sealant shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

D. Flange Gaskets: Butyl rubber, neoprene, or EPDM polymer with polyisobutylene plasticizer.

2.7 HANGERS AND SUPPORTS

A. Hanger Rods: Cadmium-plated steel rods and nuts.

B. Strap and Rod Sizes: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible." Table 5-1 (Table 5-1M), "Rectangular Duct Hangers Minimum Size," and Table 5-2, "Minimum Hanger Sizes for Round Duct."

C. Steel Cables for Galvanized-Steel Ducts: Galvanized steel complying with ASTM A 603.

D. Steel Cables for Stainless-Steel Ducts: Stainless steel complying with ASTM A 492.

E. Steel Cable End Connections: Cadmium-plated steel assemblies with brackets, swivel, and bolts designed for duct hanger service; with an automatic-locking and clamping device.

F. Duct Attachments: Sheet metal screws, blind rivets, or self-tapping metal screws; compatible with duct materials.

G. Trapeze and Riser Supports:
   3. Supports for Aluminum Ducts: Aluminum or galvanized steel coated with zinc chromate.

2.8 SEISMIC-RESTRAINT DEVICES

A. General Requirements for Restraint Components: Rated strengths, features, and applications shall be as defined in reports by an agency acceptable to authorities having jurisdiction.
   1. Structural Safety Factor: Allowable strength in tension, shear, and pullout force of components shall be at least four times the maximum seismic forces to which they will be subjected.

B. Channel Support System: Shop- or field-fabricated support assembly made of slotted steel channels rated in tension, compression, and torsion forces and with accessories for attachment to braced component at one end and to building structure at the other end. Include matching components and corrosion-resistant coating.
C. Restraint Cables: ASTM A 603, galvanized-steel cables with end connections made of cadmium-plated steel assemblies with brackets, swivel, and bolts designed for restraining cable service; and with an automatic-locking and clamping device or double-cable clips.

1. Basis of Design: Mason SCB.

D. Hanger Rod Stiffener: Steel tube or steel slotted-support-system sleeve with internally bolted connections to hanger rod.

E. Mechanical Anchor Bolts: Drilled-in and stud-wedge or female-wedge type. Select anchor bolts with strength required for anchor and as tested according to ASTM E 488.

PART 3 - EXECUTION

3.1 DUCT INSTALLATION

A. Drawing plans, schematics, and diagrams indicate general location and arrangement of duct system. Indicated duct locations, configurations, and arrangements were used to size ducts and calculate friction loss for air-handling equipment sizing and for other design considerations. Install duct systems as indicated unless deviations to layout are approved on Shop Drawings and Coordination Drawings.

B. Install ducts according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" unless otherwise indicated.

C. Install ducts with fewest possible joints.

D. Install factory- or shop-fabricated fittings for changes in direction, size, and shape and for branch connections.

E. Unless otherwise indicated, install ducts vertically and horizontally, and parallel and perpendicular to building lines.

F. Install ducts close to walls, overhead construction, columns, and other structural and permanent enclosure elements of building.

G. Install ducts with a clearance of at least 1 inch (25 mm), plus allowance for insulation thickness.

H. Route ducts to avoid passing through transformer vaults and electrical equipment rooms and enclosures.

I. Where ducts pass through non-fire-rated interior partitions and exterior walls and are exposed to view, cover the opening between the partition and duct or duct insulation with sheet metal flanges of same metal thickness as the duct. Overlap openings on four sides by at least 1-1/2 inches (38 mm).

J. Where ducts pass through fire-rated interior partitions and exterior walls, install fire dampers. Comply with requirements in Section 233300 "Air Duct Accessories" for fire and smoke dampers.

3.2 INSTALLATION OF EXPOSED DUCTWORK

A. Protect ducts from being dented, scratched, or damaged.

B. Trim duct sealants flush with metal. Create a smooth and uniform exposed bead. Do not use two-part tape sealing system.

C. Grind welds to provide smooth surface free of burrs, sharp edges, and weld splatter. When welding stainless steel with a No. 3 or 4 finish, grind the welds flush, polish the exposed welds, and treat the welds to remove discoloration caused by welding.

D. Maintain consistency, symmetry, and uniformity in the arrangement and fabrication of fittings, hangers and supports, duct accessories, and air outlets.

E. Repair or replace damaged sections and finished work that does not comply with these requirements. Comply with ASTM A780.

3.3 CASING INSTALLATION

A. Install casings according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

B. Equipment Mounting:
   1. Install HVAC casings on cast-in-place concrete equipment base(s). Comply with requirements for equipment bases and foundations specified in Division 03.
   2. Anchor panels to concrete base on 8 inch centers and seal.
   3. Comply with requirements for vibration isolation and seismic control devices specified in Section 230548 "Vibration and Seismic Controls for HVAC."

C. Apply sealant to joints, connections, and mountings.

D. Field-cut openings for pipe and conduit penetrations; insulate and seal according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

E. Support components rigidly with ties, braces, brackets, seismic restraints, and anchors of types that will maintain housing shape and prevent buckling.

F. Align casings accurately at connections, with 1/8-inch (3-mm) misalignment tolerance and with smooth interior surfaces.

3.4 DUCT SEALING

A. Seal ducts for duct static-pressure, seal classes, and leakage classes specified in "Duct Schedule" Article according to SMACNA's "HVAC Duct Construction Standards - Metal and Flexible."

3.5 HANGER AND SUPPORT INSTALLATION

A. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Chapter 5, "Hangers and Supports."
B. Building Attachments: Concrete inserts, expansion anchors, or structural-steel fasteners appropriate for construction materials to which hangers are being attached. Where practical, install concrete inserts before placing concrete.

C. Hanger Spacing: Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible," Table 5-1 (Table 5-1M), "Rectangular Duct Hangers Minimum Size," and Table 5-2, "Minimum Hanger Sizes for Round Duct," for maximum hanger spacing; install hangers and supports within 24 inches (610 mm) of each elbow and within 48 inches (1200 mm) of each branch intersection.

D. Hangers Exposed to View: Threaded rod and angle or channel supports.

E. Support vertical ducts with steel angles or channel secured to the sides of the duct with welds, bolts, sheet metal screws, or blind rivets; support at each floor and at a maximum intervals of 16 feet (5 m).

F. Install upper attachments to structures. Select and size upper attachments with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.

3.6 SEISMIC-RESTRAINT-DEVICE INSTALLATION

A. Install according to OSHPD OPM-0043013 as indicated on drawings.

B. Install cables so they do not bend across edges of adjacent equipment or building structure.

C. Install cable restraints on ducts that are suspended with vibration isolators.

D. Install seismic-restraint devices using methods approved by an agency acceptable to authorities having jurisdiction.

E. Attachment to Structure: If specific attachment is not indicated, anchor bracing and restraints to structure, to flanges of beams, to upper truss chords of bar joists, or to concrete members.

F. Drilling for and Setting Anchors:
   1. Identify position of reinforcing steel and other embedded items prior to drilling holes for anchors. Do not damage existing reinforcement or embedded items during drilling. Notify the Architect if reinforcing steel or other embedded items are encountered during drilling. Locate and avoid prestressed tendons, electrical and telecommunications conduit, and gas lines.
   2. Do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength.
   3. Wedge Anchors: Protect threads from damage during anchor installation. Heavy-duty sleeve anchors shall be installed with sleeve fully engaged in the structural element to which anchor is to be fastened.
   4. Set anchors to manufacturer's recommended torque, using a torque wrench.
   5. Install zinc-coated steel anchors for interior applications and stainless-steel anchors for applications exposed to weather.
3.7 CONNECTIONS

A. Make connections to equipment with flexible connectors complying with Section 23 33 00 "Air Duct Accessories."

B. Comply with SMACNA’s "HVAC Duct Construction Standards - Metal and Flexible" for branch, outlet and inlet, and terminal unit connections.

3.8 PAINTING

A. Paint interior of metal ducts that are visible through registers and grilles and that do not have duct liner. Apply one coat of flat, black, latex paint over a compatible galvanized-steel primer. Paint materials and application requirements are specified in Division 09.

3.9 DUCT CLEANING

A. Clean new duct system(s) before testing, adjusting, and balancing.

B. Use service openings for entry and inspection.
   1. Create new openings and install access panels appropriate for duct static-pressure class if required for cleaning access. Provide insulated panels for insulated or lined duct. Patch insulation and liner as recommended by duct liner manufacturer. Comply with Section 233300 "Air Duct Accessories" for access panels and doors.
   2. Disconnect and reconnect flexible ducts as needed for cleaning and inspection.
   3. Remove and reinstall ceiling to gain access during the cleaning process.

C. Particulate Collection and Odor Control:
   1. When venting vacuuming system inside the building, use HEPA filtration with 99.97 percent collection efficiency for 0.3-micron-size (or larger) particles.
   2. When venting vacuuming system to outdoors, use filter to collect debris removed from HVAC system, and locate exhaust downwind and away from air intakes and other points of entry into building.

D. Clean the following components by removing surface contaminants and deposits:
   1. Air outlets and inlets (registers, grilles, and diffusers).
   2. Supply, return, and exhaust fans including fan housings, plenums (except ceiling supply and return plenums), scrolls, blades or vanes, shafts, baffles, dampers, and drive assemblies.
   3. Air-handling unit internal surfaces and components including mixing box, coil section, airwash systems, spray eliminators, condensate drain pans, humidifiers and dehumidifiers, filters and filter sections, and condensate collectors and drains.
   5. Return-air ducts, dampers, actuators, and turning vanes except in ceiling plenums and mechanical equipment rooms.
   7. Dedicated exhaust and ventilation components and makeup air systems.

E. Mechanical Cleaning Methodology:
   1. Clean metal duct systems using mechanical cleaning methods that extract contaminants from within duct systems and remove contaminants from building.
2. Use vacuum-collection devices that are operated continuously during cleaning. Connect vacuum device to downstream end of duct sections so areas being cleaned are under negative pressure.
3. Use mechanical agitation to dislodge debris adhered to interior duct surfaces without damaging integrity of metal ducts, duct liner, or duct accessories.
4. Clean fibrous-glass duct liner with HEPA vacuuming equipment; do not permit duct liner to get wet. Replace fibrous-glass duct liner that is damaged, deteriorated, or delaminated or that has friable material, mold, or fungus growth.
5. Clean coils and coil drain pans according to NADCA 1992. Keep drain pan operational. Rinse coils with clean water to remove latent residues and cleaning materials; comb and straighten fins.
6. Provide drainage and cleanup for wash-down procedures.
7. Antimicrobial Agents and Coatings: Apply EPA-registered antimicrobial agents if fungus is present. Apply antimicrobial agents according to manufacturer's written instructions after removal of surface deposits and debris.

3.10 FIELD QUALITY CONTROL

A. Perform tests and inspections.

B. Leakage Tests:
2. Test the following systems:
   a. Ducts with a Pressure Class of positive 3-Inch wg (750 Pa) or higher or negative 3-Inch wg (750 Pa) or lower: Test 100 percent of total installed duct area for each designated pressure class.
   b. Ducts with a Pressure Class between positive 2-Inch wg (500 Pa) and negative 2-Inch wg (500 Pa), inclusive: Test representative duct sections, selected by Design Engineer, totaling no less than 25 percent of total installed duct area for each designated pressure class.
   c. Risers and all supply and exhaust branch ducting shall be tested to within 5 feet of a diffuser collar or the point of connection to an exhaust device, respectively.
   d. Welded Exhaust Ducts: Test 100 percent of total installed duct area for each designated pressure class.
3. Disassemble, reassemble, and seal segments of systems to accommodate leakage testing and for compliance with test requirements.
4. Test for leaks before applying external insulation.
5. Conduct tests at static pressures equal to maximum design pressure of system or section being tested. If static-pressure classes are not indicated, test system at maximum system design pressure. Do not pressurize systems above maximum design operating pressure.
6. Give seven days' advance notice for testing.

C. Duct System Cleanliness Tests:
1. Visually inspect duct system to ensure that no visible contaminants are present.
2. Test sections of metal duct system, chosen randomly by Owner, for cleanliness according to "Vacuum Test" in NADCA ACR, "Assessment, Cleaning and Restoration of HVAC Systems."
   a. Acceptable Cleanliness Level: Net weight of debris collected on the filter media shall not exceed 0.75 mg/100 sq. cm.
D. Duct system will be considered defective if it does not pass tests and inspections.

E. Prepare test and inspection reports.

SECTION 233300 - HVAC DUCT ACCESSORIES

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Backdraft dampers.
   2. Barometric relief dampers.
   4. Control dampers.
   5. Fire dampers.
   7. Combination fire and smoke dampers.
   8. Turning vanes.
   9. Duct-mounted access doors.
  10. Flexible connectors.
  11. Duct accessory hardware.

B. Related Requirements:
   1. Division 07 for Firestopping.
   2. Section 233100 "HVAC Metal Ducts" for flexible ducts.
   3. Division 26 for wiring connections.

1.3 ACTION SUBMITTALS

A. LEED Submittals:
   1. Product Data for Prerequisite IEQ 1: Documentation indicating that units comply with ASHRAE 62.1, Section 5 - "Systems and Equipment."
   2. Product Data for Prerequisite EA 2: Documentation indicating that duct insulation R-values comply with tables in ASHRAE/IESNA 90.1, Section 6 - "Heating, Ventilating, and Air Conditioning."

B. Shop Drawings: For duct accessories. Include plans, elevations, sections, details and attachments to other work.
   1. Detail duct accessories fabrication and installation in ducts and other construction. Include dimensions, weights, loads, and required clearances; and method of field assembly into duct systems and other construction. Include the following:
      a. Special fittings.
      c. Control-damper installations.
d. Fire-damper, smoke-damper, combination fire- and smoke-damper, ceiling, and corridor damper installations, including sleeves; and duct-mounted access doors and remote damper operators.
e. Wiring Diagrams: For power, signal, and control wiring.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Reflected ceiling plans, drawn to scale, on which ceiling-mounted access panels and access doors required for access to duct accessories are shown and coordinated with each other, using input from Installers of the items involved.

B. Source quality-control reports.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For air duct accessories to include in operation and maintenance manuals.

1.6 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Fusible Links: Furnish quantity equal to 10 percent of amount installed.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

B. Comply with SMACNA's "HVAC Duct Construction Standards - Metal and Flexible" for acceptable materials, material thicknesses, and duct construction methods unless otherwise indicated. Sheet metal materials shall be free of pitting, seam marks, roller marks, stains, discolorations, and other imperfections.

C. Provide duct accessories of materials suited to associated duct materials.

D. Air extractors shall not be used, except with the expressed written consent of the Design Engineer.

2.2 BACKDRAFT DAMPERS

A. General:

1. Provide manufacturer’s standard backdraft damper if available as fan or air-moving equipment accessory.

2. Provide damper material of the same material as associated ductwork.
B. Manufacturers:
2. Pottorff.
3. Ruskin Company.

C. Description: Gravity balanced.
3. Frame: 20 gage galvanized steel.
6. Blade Axles:
   a. Up to 42 inch damper width: Nonmetallic.
   b. 42 inch width and larger: Stainless steel.
7. Tie Bars and Brackets: Galvanized steel.

2.3 BAROMETRIC RELIEF DAMPERS

A. Description: Counterbalanced backdraft damper.
1. Sensitivity: 0.01 inch w.g. differential pressure.
2. Frame and blades: extruded aluminum.
5. Accessories:

2.4 MANUAL VOLUME DAMPERS

A. General Description: Factory fabricated, with required hardware and accessories.
B. Fabricate in accordance with SMACNA HVAC Duct Construction Standards - Metal and Flexible.
C. Damper material shall match associated ductwork.
D. Manufacturers:
1. Ruskin.
2. Louvers and Dampers.
E. Standard Manual Volume Dampers:
1. Standard leakage rating, with linkage outside airstream.
2. Suitable for horizontal or vertical applications.
4. Maximum System Pressure: 2 inch w.g.
2.5 CONTROL DAMPERS

A. Commercial Grade Control Dampers:

1. Manufacturers:
   a. Ruskin Company.
   b. Pottorff.
   c. Nailor.

2. Frames:
   a. 16 gage galvanized steel hat channel reinforced with corner braces.

3. Blades:
   a. Multiple blade with maximum blade width of 8 inches.
   b. Opposed-blade design.
   c. 14 gage Galvanized-steel airfoil.
   d. Blade Edging: neoprene, mechanically secured to blade.
   e. Stainless steel jamb seals.

4. Blade Axles: 1/2-inch-diameter; plated steel, operating temperature range from minus 25 to plus 250 deg F

7. Leakage Class 1. Testing according to AMCA Std. 500. Minimum ratings:
   a. System pressure: 3.5 inch w.g.
   b. System velocity: 3,000 FPM.

B. Low Leakage Industrial Grade Control Dampers:

1. Manufacturers:
   a. Ruskin Company.
   b. Pottorff.
   c. Nailor.

2. Frames: 12 gage galvanized steel channel.

3. Blades:
   a. Multiple blade with maximum blade width of 8 inches.
   b. Opposed-blade design.
   c. 16 gage Galvanized-steel airfoil.
   d. Blade Edging: EPDM, mechanically secured to blade.
   e. Stainless steel jamb seals.

4. Blade Axles: 1/2-inch-diameter; plated steel; blade-linkage hardware of stainless steel pivot pins with lock type retainers, with operating temperature range from minus 25 to plus 250 deg F.

5. Bearings:
   a. Stainless-steel pressed into frame.
   b. Thrust washers at each end of vertical mounted blades.

7. Leakage testing according to AMCA Std. 500. Minimum ratings:
   a. System pressure: 10 inch w.g.
   b. System velocity: 4,000 FPM.
2.6 FIRE AND SMOKE DAMPERS

A. Manufacturers:
1. Ruskin Company.
2. Louvers & Dampers, Inc.
3. Nailor Industries, Inc.

B. General Requirements:
1. Labeled according to UL 555C by an NRTL.
2. Fabricate in accordance with NFPA 90A.
3. Comply with construction details for tested assemblies as indicated in UL's "Fire Resistance Directory."
4. Fire Rating: to suit wall, floor, ceiling, or corridor assembly, refer to Architectural Drawings.
5. Operational ratings: suited to meet duct pressure and velocity design airflow conditions.

C. Fire Dampers:
1. Type: Dynamic.
2. Operational ratings: suited to meet design airflow conditions, and minimum 4-inch wg static pressure class and 2000-fpm velocity.
3. Frame: Curtain type with blades outside airstream; fabricated with roll-formed, galvanized steel; with mitered and interlocking corners.
5. Horizontal Dampers: Include blade lock and stainless-steel closure spring.

D. Smoke Dampers:
1. Smoke Detector: Integral, factory wired for single-point connection.
2. Operational ratings: suited to meet design airflow conditions, and minimum 4-inch wg static pressure class and 2000-fpm velocity.
4. Leakage: Class I.
5. Actuator: electric, out of airstream, two-position, fail closed.

E. Combination Fire and Smoke Dampers:
1. Operational ratings: suited to meet design airflow conditions, and minimum 4-inch wg (1 kPa) static pressure class and 2000-fpm (10 m/s) velocity.
4. Smoke Detector: Integral, factory wired for single-point connection.
6. Provide galvanized steel factory sleeve.
7. Actuator: electric, out of airstream, two-position, fail closed.
8. Leakage: Class I.

2.7 TURNING VANES

A. Manufacturers:
1. Duro Dyne Inc.
2. Ductmate Industries.
3. Metalaire.
4. Ruskin.

B. General Requirements: Comply with SMACNA’s "HVAC Duct Construction Standards - Metal and Flexible"; Figures 4-3, "Vanes and Vane Runners," and 4-4, "Vane Support in Elbows."

C. Manufactured Turning Vanes for Metal Ducts: Curved blades of galvanized sheet steel; support with bars perpendicular to blades set; set into vane runners suitable for duct mounting.
2. Double Wall: 2 inch inside radius. Vane length not to exceed 36 inch.

2.8 DUCT-MOUNTED ACCESS DOORS

1. Door:
   a. Double wall; insulation fill and thickness as indicated for duct pressure class, minimum 1 inch.
   b. Hinges and Latches: continuous piano hinge and cam latches.
   c. Shape and material to match ductwork.
   d. Fabricate doors airtight and suitable for duct pressure class.
   e. Doors shall open against air pressure.
   f. On access doors on ducts of 4 inch w.g. pressure or greater, provide sign reading "CAUTION – DOOR CLOSES WITH AIR PRESSURE".
2. Frame duct opening with continuous 1 inch by 1 inch angle. Provide sponge rubber or neoprene gasket at door-to-frame and frame-to-duct.

2.9 FLEXIBLE CONNECTORS

A. Manufacturers:
1. Durodyne.
2. Ventfabrics.

B. Materials: Flame-retardant or noncombustible fabrics. NFPA 90A compliant.

C. Coatings and Adhesives: Comply with UL 181, Class 1.

1. Minimum Weight: 26 oz./sq. yd..
2. Tensile Strength: 480 lbf/inch in the warp and 360 lbf/inch in the filling.
3. Service Temperature: Minus 40 to plus 200 deg F.

E. Outdoor System, Flexible Connector Fabric: Glass fabric double coated with weatherproof, synthetic rubber resistant to UV rays and ozone.
1. Minimum Weight: 24 oz./sq. yd..
2. Tensile Strength: 530 lbf/inch in the warp and 440 lbf/inch in the filling.
3. Service Temperature: Minus 50 to plus 250 deg F.
2.10 DUCT ACCESSORY HARDWARE

A. Instrument Test Holes: Cast iron or cast aluminum to suit duct material, including screw cap and gasket. Size to allow insertion of pitot tube and other testing instruments and of length to suit duct-insulation thickness.

B. Adhesives: High strength, quick setting, neoprene based, waterproof, and resistant to gasoline and grease.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install duct accessories according to applicable details in SMACNA’s "HVAC Duct Construction Standards - Metal and Flexible" for metal ducts.

B. Install backdraft dampers at inlet of exhaust fans or exhaust ducts as close as possible to exhaust fan unless integral backdraft damper is provided, control damper is indicated, or otherwise indicated.

C. Install volume dampers at points on supply, return, and exhaust systems where branches extend from larger ducts. Where dampers are installed in ducts having duct liner, install dampers with hat channels of same depth as liner, and terminate liner with nosing at hat channel. Provide elevated dial or shaft extension for insulated ducts.

D. Install cable-driven remote volume dampers for all volume dampers located in inaccessible ceilings or as indicated on Contract Drawings.
   1. Locate wall box within 50 feet in accessible location.
   2. Wall box shall be recessed-type in finished spaces.

E. Set dampers to fully open position before testing, adjusting, and balancing.

F. Install test holes at fan inlets and outlets and elsewhere as indicated.

G. Install fire and smoke dampers according to UL listing.

H. Fire Damper installation is required for all ductwork penetrating fire-rated walls, floors, and ceilings. Smoke damper installation is required for all ductwork penetrating smoke-rated partitions. Coordinate location and rating of fire and smoke dampers with Architectural Drawings. Provide dampers where required even if not shown on Mechanical Drawings.

I. Install fire and smoke dampers, with fusible links, according to manufacturer’s UL-approved written instructions.

J. Install turning vanes in all rectangular elbows.
   1. Ductwork of pressure class +/- 2-inch w.g. or lower: single wall vanes.
   2. Ductwork of pressure class +/- 3-inch w.g. and greater: double wall vanes.
   3. Acoustical turning vanes are not to be used unless specifically indicated on the Contract Drawings.

K. Install duct access doors on sides of ducts to allow for inspecting, adjusting, and maintaining accessories and equipment at the following locations:
1. On both sides of duct coils.
2. Upstream and downstream from duct filters.
3. At outdoor-air intakes and mixed-air plenums.
4. At drain pans and seals.
5. Downstream from manual volume dampers, control dampers, backdraft dampers, and equipment.
6. Adjacent to and close enough to fire or smoke dampers, to reset or reinstall fusible links. Access doors for access to fire or smoke dampers having fusible links shall be pressure relief access doors and shall be outward operation for access doors installed upstream from dampers and inward operation for access doors installed downstream from dampers.
7. At each change in direction and at maximum 50-foot spacing.
8. Upstream or downstream from turning vanes.
9. Control devices requiring inspection.
10. Elsewhere as indicated.

L. Install access doors with swing against duct static pressure.

M. Access Door Sizes:
   1. Rectangular duct larger than 30 inches: 24 by 24 inches.
   2. Rectangular duct up to 30 inches: 16 by 20 inches.
   3. Rectangular duct up to 18 inches: 12 by 12 inches.
   4. For ducts smaller than 18 inches: 2 inch by 12 inch

N. Label access doors according to Section 230553 "Identification for HVAC Piping and Equipment" to indicate the purpose of access door.

O. Install duct test holes where required for testing and balancing purposes.

P. Install flexible connectors to connect ducts to air-moving equipment.

3.2 FIELD QUALITY CONTROL

A. Tests and Inspections:
   1. Operate dampers to verify full range of movement.
   2. Inspect locations of access doors and verify that purpose of access door can be performed.
   3. Operate fire, smoke, and combination fire and smoke dampers to verify full range of movement and verify that proper heat-response device is installed.
   4. Inspect turning vanes for proper and secure installation.

END OF SECTION
SECTION 233400 - HVAC FANS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Centrifugal fans.

B. Related Requirements:
   1. Section 230513 - Common Motor Requirements for HVAC Equipment.
   2. Section 230548 - Vibration and Seismic Controls for HVAC Piping and Equipment.
   3. Section 233300 - Air Duct Accessories: Backdraft dampers.
   4. Division 26 - Equipment Wiring: Electrical characteristics and wiring connections.

1.2 REFERENCE STANDARDS

A. ABMA STD 9 - Load Ratings and Fatigue Life for Ball Bearings; American Bearing Manufacturers Association, Inc.; 1990 (Reapproved 2008).

B. ABMA STD 11 - Load Ratings and Fatigue Life for Roller Bearings; American Bearing Manufacturers Association, Inc.; 2014

D. AMCA 204 – Balance Quality and Vibration Levels for Fans.

H. NEMA MG 1 - Motors and Generators; National Electrical Manufacturers Association; 2011.

I. SMACNA (DCS) - HVAC Duct Construction Standards; 2005.

1.3 ACTION SUBMITTALS

A. See Division 01 - Administrative Requirements and Section 23 05 00 “HVAC and Plumbing General Requirements”, for submittal procedures.
B. Product Data: Provide data on centrifugal fans and accessories including fan curves with specified operating point clearly plotted, power, RPM, sound power levels for both fan inlet and outlet at rated capacity, and electrical characteristics and connection requirements.
   1. Fan operating efficiency.
   2. Motor ratings and electrical characteristics, plus motor and electrical accessories.
   3. Material gages and finishes, including color charts.
   4. Dampers, including housings, linkages, and operators.

C. System Data: For systems with multiple fans in parallel, provide fan curves with fans noted in a single fan curve.

D. Shop Drawings: Indicate assembly of centrifugal fans and accessories including fan curves with specified operating point clearly plotted, sound power levels for both fan inlet and outlet at rated capacity, and electrical characteristics and connection requirements.
   1. Detail equipment assemblies and indicate dimensions, required clearances, method of field assembly, components, and location and size of each field connection.
   2. Wiring Diagrams: Power, signal, and control wiring.
   3. Vibration Isolation Base Details: Detail fabrication, including anchorages and attachments to structure and to supported equipment. Include auxiliary motor slides and rails, and base weights.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Plans and other details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
   1. Structural supports.
   2. Roof openings.

1.5 CLOSEOUT SUBMITTALS

A. Submit under provisions of General Conditions and Division 01 as applicable.

B. Maintenance Data: Include instructions for lubrication, motor and drive replacement, spare parts list, and wiring diagrams.

C. Manufacturer’s Installation Instructions.

1.6 MAINTENANCE MATERIAL SUBMITTALS

A. Maintenance Materials: Furnish the following for Owner’s use in maintenance of project.
   1. Extra Fan Belts: One set for each individual fan.
   2. Lubricant: One case of each type required.

1.7 QUALITY ASSURANCE

A. Manufacturer Qualifications: Company specializing in manufacturing the type of products specified in this section, with minimum ten years of documented experience.
B. AMCA Compliance: Fans shall have AMCA-Certified performance ratings and shall bear the AMCA-Certified Ratings Seal.

C. Certify sound-power level ratings according to AMCA 301, "Methods for Calculating Fan Sound Ratings from Laboratory Test Data." Factory test fans according to AMCA 300, "Reverberant Room Method for Sound Testing of Fans." Label fans with the AMCA-Certified Ratings Seal.

D. Certify fan performance ratings, including flow rate, pressure, power, air density, speed of rotation, and efficiency by factory tests according to AMCA 210, "Laboratory Methods of Testing Fans for Aerodynamic Performance Rating." Label fans with the AMCA-Certified Ratings Seal.

E. UL Standards: Fans shall comply with UL 705.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Protect motors, shafts, and bearings from weather and construction dust.

1.9 FIELD CONDITIONS

A. Permanent fans may be used for ventilation during construction only after ductwork is clean, filters are in place, bearings have been lubricated, and fan has been test run under observation.

B. Fans used during construction shall have all filters replaced when the Owner takes Ownership of the building.

C. Lift and support units with manufacturer's designated lifting or supporting points.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

A. Performance Ratings: Determined in accordance with AMCA 210 and bearing the AMCA Certified Rating Seal.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. Motors:
   1. Comply with NEMA designation, temperature rating, service factor, enclosure type, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
   2. Motor Sizes: Minimum size as indicated. If not indicated, large enough so driven load will not require motor to operate in service factor range above 1.0.
   3. Speed Control: Fans shall be provided with Variable-frequency Drives (VFD) unless noted otherwise.
   4. Enclosure Type: Totally enclosed, fan cooled (TEFC) unless noted otherwise.

D. Sound Ratings: AMCA 301, tested to AMCA 300, and bear AMCA Certified Sound Rating Seal.
E. Static and Dynamic Balance: Eliminate vibration or noise transmission to occupied areas.

2.2 CENTRIFUGAL FANS (LAB EXHAUST FANS)

A. Manufacturers:
   1. Loren Cook Company.
   2. Greenheck.
   4. Twin City.

B. Description:
   1. Factory-fabricated, -assembled, -tested, and -finished, belt-driven centrifugal fans consisting of housing, wheel, fan shaft, bearings, motor, drive assembly, and support structure.
   2. Wheel shall be Airfoil, Backward Inclined, or Forward Curved.
   3. Fan shall be Single Width, Single Inlet (SWSI) or Double Width, Double Inlet (DWDI) as scheduled.

C. Construction:
   1. Heavy gage steel, spot welded, adequately braced, designed to minimize turbulence with tapered spun inlet bell and shaped cut. Panel Bracing: Steel angle- or channel-iron member supports for mounting and supporting fan scroll, wheel, motor, lifting lugs, and accessories.
   2. Fan wheel: Heavy backplate, hollow die-formed, blades continuously welded at tip flange and backplate, cast-iron or cast-steel hub riveted to backplate and fastened to shaft with set screws.
   3. Factory finish before assembly to manufacturer's standard.
   4. Special Coating: Phenolic epoxy with UV protection.
   5. Fabrication: Conform to AMCA 99. Fan construction class shall be sufficient to meet fan design air flow and pressure; minimum fan class II.

D. Bearings and Drives:
   1. Bearings: Heavy duty pillow block type, selfgreasing ball bearings with ABMA 9 L10 life at 40,000 hours.
   2. Shafts: Hot rolled steel, ground and polished, with keyway, protectively coated with lubricating oil, and shaft guard. Statically and dynamically balanced and selected for continuous operation at maximum rated fan speed and motor horsepower, with final alignment and belt adjustment made after installation. Designed to operate at no more than 70 percent of first critical speed at top of fan's speed range.
   3. Belt Drives:
      a. Factory mounted, with adjustable alignment and belt tensioning.
      b. Service Factor Based on Fan Motor Size: 1.5.
      c. Motor Pulleys: Adjustable pitch for use with motors through 5 HP; fixed pitch for use with motors larger than 5 HP. Select pulley so pitch adjustment is at the middle of adjustment range at fan design conditions.
      d. Belt Guard: Fabricate to SMACNA Duct Construction Standards; 0.106 inch thick, 3/4 inch diamond mesh wire screen welded to steel angle frame or equivalent, prime coated. Secure to fan or fan supports without short circuiting vibration isolation, with provision for adjustment of belt tension, lubrication, and use of tachometer with guard in place.
E. Accessories:
   1. Backdraft Dampers: Gravity actuated with counterweight and interlocking blades with felt edges in steel frame installed on fan discharge.
   2. Access Doors: Shaped to conform to scroll, with quick opening latches and gaskets.
   5. Weather Cover: Enameled-steel sheet with ventilation slots, bolted to housing.

2.3 ROOFTOP CENTRIFUGAL FANS (RESTROOM FANS)

A. Manufacturers:
   1. Loren Cook Company.
   2. Greenheck.
   3. Penn Barry.

B. Housing: Removable, spun-aluminum, dome top and outlet baffle; one-piece, aluminum base with venturi inlet cone.
   1. Upblast Units: Provide spun-aluminum discharge baffle to direct discharge air upward, with rain and snow drains.

C. Fan Wheels: Aluminum hub and wheel.

D. Accessories:
   1. Bird Screens: Removable, 1/2-inch mesh, aluminum or brass wire.
   2. Dampers: Counterbalanced, parallel-blade, backdraft dampers mounted in curb base; factory set to close when fan stops.

E. Roof Curbs: Galvanized steel; mitered and welded corners; 1-1/2-inch-thick, rigid, fiberglass insulation adhered to inside walls; and 1-1/2-inch wood nailer. Size as required to suit roof opening and fan base.
   1. Configuration: Self-flashing without a cant strip, with mounting flange.
   2. Overall Height: 12 inches (300 mm).
   3. Hinged Subbase: Galvanized-steel hinged arrangement permitting service and maintenance.
   4. Sound Curb: Curb with sound-absorbing insulation.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install in accordance with manufacturer's instructions.

B. Install centrifugal fans level and plumb.

C. Install lab exhaust fans on structural bases, refer to 230548 “Vibration and Seismic Controls for HVAC Piping and Equipment”.

D. Curb Support: Install roof curb on roof structure, level and secure, according to "The NRCA Roofing and Waterproofing Manual," Low-Slope Membrane Roofing Construction Details.
Section, Illustration "Raised Curb Detail for Rooftop Air Handling Units and Ducts." Install and secure centrifugal fans on curbs, and coordinate roof penetrations and flashing with roof construction. Secure units to curb support with anchor bolts.

E. Install fans with resilient electrical leads; refer to Division 26.

F. Provide sheaves required for final air balance.

G. Provide safety screen where inlet or outlet is exposed.

H. Provide backdraft dampers on discharge of exhaust fans and as indicated; refer to Section 233300 “Air Duct Accessories”.

I. Install units with clearances for service and maintenance.

J. Label fans according to requirements specified in Section 230553 "Identification for HVAC Piping and Equipment."

K. Wrap lab exhaust fans in acoustical material as per the manufacturer’s recommendations, refer to 230713 “HVAC Duct Insulation” for material.

3.2 CONNECTIONS

A. Install flexible connections between fan inlet and discharge ductwork; refer to Section 233300 “Air Duct Accessories”. Ensure metal bands of connectors are parallel with minimum one inch flex between ductwork and fan while running.

B. Install piping from scroll drain connection, with trap with seal equal to 1.5 times specified static pressure, to nearest floor drain with pipe sizes matching the drain connection.

C. Connect wiring according to Division 26.

3.3 FIELD QUALITY CONTROL

A. Perform the following tests and inspections with the assistance of a factory-authorized service representative:

1. Verify that shipping, blocking, and bracing are removed.
2. Verify that unit is secure on mountings and supporting devices and that connections to ducts and electrical components are complete. Verify that proper thermal-overload protection is installed in motors, starters, and disconnect switches.
3. Verify that cleaning and adjusting are complete.
4. Disconnect fan drive from motor, verify proper motor rotation direction, and verify fan wheel free rotation and smooth bearing operation. Reconnect fan drive system, align and adjust belts, and install belt guards.
5. Adjust belt tension.
6. Adjust damper linkages for proper damper operation.
7. Verify lubrication for bearings and other moving parts.
8. Verify that manual and automatic volume control and fire and smoke dampers in connected ductwork systems are in fully open position.
9. See Section 230593 "Testing, Adjusting, and Balancing for HVAC" for testing, adjusting, and balancing procedures.
10. Remove and replace malfunctioning units and retest as specified above.
B. Test and adjust controls and safeties. Controls and equipment will be considered defective if they do not pass tests and inspections.

C. Prepare test and inspection reports.

END OF SECTION
SECTION 233600 - AIR TERMINAL UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Butterfly type constant and variable volume terminal units.
   2. Vortex-shedding type lab air valves

B. Related Sections:
   1. Section 233100—HVAC Metal Ducts
   2. Section 230548—Vibration and Seismic Controls for HVAC Piping and Equipment.
   3. Section 255005—Laboratory Monitoring and Control System

1.3 REFERENCE STANDARDS

B. ARI 880—Air Terminals.

C. ARI 885—Procedure for Estimating Occupied Space Sound Levels in the Application of Air Terminals and Air Outlets.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of air terminal unit.
   1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for air terminal units.
   2. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
   3. Provide sound power level data: include schedule of discharge and radiated sound power levels at rated capacity. Sound power levels shall be in the eight octave bands from 63 Hz to 8 kHz at design static pressure.

B. Shop Drawings: For air terminal units.
   1. Include plans, elevations, sections, and mounting details.
   2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   3. Include diagrams for power, signal, and control wiring.
   4. Hangers and supports, including methods for duct and building attachment, seismic restraints, and vibration isolation.
1.5 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Reflected ceiling plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
   1. Ceiling suspension assembly members.
   2. Size and location of initial access modules for acoustic tile.
   3. Ceiling-mounted items including lighting fixtures, diffusers, grilles, speakers, sprinklers, access panels, and special moldings.

B. Field quality-control reports.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For air terminal units to include in emergency, operation, and maintenance manuals.
   1. In addition to items specified in Division 01:
      a. Instructions for resetting minimum and maximum air volumes.
      b. Instructions for adjusting software set points.

1.7 QUALITY ASSURANCE

A. Test and rate air performance for air pressure drop, flow performance, and acoustical performance in accordance with ARI 880 and ARI 885. Attach ARI seal to each terminal unit.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 5 – “Systems and Equipment” and Section 7 – “Construction and System Start-up.”

C. ASHRAE Compliance: Applicable requirements in ASHRAE/IES 90.1, “Section 6 – Heating, Ventilating, and Air Conditioning.”

D. Control devices shall be provided and factory-installed by Division 25.

2.2 BUTTERFLY TYPE TERMINAL UNITS

A. Manufacturers:
   1. Price Industries.
   2. Nailor Industries Inc.
   3. Titus.

B. Casing: Galvanized steel, single wall.
1. Air Inlet: Round stub connection or S-slip and drive connections for duct attachment.
2. Air Outlet: S-slip and drive connections.
3. Access: Removable panels for access to parts requiring service, adjustment, or maintenance; with airtight gasket.
4. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.

C. Volume Damper: Galvanized steel with peripheral gasket and self-lubricating bearings.
   1. Damper shall be capable of full shut off (zero air volume).
   2. Maximum Damper Leakage: AHRI 880 rated, 2 percent of nominal airflow at 3-inch wg inlet static pressure.

D. Casing Liner: Fiber-Free Foam Insulation.
   2. Insulation shall comply with UL 181 erosion, mold growth and humidity requirements in accordance with ASHRAE 62.1.
   3. Surface-Burning Characteristics: Maximum flame-spread index of 25 and maximum smoke-developed index of 50 when tested according to UL 723; certified by an NRTL.

E. Airflow Sensor shall be a crossflow, differential pressure airflow device measuring total and static pressures, and mounted to the inlet valve.
   1. Sensor signal accuracy shall be plus or minus five percent throughout terminal operating range.

2.3 LAB AIR VALVES

A. Manufacturers:
   1. Accutrol Accuvalve
   2. Or Equal.

B. Casings:
   1. Valve body material for Fume Hood, Exhaust or other corrosive service shall be 304SS; 20gauge for body and 16gauge for blades. Valve shaft material shall be 316SS. Coated valves are not acceptable.
   2. Valve body material for non-corrosive service such as for Supply shall be 16 gauge aluminum for body and 16 gauge for blades. Valve shaft material shall be 316SS.

C. Construction:
   1. A compression section, two airflow control surfaces, factory-mounted digital vortex airflow measuring device factory-mounted high speed electric actuator, integral access panel and integrated high performance closed-loop feedback controller with native BACnet.
   2. The compression section shall divide the airstream into at least two separate airstreams. Each airstream shall be approximately equal in size and the total open area shall be approximately 50% of the duct open area. The divided sections shall cause compression therefore creating a more laminar flow for better airflow measurement and turndown. The compression section shall be of an aerodynamic shape with a static regain section to insure minimal pressure drop. The valve shall not require any duct straight runs either upstream or downstream of the airflow valve to achieve required specified performance.
   3. The airflow control valve shall be capable of being mounted in any position (360º mounting plane) in ductwork without the need for recalibration. It shall not be required to specify mounting plane when ordering valve.
D. Airflow Sensor
   1. Digital vortex type airflow sensing device.

E. Accuracy & Response Time:
   1. Airflow control valves shall be a linear type and shall operate with a minimum turndown ratio of 8 to 1.
   2. The airflow control valve speed of response shall be <1 second.

F. Pressure Drop
   1. Airflow control valves shall be of a low pressure drop design for energy efficiency. Valves shall not require greater pressure drop than listed at Max CFM on project valve schedule or 0.3" wc, whichever is less.

G. Operation:
   1. The air valve shall be pressure independent over a 0.05" to 3.0" W.C. drop across the valve. Integral pressure independent assembly shall respond and maintain specific air flow within one second of a change in duct static pressure irrespective of the magnitude of pressure and/or flow change or quantity of air flow controllers on a manifold system.
   2. Air flow accuracy shall be plus or minus 5% of reading or 5 CFM, whichever is greater, over an air flow turndown range of no less than 8 to 1.
   3. Electronic low-voltage actuator shall be factory mounted to the valve. Loss of electric power shall cause exhaust valves to fail open to the maximum scheduled design flow and supply valves to fail to the minimum scheduled air flow.
   4. Certification: Each air valve shall be factory calibrated to the project specific air flows as indicated on the contract drawings using air stations and instrumentation having a combined accuracy of at least plus or minus 1% of signal over the entire range of measurement. All air valves shall be marked with valve specific data; at a minimum they shall be marked with valve tag number, serial number, model number, quality control inspection number, and design air flow.

PART 3 - EXECUTION

3.1 HANGER AND SUPPORT INSTALLATION

A. Comply with SMACNA’s “HVAC Duct Construction Standards – Metal and Flexible,” Ch. 5, “Hangers and Supports” and with Section 230529 “Hangers and Supports for HVAC Piping and Equipment.”

B. Building Attachments: Concrete inserts or structural-steel fasteners appropriate for construction materials to which hangers are being attached. Where practical, install concrete inserts before placing concrete.

C. Hangers Exposed to View: Threaded rod and angle or channel supports.

D. Install upper attachments to structures. Select and size upper attachments with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.
3.2 SEISMIC-RESTRAINT-DEVICE INSTALLATION

A. Install hangers and braces designed to support the air terminal units and to restrain against seismic forces required by applicable building codes. Comply with ASCE/SEI 7. Comply with requirements for seismic-restraint devices in Section 230548 “Vibration and Seismic Controls for HVAC.”

B. Select seismic-restraint devices with capacities adequate to carry present and future static and seismic loads.

C. Install cables so they do not bend across edges of adjacent equipment or building structure.

D. Install cable restraints on air terminal units that are suspended with vibration isolators.

E. Install seismic-restraint devices using methods approved by an agency acceptable to authorities having jurisdiction.

F. Attachment to Structure: If specific attachment is not indicated, anchor bracing and restraints to structure, to flanges of beams, to upper truss chords of bar joists, or to concrete members.

G. Drilling for and Setting Anchors:
   1. Identify position of reinforcing steel and other embedded items before drilling holes for anchors. Do not damage existing reinforcement or embedded items during drilling. Notify Architect if reinforcing steel or other embedded items are encountered during drilling. Locate and avoid prestressed tendons, electrical and telecommunications conduit, and gas lines.
   2. Do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength.
   3. Wedge Anchors: Protect threads from damage during anchor installation. Install heavy-duty sleeve anchors with sleeve fully engaged in the structural element to which anchor is to be fastened.
   4. Set anchors to manufacturer’s recommended torque, using a torque wrench.
   5. Install zinc-coated steel anchors for interior applications and stainless-steel anchors for applications exposed to weather.

3.3 TERMINAL UNIT INSTALLATION

A. Install air terminal units according to NFPA 90A, “Standard for the Installation of Air Conditioning and Ventilating Systems.”

B. Install air terminal units level and plumb. Maintain sufficient clearance for normal service and maintenance.

3.4 CONNECTIONS

A. Where installing piping adjacent to air terminal unit, allow space for service and maintenance.

B. Comply with requirements in Section 233113 “Metal Ducts” for connecting ducts to air terminal units.
3.5 IDENTIFICATION

A. Label each air terminal unit with plan number, nominal airflow, and maximum and minimum factory-set airflows. Comply with requirements in Section 230553 “Identification for HVAC Piping and Equipment” for equipment labels.

3.6 FIELD QUALITY CONTROL

A. Perform the following tests and inspections:
   1. After installing air terminal units and after electrical circuitry has been energized, test for compliance with requirements.
   2. Leak Test: After installation, fill water coils and test for leaks. Repair leaks and retest until no leaks exist.
   3. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
   4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

B. Air terminal unit will be considered defective if it does not pass tests and inspections.

C. Prepare test and inspection reports.

3.7 DEMONSTRATION

A. Train Owner’s maintenance personnel to adjust, operate, and maintain air terminal units.

END OF SECTION
SECTION 233700 - AIR OUTLETS AND INLETS

PART 1 - GENERAL

1.1 SECTION INCLUDES
   A. Perforated diffusers.
   B. Adjustable blade face registers.
   C. Fixed face grilles.
   D. Linear slot diffusers.
   E. Laminar flow diffusers.

1.2 REFERENCE STANDARDS

1.3 SUBMITTALS
   A. See Division 01 – Administrative Requirements for submittal procedures.
   B. Product Data: Provide data for equipment required for this project, including materials of construction, finish, accessories furnished and mounting details. Provide performance data including throw and drop, static-pressure drop, and noise ratings. Review outlets and inlets as to size, finish, and type of mounting prior to submission. Submit schedule of outlets and inlets showing type, size, location, application, color, and noise level.
   C. Project Record Documents: Record actual locations of air outlets and inlets.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS
   A. MANUFACTURERS
      1. Titus.
      2. Price Industries.
      3. Or equal.
   B. Air outlets associated with variable air volume systems shall be specifically designed for variable air volume flows.
C. Material: Unless noted otherwise: Aluminum.

D. Finish: Unless noted otherwise: Baked enamel, color selected by Architect.

E. Mounting: compatible with surface construction, refer to Architectural drawings. Use countersunk screws when applicable unless noted otherwise.

F. Integral dampers shall not be permitted unless noted otherwise.

G. Provide extended neck when connecting to flexible duct.

2.2 SUPPLY PERFORATED DIFFUSERS (A)

A. Material: Aluminum or steel backpan and curved blade pattern controllers, with aluminum face.

B. Face Style: Extended, removeable.

C. Pattern Controller: Adjustable with pattern controllers.

D. Accessories:
   1. Equalizing grid.
   2. Backpan insulation.

2.3 LAMINAR FLOW DIFFUSERS (B)

A. Airflow Principle: Laminar flow.

B. Face Style: Radial, removeable, with retainer cables.

C. Accessories:
   1. Equalization baffle.
   2. Backpan insulation.

2.4 LINEAR SLOT DIFFUSERS (C)

A. Airflow Principle: Supply.

B. Finishes: Powder coat, color selected by architect.

C. Plenum: Insulated, fiber free.

D. Other Features:
   1. Blank-off strips, as required.

2.5 RETURN/EXHAUST/TRANSFER PERFORATED DIFFUSERS (D)

A. Material: Aluminum or steel backpan, with aluminum face.
B. Face Style: Flush.

2.6 SPIRAL ADJUSTABLE BLADE FACE REGISTERS (E)
   A. Suitable for mounting on round ductwork.
   B. Material: Steel.
   C. Face Blade Arrangement: Horizontal; spaced 3/4 inch apart.
   D. Rear Blade Arrangement: Vertical; spaced 3/4 inch apart.

2.7 ADJUSTABLE BLADE FACE REGISTERS (F)
   A. Material: Steel.
   B. Face Blade Arrangement: Horizontal; spaced 3/4 inch apart.
   C. Rear Blade Arrangement: Vertical; spaced 3/4 inch apart.

2.8 FIXED FACE GRILLES (G)
   A. Material: Steel.
   B. Face Blade Arrangement: Horizontal; spaced 1/2 inch apart.
   C. Blade deflection: 35 degrees.

PART 3 - EXECUTION

3.1 INSTALLATION
   A. Install in accordance with manufacturer’s instructions.
   B. Check location of outlets and inlets and make necessary adjustments in position to conform with architectural features, symmetry, and lighting arrangement.
   C. Install diffusers to ductwork with air tight connection.
   D. Provide balancing dampers on duct take-off to diffusers, and grilles and registers, despite whether dampers are specified as part of the diffuser, or grille and register assembly.
   E. Paint ductwork visible behind air outlets and inlets matte black. Refer to Division 09.
   F. Install diffusers, registers, and grilles level and plumb.
   G. Ceiling-Mounted Outlets and Inlets: Drawings indicate general arrangement of ducts, fittings, and accessories. Air outlet and inlet locations have been indicated to achieve design requirements for air volume, noise criteria, airflow pattern, throw, and pressure drop. Make final
locations where indicated, as much as practicable. For units installed in lay-in ceiling panels, locate units in the center of panel. Where architectural features or other items conflict with installation, notify Architect for a determination of final location.

H. Install diffusers, registers, and grilles to ducts to allow service and maintenance of dampers, air extractors, and fire dampers.

I. After installation, adjust diffusers, registers, and grilles to air patterns indicated, or as directed, before starting air balancing.

J. Protect galvanized and nonferrous-metal surfaces from corrosion or galvanic action by applying a heavy coating of bituminous paint on surfaces that will be in contact with concrete, masonry, or dissimilar metals.

K. Repair finishes damaged by cutting, welding, soldering, and grinding. Restore finishes so no evidence remains of corrective work. Return items that cannot be refinished in the field to the factory, make required alterations, and refinish entire unit or provide new units.

END OF SECTION
SECTION 237300 – CUSTOM AIR HANDLING UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes:
   1. Custom outdoor supply air handling units.
   2. Custom outdoor exhaust air energy recovery units.

B. Related sections:
   1. Section 230513 - Common Motor Requirements for HVAC Equipment.
   2. Section 230548 - Vibration and Seismic Controls for HVAC Piping and Equipment.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product. Include rated capacities, operating characteristics, and furnished specialties and accessories.

B. Shop Drawings:
   1. Include plans, elevations, sections, and attachment details.
   2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   3. Prepare the following by or under the supervision of a qualified professional engineer:
      a. Include diagrams for power, signal, and control wiring.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Roof-curb mounting details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
   1. Size and location of unit-mounted rails and anchor points and methods for anchoring units to roof curb.
   2. Required roof penetrations for ducts, pipes, and electrical raceways, including size and location of each penetration.

B. Seismic Qualification Certificates: For dedicated outdoor-air units, accessories, and components, from manufacturer.
1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

C. Startup service reports.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For units to include in emergency, operation, and maintenance manuals.

1.6 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Fan Belts: One set for each belt-driven fan.
   2. Filters: One of each type for each unit.

1.7 WARRANTY

A. Special Warranty: Manufacturer agrees to replace components of units that fail in materials or workmanship within specified warranty period.
   1. Warranty Period: 12 months from date of Substantial Completion or 18 months from shipment, whichever period expires first.

B. Unit casing and structural base shall be warrantied (parts and labor) against corrosion or failure under normal operating conditions for a period of 40 years from the date of unit delivery.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Air Enterprises
B. Energy Labs.
C. Haakon.
D. Huntair.
E. Trane.
2.2 PERFORMANCE REQUIREMENTS

A. Design unit and ancillary equipment for outdoor installation.

B. General Fabrication Requirements: Comply with requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment," and Section 7 - "Construction and System Start-up."

C. Seismic Performance: Units shall withstand the effects of earthquake motions determined according to ASCE 7-10.
   1. The term "withstand" means "the unit will remain in place without separation of any parts when subjected to the seismic forces specified."
   2. Equipment anchorage is not a deferred submittal nor a delegated design item. Refer to details on the drawings for anchorage requirements.

D. Cabinet Thermal Performance:
   1. Maximum Overall U-Value: Comply with requirements in ASHRAE/IESNA 90.1.
   2. Include effects of metal-to-metal contact and thermal bridges in the calculations.

E. Cabinet Surface Condensation:
   1. Cabinet shall have additional insulation and vapor seals if required to prevent condensation on the interior and exterior of the cabinet.
   2. Portions of cabinet located downstream from the cooling coil shall have a thermal break at each thermal bridge between the exterior and interior casing to prevent condensation from occurring on the interior and exterior surfaces. The thermal break shall not compromise the structural integrity of the cabinet.

F. Maximum Cabinet Leakage: 1 percent of the total supply-air flow at a pressure rating equal to the fan shut-off pressure.

G. Cabinet Deflection Performance:
   1. Walls and roof deflection shall be within 1/200 of the span at the design working pressure equal to the fan shut-off pressure. Deflection limits shall be measured at any point on the surface.
   2. Floor deflections shall be within 1/300 of the span considering the worst-case condition caused by the following:
      a. Service personnel.
      b. Internal components.
      c. Design working pressure defined for the walls and roof.

H. Electrical components, devices, and accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.3 CABINET AND BASE

A. Construction: Double wall.

B. Casing Material: Aluminum.

D. Base: All-aluminum or stainless steel structural base. The base shall be designed to distribute loads properly to a suitable mounting surface and be braced to support internal components without sagging, pulsating or oil canning.
   1. Perimeter support members shall be a minimum of 6" structural member properly sized to support all major components and the housing during rigging, handling and operation of the unit.

   1. Service Doors: Hinged access doors with gaskets. Material and construction of doors shall match material and construction of cabinet in which doors are installed.

F. Roof: Standing seam or membrane; sloped to drain water.

G. Floor: Reinforced, metal surface. The base floor shall be designed for a minimum live load of 100 pounds per square foot throughout the unit. Insulation shall be below metal walking surface.

H. Cabinet Insulation:
   1. Type: Fibrous-glass duct lining complying with ASTM C 1071, Type II.
   2. Weight: 3 pcf.
   3. Thickness: 2 inches.
   5. Mechanical Fasteners: Suitable for adhesive, mechanical, or welding attachment to casing without damaging liner and without causing air leakage when applied as recommended by manufacturer.

I. Condensate Drain Pans:
   1. Shape: Rectangular, with slope in at least two planes to direct water toward drain connection.
   2. Size: Large enough to collect condensate from cooling coils including coil piping connections, coil headers, and return bends.
      a. Length: Extend drain pan downstream from leaving face to comply with ASHRAE 62.1.
      b. Depth: A minimum of 2 inches deep.
   3. Configuration: Double wall, with space between walls filled with foam insulation and moisture-tight seal.
   5. Units with stacked coils shall have an intermediate drain pan to collect condensate from top coil.

J. Surfaces in Contact with Airstream: Comply with requirements in ASHRAE 62.1 for resistance to mold and erosion.

K. Each section of the unit base shall contain a minimum 1” NPT drain to facilitate system washdown, maintenance and condensate removal. Clean out drains shall be provided with removable caps of non-corrosive material.

L. All unit base service openings shall be framed with a minimum 2” high water dam continuously welded to the floor. All pipe and electric conduit chases with openings to building or elements shall be covered with thin gage aluminum or 304 stainless steel.
M. Pipe and conduit penetrations through the unit casings shall be provided by the unit manufacturer and be properly sealed prior to leaving the factory. Penetrations sealed by simply caulking around extension are not acceptable.

2.4 SUPPLY FAN

A. Plenum Fan Type: Single width, non-overloading, with backward-inclined or airfoil blades.
   1. Fan Wheel Material: Aluminum; attached directly to motor shaft.
   5. Fan Balance: Precision balance fan below 0.08 inch/s at design speed with filter in.
   6. Backdraft Damper per fan.

B. Service Factor for Belt Drive Applications: V-belt drive with matching fan pulley and adjustable motor sheaves and belt assembly with minimum 1.5 service factor.

C. Motors:
   1. Comply with NEMA designation, temperature rating, service factor, and efficiency requirements for motors specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
   2. Totally enclosed fan cooled.
   4. Mount on an adjustable slide rail motor base with two adjusting bolts per side. The fan motors shall be factory wired to an external junction box with flexible conduit of adequate length so that it will not have any affect on the vibration isolation.

D. Mounting: Fan wheel, motor, and drives shall be mounted to fan casing with spring isolators. Refer to Section 230548 "Vibration and Seismic Controls for HVAC Piping and Equipment."

E. Sound Ratings: AMCA 301; tested to AMCA 300 and label with AMCA Certified Sound Rating Seal.

2.5 COILS

A. Capacity Ratings: Comply with ASHRAE 33 and ARI 410 and coil bearing the ARI label.

B. Construction:
   2. Tube Material: Copper.
   3. Tube Header Material: Copper or prime coated steel with brazed joints.
   4. Fin Material: Aluminum.
   5. Fin and Tube Joints: Mechanical bond.
   6. Reinforcing shall be furnished so that the unsupported length is not over 60”.

C. Leak Test: Coils shall be leak tested with air underwater at 300 psi and rated for 150-psi working pressure.

D. Drainable, with threaded plugs for drain and vent; threaded plugs in return bends and in headers opposite each tube.
E. All sides of coils shall be carefully blanked off to ensure all air passes through the coil.

2.6 OUTDOOR-AIR INTAKE LOUVER

A. Type: Acoustic louver.
B. Materials: Aluminum.
C. Bird Screen: Comply with requirements in ASHRAE 62.1.
D. Configuration: Designed to inhibit wind-driven rain and snow from entering unit.

2.7 Sound Transmission Loss:

A. Basis of Design: Kinetics Noise Control KCal-1, 6” thick.

2.8 FILTERS

A. Provide filter-holding frames to accommodate scheduled filters.
B. Mounting Frames:
   1. Panel filters arranged for flat or angular orientation, with access doors on both sides of unit. Filters shall be removable from one side or from access plenum.
   2. Extended surface filters arranged for flat orientation, removable from access plenum.
   3. Aluminium or stainless steel with gaskets and fasteners, suitable for bolting together into built-up filter banks.
C. Factory install at each filter bank a Dwyer Magnehelic “Series 2000” pressure gauge complete with static pressure tips, hardware and fittings. Enclose the gauge in a protective sheet metal box with a hinged inspection door. Paint to match unit.

2.9 ELECTRICAL POWER CONNECTIONS

A. General Electrical Power Connection Requirements: Factory-installed and -wired switches, motor controllers, transformers, and other necessary electrical devices shall provide a single-point field power connection to unit.
B. Enclosure: NEMA 250, Type 4X, mounted in unit with hinged access door in unit cabinet having a lock and key or padlock and key,
C. Wiring: Numbered and color-coded to match wiring diagram.
D. Wiring Location: Install factory wiring outside an enclosure in a raceway.
E. Factory Wiring: Branch power circuit to each motor and to controls with one of the following disconnecting means:
1. NEMA KS 1, heavy-duty, fusible switch with rejection-type fuse clips rated for fuses. Select and size fuses to provide Type 2 protection according to IEC 60947-4-1.
2. NEMA KS 1, heavy-duty, nonfusible switch.
3. UL 489, motor-circuit protector (circuit breaker) with field-adjustable, short-circuit trip coordinated with motor locked-rotor amperes.

F. Factory-Mounted, Overcurrent-Protection Service: For each motor.

G. Controls: Factory wire unit-mounted controls where indicated.

H. Lights: Factory wire unit-mounted lights.

I. Receptacle: Factory wire unit-mounted, ground fault interrupt (GFI) duplex receptacle.

J. Control Relays: Auxiliary and adjustable time-delay relays.

2.10 CONTROLS

A. Control equipment and sequence of operation are specified in Division 25.

B. Control Wiring: Factory wire connection for controls' power supply.

C. Control Devices: Sensors, transmitters, relays, switches, detectors, operators, actuators, and valves shall be manufacturer's standard items to accomplish indicated control functions.

D. Control Dampers:
   1. Damper Location: Factory installed inside unit for ease of blade axle and bushing service. Arrange dampers located in a mixing box to achieve convergent airflow to minimize stratification.
   2. Damper Leakage: Comply with requirements in AMCA 500-D. Leakage shall not exceed 6.5 cfm per sq. ft. at a static-pressure differential of 4.0 inches water column when a torque of 5 inch pounds per sq. ft. is applied to the damper jackshaft.
   3. Damper Rating: Rated for close-off pressure equal to the fan shutoff pressure.
   4. Damper Label: Bear the AMCA seal for both air leakage and performance.

E. Integral Smoke Alarm: Smoke detector installed in supply air.

2.11 ACCESSORIES

A. Service Lights and Switch: Factory installed in each accessible section with weatherproof cover. Factory wire lights to a single-point field connection.

B. Duplex Receptacle: Factory mounted in unit supply-fan section, with 20 amp 120 V GFI duplex receptacle and weatherproof cover.
PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for piping, ducts, and electrical systems to verify actual locations of connections before equipment installation.

C. Examine roof curbs and equipment supports for suitable conditions where units will be installed.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with manufacturer's rigging and installation instructions for unloading units and moving to final locations.

B. Curb Support: Install roof curb on roof structure according to "The NRCA Roofing Manual."
   1. Install and secure units on curbs and coordinate roof penetrations and flashing with roof construction.
   2. Coordinate size, installation, and structural capacity of roof curbs, equipment supports, and roof penetrations. These items are specified in Section 077200 "Roof Accessories."
   3. Coordinate size, location, and installation of unit manufacturer's roof curbs and equipment supports with roof Installer.

C. Restrained Curb Support: Install restrained vibration isolation roof-curb rails on roof structure according to "The NRCA Roofing Manual."

D. Equipment Mounting:
   1. Comply with requirements for vibration isolation and seismic control devices specified in Section 230548 "Vibration and Seismic Controls for HVAC."

E. Install separate devices furnished by manufacturer and not factory installed.

F. Install new filters at completion of equipment installation and before testing, adjusting, and balancing.

G. Install drain pipes from unit drain pans to sanitary drain.

3.3 CONNECTIONS

A. Where installing piping adjacent to units, allow space for service and maintenance.

B. Hydronic Piping Connections:
   1. Comply with requirements in Section 232113 "Hydronic Piping" and Section 232116 Hydronic Piping Specialties."
   2. Install shutoff valve and union or flange on each supply connection and install balancing valve and union or flange on each return connection.
C. Duct Connections:
   1. Comply with requirements in Section 233113 "Metal Ducts."
   2. Drawings indicate the general arrangement of ducts.
   3. Connect ducts to units with flexible duct connectors. Comply with requirements for flexible duct connectors in Section 233300 "Air Duct Accessories."

D. Electrical Connections: Comply with requirements for power wiring, switches, and motor controls in electrical Sections.
   1. Install electrical devices furnished by unit manufacturer but not factory mounted.

3.4 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.
   1. Complete installation and startup checks according to manufacturer's written instructions.
   2. Inspect casing insulation for integrity, moisture content, and adhesion.
   3. Verify that clearances have been provided for servicing.
   4. Verify that controls are connected and operable.
   5. Verify that filters are installed.
   6. Clean coils and inspect for construction debris.
   7. Inspect and adjust vibration isolators and seismic restraints.
   8. Verify bearing lubrication.
   9. Clean fans and inspect fan-wheel rotation for movement in correct direction without vibration and binding.
   10. Adjust fan belts to proper alignment and tension.
   11. Start unit.
   12. Inspect and record performance of interlocks and protective devices including response to smoke detectors by fan controls and fire alarm.
   13. Operate unit for run-in period.
   15. Adjust and inspect high-temperature limits.
   16. Verify operational sequence of controls.
   17. Measure and record airflows. Plot fan volumes on fan curve.

B. After startup, change filters, verify bearing lubrication, and adjust belt tension.

C. Remove and replace components that do not properly operate and repeat startup procedures as specified above.

D. Prepare written report of the results of startup services.

3.5 ADJUSTING

A. Adjust initial temperature and humidity set points.

B. Set field-adjustable switches and circuit-breaker trip ranges as indicated.

C. Occupancy Adjustments: When requested within 12 months from date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.
3.6 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain units; minimum 4 hours.

END OF SECTION
SECTION 238143 - AIR-SOURCE HEAT PUMPS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
A. Section includes unitary heat pumps with refrigerant-to-water heat exchangers, refrigeration circuits, air-to-refrigerant heat exchanger and refrigerant compressor(s).
B. Related Sections:
   1. Section 230000 Section "HVAC General Requirements".
   2. Section 230548 "Vibration and Seismic Controls for HVAC Piping and Equipment".
   3. Section 230593 "Testing, Adjusting, and Balancing for HVAC".

1.3 ACTION SUBMITTALS
A. Submit under provisions of Section 230000" HVAC General Requirements" and Division 01.
B. Product Data:
   1. Manufacturer’s literature on heat pumps and required accessories.
   2. Certified equipment capacity and efficiency performance at full and part load conditions. Correct ratings for temperature and altitude where applicable.
   3. Sound power levels at rated capacity.
   4. Material thickness and finishes, including color charts.
   5. Any dampers, including housings, linkages, and operators.
   6. Refrigerant capacity.
   7. Construction details.
   8. Dimensions, shipping weight, and operating weight.
   10. Coil data sheets.
C. Operation and Maintenance Data: Submit O&M manual immediately after the heat pump’s production order has been placed. The O&M manual shall include instructions for lubrication, motor and drive replacement, spare parts list, and wiring diagrams. The O&M manual shall only be provided for the specific model, serial number and location of the specific unit installed for the project. The actual heat pump sheet including the actual tested voltage, amperages, measured flow and LBNL equipment ID shall be updated and included in the O&M manual. Generic fan data sheet, O&M manual is not acceptable.
D. Shop Drawings:
   1. Include plans, elevations, sections, and mounting, and attachment details.
2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
3. Include diagrams for power, signal, and control wiring.

1.4 INFORMATIONAL SUBMITTALS

A. Seismic Qualification Certificates: For air-source unitary heat pumps, accessories, and components, from manufacturer.
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
   2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
   3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

B. Product Certificates: For each type of air-source unitary heat pump, signed by product manufacturer.

C. Field quality-control reports.

D. Sample Warranty: For manufacturer's warranty.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For air-source unitary heat pumps to include in emergency, operation, and maintenance manuals.

1.6 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1.7 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace components of air-source unitary heat pumps that fail in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, refrigeration components.
   2. Warranty Period: Five years from date of Substantial Completion.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Deliver to site, store, and protect products under provisions of Section 230000 "General Requirements for HVAC", Material Delivery and Storage.

B. Ship each unit with a full charge of refrigerant. Charge each unit with nitrogen if refrigerant is shipped in containers separate from unit.
PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Units shall withstand the effects of earthquake motions determined according to ASCE 7-10.

B. Comply with ASHRAE 15.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

D. Comply with safety requirements in UL 484 for assembly of free-delivery, air-source heat pumps.

E. Comply with all performance parameters stated on the drawing schedule. Heat pump unit must meet or exceed efficiency parameters to be considered as a potential substitution.

2.2 AIR-SOURCE HEAT PUMPS

A. Manufacturers: Subject to compliance with requirements, provide products by the following:
   1. Aermec
   2. Climacool

B. Description: Packaged air-source heat pump with temperature controls and integral primary pump(s); factory assembled, piped, wired, tested, and rated according to ASHRAE/ARI/ISO-13256-1.
   1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

C. Heat pump shall be capable of operating in heat recovery (4-pipe) if required, see schedules. All heat pumps shall be capable of operating in heating and cooling only modes (2-pipe).
   1. In heat recovery operation, the system shall be capable of modulating the percentage of water-to-water recovery and air-to-water heat transfer, providing a 0 to 100 percent range of recovery.

D. Direct-driven blower with EC motor.
   1. Provide economizer capable of up to 100% economizer.

E. Filter: 2 inch thick mini-pleat. MERV 16 per ASHRAE std 52.2.

F. Cabinet and Chassis:
   1. Access panel for access and maintenance of internal components.
   2. Knockouts for electrical connections.
   3. Minimum 20 gage panels degreased and coated with electrostatically applied baked-on polyester powder paint appropriate for coastal salty climate.

G. Refrigerant Circuit Components:

2. Filter-Dryer: Factory installed to clean and dehydrate the refrigerant circuit.
3. Charging Connections: Service fittings on suction and liquid for charging and testing on each circuit.
4. Minimum two independent refrigerant circuits with single or multiple compressors in tandem per circuit for optimal staging and load control. Single circuited units will not be accepted.
5. Reversing Valve: Four-way, solenoid-activated valve designed to be fail-safe in heating position with replaceable magnetic coil.
6. Compressor:
   a. Scroll
   b. Two stage or Variable speed.
   c. Installed on vibration isolators and mounted on a structural steel base plate and full-length channel stiffeners.
   d. Exterior of compressor shall be wrapped with a high-density sound-attenuating blanket and housed in an acoustically treated enclosure.
   e. Crankcase heater.
   f. Factory-Installed Safeties:
      1) Antirecycle timer.
      2) High-pressure cutout.
      3) Low-pressure cutout or loss of charge switch.
      4) Internal thermal-overload protection.
7. Evaporator and condenser:
   a. Brazed Plate, type 316 stainless-steel construction. Externally insulated with closed cell material to reduce thermal dispersions.
   b. Heater: Factory-installed and wired electric heater with integral controls designed to protect the evaporator.
   c. Inlet strainer and flow switch.
8. Air-Side Coil Exchanger:
   1) Coils shall be constructed from seamless copper tubes mechanically expanded into aluminum fins and shall have integral subcooling circuits.
   2) Condenser fans shall be axial type, aerodynamically designed for ultra-low noise level generation.
   3) Fan Motors shall be inverter allowing fan speed modulation from a 0-10V signal. Motors shall be weather protected, three-phase, with permanently lubricated ball bearings. Motors safeties shall include magnetic circuit breakers. On/off motors will not be accepted.
   4) Fan Guards: Steel safety guards with corrosion-resistant coating.
   5) Unit shall be able to modulate the fan speed based on high pressure when in cooling mode, and based on low pressure when in heating mode.
10. Pipe Insulation: Refrigerant minimum 3/8-inch-thick, flexible elastomeric insulation on piping exposed to airflow through the unit. Maximum 25/50 flame-spread/smoke-developed indexes according to ASTM E 84.
11. Pipe Insulation Cladding: All exterior insulation shall be clad with aluminum or stainless steel per Section 230719 and/or Section 230716.
12. Identify insulated piping and unit per Section 230553; All piping must be labeled and direction of flow indicated.

H. Pumps:
1. Integrated pumping modules for Chilled Water and Heating Hot Water systems.
2. See Section 232123 for pump specifications.

I. Controls:
1. Unit shall be equipped with a standalone microprocessor-based control system. The control logic shall be designed to maximize operating efficiency and equipment life with protections for operation under unusual conditions. The system shall intelligently stage the unit to sustain leaving water temperature precision and stability while minimizing compressor cycling.
2. Basic Unit Control Modes and Devices:
   a. Economizer operation.
   b. Occupancy-based shutdown.
   c. Unit shutdown on high or low refrigerant pressures.
   d. Unit shutdown on low water temperature.
   e. Low- and high-voltage protection.
   f. Overcurrent protection for compressor.
   g. Random time delay, three to 10 seconds, start on power-up.
   h. Time delay override for servicing.
   i. Control voltage transformer.
   j. Automatic intelligent reset. Unit shall automatically reset five minutes after trip if the fault has cleared. Should a fault reoccur three times sequentially, lockout requiring manual reset occurs.
   k. Ability to defeat time delays for servicing.
   l. Digital display to indicate high pressure, low pressure, low voltage, and high voltage.
   m. The low-pressure switch shall not be monitored for the first 90 seconds after a compressor start command to prevent nuisance safety trips.
   n. Remote fault-type indication at thermostat.
   o. Selectable 24-V dc or pilot duty dry contact alarm output.
   p. Service test mode for troubleshooting and service.
   q. Unit-performance sentinel warns when heat pump is running inefficiently.
   r. Compressor soft start.
3. DDC interface requirements as further described in Section 230923 "Direct Digital Control (DDC) System for HVAC".
   a. Interface relay for scheduled operation.
   b. Interface relay to provide indication of fault at central workstation.
   c. Provide BAC-net interface for central DDC workstation for the following functions:
      1) Set-point adjustment.
      2) Start/stop and operating status of heat-pump unit.
      3) Data inquiry to include supply-air and room-air temperature and humidity, and entering-water temperature.
      4) Occupied and unoccupied schedules.

J. Electrical Connection: Single electrical connection with fused disconnect meeting all requirements defined in Section 26. System must be provided with a dedicated Lock Out Tag Out device with an O&M Manual describing the Lock Out Tag Out procedure for this specific piece of equipment.
2.3 ACCESSORIES

A. Loop Controller.

B. Condensate Pump Module:
   1. Minimum 1/2 HP, 230-V, single-phase pump, rated for at least 3 gpm per 12,000 Btu/hr capacity at 20 feet of head.
   2. General requirements for motors are specified in Section 230513 "Common Motor Requirements for HVAC Equipment."
   3. Include pump module hose kit with thread to barb fittings, hose, and hose clamps.
   5. Include controls to operate pump as required to maintain room temperature and ventilation set points.

C. Outdoor louvers, aluminum with birdscreen.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for electric installations for heat pumps to verify actual locations connections and electrical conduits before installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

D. Meet requirements of Division 01 “Demonstration and Training” and Commissioning.
   1. Provide support including false loading equipment for Commissioning function test to verify units’ supplemental heat for morning warm up / low temperature operation is functional.

E. Subcontractor shall provide 48 hours advance notice of all inspections to the University Representative to witness inspection. Hold for inspection or witness.

3.2 INSTALLATION

A. Equipment Mounting:
   1. Comply with requirements for vibration-isolation and seismic-restraint devices specified in Section 230548 "Vibration and Seismic Controls for HVAC."

3.3 CONNECTIONS

A. Drawings indicate general arrangement of ductwork, fittings, and specialties. Specific connection requirements are as follows:

B. Install electrical devices furnished by manufacturer but not specified to be factory mounted.
3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

B. Perform the following field tests and inspections:
   1. After installing heat pumps and after electrical circuitry has been energized, test units for compliance with requirements.
   2. Inspect for and remove shipping bolts, blocks, and tie-down straps.
   3. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
   4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

C. Heat pumps will be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports.

3.5 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.
   1. Complete installation and startup checks according to manufacturer's written instructions.
   2. Inspect for visible damage to unit casing.
   3. Inspect for visible damage to compressor and coils.
   4. Inspect internal insulation.
   5. Verify that labels are clearly visible.
   6. Verify that clearances have been provided for servicing.
   7. Verify that controls are connected and operable.
   8. Adjust vibration isolators.
   9. Start unit according to manufacturer's written instructions.
   10. Complete startup sheets and attach copy with Contractor's startup report.
   11. Inspect and record performance of interlocks and protective devices; verify sequences.
   12. Operate unit for an initial period as recommended or required by manufacturer.
   13. Verify thermostat calibration.
   14. Inspect controls for correct sequencing of heating, refrigeration, and normal and emergency shutdown.

3.6 ADJUSTING

A. Adjust initial temperature set points.

B. Set field-adjustable switches and circuit-breaker trip ranges as indicated.

C. Occupancy Adjustments: When requested within 12 months from date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to four visits to Project during other-than-normal occupancy hours for this purpose.
   1. Factory representative must participate in the Commissioning process. A minimum of two of these visits shall be dedicated to supporting functional testing of the equipment in the Commissioning process.
3.7 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain air-source unitary heat pumps; minimum 4 hours.

END OF SECTION
SECTION 238219 - FAN COIL UNITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Ducted fan coil units and accessories.

B. Related Requirements:
   1. Section 232113 "Hydronic Piping".
   2. Section 233100 "HVAC Metal Ducts".

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.
   1. Submit under provisions of General Conditions and Division 01 as applicable.

B. Shop Drawings:
   1. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly construction details, components electrical characteristics, and connection requirements.
   2. Include diagrams for power, signal, and control wiring.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Plans and other details, drawn to scale, on which the following items are shown and coordinated with each other using input from installers of the items involved:
   1. Suspended ceiling components.
   2. Structural members to which fan coil units will be attached.
   3. Method of attaching hangers to building structure.
   4. Size and location of initial access modules for acoustic tile.

B. Seismic Qualification Certificates: For fan coil units, accessories, and components, from manufacturer.
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
   2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

C. Field quality-control reports.

1.5 CLOSEOUT SUBMITTALS

A. Submit under provisions of General Conditions and Division 01 as applicable.

B. Operation and Maintenance Data: Include operation and maintenance manual. Include instructions for lubrication, motor, drive replacement, and spare parts list and wiring diagram.

1.6 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Filters: Furnish one set of extra filters for each filter type installed.

1.7 QUALITY ASSURANCE

A. Comply with NFPA 70.

B. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 5 - "Systems and Equipment" and Section 7 - "Construction and Startup."

C. ASHRAE/IES 90.1 Compliance: Applicable requirements in ASHRAE/IES 90.1, Section 6 - "Heating, Ventilating, and Air-Conditioning."

1.8 COORDINATION

A. Coordinate layout and installation of fan coil units and suspension system components with other construction that penetrates or is supported by ceilings, including light fixtures, HVAC equipment, fire-suppression-system components, and partition assemblies.

B. Coordinate size and location of louvers and wall sleeves for outdoor-air intake where applied.

1.9 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace components of condensing units that fail in materials or workmanship within specified warranty period.

1. Failures include, but are not limited to, the following:

   a. Fan failure.
   b. Coil leak.

2. Warranty Period: Five years from date of Substantial Completion.
PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Manufacturers:
   1. International Environmental Coil.
   2. Daikin.
   3. Carrier.
   4. Trane.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

C. Factory-packaged and -tested units rated according to AHRI 440, ASHRAE 33, and UL 1995.

2.2 FAN COIL UNITS

A. Coil Section Insulation: 1-inch-thick, coated or foil-faced glass fiber complying with ASTM C 1071 and attached with adhesive complying with ASTM C 916.
   1. Surface-Burning Characteristics: Insulation and adhesive shall have a combined maximum flame-spread index of 25 and smoke-developed index of 50 when tested according to ASTM E 84 by a qualified testing agency.
   2. Airstream Surfaces: Surfaces in contact with the airstream shall comply with requirements in ASHRAE 62.1.

B. Main and Auxiliary Drain Pans: Stainless steel or insulated galvanized steel with plastic liner. Fabricate pans and drain connections to comply with ASHRAE 62.1.

C. Chassis: Galvanized steel where exposed to moisture, with powder-coat finish and removable access panel. Floor-mounting units shall have leveling screws.

D. Cabinets: Steel with baked-enamel finish in manufacturer's standard paint color.
   1. Supply-Air Plenum: Sheet metal plenum finished and insulated to match the chassis.
   2. Return-Air or Mixing Plenum: Sheet metal plenum finished to match the chassis.
   3. Dampers: Galvanized steel with extruded-vinyl blade seals, flexible-metal jamb seals, and interlocking linkage.

E. Filters: Minimum arrestance and a minimum efficiency reporting value (MERV) according to ASHRAE 52.2 and all addendums.
   1. 1” Pleated type.

F. Hydronic Coils: Copper tube, with mechanically bonded aluminum fins spaced no closer than 0.1 inch, rated for a minimum working pressure of 200 psig and a maximum entering-water temperature of 220 deg F. Include manual air vent and drain.

G. Direct-Driven Fans: Double width, forward curved, centrifugal; with permanently lubricated, multispeed motor resiliently mounted in the fan inlet. Aluminum or painted-steel wheels, and painted-steel or galvanized-steel fan scrolls.
1. Motors: Comply with requirements in Section 230513 "Common Motor Requirements for HVAC Equipment."

H. Basic Unit Controls:
   1. Control voltage transformer.
   2. Unit-mounting thermostat with the following features.
      b. Fan on-auto switch.
      c. Fan-speed switch.
      d. Automatic changeover.
      e. Adjustable deadband.
   3. Wall-mounting temperature sensor.
   4. Unoccupied-period-override push button.
   5. Data entry and access port.
      a. Input data includes room temperature, and humidity set points and occupied and unoccupied periods.
      b. Output data includes room temperature and humidity, supply-air temperature, entering-water temperature, operating mode, and status.

I. DDC Terminal Controller:
   1. Scheduled Operation: Occupied and unoccupied periods on seven-day clock with a minimum of four programmable periods per day.
   2. Controller shall have volatile-memory backup.

J. Electrical Connection: Factory wire motors and controls for a single electrical connection.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas, with Installer present, to receive fan coil units for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for piping and electrical connections to verify actual locations before fan coil unit installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install fan coil units level and plumb.

B. Install fan coil units to comply with NFPA 90A.

C. Suspend fan coil units from structure with elastomeric hangers. Vibration isolators are specified in Section 230548 "Vibration and Seismic Controls for HVAC Piping and Equipment."
D. Verify locations of thermostats and other exposed control sensors with Drawings and room details before installation.

E. Install new filters in each fan coil unit within two weeks after Substantial Completion.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Sections. Drawings indicate general arrangement of piping, fittings, and specialties. Specific connection requirements are as follows:
   1. Install piping adjacent to machine to allow service and maintenance.
   2. Connect condensate drain to indirect waste.
      a. Install condensate trap of adequate depth to seal against fan pressure. Install cleanouts in piping at changes of direction.

B. Connect supply-air and return-air ducts to fan coil units with flexible duct connectors specified in Section 233300 "Air Duct Accessories." Comply with safety requirements in UL 1995 for duct connections.

C. Ground equipment according to Division 26.

D. Connect wiring according to Division 26.

3.4 FIELD QUALITY CONTROL

A. Perform the following tests and inspections:
   1. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation.
   2. Test and adjust controls and safety devices. Replace damaged and malfunctioning controls and equipment.

B. Remove and replace malfunctioning units and retest as specified above.

C. Prepare test and inspection reports.

3.5 ADJUSTING

A. Adjust initial temperature and humidity set points.

3.6 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain fan coil units.

END OF SECTION
SECTION 250000 – BUILDING AUTOMATION SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. Furnish and install a digital Building Automation System (BAS) as specified herein.

1.2 COORDINATION WITH OTHER TRADES

A. Consult all other Sections, determine the extent and character of related work and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable installation. This section is provided to assist Contractor in coordination of work scope but shall not be construed to limit Contractor’s scope of work encompassed by the contract documents.

B. The following table is intended to assist the Contractors in coordinating the scope of work between Division 25 Building Automation System (indicated as 25), and other Divisions as indicated. However, the General Contractor is ultimately responsible for coordination among his subcontractors regardless of what is listed in this Section.

NUMBERED REMARKS:
Wiring includes raceway, fittings, wire, boxes and related items, all voltages.
Wiring and controls to start and stop fans based on smoke detector status and smoke control logic specified under Division 26 Electrical.
Factory installed starters and variable speed drives are specified under Division 23 HVAC. Prewired control panel is specified under Division 23 HVAC; single point power connection (unless otherwise noted on drawings) specified by Division 23 HVAC.
Applies to motors that are not covered by note 0. Integral starter control devices such as HOA switches, 120V control transformers specified under Division 26 Electrical.
Single phase 120V motors with integral motor overload protection specified under Division 23 HVAC.
Line voltage control device such as thermostat or switch specified under Division 25 BAS; wiring and conduit between control device and motor specified under Division 26 Electrical.
Factory installed and wired chilled and condenser water flow switches are specified under Division 23 HVAC; no work is required under Division 25 BAS. Bi-directional (read/write) factory installed BACnet gateway between the BAS and ASHP control panel specified with ASHP under Division 23 HVAC; control wiring specified under Division 25 BAS. ASHP vendor to provide all necessary technical assistance to Division 25 BAS Contractor in mapping across ASHP points to the BAS.
Disconnects or circuit breakers are specified under Division 23 HVAC where specifically called for in equipment schedules or specifications to be factory installed with equipment. Otherwise all disconnects are specified under Division 26 Electrical.
Emergency override switches, status lights and other refrigerant machinery room controls as required by CMC are specified under Division 25 BAS.
TDS controller, bleed valve, injector pump, make-up water flow meter, and all other water treatment system controls are specified under Division 23 HVAC. Field wiring of all components is specified under Division 25 BAS.

Network wiring and routers within building is specified under Division 25 BAS. Connection to campus IT LAN shall be wired by others to main building control panel. Division 25 BAS shall coordinate with campus IT for IP address.

120V power to BAS control panels is specified under Division 26 for the panels shown on Drawings. Power to all other control panels that may be required is specified under Division 25 BAS, coordinated with Division 26 contractor for available circuits. Division 26 contractor for available circuits.

Lighting control vendor to provide all necessary technical assistance to Division 25 BAS Contractor in mapping across lighting control points to the BAS.

Power measuring sensors, installation and wiring to a single central controller with Modbus interface specified under Division 26 Electrical. Modbus gateway and network connection from gateway to BAS specified under Division 25 BAS. Power monitoring control vendor to provide all necessary technical assistance to Division 25 BAS Contractor in mapping across power monitoring control points to the BAS.

Hoods, including all required fire protection devices and integral listed balancing dampers, are specified under Division 11 Food Service.

Ansul type fire protection system is specified under Division 11 Food Service including all control wiring between Ansul hood and fire suppression panel, power wiring to fire suppression panel, fire alarm system monitoring intertie, gas shut-off valve interlock, and circuit breaker shunt-trips for all equipment located under the hoods.

PCUs with factory pre-piped fire suppression nozzles and fusible link detector brackets for Ansul type fire protection system is specified under Division 23. Field connection, tanks, controls, fusible link detectors, and commissioning is specified under Division 11 Food Service as part of hood fire protection system.

Duct access doors required for access to control devices where required specified under Division 23 HVAC.

Actuators for motorized dampers supplied with fans or hoods where scheduled on HVAC drawings are specified under Division 23 HVAC, mounted but not wired.

BACnet gateway to BAS specified in the Division 23 HVAC, factory installed, with connection of gateway to BAS specified under Division 25 BAS. AC vendor to provide all necessary technical assistance to Division 25 BAS Contractor in mapping AC control points to the BAS.

Snorkel specified under Division 11. Snorkel damper/air valve specified under Division 23.

Control transformers for terminal boxes shall be centralized in control panels specified under Division 25 BAS.

Factory wired control transformer, safeties and contactors with single point power wiring connection specified under Division 23 HVAC.

#### 1.3 INTEGRATION WITH EXISTING SYSTEM

A. Include all services required to integrate this building into existing BAS for a fully operational system.

B. Procedure
   1. Provide all controls work within the building as indicated on Drawings and in this Section.
   2. Develop all building level control system databases and control programming using existing standards and standard programming.
3. Install building databases and control programming on a temporary portable operator’s terminal provided by the Contractor. The POT shall be used for start-up, testing, and commissioning. The POT shall remain the property of the Contractor after final completion of the project.

4. Once the building BAS has been fully commissioned and accepted by the College, merge database and programming with those existing on the Control System Servers. Confirm that the merge was successful by sample testing points and sequences and approve final installation in writing.

5. Integrate graphic screens into the Central Plant graphics including adding appropriate hyperlinks so that the system operates as one integrated system.

6. Provide high level password for College operator access to the system only at this point; College will not have access to the system prior to system acceptance and integration.

1.4 CONTRACTOR PROPOSALS

A. The system requirements described in this specification are generally performance based. Where requirements are prescriptive, the intent is to provide minimum quality, not to give unfair advantage to any given manufacturer or product. If a contractor finds that a certain requirement is unduly difficult or expensive to meet, contact the Engineer prior to bid due date and an addendum modifying the requirement will be considered.

B. Where requirements are unclear, the contractor shall clarify the requirements with the Engineer before the bid due date. Where requirements continue to be unclear, the contractor’s proposal must accurately describe what is included and excluded.

C. By submitting a proposal, contractor guarantees that their proposal is in full compliance with these specifications except as specifically excluded in their proposal.

1.5 REFERENCE STANDARDS

A. Nothing in Contract Documents shall be construed to permit Work not conforming to applicable laws, ordinances, rules, and regulations. When Contract Documents differ from requirements of applicable laws, ordinances, rules and regulations, comply with documents establishing the more stringent requirement.

B. The latest published or effective editions, including approved addenda or amendments, of the following codes and standard shall apply to the BAS design and installation as applicable.

C. State, Local, and City Codes

1. CBC – California Building Code
2. CMC – California Mechanical Code
3. CEC – California Electrical Code
4. Local City and County Codes

D. American Society of Heating, Refrigeration and Air Conditioning Engineers (ASHRAE)

E. Electronics Industries Alliance

1. EIA-232 – Interface Between Data Terminal Equipment and Data Circuit-Terminating Equipment Employing Serial Binary Data Interchange.
4. EIA-472 – General and Sectional Specifications for Fiber Optic Cable.
5. EIA-475 – Generic and Sectional Specifications for Fiber Optic Connectors and all Sectional Specifications.
7. EIA-590 – Standard for Physical Location and Protection of Below-Ground Fiber Optic Cable Plant and all Sectional Specifications.

F. Underwriters Laboratories

G. National Electrical Manufacturers Association
   1. NEMA 250 – Enclosure for Electrical Equipment.

H. Institute of Electrical and Electronics Engineers (IEEE)
   2. IEEE 802.3 – CSMA/CD (Ethernet – Based) LAN.
   3. IEEE 802.4 – Token Bus Working Group (ARCNET – Based) LAN.

</table>
### Term | Definition
--- | ---
Secondary Controlling LAN | LAN connecting AACs and ASCs.
Server | A device that is a provider of services to a client. A client device makes requests of and receives responses from a server device.
Standardized Query Language | SQL - A standardized means for requesting information from a database.
Supervisory LAN | Ethernet-based LAN connecting Primary Controller LANs with each other and OWSs, CSS, and THS. See System Architecture below.
Supply | Purchase, procure, acquire and deliver complete with related accessories.
Wiring | Raceway, fittings, wire, boxes and related items.
Work | Labor, materials, equipment, apparatus, controls, accessories and other items required for proper and complete installation.

### 1.7 QUALITY ASSURANCE

**A. Materials and Equipment**

1. Manufacturer’s Qualifications: See 2.1 for approved manufacturers.

**B. Installer**

1. The following are approved BAS contractors:
   a. Sunbelt. Marc Annicchero mannicchero@sunbeltcontrols.com
   b. Air Systems. Mike Putich Mike.Putich@airsystemsinc.com
   c. ASG: Tony Skibinski tskibinski@asgbms.com

2. BAS Contractor’s Project Manager Qualifications: Individual shall specialize in and be experienced with direct digital control system installation for not less than 3 years. Project Manager shall have experience with the installation of the proposed direct digital control equipment product line for not less than 2 projects of similar size and complexity. Project Manager must have proof of having successfully completed the most advanced training offered by the manufacturer of the proposed product line.

3. BAS Contractor’s Programmer Qualifications: Individual(s) shall specialize in and be experienced with direct digital control system programming for not less than 3 years and with the proposed direct digital control equipment product line for not less than 1.5 years. Programmers must show proof of having successfully completed the most advanced programming training offered by the vendor of the programming application on the proposed product line.

4. BAS Contractor’s Lead Installation Technician Qualifications: Individual(s) shall specialize in and be experienced with direct digital control system installation for not less than 3 years and with the proposed direct digital control equipment product line for not less than 1.5 years. Installers must show proof of having successfully completed the installation certification training offered by the vendor of the proposed product line.

5. BAS Contractor’s Service Qualifications: The installer must be experienced in control system operation, maintenance and service. BAS Contractor must document a minimum
5-year history of servicing installations of similar size and complexity. Installer must also document at least a 1-year history of servicing the proposed product line.

6. Installer’s Response Time and Proximity
   a. Installer must maintain a fully capable service facility within 50 miles of the subject Project. Service facility shall manage the emergency service dispatches and maintain the inventory of spare parts.
   b. Installer must demonstrate the ability to meet the emergency response times listed

7. Electrical installation shall be by manufacturer-trained electricians
   a. Exception: Roughing in wiring and conduit and mounting panels may be subcontracted to any licensed electrician.

1.8 SUBMITTALS

A. No work may begin on any segment of this Project until the related submittals have been reviewed for conformity with the design intent and the Contractor has responded to all comments to the satisfaction of the Owner’s Representative.

B. Submit drawings and product data as hereinafter specified. Conditions in this Section take precedence over conditions in Division 1 or Section 230501 Basic Mechanical Materials and Methods.

C. Submittal Schedule: Submittal schedule shall be as follows unless otherwise directed by the Owner’s Representative:
   1. Allow 10 working days for approval, unless Owner’s Representative agrees to accelerated schedule.
   2. Submittal Package 0 (Qualifications) shall be submitted with bid.
   3. Submittal Package 1 (Hardware and Shop Drawings) shall be submitted in accordance with schedule established by the Owner in bid documents.
   4. Submittal Package 2 (Programming and Graphics) and shall be submitted no less than 30 days before software is to be installed in field devices.
   5. Submittal Package 3 (Functional Testing) shall be submitted no less than 30 days prior to conducting tests.
   6. Submittal Package 4 (Training Materials) shall be submitted no less than 14 days prior to conducting first training class.
   7. Submittal Package 5 (Post-Construction Trend Logs) shall be submitted after demonstration tests are accepted and systems are in full automatic operation. The list of points to be trended shall be submitted for approval 14 days prior to the start of the trend collection period.

D. Submission and Resubmission Procedure
   1. Optional Pre-Submittals. At Contractor’s option, electronic submittals indicated below may be submitted unofficially via email directly to the Engineer for review and comment prior to formal submission. Comments provided by the Engineer are not official and may be changed or additional comments may be provided on the formal submittal. The intent of pre-submittals is to reduce paperwork and review time.
   2. Each submittal shall have a unique serial number that includes the associated specification section followed by a number for each sub-part of the submittal for that specification section, such as SUBMITTAL 250000-01.
   3. Each resubmittal shall have the original unique serial number plus unique revision number such as SUBMITTAL 250000-01 REVISION 1.
   4. Submit one copy of submittal in electronic format specified under each submittal package below. Submissions made in the wrong format will be returned without action.
5. Owner’s Representative will return a memo or mark-up of submittal with comments and corrections noted where required.

6. Make corrections
   a. Revise initial submittal to resolve review comments and corrections.
   b. Indicate any changes that have been made other than those requested.
   c. Clearly identify resubmittal by original submittal number and revision number.

7. Resubmit revised submittals until no exceptions are taken.

8. Once submittals are accepted with no exceptions taken, provide
   a. Complete submittal of all accepted drawings and products in a single electronic file.
   b. Photocopies or electronic copies for coordination with other trades, if and as required by the General Contractor or Owner’s Representative.

E. Submittals Packages

1. Submittal Package 0 (Qualifications)
   a. Provide Installer and Key personnel qualifications as specified in Paragraph 1.7B.
   b. Format: Word-searchable format per Paragraph 1.9C.3.

2. Submittal Package 1 (Hardware and Shop Drawings)
   a. Hardware
      1) Organize by specification section and device tags as tagged in these specifications.
      2) Do not submit products that are not used even if included in specifications.
      3) Include a summary table of contents listing for every submitted device:
         a) Tab of submittal file/binder where submittal is located
         b) Device tag as tagged in these specifications (such as TS-1A, FM-1)
         c) Specification section number (down to the lowest applicable heading number)
         d) Whether device is per specifications and a listed product or a substitution
         e) Manufacturer
         f) Model number
         g) Device accuracy (where applicable)
         h) Accuracy as installed including wiring and A/D conversion effects (where applicable)
      4) Submittal shall include manufacturer’s description and technical data, such as performance data and accuracy, product specification sheets, and installation instructions for all control devices and software.
      5) When manufacturer’s cut-sheets apply to a product series rather than a specific product, the data specifically applicable to the Project shall be highlighted or clearly indicated by other means. Each submitted piece of literature and drawings shall clearly reference the specification or drawing that the submittal is to cover. General catalogs shall not be accepted as cut sheets to fulfill submittal requirements.
      6) Format: Word-searchable format per Paragraph 1.9C.3.
   b. Shop Drawings
      1) System architecture one-line diagram indicating schematic location of all control units, workstations, LAN interface devices, gateways, etc. Indicate address and type for each control unit. Indicate media, protocol, baud rate, and type of each LAN.
      2) Schematic flow diagram of each air and water system showing fans, coils, dampers, valves, pumps, heat exchange equipment and control devices. The
schematics provided on Drawings shall be the basis of the schematics with respect to layout and location of control points.

3) All physical points on the schematic flow diagram shall be indicated with names, descriptors, and point addresses identified as listed in the point summary table.

4) Label each input and output with the appropriate range.

5) Device table (Bill of Materials). With each schematic, provide a table of all materials and equipment including:
   a) Device tag as indicated in the schematic and actual field labeling (use tag as indicated in these specifications where applicable and practical)
   b) Device tag as indicated in these specifications where applicable and if it differs from schematic device tag
   c) Description
   d) Proposed manufacturer and model number
   e) Range
   f) Quantity

6) With each schematic or on separate valve sheet, provide valve and actuator information including pipe size, valve size, \( C_v \), design flow, target pressure drops, actual design pressure drops, manufacturer, model number, close off rating, etc. Indicate normal positions of fail-safe valves and dampers.

7) Indicate all required electrical wiring. Electrical wiring diagrams shall include both ladder logic type diagram for motor starter, control, and safety circuits and detailed digital interface panel point termination diagrams with all wire numbers and terminal block numbers identified. Provide panel termination drawings on separate drawings. Ladder diagrams shall appear on system schematic. Clearly differentiate between portions of wiring that are factory-installed and portions to be field-installed.

8) Details of control panels, including controllers, instruments, and labeling shown in plan or elevation indicating the installed locations.

9) Floor plans: None required.

10) Format
   a) Sheets shall be consecutively numbered.
   b) Each sheet shall have a title indicating the type of information included and the mechanical/electrical system controlled.
   c) Table of Contents listing sheet titles and sheet numbers.
   d) Legend and list of abbreviations.
   e) Schematics
      (1) Word searchable pdf format.
      (2) 21-inch x 15 inch or 17 inch x 11 inch.

   c. Do not include sequence of controls on shop drawings or equipment submittals; they are included in Submittal Package 2.

3. Submittal Package 2 (Programming and Graphics)
   a. A detailed description of point naming convention conforming to Paragraph 3.12B to be used for all software and hardware points, integrated with existing database convention.
   b. A list of all hardware and software points identifying their full text names, device addresses and descriptions.
   c. Control Logic Documentation
      1) Submit control logic program listings (graphical programming) consistent with specified English-language Sequences of Operation for all control units.
      2) Control logic shall be annotated to describe how it accomplishes the sequence of operation. Annotations shall be sufficient to allow an operator to
relate each program component (block or line) to corresponding portions of the specified Sequence of Operation.

3) Include specified English-language Sequences of Operation of each control sequence updated to reflect any suggested changes made by the Contractor to clarify or improve the sequences. Changes shall be clearly marked. SOO shall be fully consistent with the graphical programming. (An electronic version of the sequences of controls in Paragraph 3.12 will be provided to the Contractor upon request.)

4) Include control settings, setpoints, throttling ranges, reset schedules, adjustable parameters and limits.

5) Submit one complete set of programming and operating manuals for all digital controllers concurrently with control logic documentation.

d. Graphic screens of all required graphics provided in final colors.

e. Format

1) Points list: Word-searchable format per Paragraph 1.9C.3.
2) Programming: Native ALC Eikon.
3) Programming and operating manual: Word-searchable format per Paragraph 1.9C.3.
4) Graphics: Graphical electronic format (pdf, png, etc.).

4. Submittal Package 3 (Functional Testing)

a. Provide pre-functional test forms as required by Paragraph 3.15B.1.a.

b. Provide functional test forms as required by Paragraph 3.15B.2.

c. Format: Word-searchable format per Paragraph 1.9C.3.

5. Submittal Package 4 (Training Materials)

a. Provide training materials as required by Paragraph 3.16.

b. Format: Word-searchable format per Paragraph 1.9C.3.

6. Submittal Package 5 (Trend Logs)

a. Provide a list of points being trended along with trend interval or change-of-value per Paragraph 3.15I.2.d.

b. Provide trend logs as required by Paragraph 3.15I.

1.9 COMPLETION REQUIREMENTS

A. Procedure

1. Until the documents required in this Section are submitted and approved, the system will not be considered accepted and final payment to Contractor will not be made.

2. Before requesting acceptance of Work, submit one set of completion documents for review and approval of Owner.

3. After review, furnish quantity of sets indicated below to Owner.

B. Completion Documents

1. Operation and Maintenance (O & M) Manuals. Provide in both paper and electronic format per Paragraph 1.9C.

a. Include all submittals (product data, shop drawings, control logic documentation, hardware manuals, software manuals, installation guides or manuals, maintenance instructions and spare parts lists) in maintenance manual.

b. As-built versions of the submittal product data. Submittal data shall be located in tabs along with associated maintenance information.
c. Engineering, Installation, and Maintenance Manual(s) that explain how to design and install new points, panels, and other hardware; preventive maintenance and calibration procedures; how to debug hardware problems; and how to repair or replace hardware.

d. Complete original issue documentation, installation, and maintenance information for all third-party hardware and software provided, including computer equipment and sensors.

e. A list of recommended spare parts with part numbers and suppliers.

f. Operators Manual with procedures for operating the control systems, including logging on/off, alarm handling, producing point reports, trending data, overriding computer control, and changing set points and other variables.

g. Programming Manuals with a description of the programming language, control block descriptions (including algorithms and calculations used), point database creation and modification, program creation and modification, and use of the programming editor.

h. Recommended preventive maintenance procedures for all system components, including a schedule of tasks (inspection, cleaning, calibration, etc.), time between tasks, and task descriptions.

i. A listing and documentation of all custom software for the Project created using the programming language, including the set points, tuning parameters, and point and object database.

j. English language control sequences updated to reflect final programming installed in the BAS at the time of system acceptance.

k. A BACnet Protocol Implementation Conformance Statement (PICS) for each type of controller and operator interface.

2. Complete original issue electronic copy for all software provided, including operating systems, programming language, operator workstation software, and graphics software.

3. Complete electronic copy of BAS database, user screens, setpoints and all configuration settings necessary to allow re-installation of system after crash or replacement of server, and resume operations with the BAS in the same configuration as during owner sign-off.

4. Project Record Drawings

   a. As-built versions of the submittal drawings in reproducible paper and electronic format per Paragraph 1.9C.

   b. As-built network architecture drawings showing all BACnet nodes including a description field with specific controller and device identification, description and location information.

5. Commissioning Reports. Completed versions of all Pre-functional, Functional, and Demonstration Commissioning Test reports, calibration logs, etc., per Paragraph 3.15B.

6. Copy of inspection certificates provided by the local code authorities.

7. Written guarantee and warranty documents for all equipment and systems, including the start and end date for each.

8. Training materials as required

9. Contact information. Names, addresses, and 24-hour telephone numbers of contractors installing equipment, and the control systems and service representatives of each.

C. Format of Completion Documents

1. Provide the type and quantity of media listed in table below.

2. Project database, programming source files, and all other files required to modify, maintain, or enhance the installed system shall be provided in their source format and compiled format (where applicable).

3. Where electronic copies are specified, comply with the following:
a. Provide in word-searchable electronic format; acceptable formats are MS Word, Adobe Acrobat (pdf), and HTML; submit other formats for review and approval prior to submission; scanned paper documents not acceptable.

b. For submittals, provide separate file for each type of equipment.

c. Control sequences shall be in MS Word.

D. Permanent On-site Documentation

1. In panels, provide the following in a sufficiently permanent manner such that documentation cannot be easily removed (and lost):

a. Point list of all points in panel.

b. Shop drawings for devices in panel.

1.10 BAS DESIGN

A. System Architecture

1. Use ALC DDC controls on Accutrol Lab Air Valves

2. General

a. The system provided shall incorporate hardware resources sufficient to meet the functional requirements specified in this Section. Include all items not specifically itemized in this Section that are necessary to implement, maintain, and operate the system in compliance with the functional intent of this Section.

b. The system shall be configured as a distributed processing network(s) capable of expansion as specified herein.

c. The existing Campus BAS consists of a control system server interconnected by a high speed Supervisory LAN to each campus building and facility. This project includes integrating building level BCs and other control devices into the campus system.

1) Within the building, the BAS shall be standalone and not rely on any 3rd party networks, such as the Campus IT LAN.

2) To communicate with the central CSS (and internet via VPN), the building Supervisory LAN shall connect via router, provided under Division 25, to the Campus IT LAN, provided by the College IT group. Locate in building MDF or other location as directed by the College IT group.
d. All control products provided for this Project shall comprise an interoperable Native BACnet System. All control products provided for this Project shall conform to ANSI/ASHRAE Standard 135.

3. BAS Network Architecture
   a. Supervisory LAN: The LAN shall be an Ethernet-based, 100 or 1000 Mbps network connecting the server and OWS(s) and to certain gateways as specified herein. Provide this as a dedicated LAN for the control system; the Campus IT LAN shall not be used for this purpose. LAN shall be IEEE 802.3 Ethernet with switches and routers that support 100 Mbps minimum throughput. Power-line carrier communication are not acceptable for communications. This network shall be BACnet/IP as defined in the BACnet standard, and shall share a common network number for the Ethernet backbone, as defined in BACnet.
      1) Supervisory LAN shall be extended to the following mechanical rooms (to allow POTs to connect to system using browser and to improve throughput of trend date)
         2) ASHP
         3) Penthouse AHU, EF
   b. Primary Controller LAN (Primary LAN): High-speed, peer-to-peer communicating LAN used to connect BCs, AACs, and certain gateways where specified herein. The Primary LAN communicates exclusively control information. Acceptable technologies include and are limited to:
      1) Ethernet (IEEE802.3)
      2) ARCNET (IEEE802.4)
   c. Secondary Controller LAN (Secondary LAN): Network used to connect ASCs and certain gateways where specified herein. These may be Master Slave/ Token Passing (MS/TP) in addition to those allowed for Primary Controller LANs. Network speed versus the number of controllers on the LAN shall be dictated by the response time and trending requirements.

4. Operator Interfaces and Servers. The Control Systems Server (CSS) and Operator interface devices are existing. No additional CSS, OWS, or POT shall be provided as a part of this project. See Paragraph 1.3 for temporary CSS requirements.

5. Controllers. The BCs, AACs, and ASCs shall monitor, control, and provide the field interface for all points specified.

6. Gateways
   a. See Paragraph 2.4C for a list of gateways and routers.
   b. Where gateways are used, critical points shall be hardwired from the BAS to the controlled device, rather than using the gateway, to avoid problems with gateway failures, currently a common problem. Critical points are those that are essential for proper operation and are listed in points list as separate points. Where listed, these points shall be hardwired even when available through gateway.

B. System Performance
   1. The communication speed between the controllers, LAN interface devices, and operator interface devices shall be sufficient to ensure fast system response time under any loading condition. This includes when system is collecting trend data for commissioning and for long term monitoring. (See Paragraph 3.15I.) In no case shall delay times between an event, request, or command initiation and its completion be greater than those listed herein, assuming no other simultaneous operator activity. Reconfigure LAN as necessary to accomplish these performance requirements. This does not apply to gateways and their interaction with non-BAS-vendor equipment.
a. Object Command: The maximum time between an operator command via the operator interface to change an analog or binary point and the subsequent change in the controller shall be less than 5 seconds.

b. Object Scan: All changes of state and change of analog values will be transmitted over the network such that any data used or displayed at a controller or workstation will have been current within the previous 10 seconds.

c. Graphics Scan: The maximum time between an operator’s selection of a graphic and it completely painting the screen and updating at least 10 points shall be less than 10 seconds.

d. Alarm Response Time: The maximum time from when an object goes into alarm to when it is annunciated at the workstation or broadcast (where so programmed) shall not exceed 10 seconds for a Level 1 alarm, 20 seconds for alarm levels 2 and 3, and 30 seconds for alarm levels 4 and 5. All workstations on the onsite network must receive alarms within 5 seconds of each other.

e. Program Execution Frequency: Custom and standard applications shall be capable of running as often as once every 5 seconds. Contractor shall be responsible for selecting execution times consistent with the mechanical process under control.

f. Control Loop Performance: Programmable controllers shall be able to execute DDC PID control loops at a selectable frequency of at least once per second. The controller shall scan and update the process value and output generated by this calculation at this same frequency.

2. Sensor selection, wiring method, use of transmitters, A-to-D conversion bits, etc. shall be selected and adjusted to provide end-to-end (fluid to display) accuracy at or better than those listed in the following table.

1.11 OWNERSHIP OF PROPRIETARY MATERIAL

A. All project-developed software and documentation shall become the property of the Owner. These include, but are not limited to:

1. Project graphic images
2. Record drawings
3. Project database
4. Project-specific application programming code
5. All documentation

1.12 WARRANTY

A. At the successful completion of the final testing, commissioning, and demonstration phase in accordance with the terms of this specification, if equipment and systems are operating satisfactorily to the Owner, the Owner shall certify in writing that the control system has been accepted. The date of acceptance shall be the start of the warranty period.

B. Guarantee all materials, equipment, apparatus and workmanship (including programming) to be free of defective materials and faulty workmanship for the following periods from date of acceptance:
   1. BCs, AACs, and ASCs: two years
   2. Valve and damper actuators: five years
   3. All else: one year

C. Provide new materials, equipment, apparatus and labor to replace that determined by Owner to be defective or faulty.

D. Control system failures during the warranty period shall be adjusted, repaired, or replaced at no additional cost or reduction in service to the Owner. Contractor shall respond to the Owner’s request for warranty service within 24 hours during normal business hours.

E. Sequence of operation programming bugs (both due to programming misinterpretations and sequence errors) shall be corrected and any reasonable control sequence changes required to provide proper system operation shall be provided at no additional cost to the Owner during this period.

1.13 WARRANTY MAINTENANCE

A. The Contractor shall warrant parts and installation work due to malfunction or incorrect initial installation, unless the owner provides clear and convincing evidence that a specific problem is the result of such changes to the BAS.

B. At no cost to the Owner, provide maintenance services for software and hardware components during the warranty period as specified below:
   1. Normal Service: Any malfunction, failure, or defect in any hardware component or failure of any control programming shall be corrected and repaired following notification by the Owner to the Contractor.
      a. Response by telephone to any request for service shall be provided within eight working hours (contractor specified 40 hr. per week normal working period) of the Owner’s initial request for service.
      b. In the event that the malfunction, failure, or defect is covered under warranty, at least one technician, trained in the system to be serviced, shall be dispatched to the Owner’s site within three working days of the Owner’s initial request for such services, as specified.
      c. Seasonal tuning of setpoint variables is not considered part of warranty as the sequence of operations does not change.
2. Owner’s Telephonic Request for Service: Contractor shall specify a maximum of three telephone numbers for Owner to call in the event of a need for service. At least one of the lines shall be attended continuously (24/7). Alternatively, pagers/SMS can be used for technicians trained in system to be serviced. One of the three paged/texted technicians shall respond to every call within 15 minutes.

3. Documentation: Record drawings and software documentation shall be updated as required to reflect any and all changes made to the system or programming during the warranty period.

PART 2 - PRODUCTS

2.1 PRIMARY BAS MANUFACTURER

A. Automated Logic Corp.

B. Accutrol Lab Air Valves with Automated Logic Corp controllers.

C. No Equal

2.2 GENERAL

A. Materials shall be new, the best of their respective kinds without imperfections or blemishes and shall not be damaged in any way.

B. To the extent practical, all equipment of the same type serving the same function shall be identical and from the same manufacturer.

C. All controllers, associated hardware (repeaters, routers, etc.), sensors, and control devices shall be fully operational and maintain specified accuracy at the anticipated ambient conditions of the installed location as follows:

1. Outdoors or in harsh ambient conditions: -20°C to 55°C (-4°F to 130°F), 10% RH to 90% RH noncondensing.

2. Conditioned spaces or mechanical rooms: 0°C to 40°C (32°F to 104°F), 10% RH to 80% RH noncondensing.

2.3 CONTROLLERS

A. Building Controller (BC)
   1. ALC ME-series

B. Advanced Application Specific Controller (AAC)
   1. ALC SE-series

C. Application Specific Controller (ASC)
   1. ALC ZN-series

D. Lab Air Valves
1. Accutrol lab air valves with ALC controllers. Single controller per zone. Use expandable controller where necessary to accommodate all the zone IO.

2.4 COMMUNICATION DEVICES

A. Supervisory LAN Routers
   1. ALC LGR and AAR line

B. BACnet Gateways & Routers
   1. Gateways shall be provided to link non-BACnet control products to the BACnet internetwork. All of the functionality described in this Paragraph is to be provided by using the BACnet capabilities. Each Gateway shall have the ability to expand the number of BACnet objects of each type supported by 20% to accommodate future system changes.
   2. Each Gateway shall provide values for all points on the non-BACnet side of the Gateway to BACnet devices as if the values were originating from BACnet objects. The Gateway shall also provide a way for BACnet devices to modify (write) all points specified by the Points List using standard BACnet services.

C. Gateway and Routers

2.5 BAS INTERFACE HARDWARE

A. Not required (existing)

2.6 AIR TUBING

A. Seamless copper tubing, Type L-ACR, ASTM B 88; with cast-bronze solder joint fittings, ANSI B1.18; or wrought-copper solder-joint fittings, ANSI B16.22; except brass compression-type fittings at connections to equipment. Solder shall be 95/5 tin antimony, or other suitable lead free composition solder.

B. Virgin polyethylene non-metallic tubing type FR, ASTM D 2737, and with flame-retardant harness for multiple tubing. Use compression or push-on brass fittings.
2.7 ELECTRIC WIRING AND DEVICES

A. All electrical work shall comply with Division 26.

B. Communication Wiring
   1. Provide all communication wiring between Building Controllers, Routers, Gateways, AACs, ASCs and local and remote peripherals (such as operator workstations and printers).
   2. Ethernet LAN: Use Fiber or Category 5 or 6 of standard TIA/EIA 68 (10baseT). Network shall be run with no splices and separate from any wiring over 30 volts.
   3. ARCnet and MS/TP LAN: Communication wiring shall be individually 100% shielded pairs per manufacturers recommendations for distances installed, with overall PVC cover, Class 2, plenum-rated run with no splices and separate from any wiring over 30 volts. Shield shall be terminated and wiring shall be grounded as recommended by BC manufacturer.

C. Analog Signal Wiring
   1. Input and output signal wiring to all field devices, including, but not limited to, all sensors, transducers, transmitters, switches, current or voltage analog outputs, etc. shall be twisted pair, 100% shielded if recommended or required by controller manufacturer, with PVC cover. Gauge shall be as recommended by controller manufacturer.

2.8 CONTROL CABINETS

A. All control cabinets shall be fully enclosed with hinged door and quarter-turn slotted latch.

B. Construction
   1. Indoor: NEMA 1
   2. Outdoor: NEMA 3R

C. Interconnections between internal and face-mounted devices shall be pre-wired with color-coded stranded conductors neatly installed in plastic troughs or tie-wrapped. Terminals for field connections shall be UL Listed for service, individually identified per control-interlock drawings, with adequate clearance for field wiring. All control tubing and wiring shall be run neatly and orderly in open slot wiring duct with cover. Control terminations for field connection shall be individually identified per control Shop Drawings.

D. Provide ON/OFF power switch with over-current protection for control power sources to each local panel.

E. Provide with
   1. Framed, plastic-encased point list for all points in cabinet.
   2. Nameplates for all devices on face.

2.9 SENSORS AND MISCELLANEOUS FIELD DEVICES

A. The listing of several sensors or devices in this section does not imply that any may be used. Refer to points list in Paragraph 2.12 Points List for device specification. Only where two or more devices are specifically listed in points list (such as “FM-1 or FM-4”) may the Contractor choose among listed products.

B. Control Valves
   1. Manufacturers
2. Butterfly Valves
   a. Body: Extended neck epoxy coated cast or ductile iron with full lug pattern, ANSI Class bolt pattern to match specified flanges.
   b. Seat: EPDM replaceable, non-collapsible, phenolic backed.
   c. Disc: Polished aluminum bronze or stainless steel, pinned or mechanically locked to shaft. Sanded castings are not acceptable.
   d. Bearings: Bronze or stainless steel.
   e. Shaft: 416 stainless steel supported at three locations with PTFE bushings for positive shaft alignment.
   f. Close off rating: Bubble-tight shutoff greater or equal to 125% of pump shut-off head.

3. Two Position Ball Valves
   a. Valves shall be specifically designed for two-position duty in control application with guaranteed average leak-free life span over 200,000 full stroke cycles.
   b. Industrial quality with nickel plated forged brass body and female NPT threads.
   c. Blowout proof stem design, glass-reinforced Teflon thrust seal washer and stuffing box ring with minimum 600 psi rating (1 inch and smaller) or 400 psi rating (larger than 1 inch). The stem packing shall consist of 2 lubricated O-rings designed for on-off service and requiring no maintenance.
   d. Valves suitable for water or low-pressure steam shall incorporate an anti-condensation cap thermal break in stem design.
   e. No characterization disks
   f. Close off rating: Bubble-tight shutoff greater or equal to 125% of pump shut-off head.
   g. Ball: Chrome plated brass
   h. Stem: Chrome plated brass

4. Modulating Characterized Ball Valves
   a. Valves shall be specifically designed for modulating duty in control application with guaranteed average leak-free life span over 200,000 full stroke cycles.
   b. Industrial quality with nickel plated forged brass body and female NPT threads.
   c. Blowout proof stem design, glass-reinforced Teflon thrust seal washer and stuffing box ring with minimum 230 psi rating (2-way valves) or 400 psi rating (3-way valves). The stem packing shall consist of 2 lubricated O-rings designed for modulating service and requiring no maintenance.
   d. Valves suitable for water or low-pressure steam shall incorporate an anti-condensation cap thermal break in stem design.
   e. Close off rating: Bubble-tight shutoff greater or equal to 125% of pump shut-off head.
   f. Ball: stainless steel
   g. Stem: stainless steel
   h. Characterizing disk held securely by a keyed ring providing equal percentage characteristic

5. Six-way Characterized Ball Valves
   a. Valves shall be specifically designed for modulating duty in control application with guaranteed average leak-free life span over 200,000 full stroke cycles.
   b. Industrial quality with nickel plated forged brass body and NPT threads.
   c. Blowout proof stem design, glass-reinforced Teflon thrust seal washer and stuffing box ring with minimum 230 psi rating. The stem packing shall consist of 2 lubricated O-rings designed for modulating service and requiring no maintenance.
d. Valves suitable for water or low-pressure steam shall incorporate an anti-condensation cap thermal break in stem design.
e. Built-in pressure relief  
f. Close off rating: 50 psi  
g. Ball: chrome plated brass  
h. Stem: nickel plated brass  
i. Characterizing disk held securely by a keyed ring providing linear characteristic

6. Minimum valve assembly pressure ratings
   a. Chilled water: 125 psi at 60ºF  
   b. Hot water: 125 psi at 200ºF  
   c. Condenser water: 125 psi at 100ºF

7. Valve Selection
   a. Valve type  
      1) Modulating 2-way or 3-way valves  
         a) 6 inch and less: characterized ball type  
         b) 8 inch and greater: globe type  
      2) Bypass valve at primary-only variable flow pumping system outlet: Same as  
         Modulating 2-way valve.  
      3) Two-position isolation: butterfly or non-characterized ball type
   b. Valve Characteristic  
      1) 2-way valves: equal percentage or modified equal percentage.  
      2) 3-way valves controlling cooling coils and condenser water heat exchangers:  
         linear.  
      3) 3-way valves controlling heating coils: equal percentage or modified equal  
         percentage.  
      4) 6-way valves: linear  
      5) Two-position valves: not applicable. For ball valves used for two-position duty,  
         do not include characterizing disk.
   c. Valve Sizing  
      1) Modulating Water: Size valve to achieve the following full-open pressure drop  
         a) Minimum pressure drop: equal to half the pressure drop of coil or  
            exchanger.  
         b) Maximum pressure drop  
            (1) Hot water at coils: 2 psi  
            (2) Chilled water at coils: 5 psi  
         c) 3-way valves shall be selected for near minimum pressure drop. 2-way  
            and 6-way valves shall be selected near maximum pressure drop.  
         d) Flow coefficient (Cₜ) shall not be less than 1.0 (to avoid clogging)  
            unless protected by strainer. Verify from piping schematics that a  
            strainer is being provided.  
         e) Valve size shall match as close as possible the pipe size where Cₜ is  
            available in that size.  
      2) Two-position valves: Line size unless otherwise indicated on Drawings.

C. Control Dampers
   1. See Division 23
D. Actuators

1. Manufacturers
   a. Belimo
   b. No equal

2. Warranty: Valve and damper actuators shall carry a manufacturer’s 5-year warranty.

3. Electric Actuators
   a. Entire actuator shall be UL or CSA approved by a National Recognized Testing Laboratory.
   b. Enclosure shall meet NEMA 4X weatherproof requirements for outdoor applications.
   c. Dampers. The actuator shall be direct coupled over the shaft, enabling it to be mounted directly to the damper shaft without the need for connecting linkage. The clamp shall be steel of a V-bolt design with associated V-shaped, toothed cradle attaching to the shaft for maximum strength and eliminating slippage via cold weld attachment. Single bolt or set screw type fasteners are not acceptable. Aluminum clamps are unacceptable.
   d. Valves. Actuators shall be specifically designed for integral mounting to valves without external couplings.
   e. Actuator shall have microprocessor-based motor controller providing electronic cut off at full open so that no noise can be generated while holding open. Holding noise level shall be inaudible.
   f. Noise from actuator while it is moving shall be inaudible through a tee-bar ceiling.
   g. Actuators shall provide protection against actuator burnout using an internal current limiting circuit or digital motor rotation sensing circuit. Circuit shall insure that actuators cannot burn out due to stalled damper or mechanical and electrical paralleling. End switches to deactivate the actuator at the end of rotation or use of magnetic clutches are not acceptable.
   h. Modulating Actuators. Actuators shall accept a 0 to 10 VDC or 0 to 20 mA control signal and provide a 2 to 10 VDC or 4 to 20 mA operating range. Actuators shall have positive positioning circuit so that controlled device is at same position for a given signal regardless of operating differential pressure. Actuators that internally use a floating actuator with an analog signal converter are not acceptable.
   i. Where indicated on Drawings or Points List, actuators shall include
      1) 2 to 10 VDC position feedback signal
      2) Limit (end) position switches
   j. All 24 VAC/DC actuators shall operate on Class 2 wiring and shall not require more than 10 VA for AC. Actuators operating on 120 VAC power shall not require more than 10 VA. Actuators operating on 230 VAC power shall not require more than 11 VA.
   k. All modulating actuators shall have an external, built-in switch to allow the reversing of direction of rotation.
   l. Actuators shall be provided with a conduit fitting a minimum three-foot electrical cable and shall be pre-wired to eliminate the necessity of opening the actuator housing to make electrical connections.
   m. Where fail-open or fail-closed (fail-safe) position is required by Paragraph Error! Reference source not found., an internal mechanical, spring return mechanism shall be built into the actuator housing. Electrical capacitor type fail-safe are also acceptable. All fail-safe actuators shall be capable of both clockwise or counterclockwise spring return operation by simply changing the mounting orientation.
   n. Actuators shall be capable of being mechanically and electrically paralleled to increase torque where required.
   o. All non-spring return actuators shall have an external manual gear release to allow manual positioning of the damper when the actuator is not powered. Spring return
actuators with more than 60 inch-pound torque capacity shall have a manual crank for this purpose.

p. Actuators shall be designed for a minimum of 60,000 full cycles at full torque and be UL 873 listed.
q. Actuators shall provide clear visual indication of damper/valve position.

4. Electric Actuators for Large Butterfly Valves

a. Entire actuator shall be UL or CSA approved by a National Recognized Testing Laboratory.
b. The valve actuator shall consist of a capacitor-type reversible electric motor, gear train, limit switches and terminal block, all contained in a die cast aluminum enclosure.
c. Enclosure shall meet NEMA 4X weatherproof requirements for outdoor applications.
d. Output shaft shall be electroless nickel plated to prevent corrosion.
e. Actuator shall have a motor rated for minimum 75% duty cycle. Duty cycle shall be defined as running time divided by installed time at maximum torque.
f. Actuator shall be suitable for operation in ambient temperature ranging from -22°F to +150°F.
g. A pre-wired cable shall bring wiring outside enclosure to avoid necessity of opening cover.
h. Gears shall be hardened alloy steel, permanently lubricated. A self-locking gear assembly or a brake shall be supplied.
i. Actuator shall be equipped with a hand wheel for manual override to permit operation of the valve in the event of electrical power failure or system malfunction. Hand wheel must be permanently attached to the actuator. When in manual operation electrical power to the actuator will be permanently interrupted.
j. The hand wheel will not rotate while the actuator is electrically driven.
k. Actuator shall have heater and thermostat to minimize condensation within the actuator housing.
l. Provide limit (end) position switches where indicated on schematics.
m. Actuators shall provide clear visual indication of valve position.

5. Normal and Fail-Safe Position

a. Except as specified otherwise herein, the normal position (that with zero control signal) and the fail-safe position (that with no power to the actuator) of control devices and actuators shall be as indicated in table below. “Last” means last position. Actuators with a fail-safe position other than “Last” must have spring or electronic fail-safe capability.

6. Valve Actuator Selection
   a. Modulating actuators for valves shall have minimum rangeability of 50 to 1.
   b. Water
      1) 2-way, 6-way, and two-position valves
         a) Tight closing against 125% of system pump shut-off head.
         b) Modulating duty against 90% of system pump shut-off head.
      2) 3-way shall be tight closing against twice the full open differential pressure for which they are sized.

7. Damper Actuator Selection
   a. Actuators shall be direct coupled. For multiple sections, provide one actuator for each section; linking or jack-shafting damper sections shall not be allowed.
   b. Provide sufficient torque as velocity, static, or side seals require per damper manufacturer’s recommendations and the following:
      1) Torque shall be a minimum 5 inch-pound per square foot for opposed blade dampers and 7 inch-pound per square foot for parallel blade dampers.
      2) The total damper area operated by an actuator shall not exceed 80% of the manufacturer’s maximum area rating.

E. General Field Devices
   1. Provide field devices for input and output of digital (binary) and analog signals into controllers (BCs, AACs, ASCs). Provide signal conditioning for all field devices as recommended by field device manufacturers and as required for proper operation in the system.
   2. It shall be the Contractor’s responsibility to assure that all field devices are compatible with controller hardware and software.
   3. Field devices specified herein are generally two-wire type transmitters, with power for the device to be supplied from the respective controller. If the controller provided is not equipped to provide this power, or is not designed to work with two-wire type transmitters, or if field device is to serve as input to more than one controller, or where the length of wire to the controller will unacceptably affect the accuracy, provide a transmitter and necessary regulated DC power supply, as required.
   4. For field devices specified hereinafter that require signal conditioners, signal boosters, signal repeaters, or other devices for proper interface to controllers, furnish and install proper device, including 120V power as required. Such devices shall have accuracy equal to, or better than, the accuracy listed for respective field devices.
   5. Accuracy: As used in this Section, accuracy shall include combined effects of nonlinearity, non-repeatability and hysteresis. Sensor accuracy shall be at or better than both that specifically listed for a device and as required by Paragraph 1.10B.2.

F. Temperature Sensors (TS)
   1. General
      a. Unless otherwise noted, sensors may be platinum RTD, thermistor, or other device that is commonly used for temperature sensing and that meets accuracy, stability, and resolution requirements.
      b. When matched with A/D converter of BC, AAC, or ASC, sensor range shall provide a resolution of no worse than 0.3°F (0.16 °C) (unless noted otherwise herein).
      c. Sensors shall drift no more than 0.3°F and shall not require calibration over a five-year period.
      d. Manufacturers
         1) Mamac
2) Kele Associates
3) Building Automation Products Inc.
4) Automated Logic Corp.
5) Or equal

2. Duct temperature sensors: Shall consist of sensing element, junction box for wiring connections and gasket to prevent air leakage or vibration noise.
   a. TS-1A: Single point (use where not specifically called out to be averaging in points list). Sensor probe shall be 304 stainless steel.
   b. TS-1B: Averaging. Sensor length shall be at least 1 linear foot for each 2 square feet of face area up to 25 feet maximum. Sensor probe shall be bendable aluminum.

3. Water Temperature Sensors
   a. TS-2A: Well mounted immersion sensor, ¼” stainless steel probe, double encapsulated sensor, with enclosure suitable for location.
   b. TS-2B: Same as TS-2A except provide extra precision (XP) temperature sensors to meet accuracy specified Paragraph 1.10B.2.
   c. TS-2C. See BTU-1.
   d. All piping immersion sensors shall be in one-piece machined brass or stainless-steel wells that allow removal from operating system, with lagging extension equal to insulation thickness where installed in insulated piping. Wells shall be rated for maximum system operating pressure, temperature and fluid velocity. The well shall penetrate the pipe by the lesser of approximately half the pipe diameter or eight inches. The use of direct immersion or strap-on type sensors is not acceptable.

4. Room Sensors
   a. Thermostat tags refer to the following:

<table>
<thead>
<tr>
<th>Type</th>
<th>Tag</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display</td>
<td>Blank</td>
</tr>
<tr>
<td>Temperature only</td>
<td>TS-3A</td>
</tr>
<tr>
<td>With CO2</td>
<td>TS-3AC</td>
</tr>
</tbody>
</table>

1) Display
   a) Blank: Blank cover (or LCD display with display configured to be shut off and touchpad or keypad disabled)
   b) LCD: LCD display of all sensors, temperature setpoint adjustment buttons, and schedule override button

2) CO2 Sensor
   a) 400 to 1250 PPM/ ±30PPM or 3% of reading, whichever is greater.
   b) The sensor shall include automatic background calibration (ABC) logic to compensate for the aging of the infrared source and shall not require recalibration for a minimum of 5 years, guaranteed. If sensor is found to be out of calibration, supplier shall recalibrate at no additional cost to the Owner within 5 years of purchase date.
   c) Meet Title 24 requirements including calibration interval

3) For room sensors connected to terminal box controllers (such as at VAV boxes) that require calibration: Include a USB port or some other means for connection of POT for terminal box calibration. Alternative means of terminal calibration are acceptable provided they result in no cost to Work performed under Section 230593 Testing, Adjusting, and Balancing.

b. Unless otherwise indicated in points list or drawings, locate sensors as follows:
   1) Lobbies, corridors, break rooms, and public spaces: TS-3A
   2) Equipment rooms and other back-of-house spaces: TS-3A
3) Open offices: TS-3A
4) Private offices: TS-3C
5) Conference rooms, meeting rooms, etc.: TS-3C
6) Classrooms, labs, training rooms, multi-purpose rooms, etc.: TS-3C
7) Others not listed: Confirm with Engineer through RFI.

5. TS-4: Outdoor Air Sensors
   a. Enclose in fan-aspirated radiation shield that combines both active and passive aspiration to minimize the effects of radiation.
      1) Motor-driven fan draws air through the sensor chamber and exhausts it through the top of the shield.
      2) Triple-walled sensor chamber shielded by flow-through plates.
      3) Aspiration rate: minimum is 220 feet per minute.
   b. Sensor electronics mounted in watertight gasketed enclosure to prevent water seepage
   c. Manufacturer
      1) Davis Instruments 7747
      2) Kele A21
      3) Or equal

G. BTU Meter (BTU-1)
   1. Matched RTD or solid state temperature sensors with a differential temperature accuracy of +/-0.15°F.
   2. Flow meter: FM-1
   3. Unit accuracy shall be +/- 1% factory calibrated, traceable to NIST with certification.
   4. NEMA 1 enclosure.
   5. UL listed.
   6. Provide BACnet/MSTP network connection that will allow all point data to be transmitted to BAS network.
   7. I/O.
      a. BACnet Points:
         1) Supply Temperature
         2) Return Temperature
         3) Flow
         4) Energy Rate (Btu/hr.)
      b. Hardwired Points:
         1) Flow

8. Manufacturers
   a. Onicon System 20
   b. Siemens Sitrans
   c. Or Equal

H. Pressure Transmitters (PT)
   1. PT-1: Water, General Purpose
      a. Fast-response stainless steel sensor
      b. Two-wire transmitter, 4-20 mA output with zero and span adjustments
      c. Accuracy
         1) Overall Accuracy (at constant temp) ±0.5% full scale, includes non-linearity, repeatability, and hysteresis
d. Long Term Stability 0.5% FS per year
e. Pressure Limits
   1) Rated pressure: see points list
   2) Proof pressure = 3x rated pressure
   3) Burst pressure = 5x rated pressure
f. Manufacturers
   1) Setra 209
   2) Kele & Associates P51 Series
   3) Or equal

I. Differential Pressure Transmitters (DPT)
   1. DPT-1: Water, General Purpose
      a. Fast-response capacitance sensor
      b. Two-wire transmitter, 4-20 mA output with zero and span adjustments
      c. Accuracy
         1) Overall Accuracy (at constant temp) ±0.25% full scale (FS).
         2) Non-Linearity, BFSL ±0.22% FS.
         3) Hysteresis 0.10% FS.
         4) Non-Repeatability 0.05% FS.
      d. Long Term Stability 0.5% FS per year
      e. Only 316 stainless steel in contact with fluid
      f. Pressure Limits
         1) 0 to 100 psid range: 250 psig maximum static pressure rating, 250 psig maximum overpressure rating.
         2) 100 to 300 psid range: 450 psig maximum static pressure rating, 450 psig maximum overpressure rating.
      g. Include brass 5-valve assembly for single sensor devices. See Paragraph 3.11E.7.
      h. Manufacturers
         1) Setra 209 or 230
         2) Modus W30
         3) Or equal
   2. DPT-2: Not used
   3. DPT-3: Air, Duct Pressure:
      a. General: Loop powered two-wire differential capacitance cell-type transmitter.
      b. Output: two wire 4-20 mA output with zero adjustment.
      c. Overall Accuracy: ±1% of range (not of maximum range/scale)
      d. Switch selectable range:
         1) ≥ 0.5 inches water column
         2) ≤10 inches water column
         3) Select range as specified in points list or, if not listed for specified setpoint to be between 25% and 75% full-scale.
      e. Housing: Polymer housing suitable for surface mounting.
      f. Static Sensing Element: Pitot-type static pressure sensing tips similar to Dwyer model A-301, Davis Instruments, or equal, with connecting tubing.
      g. DPT-3A: Include LCD display of reading.
      h. DPT-3B: Same as DPT-3 except with stainless steel pitot-type static pressure sensing tips similar to Dwyer model A-301-SS, or equal.
      i. Manufacturers.
4. DPT-4: Air, Low Differential Pressure
   a. General: Loop powered, two-wire differential capacitance cell type transmitter.
   b. Output: Two-wire 4-20 mA output with zero adjustment.
   c. Overall Accuracy
      1) General: ±1% FS
      2) Underfloor: ±0.5% FS
      3) Minimum outdoor air damper DP used for minimum outdoor airflow: ±0.25% FS
   d. Range
      1) Fixed (non-switch selectable)
      2) Minimum Range: 0, -0.1, -0.25, -0.5, or -1.0 inches water column
      3) Maximum Range: +0.1, 0.25, 0.5, or 1.0 inches water column
      4) Range shall be as specified in points list or, if not listed, selected such that specified setpoint is between 25% and 75% full-scale.
   e. Housing: Polymer housing suitable for surface mounting
   f. Static Sensing Element
      1) Ambient sensor: Dwyer A-306 or 420, BAPI ZPS-ACC-10, or equal
      2) Space sensor: Kele RPS-W, BAPI ZPS-ACC-01, Dwyer A-417 or 465, Veris AA05 or equal wall plate sensor
      3) Filter or duct pressure sensor: Dwyer A-301 or equal
      4) Plenum pressure sensor: Dwyer A-421 or equal
   g. DPT-4A: Include LCD display of reading
   h. Manufacturers
      1) Setra 267
      2) Modus
      3) Air Monitor
      4) Paragon
      5) Or equal

5. DPT-5: VAV Velocity Pressure
   a. General: Loop powered two-wire differential capacitance cell type transmitter.
   b. Output: Two-wire, 4-20 mA output with zero adjustment.
   c. Calibration software shall use a minimum of two field measured points, minimum and maximum airflow, with curve fitting airflow interpolation in between.
   d. Flow transducer (including impact of A-to-D conversion) shall be capable of stably controlling to a setpoint of 0.004 inches differential pressure or lower, shall be capable of sensing 0.002 inches differential pressure or lower, and shall have a ±0.001 inches or lower resolution across the entire scale.
   e. Range: 0 to 1.5 in.w.c.
   f. Housing: Polymer housing suitable for surface mounting.
   g. Manufacturer
      1) Automated Logic
      2) No equal

J. Differential Pressure Switches (DPS)
1. DPS-1: Water: Diaphragm with adjustable setpoint, 2 psig or adjustable differential, and snap-acting Form C contacts rated for the application. 60 psid minimum pressure differential range. 0°F to 160°F operating temperature range.

2. DPS-2: Air: Diaphragm with adjustable setpoint and differential and snap acting form C contacts rated for the application. Automatic reset. Provide manufacturer’s recommended static pressure sensing tips and connecting tubing.

K. Level Sensor (LS-1)

1. Sensor Element:
   a. Capacitive
   b. Stainless steel

2. Performance
   a. Linearity and Hysteresis: ±0.1% FS
   b. Accuracy: ±0.1% of full scale at constant temperature, ±0.25% over 35°F to 70°F range
   c. Automatic barometric pressure compensation

3. Outputs: 4-20 mA or 0 to Vdc

4. Operating Temperature: -40° to +185°F

5. Housing
   a. NEMA 4X weather tight
   b. Corrosion resistant material

6. Electronics shall be fully encapsulated in marine grade epoxy, guaranteed not to leak

7. Rated for 190°F fluid temperature.

8. Manufacturer
   a. Mercoid Series CRF2
   b. Intempco LTX01
   c. Or equal

L. Current Switches (CS-1)

1. Clamp-on or solid-core

2. Range: as required by application

3. Trip Point: Automatic or adjustable
   a. Exception: Fixed setpoint (Veris H-300 or equal) may be used on direct drive constant speed fans that do not have backdraft or motorized shutoff dampers.

4. Switch: Solid state, normally open, 1 to 135 Vac or Vdc, 0.3 Amps. Zero off state leakage

5. Lower Frequency Limit: 6 Hz

6. Trip Indication: LED

7. Approvals: UL, CSA

8. May be combined with relay for start/stop

9. Where used for single-phase devices, provide the CS/CR in a self-contained unit in a housing with override switch. Kele RIBX, Veris H500, or equal

10. Manufacturers
   a. Veris Industries H-608/708/808/908
   b. Serva C-2320L
   c. RE Technologies SCS1150A-LED
   d. Or equal

M. Current Transformers (CT)

a. Range: 1-10 amps minimum, 20-200 amps maximum
b. Trip Point: Adjustable
c. Output: 0-5 Vdc or 0-10 Vdc,
d. Accuracy: ±0.2% from 20 to 100 Hz.
e. Manufacturers: Kele SC100, Veris 722, or equal

N. Flow Meter (FM)

1. This is the CCCCD standard for accurate metering of water flows with very low maintenance

2. FM-1: Magnetic Flow Tube Flow Meters

a. General Requirements

   1) Sensor shall be a magnetic flow meter, which utilizes Faraday’s Law to measure volumetric fluid flow through a pipe. The flow meter shall consist of 2 elements, the sensor and the electronics. The sensor shall generate a measuring signal proportional to the flow velocity in the pipe. The electronics shall convert this EMF into a standard current output.

   2) Electronic replacement shall not affect meter accuracy (electronic units are not matched with specific sensors).

   3) Provide a four-wire, externally powered, magnetic type flow transmitter with adjustable span and zero, integrally mounted to flow tube. Output signal shall be a digital pulse proportional to the flow rate (to provide maximum accuracy and to handle abrupt changes in flow). Standard 4-20 mA or 0-10 Vdc outputs may be used on HVAC applications provided accuracy is as specified.

   4) Flow Tube

      a) ANSI class 150 psig steel
      b) ANSI flanges
      c) Lined with

         (1) Heating hot water: PTFE, PFA, or ETFE liner rated for 210°F minimum fluid temperature
         (2) Chilled, condenser, domestic hot and cold water: Polypropylene, Ebonite PTFE, PFA, or ETFE liner rated for 140°F minimum fluid temperature

   5) Electrode and grounding material

      a) 316L Stainless steel or Hastelloy C
      b) Electrodes shall be fused to ceramic liner and not require O-rings.

   6) Electrical Enclosure: NEMA 4

   7) Approvals

      a) UL or CSA
      b) NSF Drinking Water approval for domestic water applications

   8) Performance

      a) Accuracy shall be ±0.5% of actual reading from 3 to 30 feet per second flow velocities, and ±0.015 fps from 0.04 fps to 3 fps.
      b) Stability: 0.1% of rate over six months.
      c) Meter repeatability shall be ± 0.1% of rate at velocities > 3 feet per second.
      d) Calibration: The sensor must be factory calibrated on an internationally accredited (such as NAMAS) water flow rig with accuracy better than 0.1%. Calibration shall be NIST traceable.

b. Manufacturers
1) Onicon F-3000 series
2) Siemens/Danfoss Magflo 3100
3) Krohne Optiflux 4000
4) Sparling Tigermag EP FM656
5) Or equal

O. Airflow Measuring Stations (AFMS)
   1. General. AFMS provided under this Section shall be licensed to bear the AMCA Certified Rating Seal for Airflow Measuring Stations. Ratings shall be based on tests and procedures performed in accordance with AMCA Publication 611 and comply with requirements of the AMCA Certified Ratings Program.
   2. AFMS-3. Airflow measurement device and control damper provided with air handling units.
      See Section 237300 Air Handling Units & Coils.
   3. AFMS-3
      a. Differential pressure type with uniframe DP sensor
      1) Provide quantity of DP sensors per manufacturer’s recommendations
      b. Extended flow (2 transducers, 0.05” and 0.25” range)
      c. Station mounted with expanded metal screen
      d. Analog outputs for airflow and temperature
      e. Manufacturers
         1) Air Monitor OAM-II-2111-MMAB
         2) No equal

P. Airflow Measuring Lab Air Valves
   1. Accutrol air flow valves to be used for all hoods with ALC controllers per the district standard
   2. All labs to be controlled from a single ALC controller. Individual controllers on the terminal units is not acceptable.

Q. Electric Control Components
   1. Control Relays: All control relays shall be UL listed, with contacts rated for the application, and mounted in minimum NEMA-1 enclosure for indoor locations, NEMA-4 for outdoor locations.
      a. Control relays for use on electrical systems of 120 volts or less shall have, as a minimum, the following:
         1) AC coil pull-in voltage range of +10%, -15% or nominal voltage.
         2) Coil sealed volt-amperes (VA) not greater than 4 VA.
         3) Silver cadmium Form C (SPDT) contacts in a dustproof enclosure, with 8 or 11 pin type plug.
         4) Pilot light indication of power-to-coil and coil retainer clips.
      b. Relays used for across-the-line control (start/stop) of 120V motors, 1/4 HP, and 1/3 HP, shall be rated to break minimum 10 Amps inductive load.
      c. Relays used for stop/start control shall have low voltage coils (30 VAC or less), and shall be provided with transient and surge suppression devices at the controller interface.
   2. General Purpose Power Contactors: NEMA ICS 2, AC general-purpose magnetic contactor. ANSI/NEMA ICS 6, NEMA type 1 enclosure. Manufacturer shall be Square D, Cutler-Hammer, or equal.
   3. Control Transformers and Power Supplies
a. Control transformers shall be UL Listed. Furnish Class 2 current-limiting type, or furnish over-current protection in both primary and secondary circuits for Class 2 service per NEC requirements. Mount in minimum NEMA-1 enclosure.

b. Transformer shall be proper size for application. Limit connected loads to 80% of rated capacity.

c. DC power supply output shall match output current and voltage requirements. Unit shall be full-wave rectifier type with output ripple of 5.0 mV maximum peak-to-peak. Regulation shall be 1.0% line and load combined, with 100 microsecond response time for 50% load changes. Unit shall have built-in over-voltage and over-current protection, and shall be able to withstand a 150% current overload for at least 3 seconds without trip-out or failure.

d. Separate power transformer shall be used for controllers and for actuators and other end devices that use half wave rectification.

e. Unit shall operate between 0°C and 50°C [32°F and 120°F]. EM/RF shall meet FCC Class B and VDE 0871 for Class B, and MIL-STD 810C for shock and vibration.

4. Electric Push Button Switch: Switch shall be momentary contact, oil tight, push button, with number of N.O. or N.C. contacts as required. Contacts shall be snap-action type, and rated for minimum 120 Vac operation. Switch shall be 800T type, as manufactured by Allen Bradley, Kele, or equal.

5. Mechanical Timer Switch: Switch shall be mechanically spring wound with a N.O. contact or N.C. contacts as required. Timer shall be 0-60 minutes and shall not include a “hold” feature, which allows switch contacts to remain closed. Contacts shall be rated for minimum 120 VAC operation. Switch shall be C560M type, as manufactured by NSI Industries or equal.

6. Pilot Light: Panel-mounted pilot light shall be NEMA ICS 2 oil tight, transformer type, with screw terminals, push-to-test unit, LED type, rated for 120 VAC. Unit shall be 800T type, as manufactured by Allen-Bradley, Kele, or equal.

7. Alarm Horn: Panel-mounted audible alarm horn shall be continuous tone, Sonalert solid-state electronic signal, as manufactured by Mallory, Kele, or equal.

8. Potentiometer. Wall box mounted single turn with knob numbered 0 to 10 or 0 to 100. Wall plate cover to match electrical.

9. Window switch (WS)
   a. Surface mount magnetic burglar alarm switch.
   b. Screw mount, magnet on window, switch on frame.
   c. Sealed to prevent dirt or dust contact.
   d. Color to match electrical and lighting switch plates in the room. See Division 26 and Electrical Drawings.

2.10 CALIBRATION & TESTING INSTRUMENTATION

A. Provide instrumentation required to verify readings, calibrate sensors, and test the system and equipment performance.

B. All equipment used for testing and calibration shall be NIST/NBS traceable and calibrated within the preceding 6-month period. Certificates of calibration shall be submitted.

C. Test equipment used for testing and calibration of field devices shall be at least twice as accurate as respective field device (for example if field device is ±0.5% accurate, test equipment shall be ±0.25% accurate over same range).

2.11 SOFTWARE
A. General
   1. System software shall be the latest version of ALC WebCTRL.

B. Licensing
   1. Include licensing and hardware keys for all software packages at all workstations (OWSs and POTs) and servers.
   2. Within the limitations of the server, provide licenses for any number of users to have web access to the CSS at any given time.
   3. All operator interface, programming environment, networking, database management and any other software used by the Contractor to install the system or needed to operate the system to its full capabilities shall be licensed and provided to the Owner.
   4. All operator software, including that for programming and configuration, shall be available on all workstations. Hardware and software keys to provide all rights shall be installed on all workstations.

C. Graphical User Interface Software
   1. Graphics
      a. The GUI shall make extensive use of color in the graphic pane to communicate information related to setpoints and comfort. Animated graphics and active setpoint graphic controls shall be used to enhance usability.
      b. Graphics tools used to create Web Browser graphics shall be non-proprietary and provided and installed on each OWS.
      c. Graphical display shall be 1280 x 1024 pixels or denser, 256 color minimum.
      d. Links
         1) Graphics shall include hyperlinks which when selected (clicked on with mouse button) launch applications, initiate other graphics, etc.
         2) Screen Penetration: Links shall be provided to allow user to navigate graphics logically without having to navigate back to the home graphic. See additional discussion in Paragraph 3.12E.
         3) Information Links
            a) On each MEP system and subsystem graphic, provide links to display in a new window the information listed below.
               (1) English-language as-built control sequence associated with the system. See Paragraph 1.9B.
               (2) O&M and submittal information for the devices on the graphic. See Paragraph 1.9B. This includes links to electronic O&M and submittal information for mechanical equipment supplied under Section 230501 Basic Mechanical Materials and Methods.
            b) The display shall identify the target of the link by file name/address.
            c) Information shall be displayed in electronic format that is text searchable.
            d) Window shall include software tools so that text, model numbers, or point names may be found. Source documents shall be read-only (not be editable) with this software.
      e. Point Override Feature
         1) Every real output or virtual point displayed on a graphic shall be capable of being overridden by the user (subject to security level access) by mouse point-and-click from the graphic without having to open another program or view.
         2) When the point is selected to be commanded
a) Dialog box opens to allow user to override the point (Operator Mode) or release the point (Automatic Mode). Operator Mode will override automatic control of the point from normal control programs.
b) Dialog box shall have buttons (for digital points) or a text box or slide bar (for analog points) to allow user to set the point’s value when in operator mode. These are grayed out when in automatic mode.
c) When dialog box is closed, mode and value are sent to controller.
d) Graphic is updated upon next upload scan of the actual point value.

3) A list of points that are currently in an operator mode shall be available through menu selection.

f. Point override status (if a digital point is overridden by the supervised manual override per Paragraph 2.3A or if a point is in operator mode per Paragraph 2.11C.1.e) shall be clearly displayed on graphics for each point, such as by changing color or flag.
g. The color of symbols representing equipment shall be able to change color or become animated based on status of binary point to graphically represent on/off status.

2. Alarms
a. ALC WebCTRL Enterprise Integration advanced alarm package configured as indicated below.

3. Trends
a. ALC WebCTRL Enterprise Integration trend package configured as indicated below.
b. Trend Data Storage
   1) The database shall allow applications to access the data while the database is running. The database shall not require shutting down in order to provide read-write access to the data. Data shall be able to be read from the database without interrupting the continuous storage of trend data being carried by the BAS using SQL queries.
   2) Data shall be stored in an SQL compliant database format and shall be available through the Owner’s intranet or internet (with appropriate security clearance) without having to disable BAS access to the database.
   3) The database shall not be inherently limited in size, e.g. due to software limitations or lack of a correct license. Database size shall be limited only by the size of the provided storage media (hard drive size).

4. Security Access
a. Standard ALC WebCTRL security package

5. Report Software
a. ALC WebCTRL Enterprise Integration advanced reporting package.
b. Standard reports. Prepare the following standard reports, accessible automatically without requiring definition by user.
   1) Tenant or department after-hour usage. System must be capable of monitoring tenant override requests and generating a monthly report showing the daily total time in hours that each tenant has requested after-hours HVAC services.
   3) Alarm events and status.
   4) Points in Hand (Operator Override) via Workstation command (including name of operator who made the command) or via supervised HOA switch at output, including date and time.
D. Control Programming Software

E. Miscellaneous Software
   1. Provide a context-sensitive, on-line help system to assist the operator in operating and editing the system. On-line help shall be available for all applications and shall provide relevant data for the application or object that help is being called from.
   2. Provide software for viewing (but not editing) electronic versions of as-built shop drawings of
      a. Mechanical, electrical, and plumbing systems in Adobe pdf format
      b. BAS drawings in Adobe pdf format

2.12 CONTROL POINTS

A. Table Column Definitions
   1. Point description
   2. Type (number in point schedule after each type refers to tag on schematics)
      a. AO: analog output
      b. AI: analog input
      c. DO: digital or binary output
      d. DI: digital or binary input
   3. Device description
      a. See Paragraph 2.9 for device definition.
   4. Trend Logging
      a. Commissioning: Where listed, point is to be trended at the basis listed for commissioning and performance verification purposes.
      b. Continuous: Where listed, point is to be trended at the basis listed continuously, initiated after system acceptance, for the purpose of future diagnostics.
      c. Trend Basis
         1) Where range of engineering units is listed, trend on a change of value (COV) basis (in other words record time stamp and value when point value changes by engineering unit listed).
         2) Where time interval is listed, trend on a time basis (in other words record time stamp and value at interval listed). All points relating to a specific piece of equipment shall be trended at the same initiation time of day so data can be compared in text format.
   5. Calibration
      a. F = factory calibration only is required (no field calibration)
      b. HH = field calibrate with handheld device. See Paragraph 3.15E.5.a.2)

B. Note that points lists below are for each system of like kind. Refer to drawings for quantity of each.

PART 3 - EXECUTION

3.1 INSTALLATION - GENERAL
A. Install systems and materials in accordance with manufacturer’s instructions, roughing-in drawings and details indicated on Drawings.

B. Coordinate Work and Work schedule with other trades prior to construction.

C. Examine areas and conditions under which control systems are to be installed. Do not proceed with work until unsatisfactory conditions have been corrected in manner acceptable to Installer.

3.2 DELIVERY, STORAGE, AND HANDLING

A. Provide factory-shipping cartons for each piece of equipment and control device. Maintain cartons during shipping, storage and handling as required to prevent equipment damage, and to eliminate dirt and moisture from equipment.

B. Store equipment and materials inside and protect from weather.

3.3 IDENTIFICATION

A. General
   1. Manufacturers’ nameplates and UL or CSA labels to be visible and legible after equipment is installed.
   2. Identifiers shall match record documents.
   3. All plug-in components shall be labeled such that removal of the component does not remove the label.

B. Wiring and Tubing
   1. All wiring and cabling, including that within factory-fabricated panels, shall be labeled at each end within 2 inches of termination with the BAS address or termination number.
   2. Permanently label or code each point of field terminal strips to show the instrument or item served.
   3. All pneumatic tubing shall be labeled at each end within 2 inches of termination with a descriptive identifier.

C. Equipment and Devices
   1. Valve and damper actuators: None required.
   2. Sensors: Provide 1 inch x 3 inches x 1/8 inches black micarta or lamacoid labels with engraved white lettering, ¼ inches high. Indicate sensor identifier and function (for example “CHWS Temp”).
   3. Panels
      a. Provide 2 inches x 5 inches 1/8 inches black micarta or lamacoid labels with engraved white lettering, ½ inches high. Indicate panel identifier and service.
      b. Provide permanent tag indicating the electrical panel and circuit number from which panel is powered.
   4. Identify room sensors relating to terminal box or valves with indelible marker on sensor hidden by cover.

3.4 CUTTING, CORING, PATCHING AND PAINTING

A. Provide canning for openings in concrete walls and floors and other structural elements prior to their construction.
B. Penetrations through rated walls or floors shall be filled with a listed material to provide a code compliant fire-stop.

C. All damage to and openings in ductwork, piping insulation, and other materials and equipment resulting from Work in this Section shall be properly sealed, repaired, or re-insulated by experienced mechanics of the trade involved. Repair insulation to maintain integrity of insulation and vapor barrier jacket. Use hydraulic insulating cement to fill voids and finish with material matching or compatible with adjacent jacket material.

D. At the completion of Work, all equipment furnished under this Section shall be checked for paint damage, and any factory-finished paint that has been damaged shall be repaired and repainted to original finish.

3.5 CLEANING

A. Clean up all debris resulting from its activities daily. Remove all cartons, containers, crates, and other debris generated by Work in this Section as soon as their contents have been removed. Waste shall be collected and legally disposed of.

B. Materials stored on-site shall be protected from weather and stored in an orderly manner, neatly stacked, or piled in the designated area assigned by the Owner’s Representative.

C. At the completion of work in any area, clean all work and equipment of dust, dirt, and debris.

D. Use only cleaning materials recommended by the manufacturer of the surfaces to be cleaned and on surfaces recommended by the cleaning material manufacturer.

3.6 CONTROLLERS

A. General

1. Install systems and materials in accordance with manufacturer’s instructions, specifications, roughing-in drawings and details indicated on Drawings.

2. Regardless of application category listed below, each Control Unit shall be capable of performing the specified sequence of operation for the associated equipment. Except as listed below, all physical point data and calculated values required to accomplish the sequence of operation shall reside within the associated CU. Listed below are point data and calculated values that shall be allowed to be obtained from other CUs via LAN.

   a. Global points such as outdoor air temperature
   b. Requests, such as heat/cool requests, used to request operation or for setpoint reset from zones to systems and systems to plants
   c. Modes, such as system modes, used to change operating logic from plants to systems and systems to zones

3. Where associated control functions involve functions from different categories identified below, the requirements for the most restrictive category shall be met.

B. Controller Application Categories

1. Controllers shall comply with the application table below (X under controller type indicates acceptable controller type).
<table>
<thead>
<tr>
<th>Application Category</th>
<th>Examples</th>
<th>Acceptable Controller</th>

Notes:
1. ALL FUNCTIONS TO BE ACCOMPLISHED BY A SINGLE CONTROLLER RATHER THAN SEVERAL CONTROLLERS INDEPENDENTLY. USE EXPANDABLE CONTROLLER WHERE NECESSARY TO ACCOMMODATE ALL THE I/O OF THE ZONE.

2. ASC Installation
   a. ASCs that control equipment located above accessible ceilings shall be mounted on the equipment in an accessible enclosure and shall be rated for plenum use if ceiling attic is used as a return air plenum.
   b. ASCs that control equipment mounted in a mechanical room may either be mounted in or on the equipment, or on the wall of the mechanical room at an adjacent, accessible location.
   c. ASCs that control equipment mounted outside or in occupied spaces shall either be located in the unit or in a proximate mechanical/utility space.

3. AAC and BC Installation
   a. AACs/BCs that control equipment located above accessible ceilings shall be mounted in a NEMA 1, locking enclosure and shall be rated for plenum use if ceiling attic is used as a return air plenum.
   b. AACs/BCs that control equipment located in occupied spaces or outside shall either be mounted within the equipment enclosure (responsibility for physical fit remains with the Contractor) or in a proximate mechanical/utility room in which case it shall be enclosed in a NEMA 1, locking enclosure.

4. Lab Box Controllers:
   a. Accutrol lab air valves are to be used with ALC controllers per the district standard.

3.7 COMMUNICATION DEVICES
A. General
1. Install systems and materials in accordance with manufacturer's instructions, roughing-in drawings and details indicated on Drawings.
2. Provide all interface devices and software to provide an integrated system.

B. LANID and LAN Routers
1. Provide as required
2. Connect networks to both sides of device
3. Thoroughly test to ensure proper operation
4. Interruptions or fault at any point on any Primary Controller LAN shall not interrupt communications between other nodes on the network. If a LAN is severed, two separate networks shall be formed and communications within each network shall continue uninterrupted. The system shall automatically monitor the operation of all network devices and annunciate any device that goes off-line because it is failing to communicate.

C. Gateways and Routers to Equipment Controllers
1. See Paragraph 2.4C for network connection of gateways and routers.
2. Wire to networks on both sides of device.
3. Map across all monitoring and control points listed in Paragraph Error! Reference source not found.
4. Thoroughly test each point to ensure that mapping is accurate.
5. Initiate trends of points as indication in Paragraph Error! Reference source not found..

D. External Communications
1. Provide an Ethernet second port on the CSS to which the Owner can connect their Owner IT LAN (intranet), by others. Contractor shall coordinate with the Owner's Representative to establish an IP address and communications parameters to assure proper operation. This connection shall also provide access to Internet through Owner's firewall to Internet Services Provider procured by Owner.

3.8 CONTROL AIR TUBING

A. Sensor air tubing shall be sized by the Contractor.

B. All control air piping shall be concealed except in equipment rooms or unfinished areas.

C. Installation methods and materials
1. Concealed and Inaccessible: Use copper tubing or FR plastic in metal raceway. Exception: Room thermostat drops in stud walls in areas with lay-in ceiling may be FR plastic tubing.
2. Concealed and Accessible tubing (including ceiling return air plenums) shall be copper tubing or FR plastic tubing, subject to the following limitations
   a. FR tubing shall be enclosed in metal raceway when required by local code.
   b. Quantity of FR tubing per cubic foot of plenum space shall not exceed manufacturer's published data for Class 1 installation.
3. Exposed to view or damage: Use hard-drawn copper or FR plastic in metal raceway.
   a. Where copper tubing is used, a section 12 inches or less of FR plastic tubing is acceptable at final connection to control device.

D. Mechanically attach tubing to supporting surfaces. Sleeve through concrete surfaces in minimum 1-inch sleeves, extended 6 inches above floors and 1 inch below bottom surface of slabs.
E. Pneumatic tubing shall not be run in raceway containing electrical wiring.

F. Where FR tubing exits the end of raceway or junction box, provide a snap-in nylon bushing. Where pneumatic tubing exits control panels, provide bulkhead fittings. Where copper tubing exits junction boxes or panels, provide bulkhead fittings.

G. All tubing shall be number coded on each end and at each junction for easy identification.

H. All control air piping shall be installed in a neat and workmanlike manner parallel to building lines with adequate support.

I. Piping above suspended ceilings shall be supported from or anchored to structural members or other piping or duct supports. Tubing shall not be supported by or anchored to electrical raceways or ceiling support systems.

J. Brass-barbed fittings shall be used at copper-to-FR tubing junctions. Plastic slipped-over copper tubing is not acceptable.

K. Number-code or color-code tubing, except local individual room control tubing, for future identification and servicing of control system. Code shall be as indicated on approved installation drawings.

3.9 CONTROL POWER

A. Power wiring and wiring connections required for Work in this Section shall be provided under this Section unless specifically indicated on Division 26 Drawings or Specifications. See Paragraph 1.2.
   1. See Division 26 Electrical Drawings for power locations pre-allocated for BAS system.
   2. Coordinate with Division 26 during shop drawing development for final connection location.

B. General requirements for obtaining power include the following:
   1. Electrical service to controls panels and control devices shall be provided by isolated circuits, with no other loads attached to the circuit, clearly marked at its source. The location of the breaker shall be clearly identified in each panel served by it.
   2. Where control equipment is located inside a new equipment enclosure, coordinate with the equipment manufacturer and feed the control with the same source as the equipment. If the equipment’s control transformer is large enough and of the correct voltage to supply the controls, it may be used. If the equipment’s control transformer is not large enough or not of the correct voltage to supply the controls, provide separate transformer(s).

C. Unless transformers are provided with equipment as specified in related Division 23 and 26 equipment Sections, Contractor shall provide transformers for all low voltage control devices including non-powered terminal units such as cooling-only VAV boxes and VAV boxes with hot water reheat. Transformer(s) shall be located in control panels in readily accessible locations such as Electrical Rooms.

D. Power line filtering. Provide transient voltage and surge suppression for all workstations and BCs either internally or as an external component.

3.10 CONTROL AND COMMUNICATION WIRING

A. Control and Signal Wiring

2. Line Voltage Wiring
   a. All line-voltage wiring shall meet NEC Class 1 requirements.
   b. All Class 1 wiring shall be installed in UL Listed approved raceway per NEC requirements and shall be installed by a licensed electrician.
   c. Class 1 wiring shall not be installed in raceway containing pneumatic tubing.

3. Low Voltage Wiring
   a. All low-voltage wiring shall meet NEC Class 2 requirements. (Low-voltage power circuits shall be sub-fused when required to meet Class 2 current-limit.)
   b. Class 2 wiring shall be installed in UL Listed approved raceway as follows:
      1) Where located in unconcealed or inaccessible locations, such as:
         a) Equipment rooms
         b) Exposed to weather
         c) Exposed to occupant view
         d) Inaccessible locations such as concealed shafts and above inaccessible ceilings
      2) Class 2 wiring shall not be installed in raceway containing Class 1 wiring.
   c. Class 2 wiring need not be installed in raceway as follows:
      1) Where located in concealed and easily accessible locations, such as:
         a) Inside mechanical equipment enclosures and control panels
         b) Above suspended accessible ceilings (e.g. lay-in and spline)
         c) Above suspended drywall ceilings within reach of access panels throughout
         d) In shafts within reach of access panels throughout
         e) Nonrated wall cavities
      2) Wiring shall be UL Listed for the intended application. For example, cables used in floor or ceiling plenums used for air transport shall be UL Listed specifically for that purpose.
      3) Wiring shall be supported from or anchored to structural members neatly tied at 10-foot intervals and at least 1 foot above ceiling tiles and light fixtures. Support or anchoring from straps or rods that support ductwork or piping is also acceptable. Cables shall not be supported by or anchored to ductwork, electrical raceways, piping, or ceilings.
      4) Install wiring in sleeves where it passes through walls and floors. Maintain fire rating at all penetrations.
   d. Boxes and panels containing high-voltage wiring and equipment shall not be used for low-voltage wiring except for the purpose of interfacing the two (for example relays and transformers).

4. All wire-to-device connections shall be made at a terminal block or terminal strip. All wire-to-wire connections shall be at a terminal block.

5. All field wiring shall be properly labeled at each end, with self-laminating typed labels indicating device address, for easy reference to the identification schematic. All power wiring shall be neatly labeled to indicate service, voltage, and breaker source.

6. Use coded conductors throughout with different colored conductors.

7. All wiring within enclosures shall be neatly bundled and anchored to permit access and prevent restriction to devices and terminals.

8. Maximum allowable voltage for control wiring shall be 120 V. If only higher voltages are available, the Contractor shall provide step-down transformers.

9. All wiring shall be installed as continuous lengths, with no splices permitted between termination points.
10. Size of raceway and size and type of wire shall be the responsibility of the Contractor, in keeping with the manufacturer’s recommendation and NEC requirements.

11. Include one pull string in each raceway 1 inch or larger.

12. Control and status relays are to be located in designated enclosures only. These enclosures include packaged equipment control panel enclosures unless they also contain Class 1 starters.

13. Conceal all raceways, except within mechanical, electrical, or service rooms. Install raceway to maintain a minimum clearance of 6 inches from high-temperature equipment (for example steam pipes or flues).

14. Secure raceways with raceway clamps fastened to the structure and spaced according to code requirements. Raceways and pull boxes may not be hung on flexible duct strap or tie rods. Raceways may not be run on or attached to ductwork.

15. Install insulated bushings on all raceway ends and openings to enclosures. Seal top end of all vertical raceways.

16. Terminate all control or interlock wiring.

17. Maintain updated as-built wiring diagrams with terminations identified at the jobsite.

18. Flexible metal raceways and liquid-tight, flexible metal raceways shall not exceed 3 feet in length and shall be supported at each end. Flexible metal raceway less than ½ inches electrical trade size shall not be used. In areas exposed to moisture liquid-tight, flexible metal raceways shall be used.

19. Raceway must be rigidly installed, adequately supported, properly reamed at both ends, and left clean and free of obstructions. Raceway sections shall be joined with couplings per code. Terminations must be made with fittings at boxes and ends not terminating in boxes shall have bushings installed.

20. Wire digital outputs to either the normally-closed or normally-open contacts of binary output depending on desired action in case of system failure. Unless otherwise indicated herein, wire to the NO contact except the following shall be wired to the NC contact
   a. Hot water pumps

21. Hardwire Interlocks
   a. The devices referenced in this Section are hardwire interlocked to ensure equipment shutdown occurs even if control systems are down. Do not use software (alone) for these interlocks.
   b. Hardwire device NC contact to air handler fan starter upstream of HOA switch, or to VFD enable contact.
   c. Where multiple fans (or BAS DI) are controlled off of one device and the device does not have sufficient contacts, provide a relay at the device to provide the required number of contacts.
   d. Provide for the following devices where indicated on Drawings or in Sequences of Operation:
      1) High discharge static pressure
      2) Low mixing plenum pressure

22. Shielded cable shield shall be grounded only at one end. Signal wiring shield shall be grounded at controller end only unless otherwise recommended by the controller manufacturer.

B. Communication Wiring

1. Adhere to the requirements of Paragraph 3.10A in addition to this Paragraph.

2. Communication and signal wiring may be run without conduit in concealed, accessible locations as permitted by Paragraph 3.10A only if noise immunity is ensured. Contractor is fully responsible for noise immunity and rewire in conduit if electrical or RF noise affects performance.

3. All cabling shall be installed in a neat and workmanlike manner. Follow all manufacturers’ installation recommendations for all communication cabling.
4. Do not install communication wiring in raceway and enclosures containing Class 1 or other Class 2 wiring.
5. Maximum pulling, tension, and bend radius for cable installation as specified by the cable manufacturer shall not be exceeded during installation.
6. Verify the integrity of the entire network following the cable installation. Use appropriate test measures for each particular cable.
7. All runs of communication wiring shall be un-spliced length when that length is commercially available.
8. All communication wiring shall be labeled to indicate origination and destination data.
9. Grounding of coaxial cable shall be in accordance with NEC regulations Article on Communications Circuits, Cable and Protector Grounding.
10. Power-line carrier signal communication or transmission is not acceptable.

3.11 SENSORS AND MISCELLANEOUS FIELD DEVICES

A. Install sensors in accordance with the manufacturer’s recommendations.

B. Mount sensors rigidly and adequately for the environment within which the sensor operates.

C. Sensors used as controlled points in control loops shall be hardwired to the controller to which the controlled device is wired and in which the control loop shall reside.

D. Temperature Sensors

1. Room temperature sensors and thermostats shall be installed with back plate firmly secured to the wall framing or drywall anchors.
   a. For sensors mounted in exterior walls or columns, use a back plate insulated with foam and seal all junction box openings with mastic sealant.
   b. For sensors on exposed columns, use Wiremold or equal enclosures that are the smallest required to enclose wiring (e.g. Wiremold 400 BAC or equal) and Wiremold or equal junction boxes that are the narrowest required to enclose the temperature sensor and wiring connections (e.g. Wiremold 2348S/51 or equal). Color or raceway and boxes shall be per the architect; submit for approval prior to installation.

2. All wires attached to sensors shall be air sealed in their raceways or in the wall to stop air transmitted from other areas affecting sensor readings.

3. Averaging sensors shall be installed in a serpentine manner vertically across duct. Each bend shall be supported with a capillary clip. Where located in front of filters (such as mixed air sensors), access for filter removal shall be maintained.

4. Temperature sensors downstream of coils shall be located as far from the coil fins as possible, 6 inches minimum. Temperature sensors upstream of coils shall be a minimum of 6 inches away from the coil fins. No part of the sensor or its support elements or conduit shall be in contact with the coil, coil framing or coil support elements. Discharge temperature sensors on VAV boxes shall be mounted as far from the coil as possible but upstream of the first diffuser with the probe located as near as possible to the center of the duct both vertically and horizontally.

5. All pipe-mounted temperature sensors shall be installed in wells. For small piping, well shall be installed in an elbow into pipe length. Install the sensor in the well with a thermal-conducting grease or mastic. Use a closed-cell insulation patch that is integrated into the pipe insulation system to isolate the top of the well from ambient conditions but allow easy access to the sensor. Install a test plug adjacent to all wells for testing and calibration.

6. Unless otherwise noted on Drawings or Points List, temperature sensors/thermostats, humidity sensors/humidistats, CO₂ sensors, and other room wall mounted sensors shall be installed at same centerline elevation as adjacent electrical switches, 4 feet above the finished floor where there are no adjacent electrical switches, and within ADA limitations.
7. Unless otherwise noted on Drawings or Points List, install outdoor air temperature sensors on north wall where they will not be influenced by building exhaust, exfiltration, or solar insolation. Do not install near intake or exhaust air louvers.

E. Differential Pressure Sensors

1. Supply Duct Static Pressure
   a. Mount transmitter in temperature control panel near or in BAS panel to which it is wired.
   b. Low pressure port of the pressure sensor
      1) Pipe to either
         a) Building pressure (high) signal of the building static pressure transmitter.
         b) Open to a conditioned space inside the building
         c) Open to the BAS panel in which the DPT is mounted provided the panel is inside the building envelope and not in an air plenum.
   c. High-pressure port of the pressure sensor
      1) Pipe to the duct using a static pressure tip located as indicated on Drawings; if no location is indicated, locate at end of duct riser or main as far out in the system as possible but upstream of all smoke and fire dampers.
      2) Install pressure tips securely fastened with tip facing upstream in accordance with manufacturer's installation instructions.

2. Building Static Pressure
   a. Mount transmitter in temperature control panel near or in BAS panel to which it is wired.
   b. Low pressure port of the pressure sensor
      1) Pipe to the ambient static pressure probe located on the outside and at high point of the building through a high-volume accumulator or otherwise protected from wind fluctuations.
   c. High-pressure port of the pressure sensor
      1) Pipe to either
         a) Behind a BAS temperature sensor cover in an interior zone (provided sensor has openings to allow ambient air to freely flow through it)
         b) Wall plate sensor
      2) Do not locate near elevators, exterior doors, atria, or (for ceiling sensor applications) near diffusers.

3. Filter Differential Pressure
   a. Install static-pressure tips upstream and downstream of filters with tips oriented in direction of flow.
   b. Mount transmitter on outside of filter housing or filter plenum in an accessible position with LCD display clearly visible. This sensor is used in lieu of an analog gauge and thus must be readily viewable.

4. High/Low Static Pressure Safeties
   a. High static
      1) Install DPS-2 on side of supply air duct in accessible location.
      2) High port shall be open to supply air duct downstream of fan.
      3) Reference low port pressure shall be that at DP location.
b. Low static
   1) Install DPS-2 inside or outside of mixed air plenum whichever is most accessible.
   2) Low port shall be open to mixed air plenum.
   3) Reference high port pressure shall be pressure on other side of mixed air plenum with the highest pressure, e.g. ambient pressure for systems with relief fans or non-powered relief, or relief air plenum for systems with return fans.

5. All pressure transducers, other than those controlling VAV boxes, shall be located where accessible for service without use of ladders or special equipment. If required, locate in field device panels and pipe to the equipment monitored or ductwork.

6. The piping to the pressure ports on all pressure transducers (both air and water) shall contain a capped test port located adjacent to the transducer.

7. Piping differential pressure transducers shall have one of the following:
   a. Five valve manifold, brass, two valves to allow removal of sensor without disrupting the hydronic system, an equalizing valve to allow the sensor to be zeroed and to prevent sensor from experiencing full static (as opposed to differential) where, and two valves used as air vents that also can be used as test plugs for calibration.
   b. For sensors using two separate sensors, install test plugs on each connection for calibration and also used as vents.

F. Current Switches for Motor Status Monitoring: Adjust so that setpoint is below minimum operating current and above motor no load current. For fans with motorized discharge dampers, adjust so that fan indicates off if damper is closed while fan is running. For pumps, adjust so that pump indicates off if valve is closed while pump is running.

G. Airflow Measuring Stations: Install per manufacturer’s recommendations for unobstructed straight length of duct both upstream and downstream of sensor, except those installations specifically designed for installation in fan inlet. For installations in fan inlets, provide on both inlets of double inlet fans and provide inlet cone adapter as recommended by AFMS manufacturer.

H. Fluid Flow Meters: Install per manufacturer’s recommendations for unobstructed straight length of pipe both upstream and downstream of sensor. Commission per the manufacturer’s startup and commissioning recommendations. Complete all manufacturer’s startup documentation and include this in pre-functional commissioning report.

I. Actuators
   1. Type: All actuators shall be electric.
   2. Mount and link control damper actuators per manufacturer’s instructions.
   3. Dampers
      a. To compress seals when spring-return actuators are used on normally closed dampers, power actuator to approximately 5° open position, manually close the damper, and then tighten the linkage, or follow manufacturer’s instructions to achieve same effect.
      b. Check operation of damper-actuator combination to confirm that actuator modulates damper smoothly throughout stroke to both open and closed positions.
      c. Provide all mounting hardware and linkages for actuator installation.
   4. Control Valves: Install so that actuators, wiring, and tubing connections are accessible for maintenance. Where possible, mount the valve so that the position indicator is visible from the floor or other readily accessible location. However, do not install valves with stem below horizontal or down. The preferred location for the valve and actuator is on lowest point in the valve train assembly for ease of access and inspection. If this is on the coil supply piping, the control valve may be located there even if schematics (and standard practice)
show valves located on the coil return piping. This comment applies to both 2-way valves and 3-way valves (which would become diverting valves rather than mixing valves in this location).

3.12 SOFTWARE INSTALLATION

A. System Configuration
   1. Thoroughly and completely configure BAS system software, supplemental software, network software etc. on OWS, POTs, and servers.

B. Point Structuring and Naming
   1. The intent of this Paragraph is to require a consistent means of naming points across the BAS. The following requirement establishes a standard for naming points and addressing Buildings, Networks, Devices, Instances, etc.
   2. Point Summary Table
      a. The term “Point” includes all physical I/O points, virtual points, and all application program parameters.
      b. With each schematic, provide a Point Summary Table listing
         i. Building number and abbreviation
         ii. System type
         iii. Equipment type
         iv. Point suffix
         v. Full point name (see Point Naming Convention Paragraph)
         vi. Point description
         vii. Ethernet backbone network number
         viii. Network number
         ix. Device ID
         x. Device MAC address
         xi. Object ID (object type, instance number)
         xii. Engineering units
         xiii. Device make and model number; include range of device if model number does not so identify.
         xiv. Device physical location description; include floor and column line intersection to one decimal place (for example line 6.2 and line A.3).
      c. Point Summary Table shall be provided in both hard copy and in a relational database electronic format (ODBC-compliant).
      d. Coordinate with the Owner’s representative and compile and submit a proposed Point Summary Table for review prior to any object programming or Project startup.
      e. The Point Summary Table shall be kept current throughout the duration of the Project by the Contractor as the Master List of all points for the Project. Project closeout documents shall include an up-to-date accurate Point Summary Table. The Contractor shall deliver to the Owner the final Point Summary Table prior to final acceptance of the system. The Point Summary Table shall be used as a reference and guide during the commissioning process.

3. Point Naming Convention
   a. All point names shall adhere to the format as established below, unless otherwise agreed to by the Owner. New categories and descriptors may be created with approval of the Owner.
   b. Format:
      2) Example: 001.HVAC.Heatplant.B-1.HWS.Temperature (sample)

4. Device Addressing Convention
   
a. BACnet network numbers and Device Object IDs shall be unique throughout the network.
b. All assignment of network numbers and Device Object IDs shall be coordinated with the Owner to ensure there are no duplicate BACnet device instance numbers.
c. Each Network number shall be unique throughout all facilities and shall be assigned in the following manner: VVVNN, where: VVV = 0-999 for BACnet Vendor ID, NN = 00 - 99 for building network.
d. Each Device Object Identifier property shall be unique throughout the system and shall be assigned in the following manner: VVVNNDD , where: VVV = number 0 to 999 for BACnet Vendor ID , NN = 00 - 99 for building network, DD = 01-99 for device address on a network.
e. Coordinate with the Owner or a designated representative to ensure that no duplicate Device Object IDs occur.
f. Alternative Device ID schemes or cross-project Device ID duplication if allowed shall be approved before Project commencement by the Owner.

5. I/O Point Physical Description
   
a. Each point associated with a hardware device shall have its BACnet long-name point description field filled out with:
      1) The device manufacturer and model number. Include range of device if model number does not so identify.
      2) For space sensors, include room number in which sensor is located.

C. Point Parameters
   
1. Provide the following minimum programming for each analog input
   a. Name
   b. Address
   c. Scanning frequency or COV threshold
   d. Engineering units
   e. Offset calibration and scaling factor for engineering units
f. High and low value reporting limits (reasonableness values), which shall prevent control logic from using shorted or open circuit values.
g. Default value to be used when the actual measured value is not reporting. This is required only for points that are transferred across the primary or secondary controlling networks and used in control programs residing in control units other than the one in which the point resides. Events causing the default value to be used shall include failure of the control unit in which the point resides or failure of any network over which the point value is transferred.

2. Provide the following minimum programming for each analog output
   a. Name
   b. Address
   c. Engineering units
   d. Offset calibration and scaling factor for engineering units
   e. Output Range
   f. Default value to be used when the normal controlling value is not reporting.

3. Provide the following minimum programming for each digital input
   a. Name
   b. Address
   c. Engineering units (on/off, open/closed, freeze/normal, etc.)
   d. Debounce time delay
   e. Message and alarm reporting as specified
   f. Reporting of each change of state, and memory storage of the time of the last change of state
   g. Totalization of on-time (for all motorized equipment status points), and accumulated number of off-to-on transitions.

4. Provide the following minimum programming for each digital output
   a. Name
   b. Address
   c. Output updating frequency
   d. Engineering units (on/off, open/closed, freeze/normal, etc.)
   e. Direct or Reverse action selection
   f. Minimum on-time
   g. Minimum off-time
   h. Status association with a DI and failure alarming (as applicable)
   i. Reporting of each change of state, and memory storage of the time of the last change of state.
   j. Totalization of on-time (for all motorized equipment status points), and accumulated number of off-to-on transitions.
   k. Default value to be used when the normal controlling value is not reporting.

D. Site-Specific Application Programming
   1. All site-specific application programming shall be written in a manner that will ensure programming quality and uniformity. Contractor shall ensure:
      a. Programs are developed by one programmer, or a small group of programmers with rigid programming standards, to ensure a uniform style.
      b. Programs for like functions are identical, to reduce debugging time and to ease maintainability.
      c. Programs are thoroughly debugged before they are installed in the field.
   2. Massage and tune application programming for a fully functioning system. It is the Contractor’s responsibility to request clarification on sequences of operation that require such clarification.
3. All site-specific programming shall be fully documented and submitted for review and approval
   a. Prior to downloading into the panel (see Submittal Package 2, Paragraph 1.8.)
   b. At the completion of functional performance testing, and
   c. At the end of the warranty period (see Warranty Maintenance,

4. All programming, graphics and data files must be maintained in a logical system of directories with self-explanatory file names. All files developed for the Project will be the property of the Owner and shall remain on the workstations/servers at the completion of the Project.

E. Graphic Screens

1. All site-specific graphics shall be developed in a manner that will ensure graphic display quality and uniformity among the various systems.

2. Schematics of MEP systems
   a. Schematics shall be 2-D or 3-D and shall be based substantially on the schematics provided on Drawings.
   b. All relevant I/O points and setpoints being controlled or monitored for each piece of equipment shall be displayed with the appropriate engineering units. Include appropriate engineering units for each displayed point value. Verbose names (English language descriptors) shall be included for each point on all graphics; this may be accomplished by the use of a pop-up window accessed by selecting the displayed point with the mouse.
   c. Animation or equipment graphic color changes shall be used to indicate on/off status of mechanical components.
   d. Indicate all adjustable setpoints and setpoint high and low limits (for automatically reset setpoints), on the applicable system schematic graphic or, if space does not allow, on a supplemental linked-setpoint screen.

3. Displays shall show all points relevant to the operation of the system, including setpoints.

4. The current value and point name of every I/O point and setpoint shall be shown on at least one graphic and in its appropriate physical location relative to building and mechanical systems.

5. Show weather conditions (local building outside air temperature and humidity) in the upper left-hand corner of every graphic.

6. CAD Files: The contract document drawings will be made available to the Contractor in AutoCAD format upon request for use in developing backgrounds for specified graphic screens, such as floor plans and schematics. However, the Owner does not guarantee the suitability of these drawings for the Contractor’s purpose.

7. Provide graphics for the following as a minimum
   a. Building homepage: Background shall be a building footprint, approximately to scale, oriented as shown on the campus homepage. Include links to each floor and mechanical room/area, and to summary graphics described below. Include real-time site utility data such as electric meterbuilding electrical demand, domestic cold-water flow, and natural gas demand shown roughly on the map where the utilities connect to the site.
   b. Electricity demand limiting
      1) Demand limit. Include entries for sliding window interval and a table of On-Peak or Partial-Peak demand time periods with three adjustable demand level limits for each and adjustable deadband.
      2) Electricity demand calculation. For each month, show actual peak kW and kWh for each time-of-day rate period. Show side-by-side as month-this-year and month-last-year, and month-to-date and year-to-date data.
   c. Each occupied floor plan, to scale
1) HVAC: Floor plan graphics shall show heating and cooling zones throughout the buildings in a range of colors, which provide a visual display of temperature relative to their respective setpoints. The colors shall be updated dynamically as a zone’s actual comfort condition changes. In each zone, provide links to associated terminal equipment.

2) If multiple floor plans are necessary to show all areas, provide a graphic building key plan. Use elevation views or plan views as necessary to graphically indicate the location of all of the larger scale floor plans. Link graphic building key plan to larger scale partial floor plans. Provide links from each larger scale graphic floor plan screen to the building key plan and to each of the other graphic floor plan screens.

d. Each equipment floor/area plan: To scale, with links to graphics of all BAS controlled/monitored equipment.

e. Each air handler and fan-coil: Provide link to associated HW and CHW plants where applicable.

f. Each trim & respond reset: Next to the display of the setpoint that is being reset, include a link to page showing all trim & respond points (see Guideline 36) plus the current number of requests, current setpoint, and status indicator point with values “trimming,” “responding,” or “holding.” Include a graph of the setpoint trend for the last 24 hours. Trim & respond points shall be adjustable from the graphic except for the associated device.

g. Each zone terminal:

1) Provide link to associated air handling unit where applicable and to floor plan where terminal is located.

2) Include supply air temperature from AHU serving terminal unit.

3) Include a non-editable graphic (picture) showing the design airflow setpoints from the design drawings adjacent to the editable airflows setpoints. The intent is that the original setpoints be retained over time despite “temporary” adjustments that may be made over the years.

h. Electrical power monitoring system: Show a schematic of the electrical system based on one-line diagrams with meter current kW reading and month-to-date kWh shown in actual locations. Power flow shall change on the diagram (by changing line color or width) to show which power line is active.

i. Central plant equipment including chilled water system, cooling tower system, hot water system, steam system, generators, etc.: The flow path shall change on the diagram (by changing piping line color or width) to show which piping has active flow into each ASHP, ASHP, tower, etc. as valve positions change.

j. Summary graphics: Provide a single text-based page (or as few as possible) for each of the following summary screens showing key variables listed in columns for all listed equipment. Include hyperlinks to each zone imbedded in the zone tag:

1) Air handling units: operating mode; on/off status; supply air temperature; supply air temperature setpoint; fan speed; duct static pressure; duct static pressure setpoint; outdoor air and return air damper position; coil valve positions; etc. (all key operating variables); Cooling CHWST Reset current requests, cumulative %-request-hours, and request Importance Multiplier; Heating HWST Reset current requests, cumulative %-request-hours, and request Importance Multiplier (if HW coil)

2) VAV Zone terminal units: operating mode; airflow rate; airflow rate setpoint; zone temperature; active heating setpoint; active cooling setpoint; damper position; HW valve position (reheat boxes); supply air temperature (reheat boxes); supply air temperature setpoint (reheat boxes); CO2 concentration and CO2 loop output (where applicable); Fan start/stop command, speed, and status (fan-powered); Static Pressure Reset current requests, cumulative %-request-hours, and request Importance Multiplier; Cooling SAT Reset current
requests, cumulative %-request-hours, and request Importance Multiplier; Heating HWST Reset current requests, cumulative %-request-hours, and request Importance Multiplier (HW reheat); Heating Static Pressure Reset current requests, cumulative %-request-hours, and request Importance Multiplier (dual duct); Heating SAT Reset current requests, cumulative %-request-hours, and request Importance Multiplier (dual duct).

3) Laboratory VAV Zone terminal units: operating mode; airflow rate; airflow rate setpoint; zone temperature; active heating setpoint; active cooling setpoint; damper position; HW valve position; CHW valve position; supply air temperature; supply air temperature setpoint; Static Pressure Reset current requests, cumulative %-request-hours, and request Importance Multiplier; Cooling SAT Reset current requests, cumulative %-request-hours, and request Importance Multiplier; HWST Reset current requests, cumulative %-request-hours, and request Importance Multiplier; CHWST Reset current requests, cumulative %-request-hours, and request Importance Multiplier.

4) Laboratory Air Systems: operating mode; supply airflow rate, airflow rate setpoint, damper position, Static Pressure Reset current requests, cumulative %-request-hours, and request Importance Multiplier; general exhaust airflow rate, airflow rate setpoint, damper position, Static Pressure Reset current requests, cumulative %-request-hours, and request Importance Multiplier; hood exhaust airflow rate, airflow rate setpoint, damper position, Static Pressure Reset current requests, cumulative %-request-hours, and request Importance Multiplier.

5) Fan-coil units: operating mode; zone temperature; active heating setpoint; active cooling setpoint; supply air temperature; supply air temperature setpoint (where applicable); fan status; fan speed (where applicable); HW/CHW valve position; Cooling CHWST Reset current requests, cumulative %-request-hours, and request Importance Multiplier; Heating HWST Reset current requests, cumulative %-request-hours, and request Importance Multiplier.

6) Lab Zone terminal units: operating mode; supply airflow rate; supply airflow rate setpoint; zone temperature; active heating setpoint; active cooling setpoint; supply air temperature; supply air temperature setpoint; fume hood status; exhaust airflow rate; Supply Static Pressure Reset current requests, cumulative %-request-hours, and request Importance Multiplier; Exhaust Static Pressure Reset current requests, cumulative %-request-hours, and request Importance Multiplier; Cooling SAT Reset current requests, cumulative %-request-hours, and request Importance Multiplier; CHWST Reset current requests, cumulative %-request-hours, and request Importance Multiplier; HWST Reset current requests, cumulative %-request-hours, and request Importance Multiplier.

7) Electrical meters and switches: Volts, current, kW, switch positions.

k. For all equipment with runtime alarms specified, show on graphic adjacent to equipment the current runtime, alarm setpoint (adjustable), alarm light, date of last runtime counter reset, and alarm reset/acknowledge button which resets the runtime counter.

l. For all equipment with lead/lag or lead/standby operation specified, show on graphic adjacent to equipment the current lead/lag order and manual buttons or switches to allow manual lead switching by the operator per Paragraph 3.13B.5.

m. For all controlled points used in control loops, show the setpoint adjacent to the current value of the controlled point.

n. All other BAS controlled/monitored equipment.

o. On all system graphics, include a “note” block that allows users to enter comments relevant to system operation.
p. All equipment shall be identified on the graphic screen by the unit tag as scheduled on the drawings.

F. Alarm Configuration

1. Program alarms and alarm levels per Sequence of Operations.
2. Each programmed alarm shall appear on the alarm log screen and shall be resettable or acknowledged from those screens. Equipment failure alarms shall be displayed on the graphic system schematic screen for the system that the alarm is associated with (for example, fan alarm shall be shown on graphic air handling system schematic screen). For all graphic screens, display values that are in a Level 1 or 2 condition in a red color, Level 3 and higher alarm condition in a blue color, and normal (no alarm) condition in a neutral color (black or white).

3. For initial setup, Contractor shall configure alarms as follows:

<table>
<thead>
<tr>
<th></th>
<th>Level 1</th>
<th>Level 2</th>
<th>Level 3</th>
<th>Level 4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Criticality</td>
<td>Critical</td>
<td>Not Critical</td>
<td>Not Critical</td>
<td>Not Critical</td>
</tr>
<tr>
<td>Acknowledgement</td>
<td>Required</td>
<td>Required</td>
<td>Not Required</td>
<td>Not Required</td>
</tr>
<tr>
<td>Acknowledgement of Return to Normal</td>
<td>Not Required</td>
<td>Not Required</td>
<td>Not Required</td>
<td>Not Required</td>
</tr>
<tr>
<td>Email to building engineer(s)</td>
<td>Y</td>
<td>Y</td>
<td>Y</td>
<td>N</td>
</tr>
<tr>
<td>Pop-up dialog box on OWS</td>
<td>Y</td>
<td>Y</td>
<td>N</td>
<td>N</td>
</tr>
<tr>
<td>Remove from alarm log</td>
<td>After Acknowledged</td>
<td>After Acknowledged</td>
<td>After 2 weeks</td>
<td>After 2 weeks</td>
</tr>
</tbody>
</table>

4. At the end of commissioning and then again at the end of the warranty period, fully synchronize the database on this POT with that on the CSS.

3.13 SEQUENCES OF OPERATION

A. Sequences herein reference ASHRAE Guideline 36-2018, possibly followed by exceptions or additions where indicated. Guideline 36 sequences are not repeated herein for brevity and to make exceptions/revisions very clear. However, the final as-built sequences of operation (see Paragraph 1.9B.1.j and 1.1A.1.a.1)a(1)) shall include all installed sequences verbatim from Guideline 36.

B. General

1. Fully comply with ASHRAE Guideline 36-2018 Section 5.1 General.
2. Contractor shall review sequences prior to programming and suggest modifications where required to achieve the design intent. Contractor may also suggest modifications to improve performance and stability or to simplify or reorganize logic in a manner that provides equal or better performance. Proposed changes in sequences shall be included as a part of Submittal Package 2.
3. Include costs for minor program modifications if required to provide proper performance of the system.
4. Minimum speed setpoints for all VFD-driven equipment shall be determined in accordance with Paragraph 3.15E.7.
5. Equipment Staging and Rotation
   a. Parallel devices shall be lead/lag or lead/standby rotated to maintain even wear.
   b. Two runtime points shall be defined for each device:
      1) Lifetime Runtime: The cumulative runtime of the device since device start-up. This point shall not be readily resettable by operators.
      2) Staging Runtime: An operator resettable runtime point that stores cumulative runtime since the last operator reset.
c. Lead/lag devices: Unless otherwise noted, parallel staged devices (such as CHW pumps and cooling towers) shall be lead/lag alternated when more than one is off or more than one is on so that the device with the most operating hours as determined by Staging Runtime is made the last stage device and the one with the least number of hours is made the lead stage device.

This strategy effectively makes it such that devices are not “hot swapped”, e.g. a pump would not be started and another stopped during operation just for runtime equalization.

For example, assume there are two devices and only one is on, but the operating device has exceeded the run hours of the disabled device. The devices will not rotate positions until either a stage up or down occurs. If the plant stages up, then both devices will be on and lead/lag position will switch; when the plant next stages down, the former lead device with more run hours will then turn off.

Expanding further, for a plant with three devices, if all three are off or all are on, the staging order will simply be based on run hours from lowest to highest. If two devices are on, the one with more hours will be set to be stage 2 while the other is set to stage 1; this may be the reverse of the operating order when the devices were started. If two devices are off, the one with the more hours will be set to be stage 3 while the other is set to stage 2; this may be the reverse of the operating order when the devices were stopped.

Example with three pumps:
1. P-1 (1000 hours), 2 (950 hours), and 3 (900 hours) are all off. Staging logic makes lead/lag order: 3, 2, 1
2. P-3 starts. Logic does not change its order since it is on by itself.
3. P-3 runs for 51 hours. Since it is on and others off, the lead/lag order does not change. It can run this way indefinitely and the order does not change.
4. There is then a stage-up command. P-2 (the next in lead/lag order) is started. So both P-2 and P-3 are on. P-3 now as more run hours than P-2. So the Lead/lag order changes to: 2, 3, 1.
5. These two pumps run another 51 hours. Run times are P-1 (1000 hours), P-2 (1001) and P-3 (1002). No changes are made to lead/lag order because P-1 is off alone.
6. There is a stage down command. P-2 is now lead so it stays on. P-3 is shut off. The order for the two off pumps is now adjusted because P-1 has fewest run hours. lead/lag order is now: 2, 1, 3
7. P-2 runs for 100 more hours. It now has the longest runtime, but order does not change since it is on alone. Order is still 2, 1, 3
8. There is a stage down or plant-off command. P-2 shuts off. Run times are P-1 (1000 hours), P-2 (1101) and P-3 (1002). Since all are off, order is switched to: 1, 3, 2

Example with three pumps:
1. P-1 (1000 hours), 2 (950 hours), and 3 (900 hours) are all off. Staging logic makes lead/lag order: 3, 2, 1
2. P-3 starts. Logic does not change its order since it is on by itself.
3. P-3 runs for 51 hours. Since it is on and others off, the lead/lag order does not change. It can run this way indefinitely and the order does not change.
4. There is then a stage-up command. P-2 (the next in lead/lag order) is started. So both P-2 and P-3 are on. P-3 now as more run hours than P-2. So the Lead/lag order changes to: 2, 3, 1.
5. These two pumps run another 51 hours. Run times are P-1 (1000 hours), P-2 (1001) and P-3 (1002). No changes are made to lead/lag order because P-1 is off alone.
6. There is a stage down command. P-2 is now lead so it stays on. P-3 is shut off. The order for the two off pumps is now adjusted because P-1 has fewest run hours. lead/lag order is now: 2, 1, 3
7. P-2 runs for 100 more hours. It now has the longest runtime, but order does not change since it is on alone. Order is still 2, 1, 3
8. There is a stage down or plant-off command. P-2 shuts off. Run times are P-1 (1000 hours), P-2 (1101) and P-3 (1002). Since all are off, order is switched to: 1, 3, 2

Example with three pumps:
2) If devices run continuously, lead/standby positions shall switch at an adjustable frequency (e.g. every 14 days) based on Staging Runtime; standby device shall first be started and proven on before former lead device is changed to standby and shut off.

a) Variable speed pumps shall have a deceleration rate of 1 Hz/second or slower set in BAS logic when disabled to prevent nuisance trips of operating devices (e.g. ASHPs).

e. Exceptions to Lead/lag and Lead/standby rotation

1) Operators with appropriate access level shall be able to manually command staging order via software points, but not overriding the In Alarm or Hand Operation logic below.

a) Faulted Devices: A faulted device is any device commanded to run that is either not running or unable to perform its required duty. If an operating device has any fault condition described subsequently, a Level 2 alarm shall be generated and a response shall be triggered as defined below.

(1) Fans and Pumps

(a) Status point not matching its on/off point for 3 seconds after a time delay of 15 seconds when device is commanded on.

(1) ASHPs

(a) Shutdown alarm condition either through network or hardwired alarm contact, or
(b) ASHP is manually shut off as indicated by the status of the Local/Auto switch from ASHP gateway, or
(c) ASHP status remains off 5 minutes after command to start, or
(d) If provided, CHW isolation valve feedback indicates valve is not open 90 seconds after device is commanded open, or
(e) If provided, CW isolation valve feedback indicates valve is not open 90 seconds after device is commanded open.
(f) For 15 minutes chilled water return temperature has been at least 5°F above the CHWST setpoint, and delta-T across the ASHP, as determined based on the difference between chilled water return temperature and chilled water supply temperature measured at the ASHP (i.e. not common CHWST), has been less than 3°F.

b) Upon identification of a fault condition:

(1) For fans and pumps:

(a) The next commanded OFF device in the staging order, Device “B”, shall be commanded ON while alarming Device “A” remains commanded ON.
(b) If Device B fails to prove status (i.e. it also goes into alarm), it shall remain commanded on and the preceding step shall be repeated until the quantity of devices called for by the lead/lag logic have proven on.
(c) When either the required number of devices proves on or all devices are commanded on, set alarming devices
to the last positions in the lead/lag staging order sequenced reverse chronologically (i.e. the device that alarmed most recently is sent to last position).

(d) Staging order of non-alarming devices shall follow the even wear logic. A device in alarm can only automatically move up in the staging order if another device goes into alarm.

(e) Devices in alarm shall run if so called for by the lead/lag staging order and present stage.

(2) For ASHP:

(a) The next commanded OFF device in the staging order, Device “B”, shall be commanded ON while alarming Device “A” is commanded OFF and set to the last position in the lead/lag staging order.

(b) If Device B fails to prove status (i.e. it also goes into alarm), repeat the preceding step until the quantity of devices called for by the lead/lag logic have proven on.

(c) Staging order of non-alarming devices shall follow the even wear logic. A device in alarm can only automatically move up in the staging order if another device goes into alarm.

(d) Devices in alarm shall run if so called for by the lead/lag staging order and present stage.

2) Hand Operation: If a device is on in Hand (e.g., via an HOA switch or local control of VFD), the device shall be set to the lead device and a Level 4 alarm shall be generated. The device will remain as lead until the alarm is reset by the operator. Hand operation is determined by:

a) Fans and Pumps

(1) Status point not matching its on/off point for 15 seconds when device is commanded off.

6. Occupancy Status

a. Occupancy status of all spaces shall be via the Lighting Control BACnet interface.

b. In case of the network connection with the Lighting Controls is lost:

1) For lab zones, occupancy status shall default to “occupied” (for safety reasons)

2) For all other zones, occupancy status shall default to “occupied” if the Zone Group is in Occupied Mode and “unoccupied” for any other Zone Group Mode.

7. VAV Box Controllable Minimum

a. This section is used to determine the lowest possible VAV box airflow setpoint (other than zero) allowed by the controls (Vm) used in VAV box control sequences. The minimums shall be stored as software points that may be adjusted by the user but need not be adjustable via the graphical user interface.

b. Option 1: If the VAV box controller can control to 0.004” per Paragraph 2.9I.5.c., the minimum setpoint Vm shall be determined from the table below if the VAV box manufacturer is listed:

<table>
<thead>
<tr>
<th>Inlet</th>
<th>Titus</th>
<th>Krueger</th>
<th>Price</th>
<th>MetalAire High Gain</th>
<th>ETI</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>15</td>
<td>15</td>
<td>20</td>
<td>15</td>
<td>15</td>
</tr>
</tbody>
</table>
c. Option 2: The minimum setpoint $V_m$ shall be determined per Guideline 36.

8. Lab Air Valve Controllable Minimum

a. This section is used to determine the lowest possible valve airflow setpoint allowed by the controls used in lab control sequences. The minimums shall be stored as software points that may be adjusted by the user but need not be adjustable via the graphical user interface. If not listed, obtain data from manufacturer with review and approval by Engineer.

b. The valve controllable minimum shall be determined from the table below if the valve manufacturer is listed:

<table>
<thead>
<tr>
<th>Inlet</th>
<th>Titus</th>
<th>Krueger</th>
<th>Price</th>
<th>MetalAire High Gain</th>
<th>ETI</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

C. Electricity Demand Limiting

1. Base demand on power to entire building based on monitored Division 26 power meter.
2. Sliding Window: The demand control function shall utilize a sliding window method selectable in increments of one minute, up to 60 minutes, 15-minute default.
3. Demand Levels: Demand time periods shall be set up as per utility rate schedule. For each On-Peak or Partial-Peak period, three demand level limits can be defined. When the measured demand exceeds the limit, the Demand Limit Level switch for that level shall be set; when demand is less than 10% (adjustable) below the limit for a minimum of 15 minutes, and the time is no longer within the On-Peak or Partial-Peak window, the switch shall be reset. These levels are used at the zone level (see Zone Control sequences) to shed demand.
4. In addition to setpoint reset logic triggered by Demand Levels as described below, include Demand Shed commands to the lighting control system via BACnet interface for each Demand Level. The response to each Demand Shed command shall be programmed into the lighting control system under Division 26.

D. Zones

1. Fully comply with ASHRAE Guideline 36-2018 Section 5.2 Generic Ventilation Zones.
   a. Use Title 24 for ventilation logic.
      1) Add the following to 5.2.1.4.2
c. If no value is entered in VAV box schedules for Occupied Minimum Airflow Setpoint (Vmin), Vmin shall be set equal Zone-Abs-OA-min

b. Fully implement Time Averaged Ventilation (TAV) 5.2.2 and use it when VAV minimum, Vmin*, is below the lowest allowed by the controls (Vm).

2. Fully comply with ASHRAE Guideline 36-2018 Section 5.3 Generic Thermal Zones.
   a. Default setpoints:

<table>
<thead>
<tr>
<th>Zone type</th>
<th>Occupied</th>
<th>Unoccupied</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Heat</td>
<td>Cool</td>
</tr>
<tr>
<td>VAV exterior</td>
<td>70°F</td>
<td>75°F</td>
</tr>
<tr>
<td>VAV interior</td>
<td>70°F</td>
<td>75°F</td>
</tr>
<tr>
<td>Electrical and mechanical</td>
<td>60°F</td>
<td>85°F</td>
</tr>
<tr>
<td>IDF/MDF</td>
<td>60°F</td>
<td>78°F</td>
</tr>
<tr>
<td>Labs</td>
<td>70°F</td>
<td>75°F</td>
</tr>
</tbody>
</table>

E. Zone Groups
   1. Fully comply with ASHRAE Guideline 36-2018 Section 5.4 Zone Groups.
   2. Consult with Owner for all schedules. Use the following initial schedule:
      a. Weekday: 7am to 7pm
      b. SAT: 9am to 2pm
      c. SUN: off
      d. Holiday: off

   3. Exception: the lab exhaust must run 24/7 including unoccupied times to ensure safety in the labs.

F. Laboratory Emergency Pressure Relief Dampers
   1. The intent of these dampers is to prevent the labs from becoming too negative in the event of a power loss. The exhaust fans are on emergency power and are still able to run in the event of a power loss.
   2. These dampers will have spring return actuators that return to a fail-safe position of open when power is lost.
   3. By opening, this will break the negative pressure of the room.
   4. DDC contractor to provide 24V power to these dampers. Select damper such that an input of 0V will command the damper to closed.
   5. No other monitoring of these devices is required.

G. Four-Pipe VAV Zone
   1. Design setpoints shall be as scheduled on plans:
      a. Supply air valve
         1) Maximum airflow setpoint (Vmax)
         2) Minimum occupied airflow setpoint (Vmin-occ)
         3) Minimum unoccupied airflow setpoint (Vmin-unocc)
         4) Design heating coil leaving air temperature (SATmax)
         5) Design demand control minimum

   2. Controllable minimum. Where there is more than one terminal, rates shall be added together.
   3. Supply air system
      a. Supply airflow and temperature control logic is depicted schematically in the figure below and described in the following sections.
b. When the zone served by the system is in the Cooling Mode
   1) Supply air temperature setpoint shall be reset from SATmin at 50% Cooling Loop output and above proportionally up to Deadband SAT Setpoint at 0% Cooling Loop output.
   2) Airflow setpoint shall be reset from Vmax at 100% Cooling Loop down to Vmin* at 50% Cooling Loop output and below.

c. When the zone served by the system is in the Deadband Mode
   1) Deadband SAT Setpoint shall be the average of current cooling and heating space temperature setpoints.
   2) Airflow setpoint shall be Vmin*.

d. When the zone is in the Heating Mode
   1) Supply air temperature setpoint shall be reset from Deadband SATmin at 0% Heating Loop output proportionally up to SATmax at 50% Heating Loop output and above.
   2) If the supply air temperature is greater than the room temperature plus 5°F, the airflow setpoint shall be reset from Vmin* at 50% Heating Loop output and below proportionally up to Vmax at 100% Heating Loop output.

e. The hot water and chilled water valves shall be modulated in sequence using P+I loop to maintain the discharge temperature at setpoint. (Directly controlling valves off zone temperature PID loop is not acceptable.)

f. The VAV damper shall be modulated to maintain the measured airflow at setpoint.

4. Demand Control Ventilation
   a. For zones with space co2 sensors, use the scheduled demand control ventilation rate rather than the ventilation minimum.
   b. Record the ambient space CO2 to use as a baseline.
   c. When the space CO2 rises 600 ppm (adj) above ambient, begin resetting supply cfm linearly up to the ventilation minimum.

5. System Requests
   a. Cooling SAT Reset Requests
1) If the CHW valve is less than 90%, send 0 Requests
2) If the CHW valve is greater than 95%, send 1 Request
3) IF the zone cooling valve is full open, AND the zone temperature exceeds the zone’s cooling setpoint by 3°F for 5 minutes, send 2 Requests
4) IF zone cooling valve is full open, AND the zone temperature exceeds the zone’s cooling setpoint by 5°F for 15 minutes, send 3 Requests

b. HHW Temp Reset Requests
   1) If the HHW valve is less than 90%, send 0 Requests
   2) If the HHW valve is greater than 95%, send 1 Request
   3) IF the zone heating valve is full open, AND the zone temperature exceeds the zone’s heating setpoint by 3°F for 5 minutes, send 2 Requests
   4) IF zone heating valve is full open, AND the zone temperature exceeds the zone’s heating setpoint by 5°F for 15 minutes, send 3 Requests

c. Supply Static Pressure Reset Requests (Feedback loop type valves; separately include all exhaust and supply air valves in zone)
   1) If the Damper Loop is less than 85%, send 0 requests
   2) If the Damper Loop is greater than 95%, send 1 request
   3) If the measured airflow is less than 85% of setpoint for 30 seconds, send 3 requests

H. Return Air Exhaust Damper (Floors 1 and 2)
   1. General
      a. Floors one and two have return air dampers that control to CFM.
      b. These dampers on connected to the return air duct associated with standard VAVs not with labs.
      c. These dampers are to regulate the return air from these non-lab spaces in a pressure independent manner similar to a VAV but with no temperature control.

   2. Flow control:
      a. Active airflow setpoint at the return air dampers to be a sum of the associated VAV – offset.
      b. The necessary offset for each zone group is to be field determined by the air balancer to maintain the VAV zone group positive to the surrounding spaces at +.1” positive (adj).

I. Laboratory Four-Pipe VAV Zone
   1. See Paragraph 3.13D for setpoints, loops, control modes, alarms, etc.
   2. Design setpoints shall be as scheduled on plans:
      a. Room Pressurization
         1) Pressurization offset (Voffset). Initial pressurization offsets shall be shown on schedules. For all lab zones, final pressurization offsets shall be determined as specified under Section 230593 Testing, Adjusting, and Balancing.
      b. Supply air valve
         1) Maximum airflow setpoint (Vmax)
         2) Minimum occupied airflow setpoint (Vmin-occ)
         3) Minimum unoccupied airflow setpoint (Vmin-unocc)
         4) Design heating coil leaving air temperature (SATmax)
         5) Design cooling coil leaving air temperature (SATmin)
c. Hood exhaust air valve. Where there is more than one hood (see plan for quantity), rates shall be added together.
   1) Maximum airflow setpoint (Vhex-max)
   2) Minimum airflow setpoint (Vhex-min)

d. General exhaust air valve. Where there is more than one GEX (see plan for quantity), rates shall be added together.
   1) Maximum airflow setpoint (Vgex-max)
   2) Minimum airflow setpoint (Vgex-min)

3. Controllable minimum. Where there is more than one terminal, rates shall be added together.
   a. For slow VAV zones, supply VAV box controllable minimum (Vctrl-min) and general exhaust VAV box controllable minimum (Vgex-ctrl-min) shall be determined in accordance with Paragraph 3.13B.5.
   b. For fast VAV zones, supply air valve controllable minimum (Vctrl-min) and general exhaust air valve controllable minimum (Vgex-ctrl-min) shall be determined in accordance with Paragraph 3.13B.8.

4. The actual minimum Vmin* shall be equal to the larger of:
   a. Exhaust makeup air rate calculated below, Vmu
   b. Minimum ventilation rate (Vvent) equal to
      1) If the zone is unoccupied as indicated by its occupancy sensor and the lab is scheduled to be unoccupied, Vmin-unocc.
      2) Otherwise, Vmin-occ
   c. Vctrl-min

5. Supply air system
   a. Supply airflow and temperature control logic is depicted schematically in the figure below and described in the following sections.

   b. When the zone served by the system is in the Cooling Mode
1) Supply air temperature setpoint shall be reset from SATmin at 50% Cooling Loop output and above proportionally up to Deadband SAT Setpoint at 0% Cooling Loop output.
2) Airflow setpoint shall be reset from Vmax at 100% Cooling Loop down to Vmin* at 50% Cooling Loop output and below.

c. When the zone served by the system is in the Deadband Mode
1) Deadband SAT Setpoint shall be the average of current cooling and heating space temperature setpoints.
2) Airflow setpoint shall be Vmin*.

d. When the zone is in the Heating Mode
1) Supply air temperature setpoint shall be reset from Deadband SATmin at 0% Heating Loop output proportionally up to SATmax at 50% Heating Loop output and above.
2) If the supply air temperature is greater than the room temperature plus 5ºF, the airflow setpoint shall be reset from Vmin* at 50% Heating Loop output and below proportionally up to Vmax at 100% Heating Loop output.

e. The hot water and chilled water valves shall be modulated in sequence using P+I loop to maintain the discharge temperature at setpoint. (Directly controlling valves off zone temperature PID loop is not acceptable.)
f. The VAV damper shall be modulated to maintain the measured airflow at setpoint.

6. Pressurization control
a. Sign conventions: All airflows have a positive sign, except for the room offset airflow which may be positive (for positively pressurized lab) or negative (for negatively pressurized lab).
b. Vgex-step shall be equal to Vgex-ctrl-min
1) Exception: Vgex-step shall equal 0 if the zone thermal load does not demand an increase in airflow (i.e. Cooling Loop Output < 50% and Heating Loop Output < 50% for 4-pipe zone) and the following has been less than or equal to 0 for 30 seconds or more:
   a) The larger of Vvent and Vctrl-min, minus the sum of:
      (1) Sum of fume hood exhaust valve(s) airflow feedback
      (2) Other exhaust airflows, e.g. canopy/cabinet/snorkel etc. (if applicable, see plans for quantity and airflows)
      (3) Voffset

c. The make-up airflow demand (Vmu) is equal to the sum of:
1) Sum of fume hood exhaust valve(s) airflow feedback
2) Vgex-step
3) Other exhaust airflows, e.g. canopy/cabinet/snorkel etc. (if applicable, see plans for quantity and airflows)
4) Voffset
d. The general exhaust valve setpoint shall equal 0 when Vgex-step is equal 0, otherwise it shall equal the sum of:
1) Supply valve feedback airflow minus Vmu
2) The general exhaust valve controllable minimum airflow, Vgex-ctrl-min

7. Alarms
a. Airflow alarm
1) If the airflow feedback from any valve is 15% above or below setpoint for 5 minutes, generate a Level 3 alarm.

2) If the airflow feedback from any valve is 30% above or below setpoint for 5 minutes, generate a Level 2 alarm.

b. Room pressurization polarity alarm

1) Generate a Level 2 alarm if the airflow offset has incorrect polarity for 5 minutes based on sum of exhaust feedback signals and supply feedback signal:
   a) For a room with negative offset, if exhaust minus supply < 0
   b) For a room with positive offset, if exhaust minus supply > 0

c. Room low supply rate alarm

1) If the sum of exhaust feedback signals exceeds supply feedback signal by more than 4 times (adjustable) the offset for 1 minute:
   a) Generate a Level 1 alarm (high level due to problems exiting)
   b) All fume hood sashes in room shall be commanded closed.
   c) All fume hood exhaust setpoints shall be reduced to a fixed percentage of the maximum hood rates; this percentage shall be determined as specified in Section 230593 Testing, Adjusting and Balancing.

d. Low supply air temperature

1) If HHW plant is proven on and the supply air temperature is 15°F less than setpoint for 10 minutes, generate a Level 3 alarm.

2) If HHW plant is proven on and the supply air temperature is 30°F less than setpoint for 10 minutes, generate a Level 2 alarm.

e. High supply air temperature

1) If ASHP plant is proven on and the supply air temperature is 10°F more than setpoint for 10 minutes, generate a Level 3 alarm.

2) If ASHP plant is proven on and the supply air temperature is 20°F more than setpoint for 10 minutes, generate a Level 2 alarm.

f. Fume hood

1) Fume hood alarm: Level 2

2) If average sash height (interpolated based on average cfm feedback through the hood and design maximum and minimum setpoints) during the last 24 hours is greater than 50% (adjustable), generate a Level 4 alarm

8. Testing/Commissioning Overrides: Provide software points that interlock to a system level point to

a. Force supply airflow setpoint to zero
b. Force supply airflow setpoint to Vmax
c. Force supply airflow setpoint to Vmin
d. Force supply damper full closed/open
e. Force heating valve to closed
f. Force cooling valve to closed
g. Force hood exhaust airflow setpoint to Vhex-max
h. Force hood exhaust airflow setpoint to Vhex-min
i. Force general exhaust airflow setpoint to Vgex-max
j. Force general exhaust airflow setpoint to Vgex-min
k. Reset request-hours accumulator point to zero (provide one point for each reset type listed below)

9. System Requests
a. Cooling SAT Reset Requests
   1) If the CHW valve is less than 90%, send 0 Requests
   2) If the CHW valve is greater than 95%, send 1 Request
   3) IF the zone cooling valve is full open, AND the zone temperature exceeds the zone’s cooling setpoint by 3°F for 5 minutes, send 2 Requests
   4) IF zone cooling valve is full open, AND the zone temperature exceeds the zone’s cooling setpoint by 5°F for 15 minutes, send 3 Requests

b. HHW Temp Reset Requests
   1) If the HHW valve is less than 90%, send 0 Requests
   2) If the HHW valve is greater than 95%, send 1 Request
   3) IF the zone heating valve is full open, AND the zone temperature exceeds the zone’s heating setpoint by 3°F for 5 minutes, send 2 Requests
   4) IF zone heating valve is full open, AND the zone temperature exceeds the zone’s heating setpoint by 5°F for 15 minutes, send 3 Requests

c. Supply Static Pressure Reset Requests (Feedback loop type valves; separately include all exhaust and supply air valves in zone)
   1) If the Damper Loop is less than 85%, send 0 requests
   2) If the Damper Loop is greater than 95%, send 1 request
   3) If the measured airflow is less than 85% of setpoint for 30 seconds, send 3 requests

J. Fume Hood Lab Exhaust Air Valve
   1. General
      a. Lab exhaust air valves for fume hoods control airflow to maintain face velocity at the fume hood.
      b. Lab exhaust air valves maintain face velocity at all times regardless of zone occupancy status.
      c. At the end of the occupied period command all automatic sash closers to shut in every classroom. Send alarm at front end if any sash cannot meet commanded state.

   2. Sash Position Sensor
      a. A sash position sensor mounted on the fume hood shall provide a signal that is linearly proportional to the actual sash position.

   3. Face Velocity Control
      a. The fume hood controller shall continually determine the total fume hood open area by monitoring the fume hood sash position via the sash sensor as well as taking account of any fume hood fixed open areas and/or bypass openings.
      b. The fume hood controller shall calculate the required fume hood exhaust airflow necessary to maintain the average face velocity setpoint over the total open area.

   4. Airflow Control
      a. The Fume Hood Air Valve damper shall be modulated by a control loop to maintain the measured airflow at the active setpoint Vspt_fumehood.
      b. Fume hood controller shall ensure that the required fume hood exhaust to maintain the average face velocity setpoint is always maintained independently of any variations in exhaust system static pressure or any laboratory room conditions such as the ventilation airflow or room static pressure that could otherwise affect the fume hood exhaust airflow

   5. Operator Display Panel
a. The fume hood controller shall also interface to an operator display panel (ODP) at the designated measurement location on the front of the fume hood.

b. The ODP shall provide a continuous digital display of the average fume hood face velocity at all times. The fume hood face velocity display shall be the true average face velocity as calculated by the fume hood controller based upon the actual measured fume hood exhaust airflow and the total fume hood total open area.

c. The ODP shall also include separate colored lights that shall illuminate to indicate fume hood operations status:
   1) Green- Proper face velocity
   2) Yellow- Marginal face velocity
   3) Red- Face Velocity Alarm Conditions
   4) The ODP shall also contain an audible alarm device that responds to face velocity alarm conditions and the ODP digital display shall change to “low face velocity” or “high face velocity” appropriate to the alarm condition.
   5) A silence push button at the ODP shall allow the user to silence the audible alarm which shall then remain silent until a subsequent face velocity alarm occurs.

6. Purge Mode

a. The ODP shall also provide an emergency purge pushbutton which shall allow a user to increase fume hood exhaust airflow to the maximum amount for a designated period of time as required by lab safety standards.

b. The initial setting for the emergency purge time shall be 1 minute.

c. After the designate emergency purge time has expired, the fume hood exhaust shall automatically reset to a lower level to prevent excessive demand on the exhaust system.

d. Emergency purge mode shall be cancellable at any time by depressing the emergency purge button a second time.

e. The ODP shall sound its audible alarm device whenever the emergency purge mode of operation is activated.

7. Over-Opened Sash

a. The ODP shall also provide an audible sash open alert feature that shall caution users whenever the fume hood sash exceeds a predetermined height.

b. The audible alert shall consist of a series of quick “chirps” that continue until the sash is reduced to an acceptable height.

8. Occupancy and sash closers

a. BMS shall provide monitoring only integration with lighting control for purposes of obtaining occupancy only.

b. When a lab zone is unoccupied for more than 30 min as determined by the occupancy sensors in the lighting system, BMS to roll back the room to the minimum, un-populated cfm values AND command all sash closers to closed.

c. When the building goes into unoccupied schedule, AND if the occupancy status as determined by the lighting control is unpopulated, then command all sash closers to close. ELSE, do nothing until lighting systems shows a change to unoccupied lasting 30 min.

9. Alarms

a. Low Face Velocity
   1) If the calculated face velocity is below its alarm threshold and generating an alarm at the ODP, a Level 2 alarm shall also be generated at the BMS.

b. Low airflow
1) If the measured airflow is less than 70% of setpoint while setpoint is greater than zero for 5 minutes, generate a Level 3 alarm.
2) If the measured airflow is less than 50% of setpoint while setpoint is greater than zero for 5 minutes, generate a Level 2 alarm.

K. Lab General Exhaust Air Valve

1. General
   a. Lab air valves shall be of the same manufacturer as the building DDC system.
   b. Lab air supply, general exhaust and fume hood exhaust to be controlled from a single controller per the district standard.
   c. Lab exhaust air valves maintain pressurization in the lab via airflow offset control as required for positive, negative, or neutral control relative to adjacent spaces or outside.
   d. This sequence is not to be confused with Fume Hood Lab exhaust air valves which maintain face velocity at all times regardless of zone occupancy status.

2. Zones without fume hoods: Active airflow setpoint at the lab air valve shall vary depending on the setpoint at the local supply air valve as follows:
   a. \[ V_{spt_{labexhaust}} = V_{spt_{labsupply}} + \text{offset} \]
   b. The necessary offset for each room is to be field determined by the air balancer to maintain the room at \( .1'' \) negative (adj).

3. Zones with fume hoods: Active airflow setpoint at the lab air valve shall vary depending on the setpoint at the local supply air valve and the current airflow setpoint of the fume hoods as follows:
   a. \[ V_{spt_{labexhaust}} = V_{spt_{labsupply}} - V_{spt_{labfumehood}} + \text{offset} \]

4. Airflow Control
   a. The Lab Air Valve damper shall be modulated by a PI control loop to maintain the measured airflow at the active setpoint \( V_{spt_{labexhaust}} \).

5. Alarms
   a. Low airflow
   b. If the measured airflow is less than 70% of setpoint while setpoint is greater than zero for 5 minutes, generate a Level 3 alarm.
   c. If the measured airflow is less than 50% of setpoint while setpoint is greater than zero for 5 minutes, generate a Level 2 alarm.

6. Testing/Commissioning Overrides: Provide software points that interlock to a system level point to
   a. Force zone airflow setpoint \( V_{spt} \) to zero
   b. Force zone airflow setpoint \( V_{spt} \) to \( V_{min} \)
   c. Force damper full closed/open

7. Pressure requests:
   1) If the Damper Loop is less than 85%, send 0 requests
   2) If the Damper Loop is greater than 95%, send 1 request
   3) If the measured airflow is less than 85% of setpoint for 30 seconds, send 3 requests

L. Laboratory Exhaust Fan Stack Control

1. General:
a. At all times the lab fans shall be commanded to run to protect the safety of the public. This need surpasses any occupied or unoccupied mode.

b. Min speed acceptable for any single fan is 12,000 cfm per the wind study. This is a public safety requirement. Use a buffer of 10%.

c. When a single or both fans need to be above 12,000 cfm, and this is above what the building needs, the bypass dampers will modulate to control the negative plenum pressure, so the fans can still provide min speed.

d. Fans are sized at 60% of design need, 3 fans to not need to run simultaneously.

e. Fans will be staged to meet the building demand.

f. Exhaust plenum pressure should initially be set to 2” negative pressure.

g. Once building needs more than 12kcfm from one or both fans, use trim and respond logic to control the fan speed. While described in full elsewhere in this spec, in brief the general exhaust boxes of the labs will be generating requests if they are within 80% of max capacity to satisfy their zone. The exhaust fan setpoint shall receive trim increases to respond to these requests. A PI loop will still control the single or dual fan speed to setpoint which is being reset higher or lower to provide just enough flow until at least one box is at 80% capacity.

2. Exhaust Plenum Pressure Control represented schematically below:

a. First stage of fan supply
   1) Lead fan bypass opens fully while isolation damper is closed
   2) Once both bypass and isolation dampers have reached their commanded state, lead fan ramps up to 12kcfm + 10%.
   3) Simultaneously command:
      a) Isolation damper to be opened
      b) Bypass controls with PI loop to control exhaust plenum pressure setpoint.
      c) Note: some degree of fluctuation is expected until the isolation damper is fully opened. PI loop is expected to achieve setpoint only after isolation damper is shut.
      d) Recommendation: use ramp rate on damper actuators effectively synchronizes their timing of the dampers. (Very negative conditions will slow dampers, but this is not a high precision requirement.)

   4) When the negative plenum pressure requires the bypass to be 90% closed for more than 2 min, switch from bypass control to fan control.

   5) Fan control of the negative plenum to be with trim and respond logic (as described elsewhere in this spec), resetting fan cfm higher to maintain negative plenum pressure. Recommend initial speed increments of 10%, field tuning is still required.

   6) Once the building need for exhaust climbs 10% below max speed of the lead fan for more than 2 minutes, initiate 2nd stage of fan supply.

b. 2nd stage of fan supply
   1) First, the lag fan bypass opens fully.
   2) Once bypass is confirmed full open, lag fan ramps up to 12kcfm + 10%.
   3) Once the fan has reached speed, simultaneously execute the following commands:
      a) Lag fan isolation damper to open
      b) Lead fan and lag fan set to same setpoint of 12kcfm + 10%
      c) Switch from PI plenum control with 1 damper to control with both bypass dampers.
      d) (Note: at this brief transition point, the system has been provided with ample air flow, double what is necessary, fluctuations in the plenum through transition would be normal in this instance. It is not expected
that the plenum would be too positive, but there is a chance it could be too negative. Contractor to use care in selecting ramp rates to Suspend alarms during transition or increase alarm “make” delay time span to prevent nuisance alarms)

4) When the negative plenum pressure requires the bypasses to be 90% closed for more than 2 min, switch from bypass control to fan control.
5) Fan control requires both fans be controlled to the same speed signal with trim and respond logic (as described elsewhere in this spec) by resetting fan cfm higher to control plenum pressure. Recommend initial speed increments of 5% as the fans are now working in tandem, field tuning is still required.

c. Stage down:
1) When both fans are at 24kcfm + 10% for more than 3 min, begin stage down process.
2) Enable both bypasses to control to the same signal as before with stage up.
3) Command the lead fan to ramp up to full speed. (Note: it is expected that the bypasses will be able to modulate and maintain pressure. If instability becomes evident, use more gradual ramp rate on the speed increase.)
4) Once the lead fan has proven full speed simultaneously execute the following commands:
   a) Command lag fan isolation damper closed
   b) Shut down speed of lag fan
   c) Close all bypass dampers
   d) Resume control of plenum pressure with single fan speed complete with trim and respond as before.
   e) Recommendation: use ramp rate on damper actuators effectively synchronizes their timing of the dampers. (Very negative conditions will slow dampers, but this is not a high precision requirement.)

3. In the event of an AHU supply fan failure:
   a. It is expected that all hoods will go into local alarm mode.
   b. All exhaust fans to fall back to the emergency setpoint of -.1” of static so that lab doors are not difficult to open.
   c. All sash closers are commanded to be closed.
   d. Note: such an AHU failure to be detected by a dedicated static pressure sensor on the AHU supply duct back to the EF control panel rather than passed back through the network from the AHU panel.
   e. Fans should obey unique rotation logic as there cannot be a time when there is no service to the building:

1) At the end of 80 hours of run time, enable 3rd fan to run as lag.
2) Fully open 3rd fan bypass damper
3) After bypass damper is proven full open, ramp 3rd fan to present speed of the other 2 fans.
4) When speed of 3rd fan has proven matched, simultaneously perform the following commands:
   a) Open the 3rd fan isolation damper
   b) Open the former lead fan bypass damper
   c) Close the former lead fan isolation damper
   d) The single fan not being pulled out of rotation will still be controlling to plenum pressure.
   e) When the isolation damper of the former lead fan is proven closed, shut off the fan and use the 2 running fans to control to pressure in unison as they normally would.
f) Note: there could be some fluctuation in pressure, however far more air is being supplied than needed. Controls contractor to take care as to not draw plenum too negative.

g) Send the former lead fan which is off to the end of the rotation.

f. Negative plenum pressure to be reset with trim using Trim & Respond logic parameters:

</table>

4. In the event of fire, fire alarm system to provide power kill of the bypass dampers so that plenum pressure is immediately cut.

5. In the event of loss of power,
   a. The BMS will detect loss of power when the duct supply pressure of the supply fan goes to zero. (the supply fan is not on emergency power)
   b. One Exhaust fan is on emergency power, the associated BMS control panel must be as well.
   c. Command the EF with emergency power to run at the minimum safe speed of 12,000 cfm. This will keep the lab plenum negative.
   d. The labs themselves are not on emergency power and all have dampers with spring return actuators. Upon loss of power in those zones the dampers will open to break the potential negative pressure lock on the room. This will prevent these rooms from going too negative to exit.

M. Multiple Zone VAV Air Handlers

1. Air Handling Unit System Modes:
   a. Fully comply with ASHRAE Guideline 36-2018
   b. AHU system Modes are the same as the Mode of the Zone Group served by the system. When Zone Group served by an air handling system are in different modes, the following hierarchy applies (highest one sets AHU mode).

   1) Occupied Mode
   2) Cool-down Mode
   3) Setup Mode
   4) Warm-up Mode
   5) Setback Mode
   6) Freeze Protection Setback Mode
   7) Unoccupied Mode

2. Parameters
   a. Design Information:
1) Temperature Setpoints
   a) Min_ClgSAT, lowest cooling supply air temperature setpoint: 55°F.
   b) Max_ClgSAT, highest cooling supply air temperature setpoint: 65°F.
   c) OAT_Min, the lower value of the OAT reset range: 50°F.
   d) OAT_Max, the higher value of the OAT reset range: 70°F.

2) Ventilation Setpoints
   a) AbsMinOA: the design outdoor airflow rate when all zones with CO2 sensors or occupancy sensors are unpopulated: per AHU schedule
   b) DesMinOA: the design minimum outdoor airflow with areas served by the system are occupied at their design population: per AHU schedule

3) Economizer High Limit: Paragraph 3.1.4.3.2 (California Title 24 economizer high limit requirements)
   a) California Climate Zone: 3

b. TAB Information
   1) Duct design maximum static pressure, Max_DSP to be determined by Section 230593 Testing, Adjusting and Balancing.
   2) Minimum Fan Speed: Per Paragraph 3.15E.7

3. Supply Fan Control
   1) Staged supply fan controls
      a) VFD Fan groups shall be lead/lag controlled per Paragraph 3.13B.5.
      b) When fans are enabled, start the lead supply fan. When %-supply airflow (totalized enabled VAV box readings divided by design AHU airflow) exceeds stage-up setpoint (below) for 15 minutes (adjustable) then the next lag supply fan shall run. All VFDs receive the same speed signal. When %-airflow falls below the stage-up setpoint for 15 (adjustable) minutes then last lag fan shall be staged off.

<table>

<td>45%</td>
</tr>
</tbody>
</table>

4. Supply Fan Start/Stop
   a. Supply fan shall run when system is in the Cool-down Mode, Setup Mode, or Occupied Mode.
      1) If there are any VAV-reheat boxes on perimeter zones, supply fan shall also run when system is in Setback Mode or Warm-up Mode (i.e., all Modes except Unoccupied).
      2) Totalize current airflow rate from VAV boxes to a software point, Vps.
   b. Static Pressure Control
      1) Supply fan speed is controlled with PI loop to to maintain duct static pressure at setpoint when the fan is proven on.
      2) Use initial pressure setpoint of .5” w.c. and apply trim and respond logic (described below) to adjust setpoint to satisfy zones.
High pressure trips may occur if all VAV boxes are closed (as in Unoccupied Mode) or if fire/smoke dampers are closed (in some FSD designs, the dampers are interlocked to the fan status rather than being controlled by smoke detectors). Multiple sets of gains are used to provide control loop stability as system characteristics change.

c. Static Pressure Setpoint Reset

1) Static pressure setpoint: Setpoint shall be reset using Trim & Respond using the following parameters:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device</td>
<td>Supply Fan</td>
</tr>
<tr>
<td>SP0</td>
<td>120 Pa. (0.5 inches)</td>
</tr>
<tr>
<td>SPmin</td>
<td>25 Pa. (0.1 inches)</td>
</tr>
<tr>
<td>SPmax</td>
<td>Max_DSP</td>
</tr>
<tr>
<td>Td</td>
<td>10 minutes</td>
</tr>
<tr>
<td>T</td>
<td>2 minutes</td>
</tr>
<tr>
<td>I</td>
<td>2</td>
</tr>
<tr>
<td>R</td>
<td>Zone Static Pressure Reset Requests</td>
</tr>
<tr>
<td>SPtrim</td>
<td>-12 Pa (-0.05 inches)</td>
</tr>
<tr>
<td>SPres</td>
<td>15 Pa (+0.06 inches)</td>
</tr>
<tr>
<td>SPres-max</td>
<td>32 Pa (+0.13 inches)</td>
</tr>
</tbody>
</table>

The trim & respond reset parameters above are suggested as a starting place; they will most likely require adjustment during the commissioning/tuning phase.

5. Return Fan Control

a. Return fan shall be controlled to track the supply fan setpoint with an offset.
b. This offset should initially be set to 1200 cfm.
c. The exhaust fans for restrooms are pulling approx. 3000 cfm and the labs will exhaust an additional 1200 cfm from the common areas.
d. To achieve the 1200 cfm offset the return fan should maintain an offset of 4000 cfm from the AHU supply fan.

6. Supply Air Temperature Control (return fan with airflow tracking)
a. Supply air temperature shall be controlled to setpoint using a control loop whose output is mapped to sequence the heat recovery coil with heat recovered water, HHW from the ASHP, and economizer as shown in the diagram below.
b. The points of transition along the x-axis shown and described above are representative. Separate gains shall be provided for each section of the control map (hot water, economizer, heat recovery wheel), that are determined by DDC Contractor to provide stable control. DDC Contractor shall also adjust the precise value of the x-axis thresholds shown in the figure to provide stable control.

c. Economizer damper maximum (MaxOA-P) position is limited for economizer high limit lockout.

d. For units with a separate minimum outdoor air damper: MinOA-P is 0% and MaxRA-P is modulated to maintain minimum outdoor airflow.

1) For units with a separate minimum outdoor air damper: Economizer damper minimum position (MinOA-P) is 0% and return air damper maximum position (MaxRA-P) is modulated to control minimum outdoor air

2) For units with a single common minimum outdoor air and economizer damper: Return air damper maximum position (MaxRA-P) and economizer damper minimum position (MinOA-P) are modulated to control minimum outdoor air volume [see 3.13M.9].

3) To stage up from heat recovery water to ASHP HHW:

a) Heat recovery pump is throttled with PI loop to provide additional heat according to discharge air temp.

b) If the HHW valve is 100% open AND the Heat recovery pump is full speed to provide max heating available, but the discharge air temp is not able to maintain setpoint for 5 minutes, the coil will need to receive
hotter water from the ASHP. Accomplish this sequence in the following way:
c) IF AHSP is currently producing HHW, initiate change over from heat recovery water to ASHP HHW.
d) ELSE, send signal to ASHP equipment to start producing HHW at setpoint on the mechanical schedule. When ASHP HHW is available, through BACnet signal or supply water temp sensor, initiate heat recovery coil valve change over sequence.
e) HHW valve change over sequence:
   (1) From heat recovery water to ASHP water:
      (a) First shut down the heat recovery pump,
      (b) Once proven off, begin opening ASHP HHW valves,
      (c) Once proven open, close heat recovery valves.
      (d) In that order, this prevents deadheading the pump.
   (2) From ASHP to heat recovery water:
      (a) Open heat recovery valves,
      (b) Once proven open, lose the ASHP HHW valves,
      (c) Once proven closed, start the PI loop to control the heat recovery pump to control heating.

7. Plant Requests
   a. ASHP Plant Requests. Send the ASHP plant that serves the zone a ASHP Plant Request as follows:
      1) If the HHW valve position is greater than 95%, send 1 Request

8. Minimum Outdoor Airflow Setpoints
   a. DP setpoint, for California Title 24 ventilation:
      1) See Error! Reference source not found. for design OA DP setpoints.
      2) See Error! Reference source not found. for calculation of current setpoints, AbsMinOA* and DesMinOA*.
      3) See zone CO₂ control logic under terminal unit sequences.
      a) The active minimum differential pressure setpoints, AbsDPsp* and DesDPsp*, shall be determined by the equations below:
      \[
      \text{AbsDPsp}^* = \text{AbsMinDP} \left[ \frac{\text{AbsMinOA}^*}{\text{AbsMinOA}} \right]^2 \\
      \text{DesDPsp}^* = \text{DesMinDP} \left[ \frac{\text{DesMinOA}^*}{\text{DesMinOA}} \right]^2
      \]
      4) The minimum outdoor air DP setpoint (MinDPsp) shall be reset based on the highest zone CO₂ control loop signal from AbsDPsp* at 50% signal to DesDPsp* at 100% signal.
      5) The minimum outdoor air setpoint (MinOAsp) shall be reset based on the highest zone CO₂ control loop signal from AbsMinOA* at 50% signal to DesMinOA* at 100% signal.

9. Minimum Outdoor Air Control with a single common damper for minimum outdoor air and economizer functions, and airflow measurement
   a. Outdoor airflow setpoint, for California Title 24 ventilation:
      1) See Error! Reference source not found. for calculation of current setpoints, AbsMinOA* and DesMinOA*. 
2) See zone CO₂ control logic under terminal unit sequences.
3) The minimum outdoor air setpoint MinOAsp shall be reset based on the highest zone CO₂ control loop signal from AbsMinOA* at 50% signal to DesMinOA* at 100% signal.

Figure 5.16.6.3. Minimum Outdoor Airflow Control Mapping with Single Damper

10. Economizer High Limit Lockout
   a. When economizer is enabled, MaxOA-P = 100%.
   b. Once the economizer is disabled, it shall not be re-enabled within 10 minutes, and vice versa.
   c. When the economizer is disabled:
      1) Return air damper shall be fully opened
      2) Wait 15 seconds, then set MaxOA-P equal to MinOA-P.
      3) Wait 3 minutes, then release return air damper for minimum outdoor air control.

The return air damper is at first opened to avoid drawing the mixing plenum too negative. The three-minute delay is because the minimum OA damper may be pressure controlled. In that case, delay allows time for the plenum pressure to stabilize so that the return damper loop does not become unstable chasing a fluctuating pressure reading.

11. Freeze Protection

   a. If the supply air temperature drops below 4.4°C (40°F) for 5 minutes, send two (or more, as required to ensure that heating plant is active) Heating Hot Water Plant Requests, override the outdoor air damper to the minimum position, and modulate the heating coil to maintain a supply air temperature of at least 6°C (42°F). Disable this function when supply air temperature rises above 7°C (45°F) for 5 minutes.

   There are three stages of freeze protection. The first stage modulates the heating valve to maintain a safe SAT. The second stage eliminates outdoor air ventilation, in case heating is not available for whatever reason. The third stage shuts down the unit and activates coil valves and pumps to circulate water, in case the second stage does not work (e.g., stuck economizer damper).
The first stage of freeze protection locks out the economizer. Most likely this has already occurred by this time, but this logic provides insurance.

b. If the supply air temperature drops below 3.3°C (38°F) for 5 minutes, fully close both the economizer damper and the minimum outdoor air damper for one hour, and set a Level 3 alarm noting that minimum ventilation was interrupted. After one hour, the unit shall resume minimum outdoor air ventilation and enter the previous stage of freeze protection (see 3.13M.11.a).

A timer is used (rather than an OAT threshold) to exit the second stage of freeze protection because a bad OAT sensor could lock out ventilation indefinitely, while a timer should just work and thus avoid problems with the unit getting “stuck” in this mode with no ventilation.

Upon timer expiration, the unit will re-enter the previous stage of freeze protection (minOA ventilation, with heating to maintain SAT of 6°C (42°F)), after which one of three possibilities will occur:

1) If it is warm enough that the SAT rises above 7°C (45°F) with minimum ventilation, the unit will remain in Stage “1” freeze protection for five minutes, then resume normal operation.

2) If it is cold enough that SAT remains between 3.3°C (38°F) and 7°C (45°F) with heating and minimum ventilation, the unit will remain in Stage “1” freeze protection indefinitely, until outdoor conditions warm up.

3) If it is so cold that SAT is less than 3.3°F (38°F) with minimum ventilation, despite heating, then the unit will revert to Stage “2” freeze protection, where it will remain for one hour. This process will then repeat.

c. Upon signal from the freeze-stat (if installed) or if supply air temperature drops below 3.3°C (38°F) for 15 minutes or below 1°C (34°F) for 5 minutes, shut down supply and return/relief fan(s), close outdoor air damper, open the cooling coil valve to 100%, and energize the chilled water pump system. Also send two (or more, as required to ensure that heating plant is active) Heating Hot Water Plant Requests, modulate the heating coil to maintain the higher of the supply air temperature or the mixed air temperature at 27°C (80°F), and set a Level 2 alarm indicating the unit is shut down by freeze protection.

1) If a freeze protection shutdown is triggered by a low air temperature sensor reading, it shall remain in effect until it is reset by a software switch from the operator’s workstation. (If a freeze stat with a physical reset switch is used instead, there shall be no software reset switch.)

Stage three can be triggered by either of two conditions. The second condition is meant to respond to an extreme and sudden cold snap.

Protecting the cooling coil in this situation will require water movement through the coil, which means that the CHW pumps need to be energized.

Heating coil is controlled to an air temperature setpoint. The sensors will not read accurately with the fan off, but they will be influenced by proximity to the heating coil. A temperature of 27°C (80°F) at either of these sensors indicates that the interior of the unit is sufficiently warm. This avoids the situation where a fixed valve position leads to very high (and potentially damaging) temperatures inside the unit.

12. Alarms

a. Maintenance interval alarm when fan has operated for more than 1,500 hours: Level 4. Reset interval count when alarm is acknowledged.
b. Fan alarm is indicated by the status being different from the command for a period of 15 seconds.
   1) Commanded on, status off: Level 2
   2) Commanded off, status on: Level 4

c. Filter pressure drop exceeds alarm limit: Level 4. The alarm limit shall vary with total airflow (if available; use fan speed if total airflow is not known) as follows:

\[ DP_x = DP_{100} (x)^{1.4} \]

where \( DP_{100} \) is the high limit pressure drop at design airflow (determine limit from filter manufacturer) and \( DP_x \) is the high limit at the current airflow rate \( x \) (expressed as a fraction). For instance, the setpoint at 50% of design airflow would be \((.5)^{1.4}\) or 38% of the design high limit pressure drop.

d. High building pressure [more than 25 Pa (0.10")]: Level 3

e. Low building pressure (less than 0 Pa (0.0"), i.e., negative): Level 4

f. Automatic Fault Detection and Diagnostics

The Automatic Fault Detection and Diagnostics (AFDD) routines for AHUs continually assess AHU performance by comparing the values of BAS inputs and outputs to a subset of potential fault conditions. The subset of potential fault conditions that is assessed at any point depends on the Operating State of the AHU, as determined by the position of the cooling and heating valves and the economizer damper. Time delays are applied to the evaluation and reporting of fault conditions, to suppress false alarms. Fault conditions that pass these filters are reported to the building operator along with a series of possible causes.

These equations assume that the air handler is equipped with hydronic heating and cooling coils, as well as a fully integrated economizer. If any of these components are not present, the associated tests, and variables should be omitted from the programming.

Note that these alarms rely on reasonably accurate measurement of mixed air temperature. An MAT sensor is required for many of these alarms to work, and an averaging sensor is strongly recommended for best accuracy.

1) AFDD conditions are evaluated continuously and separately for each operating air handling unit.
2) The Operating State (OS) of each AHU shall be defined by the commanded positions of the heating coil control valve, cooling coil control valve, and economizer damper in accordance with the following table and corresponding graphic.

The Operating State is distinct from and should not be confused with the Zone Status (Cooling, Heating, Deadband) or Zone Group Mode (Occupied, Warm-up, etc.).

OS#1 – OS#4 represent normal operation during which a fault may nevertheless occur, if so determined by the fault condition tests in section e below. By contrast, OS#5 may represent an abnormal or incorrect condition (such as simultaneous heating and cooling) arising from a controller failure or programming error, but it may also occur normally, e.g., when dehumidification is active or during warm-up.
Operating State | Heating Valve Position | Cooling Valve Position | Outdoor Air Damper Position
---|---|---|---
#1: Heating | > 0 | = 0 | = MIN
#2: Free Cooling, Modulating OA | = 0 | = 0 | MIN < X < 100%
#3: Mechanical + Economizer Cooling | = 0 | > 0 | = 100%
#4: Mechanical Cooling, Minimum OA | = 0 | > 0 | = MIN
#5: Unknown or Dehumidification | | | No other OS applies

Figure 5.16.14.2. VAV AHU Operating States

3) The following points must be available to the AFDD routines for each AHU:

- SAT = Supply air temperature
- MAT = Mixed air temperature
- RAT = Return air temperature
- OAT = Outdoor air temperature
- DSP = Duct static pressure
- SATSP = supply air temperature setpoint
- DSPSP = duct static pressure setpoint
- HC = heating coil valve position command; 0% ≤ HC ≤ 100%
- FS = fan speed command; 0% ≤ FS ≤ 100%

For the AFDD routines to be effective, an averaging sensor is recommended for supply air temperature. An averaging sensor is essential for mixed air temperature, as the environment of the mixing box will be subject to non-uniform and fluctuating air temperatures. It is recommended that the OAT sensor be located at the AHU, so that it accurately represents the temperature of the incoming air.
j) HCET = heating coil entering temperature; depending on the AHU configuration, this could be the MAT or a separate sensor for this specific purpose.

k) HCLT = heating coil leaving temperature; depending on the AHU configuration, this could be the SAT or a separate sensor for this specific purpose.

4) The following values must be continuously calculated by the AFDD routines for each AHU:

a) 5-minute rolling averages with 1-minute sampling time of the following point values; operator shall have the ability to adjust the averaging window and sampling period for each point independently

   (1) SAT<sub>AVG</sub> = rolling average of supply air temperature
   (2) MAT<sub>AVG</sub> = rolling average of mixed air temperature
   (3) RAT<sub>AVG</sub> = rolling average of return air temperature
   (4) OAT<sub>AVG</sub> = rolling average of outdoor air temperature
   (5) DSP<sub>AVG</sub> = rolling average of duct static pressure
   (6) HCET<sub>AVG</sub> = rolling average of heating coil entering temperature
   (7) HCLT<sub>AVG</sub> = rolling average of heating coil leaving temperature

b) %OA = actual outdoor air fraction as a percentage = \( \frac{\text{MAT} - \text{RAT}}{\text{OAT} - \text{RAT}} \) or per airflow measurement station if available.

c) %OA<sub>MIN</sub> = Active minimum OA setpoint (MinOAsp) divided by actual total airflow (from sum of VAV box flows, or by airflow measurement station) as a percentage.

d) ΔOS = number of changes in Operating State during the previous 60 minutes (moving window)

5) The following internal variables shall be defined for each AHU. All parameters are adjustable by the operator, with initial values as given below:

```
<table>
<thead>
<tr>
<th>Variable Name</th>
<th>Description</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ΔT&lt;sub&gt;SF&lt;/sub&gt;</td>
<td>Temperature rise across supply fan</td>
<td>1°C (2°F)</td>
</tr>
<tr>
<td>ΔT&lt;sub&gt;MIN&lt;/sub&gt;</td>
<td>Minimum difference between OAT and RAT to evaluate economizer error conditions (FC#6)</td>
<td>6°C (10°F)</td>
</tr>
<tr>
<td>Ɛ&lt;sub&gt;SAT&lt;/sub&gt;</td>
<td>Temperature error threshold for SAT sensor</td>
<td>1°C (2°F)</td>
</tr>
</tbody>
</table>
```

*Default values are derived from NISTIR 7365 (Jeffrey Schein, October 2006) and have been validated in field trials. They are expected to be appropriate for most circumstances, but individual installations may benefit from tuning to improve sensitivity and reduce false alarms.

The default values have been intentionally biased towards minimizing false alarms, if necessary at the expense of missing real alarms. This avoids excessive false alarms that will erode user confidence and responsiveness. However, if the goal is to achieve the best possible energy performance and system operation, these values should be adjusted based on field measurement and operational experience.

Values for physical factors such as fan heat, duct heat gain, and sensor error can be measured in the field or derived from trend logs. Likewise, the occupancy delay and switch delays can be refined by observing in trend data the time required to achieve quasi steady state operation.

Other factors can be tuned by observing false positives and false negatives (i.e., unreported faults). If transient conditions or noise cause false errors, increase the alarm delay. Likewise, failure to report real faults can be addressed by adjusting the heating coil, cooling coil, temperature, or flow thresholds.*

<td>$30$</td>
</tr>
<tr>
<td>TestModeDelay</td>
<td>Time in minutes that Test Mode is enabled</td>
<td>$120$</td>
</tr>
</tbody>
</table>

The purpose of $\Delta T_{\text{MIN}}$ is to ensure that the mixing box/economizer damper tests are meaningful. These tests are based on the relationship between supply, return, and outdoor air. If $\text{RAT} \approx \text{MAT}$, these tests will not be accurate and will produce false alarms.

The purpose of TestModeDelay is to ensure that normal fault reporting occurs after the testing and commissioning process is completed as prescribed in 3.13M.12.q.

6) The following are potential Fault Conditions that can be evaluated by the AFDD routines. If the equation statement is true, then the specified fault condition exists. The Fault Conditions to be evaluated at any given time will depend on the Operating State of the AHU.

These equations assume that the SAT sensor is located downstream of the supply fan, and the RAT sensor is located downstream of the return fan. If actual sensor locations differ from these assumptions, it may be necessary to add or delete fan heat correction factors.

To detect the required economizer faults in Title 24 section 120.2(i)(7), use Fault Conditions #2, 3, and 5-13 at a minimum. Other Title 24 AFDD requirements, including acceptance tests, are not met through these fault conditions.

   6) FC#12: SAT too high; should be less than MAT
   7) FC#13: SAT too high in full cooling
   8) FC#15: Temperature rise across inactive heating coil

l. In OS#5 (Other), the following Fault Conditions shall be evaluated:
   1) FC#1: Duct static pressure is too low with fan at full speed
   2) FC#2: MAT too low; should be between RAT and OAT
   3) FC#3: MAT too high; should be between RAT and OAT
   4) FC#4: Too many changes in Operating State

m. For each air handler, the operator shall be able to suppress the alarm for any Fault Condition.

n. Evaluation of Fault Conditions shall be suspended under the following conditions:
   1) When AHU is not operating.
   2) For a period of ModeDelay minutes following a change in Mode (e.g., from Warm up to Occupied) of any Zone Group served by the AHU.

o. Fault Conditions that are not applicable to the current Operating State shall not be evaluated.

p. A Fault Condition that evaluates as true must do so continuously for AlarmDelay minutes before it is reported to the operator.

q. Test Mode shall temporarily set ModeDelay and AlarmDelay to 0 minutes for a period of TestModeDelay minutes to allow instant testing of the AFDD system, and ensure normal fault detection occurs after testing is complete.

r. When a Fault Condition is reported to the operator, it shall be a Level 3 alarm and shall include the description of the fault and the list of possible diagnoses from the table in 3.13M.12.f.6).

13. Testing/Commissioning Overrides: Provide software switches that interlock to a chilled water and hot water plant level to
a. If there is a hot water coil, force hot water valve full open
b. If there is a hot water coil, force hot water valve full closed

, all hardware points can be overridden through the BAS. Each of the following points is interlocked so that they can be overridden together at a Zone Group level

E.g., The CxA can check for leaking dampers by forcing all VAV boxes in a Zone Group closed and then recording airflow at the AHU.

Central plant sequences are not part of the initial scope of Guideline 36, but control logic for Plant Requests are being included for future use, when central plant sequences are added.

Typically, the chiller or heating hot water plant will start when there is at least one request for 5 minutes and stop when there are no requests for 5 minutes, after a minimum run-time has elapsed.

Chilled Water and Hot Water reset requests are used in Trim & Respond loops to control supply water temperature and/or pump DP setpoints based on zone and AHU demands.

14. Plant Requests

a. HHW Reset Requests
   1) If the supply air temperature is 17°C (30°F) less than setpoint for 5 minutes, send 3 Requests,
   2) Else if the supply air temperature is 8°C (15°F) less than setpoint for 5 minutes, send 2 Requests,
   3) Else if HW valve position is greater than 95%, send 1 Request until the HW valve position is less than 85%,
   4) Else if the HW valve position is less than 95%, send 0 Requests

b. If there is a hot water coil, Heating Hot Water Plant Requests. Send the heating hot water plant that serves the AHU a Heating Hot Water Plant Request as follows:
   1) If the HW valve position is greater than 95%, send 1 Request until the HW valve position is less than 10%
   2) Else if the HW valve position is less than 95%, send 0 Requests.

N. Variable Speed 2-pipe Fan-Coils

1. See Paragraph 3.13D for setpoints, loops, control modes, alarms, etc.
2. Fan control
   a. During the Cooling mode
      1) FCU serving electrical rooms: the fan shall run when zone is in Cooling Mode. It shall be off otherwise.
      2) FCU serving IDF or server room rooms: the fan shall be enabled to run 24/7
   3. Supply Fan Speed and Supply Air Temperature Setpoint Control
      a. When supply fan is proven on, supply air temperature setpoint and fan speed setpoints shall be as follows:
1) Setpoints (individually adjustable by unit from graphic):
   a) Maximum SAT Setpoint: Current cooling space temperature setpoint
   b) Minimum SAT Setpoint: Design cooling coil leaving air temperature per coil schedule
   c) Maximum Cooling Speed: that required to deliver design airflow to the zone; coordinate with air balancer.
   d) Minimum Speed: 30% of maximum cooling speed

2) When the zone served by the system is in the Cooling Mode, supply air temperature shall be reset from Deadband SAT Setpoint at 0% Cooling Loop output signal down to Minimum SAT Setpoint at 50% PID signal. Fan speed shall be reset from Minimum Speed at 50% cooling PID signal and below, proportionally up to Maximum Cooling Speed at 100% cooling PID signal.

4. Supply Air Temperature Control
   a. Control loop is enabled when the supply air fan is proven on, and disabled and output set to zero otherwise. When loop is disabled, slowly reduce loop output to zero to prevent sudden pressure changes in the CHW flow distribution system.
   b. Supply air temperature shall be controlled to setpoint using a PID loop whose output is mapped to the chilled water valve.

5. Alarms
   a. Maintenance interval alarm when fan has operated for more than 1500 hours: Level 4. Reset interval counter when alarm is acknowledged.
   b. Fan alarm is indicated by the status input being different from the output command after a period of 15 seconds after a change in output status.
      1) Commanded on, status off: Level 2
      2) Commanded off, status on: Level 4
   c. High supply air temperature (more than 5°F above setpoint) off cooling coils when coil control loop is active for longer than 5 minutes: Level 3.

6. Testing/Commissioning Overrides: Provide software points that interlock to a chilled water plant level point to
   a. Force chilled water valve full open
b. Force chilled water valve full closed

7. Plant Requests
a. ASHP Plant Requests. Send the ASHP plant that serves the zone a ASHP Plant Request as follows:
   1) If the CHW valve position is greater than 95%, send 1 Request
   2) Else if the CHW valve position is less than 90%, send 0 Requests.

O. Air-Cooled Chilled Water Plant
1. Parameters:
   a. Temperature Setpoints
      1) CHWSTmin, the lowest chilled water supply temperature setpoint
      2) CH-LOT, the outdoor air lockout temperature below which the ASHP plant is prevented from operating
   b. Minimum Flow Setpoint
      1) CHW-MinFlowSP, the minimum ASHP chilled water flowrate per manufacturer’s recommendations
   c. Capacity
      1) Qdesign, design plant capacity in tons
      2) Qstage, design capacity in tons for each stage
      3) CHWFdesign, design primary loop flow in gpm
   d. Minimum Cycling Load
      1) MinUnloadTons, see manufacturer submittal data
   e. CHW Pump DP setpoint
      1) CHW-DPmax = as determine under 230593 Testing, Adjusting and Balancing.

2. Plant Enable/Disable
   a. The ASHP plant shall include an enabling schedule that allows operators to lock out the plant during off-hours, e.g. to allow off-hour operation of HVAC systems except the ASHP plant. The default schedule shall be 24/7 (adjustable).

3. ASHP CHW Staging
   a. ASHPs shall obey lead/lag control guidelines outlined in Paragraph 3.13B.5.
   b. If an ASHP is in alarm, pull that unit out of rotation and annunciate at the front end.
   c. The ASHP factory controls will manage any internal compressor stages that are internal to that unit. BMS to send enable command to the factory controls with hardware connection when the load in the secondary loop exceeds the capacity of a given unit.
   d. \( Q_{\text{required}} \) is calculated based on secondary flow btu meter. \( Q_{\text{required}} \) used in logic shall be a 5-minute rolling average of instantaneous values sampled at a minimum of every 30 seconds to prevent short cycling of ASHP.
   e. When a stage up or stage down transition is initiated, hold \( Q_{\text{required}} \) fixed at its last value until the longer of the successful completion of the stage change (e.g. lag ASHP proven on) and 15 minutes.
   f. Stage up to a 2nd or 3rd ASHP when the current secondary load is 80% of the tons available.
   g. Stage down to fewer ASHP when current load is at 40% of available capacity.

4. Chilled Water Plant Reset
a. Differential Pressure Controlled Loops: Chilled water supply temperature setpoint CHWSTsp and pump differential pressure setpoint CHW-DPsp shall be reset based on the current value of the logic variable called “CHW Plant Reset” as shown below and described subsequently.

![Diagram of Differential Pressure Controlled Loops]

</tbody>
</table>

**2nd stage CHW plant reset**

1) CHW Plant Reset shall be reset using Trim & Respond logic (see Guideline 36) with the following parameters as initial setpoints:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device</td>
<td>Any CHW Pump</td>
</tr>
<tr>
<td>SP₀</td>
<td>100%</td>

<td>+7%</td>
</tr>
</tbody>
</table>

2) Note: the initial setpoint is for CHW to be at max with max pumping.
3) Initially CHWST-min = as scheduled
4) CHWST-max = 5 degrees higher. Note: the control valves at the VAV boxes are all based on having constant temperature. If the CHW reset is too aggressive the zone valves will “hunt” or struggle to maintain setpoint.
5) CHW
6) CHWST Plant Reset loop shall be enabled when the plant is enabled and
disabled when the plant is disabled.
7) When a plant stage change is initiated, CHW Plant Reset logic shall be
disabled and value fixed at its last value for the longer of 15 minutes and the
time it takes for the plant to successfully stage.

5. Primary Hot Water Pumps
   a. These are controlled in fully the OEM controller on the ASHP.

6. Secondary Chilled Water Pumps
   a. Secondary CHW pumps shall obey lead/lag guidelines outlined in Paragraph
      3.13B.5.
   b. Enable lead secondary CHW pump when any ASHP CHW bypass valve is
      commanded closed.
   c. Stage up when pumps reach 80% speed for more than 3 min.
   d. Stage down when pumps fall to 40% speed.
   e. When any pump is proven on, pump speed shall be controlled to maintain differential
      pressure.
   f. All pumps receive the same speed signal when multiple pumps are running.

7. Performance Monitoring
   a. Total plant power. Calculate total plant power as the sum of ASHP power and pump
      power.
   b. Summary Data. For each ASHP and total plant, statistics shall be retained and
      displayed on graphic for runtime, average actual efficiency (kW/ton), and average
      demand (tons) and load (ton-hours). Show on ASHP plant graphic: instantaneous
      values, year-to-date totals/averages and previous-year totals/averages.

8. Alarms
   a. Maintenance interval alarm when pump has operated for more than 1500 hours:
      Level 4. Reset interval counter when alarm is acknowledged.
   b. Maintenance interval alarm when ASHP has operated for more than 1000 hours:
      Level 4. Reset interval counter when alarm is acknowledged.
   c. High ASHP leaving chilled water temperature (more than 5°F above setpoint) for
      more than 15 minutes when ASHP has been enabled for longer than 15 minutes:
      Level 3
   d. Pump alarm is indicated by the status input being different from the output command
      after a period of 15 seconds after a change in output status.
      1) Commanded on, status off: Level 2
      2) Commanded off, status on: Level 4

P. Air Cooled Hot Water Plant

1. Parameters
   a. Temperature Setpoints
      1) HWSTmax, the highest hot water supply temperature setpoint
   b. Minimum Flow Setpoint
      1) HW-MinFlowSP, the design minimum HHW plant water flowrate as
         recommended by the manufacturer
   c. Capacity
      1) Qdesign, design plant capacity = total capacity of all ASHP
      2) Qstage, design capacity in KBtu/h for each stage
3) HWFdesign, design primary loop flow = total capacity of all HW pumps

d) HW Pump DP setpoint
   1) HW-DPmax = as determine under 230593 Testing, Adjusting and Balancing.

2. Plant Enable/Disable
   a. The ASHP plant shall include an enabling schedule that allows operators to lock out
      the plant during off-hours, e.g. to allow off-hour operation of HVAC systems except
      the ASHP plant. The default schedule shall be 24/7 (adjustable).
   b. Enable the plant in the lowest stage when the plant has been disabled for at least
      15 minutes and:
         1) Number of ASHP plant Requests > I (I = Ignores shall default to 0, adjustable), and
   c. ASHP HHW Staging
      a. ASHPs shall obey lead/lag control guidelines outlined in Paragraph 3.13B.5.
      b. If an ASHP is in alarm, pull that unit out of rotation and annunciate at the front end.
      c. The ASHP factory controls will manage any internal compressor stages that are
         internal to that unit. BMS to send enable command to the factory controls with
         hardware connection when the load in the secondary loop exceeds the capacity of
         a given unit.
      d. \( Q_{\text{required}} \) is calculated based on secondary flow btu meter. \( Q_{\text{required}} \) used in logic shall
         be a 5-minute rolling average of instantaneous values sampled at a minimum of
         every 30 seconds to prevent short cycling of ASHP.
      e. When a stage up or stage down transition is initiated, hold \( Q_{\text{required}} \) fixed at its last
         value until the longer of the successful completion of the stage change (e.g. lag
         ASHP proven on) and 15 minutes.
      f. Stage up to a 2nd or 3rd ASHP when the current secondary load is 80% of the capacity
         available.
      g. Stage down to fewer ASHP when current load is at 40% of available capacity.

4. Hot Water Plant Reset for Zones
   a. Differential Pressure Controlled Loops: heating hot water supply temperature
      setpoint HHWsp and pump differential pressure setpoint HHW-DPsp shall be reset
      based on the current value of the logic variable called “HHW Plant Reset” as shown
      below and described subsequently.
1) HHW Plant Reset shall be reset using Trim & Respond logic (see Guideline 36) with the following parameters as initial setpoints:

<table>
<thead>
<tr>
<th>Variable</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device</td>
<td>Any HHW Pump</td>
</tr>
<tr>
<td>SP₀</td>
<td>100%</td>

<td>-2%</td>
</tr>
<tr>
<td>SPₘᵉˢ</td>
<td>+3%</td>
</tr>
<tr>
<td>SPₘᵉˢ-ᵐᵃₓ</td>
<td></td>
</tr>
</tbody>
</table>

2) Note: the initial setpoint is for HHW to be at max with max pumping.
3) Initially HHWST-min = as scheduled
4) HHWST-max = 5 degrees lower. Note: the control valves at the VAV boxes are all based on having constant temperature. If the HHW reset is too aggressive the zone valves will “hunt” or struggle to maintain setpoint.
5) HHWST Plant Reset loop shall be enabled when the plant is enabled and disabled when the plant is disabled.
6) When a plant stage change is initiated, HHW Plant Reset logic shall be disabled and value fixed at its last value for the longer of 15 minutes and the time it takes for the plant to successfully stage.

5. Primary Hot Water Pumps
a. These are controlled in fully the OEM controller on the ASHP.

6. Secondary Hot Water Pumps
   b. Enable lead secondary hot water pump when any ASHP isolation valve is commanded open. Disable the lead hot water pump when all ASHP isolation valves are commanded closed.
   c. Stage up when pumps reach 80% speed for more than 3 min.
   d. Stage down when pumps fall to 40% speed.
   e. When any pump is proven on, pump speed shall be controlled to maintain differential pressure.
   f. All pumps receive the same speed signal when multiple pumps are running.

7. Alarms
   a. Maintenance interval alarm when pump has operated for more than 1500 hours as indicated by the Staging Runtime: Level 4. Reset the Staging Runtime interval counter when alarm is acknowledged.
   b. Maintenance interval alarm when ASHP has operated for more than 2000 hours as indicated by the Staging Runtime: Level 4. Reset the Staging Runtime interval counter when alarm is acknowledged.
   c. ASHP alarm: Level 2
   d. Low ASHP leaving hot water temperature (more than 15°F below setpoint) for more than 15 minutes when ASHP has been enabled for longer than 15 minutes: Level 3
   e. Pump alarm is indicated by the status input being different from the output command after a period of 15 seconds after a change in output status.
      1) Commanded on, status off: Level 2
      2) Commanded off, status on: Level 4

3.14 MISCELLANEOUS ALARMS
   1. Points in Hand (Operator Override) via Workstation command (including name of operator who made the command) or via supervised HOA switch at output: Level 4
   2. Equipment alarm (for equipment with alarm contacts such as VFDs, AC units): Level 2
   3. Failure or disconnection of a sensor as indicated by signal widely out of range: Level 2.
   4. Panel or LAN failure: Level 2
   5. Loss of communication with any device via Gateway (e.g. VFD) for more than 30 seconds: Level 2 (alarm shall indicate which specific device is not responding).
   6. Electrical switchgear alarm (from Electrical Power System gateway): Level 2

3.15 SYSTEM COMMISSIONING
   A. Sequencing. The following list outlines the general sequence of events for submittals and commissioning:
      1. Submit Submittal Package 0 (Qualifications) and receive approval.
      2. Submit Submittal Package 1 (Hardware and Shop Drawings) and receive approval.
      3. Initiate installation of BAS hardware, devices and wiring.
      4. Develop point database and application software.
      5. Simulate sequencing and debug programming off-line to the extent practical.
      6. Submit Submittal Package 2 (Programming and Graphics) and receive approval.
      7. Complete installation of BAS hardware, devices and wiring.
      8. Install point database and application software in field panels.
      9. Submit Submittal Package 3 (Functional Testing) and receive approval.
10. Perform BAS Pre-functional Tests (start up, calibration and tuning) and submit completed Pre-functional Test Forms for approval.

11. Field test application programs prior to functional testing.

13. Prepare and initiate commissioning Trend Logs.

   a. Some tests may not be possible due to weather conditions. These tests may be deferred to post-occupancy period.

15. Assist in TAB tests and determining setpoints as specified in Section 230593 Testing, Adjusting and Balancing.

17. Submit Package 4 (Training Materials) and receive approval.

18. Receive BAS Functional Test Report approval and approval to schedule Demonstration Tests.

21. Train Owner personnel on BAS operation and maintenance.

22. Substantial Completion

23. Submit Package 5 (Post-Construction Trend Logs) in format specified for review and approval.

24. Receive approval of successful Trend Log tests, or retest as required.

25. Complete all items in Completion Requirements per Paragraph 1.9.

26. Provide administration level password access to the Owner.

27. Final Acceptance

29. Prepare and initiate post-occupancy Trend Logs.

30. Update all software as specified.

31. End of Warranty Period

B. Test Documentation

1. Pre-functional Tests
   a. Prepare forms to document the proper startup of the BAS components.
   b. All equipment shall be included on test forms including but not limited to
      1) Wiring: End-to-end checkout of all wiring at terminations. Power to all controllers and actuators. Confirmation of emergency power where specified.
      2) Digital Outputs: Proper installation, normal position, response to command at CU
      3) Digital Inputs: Proper installation, device test, response at CU
      4) Analog Outputs: Proper installation of devices, verification of maximum and minimum stroke.
      5) Analog Inputs: Proper installation of sensors, calibration
      6) Panels: Confirmation of location, power source (electrical circuit used), confirmation of emergency power where specified.
      7) Alarms and Safeties: Verification of alarm routing to all specified devices and correct hierarchy. Example: confirm alarm routing to cell phones, email, servers, remote workstations. Confirm that appropriate alarm levels are routed to appropriate devices.
      8) Loop Tuning: Document setting of P/I parameters for all loops, chosen setpoints, time delays, loop execution speed.

c. Each form shall have a header or footer where the technician performing the test can indicate his/her name and the date of the test.
d. Submit forms for approval in Submittal Package 3.
e. Complete work, document results on forms, and submit for approval as Pre-Functional Test Report.

2. Functional Tests

a. Owner's Representatives will prepare functional testing forms after Submittal Package 2 has been reviewed and approved. Tests will be designed to test all sequences in a formal manner with simulations and expected outcomes.
b. Review tests and recommend changes that will improve ease of testing or avoid possible system damage, etc.
c. Adapt forms from Owner's Representative into electronic format. Each form shall have a header or footer where the technician performing the test can indicate his/her name and the date of the test.
d. Submit forms for approval in Submittal Package 3.
e. Complete work, document results on forms, and submit for approval as Functional Test Report.

C. Assist Commissioning Provider/Coordinator as specified in Section 019100 Commissioning, including attending commissioning meetings.

D. Coordinate with Work specified in Section 230800 Mechanical Commissioning and Division 26 Electrical Commissioning.

E. Pre-functional tests

1. General

a. Inspect the installation of all devices. Review the manufacturer's installation instructions and validate that the device is installed in accordance with them.
b. Verify proper electrical voltages and amperages and verify that all circuits are free from faults.
c. Verify integrity/safety of all electrical connections.
d. Verify that shielded cables are grounded only at one end.
e. Verify that all sensor locations are as indicated on drawings and are away from causes of erratic operation.

2. Digital Outputs

a. Verify that all digital output devices (relays, solenoid valves, two-position actuators and control valves, magnetic starters, etc.) operate properly and that the normal positions are correct.

3. Digital Inputs

a. Adjust setpoints, where applicable.

1) For current switches used as status on fans, adjust current setpoint so that fan status is OFF when fan discharge damper (if present) is fully closed and when belt is broken (temporarily remove belt).
2) For current switches used as status on pumps, adjust current setpoint so that pump status is OFF when pump is dead-headed (temporarily close discharge valve).
3) For differential pressure sensors on pumps and fans, set so that status is on when pump operating with all valves open (out on its curve).
4. **Analog Outputs**
   a. Verify start and span are correct and control action is correct.
   b. Check all control valves and automatic dampers to ensure proper action and closure. Make any necessary adjustments to valve stem and damper blade travel.
   c. Check all normal positions of fail-safe actuators.
   d. For outputs to reset other manufacturer’s devices (for example, ASHP setpoint) and for feedback from them, calibrate ranges to establish proper parameters.

5. **Analog Input Calibration**
   a. Sensors shall be calibrated as specified on the points list. Calibration methods shall be one of the following:
      1) Factory: Calibration by factory, to standard factory specifications. Field calibration is not required.
      2) Handheld: Field calibrate using a handheld device with accuracy meeting the requirements of Paragraph 2.10.
   b. The calibrating parameters in software (such as slope and intercept) shall be adjusted as required. A calibration log shall be kept and initialed by the technician indicating date and time, sensor and hand-held readings, and calibration constant adjustments and included in the Pre-functional Test Report.
   c. Inaccurate sensors must be replaced if calibration is not possible.

6. **Alarms and Interlocks**
   a. A log shall be kept and initialed by the technician indicating date and time, alarm/interlock description, action taken to initiate the alarm/interlock, and resulting action, and included in the Pre-functional Test Report.
   b. Check each alarm separately by including an appropriate signal at a value that will trip the alarm.
   c. Coordinate with Division 26 to test fire and life safety systems alarm contacts.
   d. Interlocks shall be tripped using field contacts to check the logic, as well as to ensure that the fail-safe condition for all actuators is in the proper direction.
   e. Interlock actions shall be tested by simulating alarm conditions to check the initiating value of the variable and interlock action.

7. **Variable Frequency Drive Minimum Speed**
   a. Minimum speed for VFD-driven fans and pumps shall be determined in accordance with this Paragraph. Tests shall be done for each piece of equipment, except that for multiple pieces of identical equipment used for identical applications, only one piece of equipment need be tested with results applied to all. Note that for fans and pumps, there is no minimum speed required for motor cooling. Power drops with cube of speed, causing motor losses to be minimal at low speeds.
   b. This work shall be done only after fan/pump system is fully installed and operational.
   c. Determine minimum speed setpoint as follows:
      1) Start the fan or pump.
      2) Manually set speed to 6 Hz (10%) unless otherwise indicated in control sequences. For cooling towers with gear boxes, use 20% or whatever minimum speed is recommended by tower manufacturer.
      3) Observe fan/pump in field to ensure it is visibly rotating.
         a) If not, gradually increase speed until it is.
      4) The speed at this point shall be the minimum speed setpoint for this piece of equipment.
      5) Record minimum speeds in log and store in software point as indicated in Guideline 36.
8. Tuning

a. Tune all control loops to obtain the fastest stable response without hunting, offset or overshoot. Record tuning parameters and response test results for each control loop in the Pre-functional Test Report. Except from a startup, maximum allowable variance from set point for controlled variables under normal load fluctuations shall be as follows. Within 3 minutes of any upset (for which the system has the capability to respond) in the control loop, tolerances shall be maintained (exceptions noted).

9. Interface and Control Panels

a. Ensure devices are properly installed with adequate clearance for maintenance and with clear labels in accordance with the Record Drawings.

b. Ensure that terminations are safe, secure and labeled in accordance with the Record Drawings.

c. Check power supplies for proper voltage ranges and loading.

d. Ensure that wiring and tubing are run in a neat and workman-like manner, either bound or enclosed in trough.

e. Check for adequate signal strength on communication networks.

f. Check for standalone performance of controllers by disconnecting the controller from the LAN. Verify the event is annunciated at Operator Interfaces. Verify that the controlling LAN reconfigures as specified in the event of a LAN disconnection.

g. Ensure that buffered or volatile information is held through power outage.

h. With all system and communications operating normally, sample and record update and annunciation times for critical alarms fed from the panel to the Operator Interface.

i. Check for adequate grounding of all BAS panels and devices.

10. Operator Interfaces

a. Verify that all elements on the graphics are functional and are properly bound to physical devices or virtual points, and that hot links or page jumps are functional and logical.

b. Verify that the alarm logging, paging, emailing etc. are functional and per requirements.

F. Testing, Adjusting, and Balancing (TAB) Coordination

1. Coordinate with Work performed under Section 230593 Testing, Adjusting, and Balancing. Some balancing procedures require the BAS to be operational and require Contractor time and assistance.

2. Calibration Software
a. Software shall be provided free of charge on at least a temporary basis to allow calibration of terminal box airflow controls and other Work specified under Section 230593 Testing, Adjusting, and Balancing.
b. Software shall be provided for installation on POT(s) provided by Others or Contractor shall loan a POT or handheld device with software installed for the duration of Work specified under Section 230593 Testing, Adjusting, and Balancing.
c. Provide sufficient training to those performing Work specified under Section 230593 Testing, Adjusting, and Balancing to allow them to use the software for balancing and airflow calibration purposes. Contractor shall include a single training session for this purpose.

3. Setpoint Determination
   a. Perform pre-functional tests described in Paragraph 3.15B.1 before assisting in setpoint determination.
   b. Coordinate with Work performed under Section 230593 Testing, Adjusting, and Balancing to determine fan and pump differential pressure setpoints, outdoor air damper minimum positions and DP setpoints, etc. as indicated in Section 230593 Testing, Adjusting and Balancing.

G. Functional Tests
   1. Test schedule shall be coordinated with the Commissioning Provider, Commissioning Coordinator, and Owner’s Representative.
   2. Functional tests may be witnessed by Owner’s Representative at the Owner’s option.
   3. All approved Functional Tests shall be conducted by the Contractor with results confirmed and signed by the Contractor’s start-up technician.
   4. Test documentation shall be submitted to the Owner for review and approval.

H. Demonstration Test
   1. Demonstration tests consist of a small representative sample of functional tests and systems randomly selected by the Commissioning Provider. Tests will be designed to occur over no longer than 2 working days.
   2. Schedule the demonstration with the Commissioning Provider and Owner’s Representative at least 1 week in advance. Demonstration shall not be scheduled until the Functional Test Report has been approved.
   3. The Contractor shall supply all personnel and equipment for the demonstration, including, but not limited to, instruments, ladders, etc. Contractor-supplied personnel shall be those who conducted the Functional tests or who are otherwise competent with and knowledgeable of all project-specific hardware, software, and the HVAC systems.
   4. The system will be demonstrated following procedures that are the same or similar to those used in the Pre-Functional and Functional Tests. The Commissioning Provider will supply the test forms at the site at the start of the tests.
   5. Demonstration tests may be witnessed by Owner’s Representative at the Owner’s option.
   6. Contractor shall conduct tests as directed by and in the presence of the Commissioning Provider and complete test forms. Completed forms shall be submitted as the Demonstration Test Report to the Commissioning Provider after tests are complete.
   7. Demonstration Tests shall be successfully completed and approved prior to Substantial Completion.

I. Trend Log Tests
   1. Trends shall be fully configured to record and store data to the server for the points and at the interval listed in Paragraph 2.11 as follows:
      a. Commissioning: Configure trends prior to functional testing phase. Retain configuration until post-construction commissioning trend review has been
completed successfully and accepted by the Owner’s representative. Trends shall be deactivated after acceptance.

b. Continuous: After system acceptance, configure trends for the purpose of long-term future diagnostics. Configure trends to overwrite the oldest trends at the longest interval possible without filling the server hard disk beyond 80%.

2. Post-Construction Trend Test

a. Trend logging shall not commence until Demonstration Tests are successfully completed.

b. Hardware Points. Contractor shall configure points to trend as indicated in the Commissioning Trend column listed in Paragraph 2.11 points.

c. Software Points. Include the following in trends of systems and zones whose hardware points are being trended as called for above. Time interval shall be the same as associated hardware point.

1) All setpoints and limits that are automatically reset, such as supply air temperature and fan static pressure setpoints, plus the points that are driving the reset, such as zone level cooling and static pressure requests

2) All setpoints that are adjustable by occupants

3) Outputs of all control loops, other than those driving a single AO point that is already being trended

4) System mode points (e.g. Warm-up, Occupied, etc.)

5) Global overrides such as demand shed signals

6) Calculated performance monitoring points, such as ASHP efficiency

d. Submit for review and approval by the by Commissioning Provider a table of points to be trended along with trend intervals or change-of-value a minimum of 14 days prior to trend collection period.

e. Trends shall be uploaded to the CSS in data format specified in Paragraph 2.11C.3.

f. Trend logs of all points indicated above shall be collected for a 4-week Trend Period.

g. At the completion of the Trend Period, data shall be reviewed by the Contractor to ensure that the system is operating properly. If so, data shall be submitted to the Owner in an electronic format agreed to by the Owner and Contractor (such as flash drive or via direct access to the CSS via the internet).

h. Data will be analyzed by the Commissioning Provider.

i. The system shall be accepted only if the trend review indicates proper system operation without malfunction, without alarm caused by control action or device failure, and with smooth and stable control of systems and equipment in conformance with these specifications. If any but very minor glitches are indicated in the trends, steps f to h above shall be repeated for the same Trend Period until there is a complete Trend Period of error free operation.

j. After successfully completing the Post-Construction Trend Tests, the Contractor shall configure all points to trend as indicated in the Continuous Trend column listed in Paragraph 2.11 points list.

J. Remedial Work

1. Repair or replace defective Work, as directed by Owner’s Representative in writing, at no additional cost to the Owner.

2. Restore or replace damaged Work due to tests as directed by Owner’s Representative in writing, at no additional cost to the Owner.

3. Restore or replace damaged Work of others, due to tests, as directed by Owner’s Representative in writing, at no additional cost to the Owner.

4. Remedial Work identified by site reviews, review of submittals, demonstration test, trend reviews, etc. shall be performed to the satisfaction of the Owner’s Representative, at no additional cost to the Owner.
5. Contractor shall compensate Owner’s Representatives and Commissioning Provider on a time and material basis at standard billing rates for any additional time required to witness additional demonstration tests or to review additional BAS trends beyond the initial tests, at no additional cost to the Owner.

3.16 TRAINING

A. Coordinate schedule and materials with Commissioning Authority.

B. Interim Training
   1. Provide minimal training so the operating staff can respond to occupant needs and other operating requirements during start-up and commissioning phase.

C. Formal Training
   1. Training shall be conducted after all commissioning is complete and systems are fully operational.
   2. ALC Training
      a. It may be assumed that College building engineers have been previously trained on the existing ALC system.
      b. Include training on ALC system operations only for new features installed at CSS/OWS as a part of this project.
   3. Jobsite Training
      a. Include 40 hours total of on-site training to assist personnel in becoming familiar with job-specific issues, systems, control sequences, etc.
      b. College shall be permitted to videotape training sessions.
   4. Training may be in non-contiguous days at the request of the College.
   5. During the warranty period, provide unlimited telephone support for all trained operators.

END OF SECTION
SECTION 250413 - COMMON SUBMITTAL REQUIREMENTS FOR INTEGRATED AUTOMATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Supplementary administrative and procedural requirements for submitting Shop Drawings, Product Data, Samples, and other submittals specific to the work of this Division.

B. Related Requirements:
   1. Division 01 submittal requirements.

1.3 DEFINITIONS

A. Contractor: Refers to an entity in direct Contract with the Owner to furnish and/or perform any portion of the Work of the Contract.
   1. Contractor shall review and approve Product Submittals prior to forwarding them to the Architect.

B. Product Submittals: In general, Product Submittals show characteristics of the proposed construction in one of the following forms:
   1. Shop Drawings.
   2. Product Data.
   3. Samples.

C. Action Submittals: Written and graphic information and physical samples that require Architect/Engineer's responsive action. Action submittals are those submittals indicated in individual Specification Sections as "action submittals."

D. Sustainable Design Submittals: Submittals required by Section 01813 "Sustainable Design Requirements." Submit documentation for products and materials contributing to achievement of LEED rating indicated. Sustainable Design Submittals are in addition to other submittal requirements.

E. Informational Submittals: Written and graphic information and physical samples that do not require Architect/Engineer's responsive action. Submittals may be rejected for not complying with requirements. Informational submittals are those submittals indicated in individual Specification Sections as "informational submittals."

F. Submittal Review Sheet: Specific form required to accompany each submittal. Obtain Submittal Review Sheet from the SmithGroup Project Manager.
1.4 SUBMITTAL ADMINISTRATIVE REQUIREMENTS

A. Requirements specified for submittals are intended to provide efficient handling, while permitting review responsibilities to be carried out.

B. Avoidable Resubmittals: The first two reviews of each specified submittal will be processed without cost to the Contractor. After the second review, the Owner may charge the Contractor for the cost of such additional processing, unless the processing results from approved Change Orders causing revisions to previously approved submittals.

C. Coordination: Coordinate preparation and processing of submittals with performance of construction activities.
   1. Coordinate each submittal with fabrication, purchasing, testing, delivery, other submittals, and related activities that require sequential activity.
   2. Submit all submittal items required for each Specification Section concurrently unless partial submittals for portions of the Work are indicated on approved submittal schedule.
   3. Submit action submittals and informational submittals required by the same Specification Section as separate packages under separate transmittals.
   4. Coordinate transmittal of different types of submittals for related parts of the Work so processing will not be delayed because of need to review submittals concurrently for coordination.
      a. Architect and Engineer reserve the right to withhold action on a submittal requiring coordination with other submittals until related submittals are received.

D. Processing Time: Allow time for submittal review, including time for resubmittals, as follows. Time for review shall commence on Architect's receipt of submittal. No extension of the Contract Time will be authorized because of failure to transmit submittals enough in advance of the Work to permit processing, including resubmittals.
   1. Refer to Section 01330 for quantity of days allowed for review.
   2. When a large volume of submittal materials is scheduled, additional review time may be required. Similarly, a particular submittal may require review completion in less than the agreed normal time. Due to variations in submittal volume and processing needs, agreed review time is not intended to apply to extreme conditions.

E. Maintain at the Project Site ready access to the latest reviewed Shop Drawings and Product Data, and one set of samples.

PART 2 - PRODUCTS

2.1 SUSTAINABLE DESIGN REQUIREMENTS

A. The District requires the Contractor to implement practices and procedures to meet the project’s environmental performance goals. The Contractor shall ensure that the minimum requirements related to these goals, as defined in Section 01813 "Sustainable Design Requirements" are implemented to the fullest extent possible. Specific materials and systems have been selected to this end. Substitutions, or other changes to the work proposed by the Contractor or their Subcontractors, shall not be allowed if such changes compromise the aforementioned environmental goals and LEED certification.
B. Specific material goals, beyond inherently designed facility service systems, that may impact this area of work include: use of products with third-party verified Environmental Product Declaration, use of products with Health Product Declarations, use of products from manufacturers with publicly disclosed Corporate Sustainability Reports, use of products with recycled-content materials; use of locally-purchased, manufactured and extracted materials; use of FSC certified wood; use of low-emitting materials; construction waste recycling; and the implementation of a construction indoor air quality management plan.

PART 3 - EXECUTION

3.1 CONTRACTOR’S REVIEW

A. Project Closeout and Maintenance Material Submittals: See requirements in Division 01.

B. Be responsible for quantities, weights, and dimensions to be confirmed and correlated at the site; for information that pertains solely to the fabrication processes and to the means, methods, techniques, sequences, and procedures of construction; and for coordination of the work of every trade, supplier, and subcontractor.

C. Be responsible for each submittal to be in conformance with information given and the design intent expressed in the Contract Documents.

D. Provide with each submittal specific written notice of any variation from the requirements of the Contract Documents by causing a specific notation to be made on the Submittal Review Sheet and Submittal Transmittal. Changes to the approved construction documents are subject to DSA review and approval, submitted by the Architect as a CCD per DSA IR A-6.

3.2 ARCHITECT/ENGINEER’S AND GENERAL CONTRACTOR’S ACTION

A. General: Architect will not review submittals that do not include the Submittal Review Sheet.

B. Action Submittals: Architect’s staff and consultants will review the submittal, and mark the Submittal Review Sheet with an action code. The code meanings are described below.

C. Additional codes may be provided within comments or as an electronic submittal review stamp and shall be used in help indicating return of partial submittals.

E. Review Code meanings are as follows:

1. Action Codes Permitting Use:
   a. When an action code permitting use is assigned to a submittal, it does not authorize work that does not comply with the requirements of the Contract Documents. Acceptance of the Work will depend on compliance.
   b. Code AP - Approved: The Work covered by the submittal item may proceed, provided it complies with Contract Document requirements.
   c. Code AN - Approved as Noted: The Work covered by the submittal item may proceed, provided it complies with the Architect’s notations and Contract Document requirements.
d. Code AN-R - Approved as Noted - Resubmit: Do not deliver or install the related work until the resubmittal has received Code AP or AN. However, fabrication and other off-site work covered by the submittal item may proceed, at the Contractor's risk, provided it complies with the Architect's notations and Contract Document requirements.

2. Action Code Prohibiting Use:
   a. Action Code REJ - Not Approved: The Work covered by the submittal item, including purchasing, fabrication, delivery, and other activity, shall not proceed. Revise the submittal item or prepare a new item in accordance with the Architect's notations. Resubmit the corrected or new item without delay; do not permit submittal items marked "Not Approved" to be used. Work incorporating such items will be rejected.

3. Action Code for Items Not Required:
   a. Action Code X - Not Requested by Contract Documents: The submittal item is not called for by the Contract Documents and is being returned unreviewed by the Architect except to the extent necessary to determine its status.

F. Informational Submittals: For Architect's information only. Architect will review each submittal and will not return it, or will return it if it does not comply with requirements. Architect will forward each submittal to appropriate party.
   1. Action Code for Information Only:
      a. Action Code INF - Information Only - Received: The submittal item is not called for a return with a reviewed action code by the Contract Documents and is being returned un-reviewed by the Architect except to the extent necessary to determine its status.

G. Partial submittals prepared for a portion of the Work will be reviewed when use of partial submittals has received prior approval from Architect.

H. Incomplete submittals are not acceptable, will be considered non-responsive, and will be returned without review.

I. Architect will return without review or discard submittals received from sources other than the Contractor.

J. Submittals not required by the Contract Documents may be returned by the Architect without action.
   1. Do not submit Material Safety Data Sheets. They will be returned without review or discarded.

3.3 SUBMITTAL TRANSMITTAL REQUIREMENTS

A. Submittal Transmittal shall be a PDF file in electronic format. It is recommended, to expedite the submittal review, the electronic form be emailed for review to the Architect as early as possible.
   1. Submittal Numbering: See below.
   2. Contact Information: Full Name, Phone Number and Email Address.

B. Submittal Definition
   1. Each submittal consists of items from only ONE Specifications section.
2. Complete Submittal: If ALL the items required by the Specifications section are listed on one Submittal Form (including continuation sheet), it is a complete submittal.

3. Partial Submittals: If it is necessary to divide the required items of a given Specifications section into two or more submittals to meet schedule or handling requirements, the separate submittals are partial submittals. All partial submittals have the same submittal number, and are differentiated by sequential P-numbers (see below).

4. All items in each submittal, whether complete or partial, will be processed together: Individual items will not be ‘broken out’ for special handling. Arrange submittals accordingly.

C. Submittal Numbering
1. Number submittals as described below to assist tracking.
2. Number each submittal in the format nnnnnn-nn.
   a. The 6-digit number is the number of the section that requires the submittal. For example, 044200.
   b. The 2-digit number is based on the numerical sequence of submittals from that section. In other words, for each section, the first submittal is 01, the second is 02, and so on. The 2-digit number does not change for partial or re-submittals, so that the submittal can be tracked.
   c. P-Number for Partial Submittals: Number each partial submittal in the pee space, beginning with P1, and increasing by one for each partial submittal of that submittal. If the submittal is a complete submittal, leave the P space blank.
   d. R-Number for Re-submittals: Number each re-submittal in the arr space, beginning with R1, and increasing by one for each re-submittal of that submittal. Do not include an R-Number for the initial submittal.
   e. Examples:

3.4 SUBMITTAL REVIEW SHEET REQUIREMENTS
   A. Provide Submittal Review Sheet in PDF format. Submit as the page after the Submittal Transmittal.
   B. When attached, the Submittal Review Sheet shall not obscure information contained in the submittal.
   C. Do not edit any of the information contained within the Submittal Review Sheet except as follows:
      1. Submittal Number: See Submittal Numbering in Submittal Transmittal Requirements paragraph.
   D. The Contractor shall submit the PDF file in a manner that will allow editing of the Submittal Review Sheet fields by SmithGroup and its consultants.

END OF SECTION
SECTION 253000 - BUILDING AUTOMATION SENSORS AND CONTROL DEVICES

PART 1 - GENERAL

1.1 SUMMARY

A. As part of the Work performed under Section 25 50 00 “Building Automation Hardware and Networking”, the DDC Contractor shall furnish control devices, instruments, meters and sensors in accordance with this Section. Provide all control devices, instruments, meters and sensors required for a fully functional DDC System capable of fully executing the specified Sequences of Operations.

B. DDC Contractor shall install these products or deliver them to contractors of other trades for installation under the direction of the General Contractor and in accordance with the coordination requirements of Section 255000.

C. All General Conditions of Section 255000 shall apply to the Work done under this Section.

D. Except as specifically allowed in this Section, all networked control devices shall be ANSI/ASHRAE 135 native BACnet devices.

1. All DDC devices shall be tested, certified, clearly stamped and listed by the BACnet Testing Laboratories (BTL) prior to the bid date for this Project.

2. The BACnet operating stack must be embedded directly in each individual DDC device at the media access controller level and in all operator interface and configuration applications.

3. Communication gateways, bridges, and protocol translators are permitted only under the following conditions:
   a. Protocol translators as required to communicate to existing building systems or legacy control systems.
   b. Equipment-specific gateways and dedicated controllers that are supplied, recommended or endorsed by the manufacturer of the equipment they are to control.
   c. Gateways shall allow the DDC System to read all readable object properties and write to all writeable object properties using standard BACnet services.
   d. Gateways shall provide all BACnet communication services and features described in “BACnet Gateways” under Network Communication Devices in Part 2 of Section 25 50 00.

E. Section includes

1. Actuators
2. Control Valves
4. Sensors for Air: Temperature, Pressure, and Flow
5. Thermostats
6. Space Sensors: Temperature, CO₂, CO, Humidity
7. Outdoor Sensors: Temperature, Humidity, Wind Speed, Radiation
8. Switches and Status Indicators
9. Time Clocks
1.2 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01, apply to this Section, except as specifically noted in this Section.

B. Product and installation requirements for electrical wiring and devices in Division 26 and Division 27 apply to this Section, except as specifically noted in this document.

C. Related Specifications
   1. Section 230000 “HVAC General Requirements”
   2. Section 233300 “Air Duct Accessories”
   3. Section 255000 “Building Automation Hardware and Networking”
   4. Section 255005 “Laboratory Monitoring & Control System”

1.3 DEFINITIONS

A. See Definitions in Section 255000.

1.4 CODES AND STANDARDS

A. Workmanship, materials and equipment together with the resultant complete and operational DDC System shall be in compliance with the Authorities Having Jurisdiction (AHJ) for the project and the most restrictive of applicable local, state and federal codes and ordinances in cooperation with these plans and specifications.

B. At a minimum, the installation shall comply with the applicable sections of the current editions in effect thirty (30) days prior to receipt of bids of the following codes:
   1. ANSI/ASHRAE Standard 135: Data Communication Protocol for Building Automation and Control Networks (BACnet)
   3. California Code Title 24, if Project is located in California
   4. National Electric Code (NEC) with all state and local amendments
   5. Telecommunications Industry Association (TIA):
      a. ANSI/TIA-568-C.0: Generic Telecommunications Cabling for Customer Premises
      b. ANSI/TIA-568-C.1: Commercial Building Telecommunications Cabling Standards
      c. ANSI/TIA-568-C.2: Balanced Twisted Pair Telecommunications Cabling and Components
      d. ANSI-TIA-607-B: Generic Telecommunications Bonding and Grounding for Customer Premises

1.5 SUBMITTALS AND COMPLETION REQUIREMENTS

A. Submittal schedule and requirements shall be as described under Submittals in Part 1 of Section 255000

B. Closeout requirements shall be as described under Completion Requirements in Part 1 of Section 255000.

C. All products and devices furnished under this Section shall be submitted for review and approval as described in Section 25 50 00. All conditions of Section 25 50 00 apply, including procedures for submitting substitution and documenting product deviations from specification.
1.6 OWNERSHIP AND WARRANTY

A. All materials, hardware and software associated with the Work performed under Section 25 50 00 and this section shall be provided to the Owner, and shall be owned by or licensed to the Owner. This includes all materials required to support a later expansion of the DDC System, as detailed in Section 25 50 00.

B. All products provided under this Section are subject to the DDC System warranty and warranty maintenance conditions as described in Section 25 50 00.

PART 2 - PRODUCTS

2.1 GENERAL

A. It shall be the DDC Contractor’s responsibility to ensure that all control devices are compatible with controller hardware, firmware, and software.

B. All networked devices provided under this Section shall be native BACnet devices as specified in Paragraph 1.1D.

C. Provide signal conditioning for all instruments and sensors devices as recommended by device manufacturer and as required for proper operation in the system.

D. Where signal conditioners, signal boosters, signal repeaters, or other devices are required for proper interface to controllers, DDC Contractor shall furnish and install proper device, including 120V power as required. Such devices shall have accuracy equal to, or better than, the accuracy listed for respective field devices.

E. Except as specifically noted in this Section, transmitters are assumed to be two-wire type with power supplied by the connected controller. If the controller is not compatible with two-wire transmitters, if the transmitter is to connect to more than one controller, or if length of wire to the controller would compromise accuracy, DDC contractor shall provide a four-wire transmitter and power supply as required.

F. Environmental Conditions

1. Unless otherwise indicated, all components provided under Division 25 shall operate under ambient environmental conditions of 32°F to 122°F dry-bulb and 10% to 90% relative humidity, non-condensing as a minimum.

   a. It is the DDC Contractor’s responsibility to identify locations subject to more extreme conditions, particularly rooftop and outdoor installations, and provide products suitable for those locations.

2. Sensors and control elements shall be constructed of material suitable and rated for the media sensed under the ambient environmental temperature, pressure, humidity, and vibration conditions encountered for the installed location.

G. Accuracy

1. Accuracy shall include combined effects of nonlinearity, repeatability and hysteresis.
2. Accuracy of the instrument shall be equal or better than the requirements of specific devices in this Section.
3. Overall end-to-end accuracy of installed sensors shall satisfy the performance requirements in Section 25 50 00. DDC Contractor shall select sensors, wiring method, transmitters, A/D conversion bits, etc. to provide required accuracy.
4. Note that accuracy performance requirements in Section 25 50 00 are generally given in absolute deviation (e.g. ±X°F) or in percentage of sensor span (i.e. from minimum to maximum value that will be measured in the application). Most sensors are specified in terms of sensor range/scale (i.e. the capabilities of sensor). If a sensor range is much larger than its span, a higher accuracy over range will be required to meet the required accuracy over span. DDC Contractor shall select sensors accordingly.

H. Products requiring an electrical connection shall be listed and classified by Underwriters Laboratories Inc. (UL), as suitable for the purpose specified and indicated.

2.2 ACTUATORS

A. General, All Actuators

1. Actuator shall have microprocessor based motor controller providing electronic cut off at full open/closed.
   a. Actuator shall have internal current limiting circuit or digital motor rotation sensing circuit to prevent motor burnout.
   b. End switches to deactivate the actuator at the end of rotation or use of magnetic clutches are not acceptable.

2. Actuator shall emit no audible noise while holding position.
3. Moving noise shall be inaudible through a T-bar ceiling.
4. Actuator shall be capable of being mechanically and electrically paralleled to increase torque where required.
5. Actuator shall clearly indicate current position.
6. Provide pre-wired with conduit fitting and minimum three-foot electrical cable. It shall not be necessary to open actuator housing to connect power to actuator.
7. For fail-safe (fail-open or fail-closed) applications, include mechanical spring return or capacitor return mechanism built into actuator housing. All fail-safe actuators shall be capable of reversing return direction by changing mounting orientation, or by selection switch.
8. Include external gear release to allow manual positioning of unpowered actuator.
    a. Spring return actuators with more than 60 inch-pound torque shall have a manual crank for this purpose.
    b. Large industrial actuators (e.g. for butterfly valves) shall be equipped with a hand wheel to permit operation of the valve when the actuator is unpowered.
9. Only where indicated on Contract Drawing control schematics, actuator shall include the following:
    a. Analog position feedback signal from actuator output. The use of a separate potentiometer for position feedback is not acceptable.
    b. Limit (end) position feedback. Switches must be built into actuator and constructed so as not to require a separate electrical ground. Switch must be adjustable to match stroke range. The use of separate (bolt-on or clip-on) actuator auxiliary switches is not acceptable. The use of separate mechanical position switches (e.g. on dampers) is not acceptable unless specifically called for on drawings. Switch must prove at 0% and 100% of the field-adjusted (not maximum) stroke.
10. Power Requirements
   a. 24 VAC/DC actuators shall operate on Class 2 wiring.
   b. 24 VAC actuators shall not require more than 10 VA.
   c. 120 VAC actuators shall not require more than 10 VA.
   d. 240 VAC actuators shall not require more than 11 VA.

11. Entire actuator shall be UL 873 listed.

12. Provide with enclosure per requirements of Section 25 50 00.

13. Design life of at least 60,000 full cycles at full torque

14. Provide with manufacturer’s 5-year warranty.

B. Modulating Actuators, All Types

1. Actuators shall accept a 0-10 VDC or 0-20 mA control signal and provide a 2-10 VDC or 4-20 mA operating range.

2. Actuators shall have positive positioning circuit so that controlled device is at same position for a given signal regardless of operating differential pressure.

3. Actuators shall have true proportional position control. Floating point actuators are not acceptable, except for terminal unit damper actuators which may be floating point type if both of the following conditions are met:
   a. Actuator provides position feedback as an analog input to the terminal unit controller.
   b. Position end switches recalibrate damper position feedback when end of stroke is reached. Recalibration shall be automatic and transparent to user.

4. All modulating actuators shall have a built-in external switch to reverse direction of rotation.

C. Damper Actuators

1. Actuator shall clamp directly to damper shaft. The clamp shall be all steel of a V-bolt design with associated V-shaped, toothed cradle for cold weld attachment.
   a. Single bolt or set screw type fasteners are not acceptable.
   b. Aluminum clamps are not acceptable.

2. For each individual damper section, the actuator shall be direct coupled to shaft, without connecting linkage.

3. Select actuator torque and/or quantity to satisfy all of the following requirements:
   a. Opposed blade dampers: Minimum 7 inch-pounds per ft² of damper.
   b. Parallel blade dampers: Minimum 5 inch-pounds per ft² of damper.
   c. Terminal unit dampers: Minimum 45 inch-pounds.
   d. Sufficient to provide smooth proportional control with air velocities 20% greater than maximum design velocity.
   e. As required by blade and/or edge seals, per damper manufacturer.
   f. The total damper area operated by an actuator shall not exceed 80% of the manufacturer’s maximum area rating.

D. Valve Actuators

1. Actuators shall be specifically designed for integral mounting to valves without external couplings.

2. Modulating valve actuators shall have minimum rangeability of 50 to 1.

3. Actuators for 2-way valves shall have sufficient torque for
   a. Tight closing against 125% of system pump shut-off head
   b. Modulating duty against 90% of system pump shut-off head

4. Actuators for 3-way valves shall have sufficient torque for tight closing against twice (200%) of the full open differential pressure for which they are sized.
E. Manufacturers (alphabetical order)
   1. Belimo
   2. Delta
   3. Invensys
   4. Johnson Controls
   5. Siemens
   6. Or equal

2.3 CONTROL VALVES

A. General
   1. DDC Contractor shall provide type of valve per this specification, unless specifically indicated otherwise on Contract Drawings.
   2. Three-way valves are only to be used where specifically shown on Contract Drawings. Unless otherwise indicated, all control valves shall be two-way valves.

B. Valve Size and Selection
   1. Valves for modulating service shall be selected as follows:
      a. DDC Contractor is responsible for selecting valve Cv and size unless otherwise specified on Contract Drawings. Use the highest Cv that will provide good control, while observing the following limits:
         1) Minimum full-open pressure drop: equal to half the pressure drop of coil or heat exchanger
         2) Maximum full-open pressure drop
            a) Hot water coil: 2 PSI
            b) Chilled water coil: 5 PSI
            c) Chiller head pressure control: 1 PSI
         3) Cv shall be greater than 1.0, to avoid clogging, unless protected by a strainer.
      b. Valve size shall be as close as possible to pipe size while providing required Cv.
      c. If good control cannot be achieved while observing these limits, Contractor shall ask for clarification.
   2. Valves for two-position service shall equal pipe size unless otherwise indicated on Contract Drawings.
   3. Minimum pressure rating for valve assemblies shall depend on application:
      a. Chilled or condenser water: 125 PSI at 60°F, or higher as required by application
      b. Hot water: 125 PSI at 250°F, or higher as required by application
      c. Steam: 125 PSI at 350°F, or higher as required by application
   4. Valve type shall depend on size and service. Unless otherwise noted on Contract Drawings, select valves as follows:
      a. Modulating, 6 inches and less: Ball valve, equal percentage or modified equal percentage characteristic.
      b. Modulating, 8 inches and greater: Butterfly valve, equal percentage characteristic.
      c. Chiller head pressure control: Butterfly valve, equal percentage characteristic.
      d. Two-position service: Full-port ball valve without characterizing disc, or butterfly valve with linear or quick-opening characteristic.

C. Ball Type
   1. Body: Nickel plated forged brass
   2. Trim: Brass or bronze
3. Ball: Stainless steel
4. Stem: Stainless steel
5. Blowout proof stem design
   a. Glass-reinforced Teflon thrust seal washer and stuffing box ring with minimum 600 PSI rating (2-way valves) or 400 PSI rating (3-way valves).
   b. Stem packing shall consist of 2 lubricated O-rings designed for on-off, floating, or modulating service and requiring no maintenance.
   c. Thermal break in stem
6. Guaranteed leak-free for 200,000 full stroke cycles
7. Valves for modulating service shall:
   a. Be specifically designed for modulating duty in control application
   b. Provide equal percentage or modified equal percentage characteristics
   c. Have characterizing disk held securely by keyed ring
8. Valves for two-position service shall be full bore and equal to pipe size, with no characterizing disc.
9. Manufacturers (alphabetical order)
   a. Belimo
   b. Delta
   c. Invensys
   d. Siemens
   e. Or equal

D. Butterfly Type
1. Body: Epoxy-coated cast or ductile iron, full lug, extended neck
2. Seat: Replaceable, non-collapsible, phenolic backed EPDM or PTFE
3. Disc: Polished aluminum bronze or stainless steel with machined edge, mechanically locked to shaft. Sanded cast disc is not acceptable.
4. Bearings: Bronze or stainless steel
5. Stem: 410 or 416 stainless steel with mechanical retention, supported at three locations with PTFE bushings for positive shaft alignment
6. Bubble-tight shutoff at rated differential pressure
7. Valves for modulating service shall have equal percentage characteristic.
8. Valves for two-position service shall have linear or quick opening characteristic.
9. Manufacturers (alphabetical order)
   a. Belimo
   b. Delta
   c. Dezurik
   d. Invensys
   e. Jamesbury
   f. Keystone
   g. Siemens
   h. Or equal

E. Globe Type
1. Not to be used. Globe valves are not acceptable for hydronic applications.

F. Gate Type
1. Not to be used. Gate valves are not acceptable for any application.
2.4 WATER TEMPERATURE SENSORS

A. Immersion Type

1. Thermistor or RTD type sensor, suitable for temperatures being sensed. Sensor full scale shall not be less than 125% of expected range, as indicated on Contract Drawing control schematics or in sequences of operations (Section 259000).

2. ¼” stainless steel probe, double encapsulated sensor, thermowell mounted, with enclosure suitable to location.

3. Accuracy as required to satisfy Paragraph 2.1F and Section 25 50 00
   a. Inaccuracy due to wire resistance shall in no case exceed 0.5°F. Select wire gauge and/or provide transmitter if necessary to meet this requirement.

4. Drift shall not exceed 0.3°F per year.

5. Sensor shall not require recalibration for at least five years.

6. Temperature transmitter
   a. Provide when required for compatibility with controller or to meet specified accuracy.
   b. Output: 4-20mA linearly across specified temperature range
   c. Include non-interactive zero and span adjustment
   d. Accuracy: ±0.1°F across sensor range

7. Provide with thermowell
   a. One-piece machined brass or stainless steel
   b. With lagging extension equal to pipe insulation thickness
   c. Permits sensor removal from operating system
   d. Rated for maximum system operating pressure, temperature and fluid velocity

8. Manufacturers (alphabetical order)
   a. Automated Logic Corp.
   b. Building Automation Products Inc.
   c. Kele Associates
   d. Mamac
   e. Or equal

B. The use of direct immersion or strap-on type sensors is not acceptable.

2.5 WATER PRESSURE SENSORS

A. General

1. Stainless steel welded construction.
   a. All wetted surfaces shall be stainless steel
   b. Brazed construction or the use of O-rings or mechanical interference fit to seal assemblies is not acceptable.

2. Two-wire transmitter, 4-20 mA output with non-interactive zero and span adjustments

3. Long-term stability 0.5% full scale per year

4. Sensor shall be fixed-range. Switch-selectable pressure range is not acceptable.

5. Select sensor based on expected range as shown on control drawings or as indicated in sequences of operations (Section 259000).
   a. For unidirectional sensors, the maximum of expected range (i.e. largest positive or negative reading) shall be no more than 75% of sensor full scale.
   b. For bidirectional sensors, expected range shall be between 25% and 75% of sensor full scale.
6. Pressure limits
   a. Rated pressure: by application
   b. Proof pressure: 2x rated pressure
   c. Burst pressure: 5x rated pressure

7. Temperature range suitable for application

8. Provide with valved "block and bleed" manifold allowing sensor to be isolated and vented. Vent ports shall be usable as test plugs for calibration.

B. Water, Absolute Pressure, General Purpose
   1. Fast response piezoresistive or capacitive sensor
   2. Device accuracy (at constant temp) ±0.5% full scale (see Paragraph 2.1F)
   3. Include temperature compensation
   4. Provide with 3-valve brass manifold
   5. Manufacturers (order of preference)
      a. Setra 209
      b. Kele P51 Series
      c. Or equal

C. Water, Differential Pressure, General Purpose
   1. Fast response capacitive sensor
   2. Single diaphragm wet-to-wet construction
   3. Device accuracy (at constant temp) ±0.25% full scale (see Paragraph 2.1F)
   4. Non-Linearity (BFSL method): ±0.22% full scale
   5. Hysteresis: 0.10% full scale
   6. Include temperature compensation
   7. Provide with 5-valve brass manifold
   8. Manufacturers (order of preference)
      a. Setra 230
      b. Or equal

2.6 WATER FLOW METERS, HIGH ACCURACY

A. General
   1. Flow sensor and signal converter shall be sold as a package by the same manufacturer.
   2. Install with isolation valves immediately upstream and downstream of meter. If isolation valves are by others, DDC Contractor shall coordinate installation with installing Trade. If hot-tapping an operating hydronic system, provide hot-tap isolation valve instead to enable sensor removal without water supply system shutdown.
   3. Install sensor in a location that provides sufficient lengths of straight pipe upstream and downstream of meter. Follow all manufacturer recommendations. If sufficient straight pipe is not available, notify Engineer of Record.
   4. All I/O points shown as hardwired on Contract Drawing control schematics must be hardwired. Points shown as networked may be transmitted as BACnet objects via network, or as hardwired I/O points.
   5. UL listed.
   6. NSF Drinking Water approval for domestic water applications.
B. Magnetic, Full Bore

1. Flow Sensor
   a. Full bore electromagnetic flow sensor
   b. Range suitable for application and design flows
   c. Flanged or grooved connections for pipe over 1” diameter; threaded connections acceptable for 1” diameter or less.
   d. Fully welded construction
   e. Stainless steel or Hastelloy C electrodes bonded to sensor tube without o-rings.
   f. Liner material shall be:
      1) Polypropylene, ebonite or EPDM for chilled or condenser water applications.
      2) Polypropylene only for hot or cold domestic water applications
      3) PTFE or PFA rated for 210°F for heating hot water applications.
   g. No moving parts

2. Signal Converter/Transmitter
   a. Provide four-wire, externally powered transmitter with non-interactive zero and span adjustments.
   b. Include alphanumeric display indicating current flow rate. Mount to flow sensor if readily visible; otherwise remote wall-mount in a readily visible location.
   c. Hardwired I/O (where required; see control schematics): Flow signal shall be a digital pulse proportional to the flow rate (to provide maximum accuracy and to handle abrupt changes in flow).

3. Performance
   a. Flow velocity range: 0.04 - 33 FPS
   b. Accuracy shall be ±0.5% of actual reading from 3 to 30 FPS flow velocity, and ±0.015 FPS from 0.04 to 3 FPS.
   c. Accuracy shall be maintained over a turndown ratio of at least 10:1.
   d. Stability: 0.1% of rate over six months.
   e. Repeatability: ±0.1% of rate velocities > 3 FPS.
   f. NIST traceable factory calibration performed on accredited water flow test rig.

4. Manufacturers (order of preference)
   a. Onicon F-3000 series
   b. Siemens Sitrans FM Mag series
   c. Krohne Optiflux 2000 or 4000
   d. Sparling TigermagEP
   e. McCrometer UltraMag
   f. Or equal

C. Magnetic, Insertion Type

1. Flow Sensor
   a. Insertion electromagnetic flow sensor
   b. Meter shall have at least two sets of electrodes, with the flow reading based on the average across all electrodes.
   c. Stainless steel or Hastelloy C electrodes
   d. No moving parts

2. Include 'hot-tap' isolation valves to enable sensor removal without water supply system shutdown.
3. Signal Converter/Transmitter
   a. Adjustable zero and span, non-interactive.
   b. Hardwired I/O (where required, see control schematics): 0-10 V or 4-20 mA output for flow.

4. Performance
   a. Flow velocity range: 0.3 - 20 FPS
   b. Accuracy shall be ±1% of actual reading from .3 to 20 FPS flow velocity.
   c. Accuracy shall be maintained over a turndown ratio of at least 10:1.
   d. NIST traceable factory calibration performed on accredited water flow test rig.

5. Manufacturers (order of preference)
   a. Marsh MultiMag 284L
   b. McCrometer FPI Mag
   c. Onicon F-3500
   d. SeaMetrics EX100/200 Series
   e. Or equal

D. Ultrasonic, Inline
   1. Flow Sensor
      a. Ultrasonic type measuring flow by differential transit time
      b. Measurement by wetted direct-beam path. Clamp-on or indirect measurement is not acceptable.
      c. Range suitable for application and design flows
      d. Maximum 1.5 PSI pressure drop at design flow
      e. Flanged connections for pipe over 2” diameter; threaded connections acceptable for 2” diameter or less.
      f. All wetted parts shall be brass or stainless steel.
      g. No moving parts
   2. Signal Converter/Transmitter
      a. Provide four-wire, externally powered transmitter with non-interactive zero and span adjustments.
      b. Hardwired I/O (if required): Flow signal shall be a digital pulse proportional to the flow rate (to provide maximum accuracy and to handle abrupt changes in flow).
   3. Performance:
      a. ±1% of reading over 25:1 turndown
      b. ±2% of reading over 100:1 turndown
      c. Minimum measurable flow: 500:1 turndown
      d. Repeatability: ≤ ± 0.2%
      e. NIST traceable factory calibration performed on accredited water flow test rig.
   4. Manufacturers (order of preference)
      a. Onicon F-4600
      b. No known equal

E. The following types of flow meter are not acceptable for high-accuracy applications:
   1. Turbine meters
   2. Clamp-on ultrasonic
2.7 THERMAL ENERGY (BTU) METERS FOR WATER

A. General
   1. Provide flowmeter, temperature sensors and communications/control unit sold and warranted as a package from a single manufacturer.
   2. Accuracy: ±1% factory calibrated, traceable to NIST with certification.
   3. BTU meter shall be UL listed as a complete package.

B. Sensors
   1. Temperature sensors shall be matched RTD or solid state temperature sensors with a differential temperature accuracy of ±0.15°F.
   2. Flow meter may be any high accuracy flow meter type listed in Article 2.6.

C. Communications
   1. Signal converter unit shall provide at least the following data to the DDC System:
     a. Supply temperature
     b. Return temperature
     c. Flow rate
     d. Energy rate (BTU/hr)
   2. All I/O connections shall be to signal converter. Do not connect sensors or meters directly to DDC System.
   3. All I/O points shown as hardwired on Contract Drawing control schematics must be hardwired.
   4. Points shown as networked may be transmitted as BACnet objects via network, or as hardwired I/O points.

D. Manufacturers (order of preference)
   1. Onicon System 10
   2. Onicon System 40 (if hardwired I/O is sufficient for required application; see Contract Drawing control schematics)
   3. Onicon System 30 utilizes turbine meters and is not acceptable
   4. No known equal

2.8 DAMPERS

A. Refer to Division 23.

2.9 AIR TEMPERATURE SENSORS

A. General
   1. Thermistor or RTD type sensor, suitable for temperatures being sensed. Sensor full scale shall not be less than 125% of expected range, as indicated on Contract Drawing control schematics or in sequences of operations (Section 259000).
   2. Accuracy as required to satisfy Paragraph 2.1F and Section 25 50 00.
      a. Inaccuracy due to wire resistance shall in no case exceed 0.5°F. Select wire gauge and/or provide transmitter if necessary to meet this requirement.
   3. Drift shall not exceed 0.3°F per year.
   4. Sensor shall not require recalibration for at least five years
5. Temperature Transmitter
   a. Provide when required for compatibility with controller or to meet specified accuracy.
   b. Output: 4-20mA linearly across specified temperature range
   c. Include non-interactive zero and span adjustments
   d. Accuracy: ±0.1°F across sensor range

B. Duct Temperature Sensor, Single-Point Insertion
   1. Use in ducts not affected by temperature stratification.
   2. Probe shall be stainless steel.
   3. Provide with junction box for wiring connections and gasket to prevent air leakage and vibration noise.
   4. Minimum insertion length of 20% of duct width

C. Duct Temperature Sensor, Averaging
   1. Averaging sensors shall be used in the following locations and situations:
      a. When shown on Contract Drawing control schematics
      b. Air handler mixing plenums
      c. Ductwork of 25 ft² or larger cross-sectional area, or more than 6 ft in height or width.
      d. Any ducts affected by temperature stratification
   2. Sensor length shall be at least 1 linear foot for each 2 ft² of duct area.
   3. Provide sensor length as required to meet installation requirements (see Paragraph 3.4B.3). Provide multiple sensors if required.
   4. Probe shall be flexible aluminum or copper.
   5. Provide with junction box for wiring connections and gasket to prevent air leakage and vibration noise.

D. Outdoor Air Temperature Sensor
   1. Encapsulated or wall-mount temperature sensor installed in aspirated enclosure as specified in Article 2.17.

E. Manufacturers (alphabetical order)
   1. Automated Logic Corp
   2. Building Automation Products Inc
   3. Kele Associates
   4. Mamac
   5. Or equal

2.10 ROOM TEMPERATURE SENSORS

A. Room Temperature Sensor, Air
   1. Provide wall mounted, low-profile DDC temperature sensor only – no display or occupant controls. (For thermostats, see Article 2.11.)
   2. Plate-Type
      a. Flush-mount stainless steel plate with sensor permanently bonded to back side of plate
      b. Kele KTP series or equal
   3. Button-Type
      a. Flush-mount button, max 1" diameter x 1/8" thick
b. Secure to wall with adhesive backing or threaded connection

c. BAPI LP, Titan Products TPWBS, or equal

4. Color selected or painted to match wall

2.11 THERMOSTATS, DIRECT DIGITAL

A. General

1. Thermostat shall consist of a sensing element within a ventilated cover.
2. Cover shall be aesthetically pleasing and designed for wall box mounting in occupied space.
3. Provide with insulated base and wall box.
4. For thermostats connected to terminal box controller that requires calibration, include port for connection of POT or laptop.

B. Communication

1. Contract Drawing control schematics may show hardwired point connections but thermostat may connect to BAS via any of the following methods:
   a. Hardwired points (4-20 mA or 0-10 V)
   b. As a BACnet networked device, on a Secondary Control LAN.
   c. Connected directly to terminal unit controller, where controller provides thermostat data as BACnet objects to BAS. A proprietary connection between thermostat and controller is acceptable if and only if all thermostat data is available as BACnet objects from the terminal unit controller.

2. Thermostat may use wireless communication with the following restrictions
   a. Each thermostat shall communicate directly with the device that it controls, without intermediate device. Mesh-network communication is not acceptable without approval from Engineer of Record.
      1) Deviations from this requirement will be considered with appropriate submittals. See Wireless Networking requirements in Section 25 50 00. If deviation is sought, provide pre-submittal with complete information on proposed device. Wireless devices submitted for the first time with Submittal Package 1 will be rejected.
   b. DDC Contractor assumes full responsibility for the reliable and robust performance of wireless communication. If wireless connection is deemed unreliable by Engineer of Record, Commissioning Authority, or Owner, DDC Contractor shall be responsible for replacing wireless thermostats with wired equivalents at no cost to the Owner.

C. Thermostat Types

1. Type 1 – No Display, No Controls
   a. Blank cover
   b. No occupant controls

2. Type 2 – With Display, No Controls
   a. Cover shall include integral LCD display showing current temperature and active setpoint.
   b. No occupant controls.
3. Type 3 – With Display, With Controls
   a. Display per Type 2 thermostat.
   b. Include means for occupant to adjust setpoint (buttons, dials, or sliders).
      1) Heating and cooling setpoint shall be independently adjustable.
      2) Setpoint adjustment shall be capable of being limited by BAS in software. If
         setpoint limitation function resides in thermostat, limits must be adjustable
         though BAS interface. Devices which require setpoint limitations to be
         programmed at the thermostat are not acceptable.
   c. Include override pushbutton (“janitor’s button”) capable of being programmed to start
      system outside of scheduled occupancy.

4. Type of thermostat depends on the type of space in which it is installed. See
   Paragraph 3.4D.7.

D. Manufacturers (alphabetical order)
   1. Automated Logic Corp
   2. Building Automation Products Inc
   3. Kele Associates
   4. Mamac
   5. Or equal

2.12 AIR PRESSURE SENSORS

A. General
   1. Transmitter: Loop powered, two-wire 4-20 mA output with zero adjustment
   2. Repeatability shall be 0.3% or better.
   3. Select sensor based on expected range as shown on control drawings or as indicated in
      sequences of operations (Section 259000).
         a. For unidirectional sensors, the maximum of expected range (i.e. largest positive or
            negative reading) shall be no more than 75% of sensor full scale.
         b. For bidirectional sensors, expected range shall be between 25% and 75% of sensor
            full scale.
   4. Provide with static pressure pickup tip/port with flexible tubing. Select based on
      application, as follows:
         a. Duct or filter pressure: Pitot tip, Dwyer A-302 or equal
         b. Plenum pressure: Straight tip with surge damper, Dwyer A-421 or equal
         c. Space pressure: Flush-mount wall plate with screened port, Dwyer A-417 or A-465,
            or equal
         d. Outdoor pressure: Outdoor pickup port shielded to minimize effects of wind gusts,
            Dwyer A-306 or A-420, or equal
   5. Provide with plastic housing suitable for surface mounting.

B. Differential Sensor, General Applications
   1. Sensor: Differential capacitance cell, with temperature compensation
   2. This type of sensor may be used for any application with pressures over ±0.5 inches
      where a fixed-range sensor is not required per this Article (see below) or indicated on
      Contract Drawing control schematics.
   3. Sensor range may be switch-selectable. Set sensor range per Paragraph 2.12A.3.
   4. Accuracy shall be no less than ±1% of full scale selected for application (not ±1% of
      sensor maximum range).
5. Provide with LCD display when installed at air handling unit or in mechanical room or other readily accessible location. Display is not required for sensors located above ceiling or under raised floor.

C. Differential Sensor, Fixed Range for Low Pressure/High Precision Applications
   1. Sensor: Differential capacitance cell, with temperature compensation
   2. Provide fixed-range sensor for any of the following applications:
      a. All pressures less than ±0.5 inches
      b. Building pressure monitoring or control
      c. Underfloor air distribution plenum pressure
      d. Differential pressure across outdoor air intake
   3. Provide fixed-range sensor. Switch-selectable range is not acceptable for this application. Select sensor range per Paragraph 2.12A.3.
   4. Accuracy shall be no less than ±0.25% of full scale.
   5. Provide with LCD display when installed in mechanical room or other readily accessible location. Display is not required for sensors located above ceiling or under raised floor.

D. Terminal Unit Velocity Pressure Sensor
   1. Sensor: Hot-wire flow-based differential pressure sensor. Diaphragm-style sensor does not provide sufficient accuracy and is not acceptable.
   2. Combination of pressure transducer and associated controller shall be capable of stable control to a setpoint of 0.004 inches or lower differential pressure.
      a. Overall accuracy (including impact of A/D conversion) shall be no worse than ±0.002 inches differential pressure.
      b. Overall resolution (including impact of A/D conversion) shall be no worse than ±0.001 inches differential pressure.
   3. Calibration software shall use a minimum of two field measured points, minimum and maximum airflow, with curve fitting airflow interpolation in between.
   4. Sensor may be integral to terminal unit controller, or separate but mounted with controller.

E. Manufacturers (alphabetical order)
   1. Air Monitor
   2. Dwyer
   3. Modus
   4. Paragon
   5. Setra
   6. Or equal

2.13 AIRFLOW MEASUREMENT STATIONS

A. VAV Terminal Unit Airflow Measurement
   1. Unless otherwise noted on VAV schedule, terminal unit airflow measurement is by terminal unit manufacturer’s differential pressure pickup in combination with a velocity pressure sensor meeting the requirements of Paragraph 2.12D.

B. Thermal Dispersion Type
   1. AFMS shall consist of one or more thermal mass flow sensors and associated controller/transducer.
2. Airflow probe shall span the entire area of the duct or fan inlet in which the AFMS is mounted, with sensor array density based on application per manufacturer’s requirements.

3. Materials:
   a. Sensor: Hermetically sealed bead-in-glass thermistor
   b. Probe: Stainless steel
   c. Brackets: Stainless steel

4. Operating limits
   a. Transmitter:
      1) Humidity: 5% to 100% non-condensing
      2) Temperature: -20°F to +160°F
   b. Sensor/Probe:
      1) Humidity: 0% to 95%
      2) Temperature: -20°F to +120°F

5. Airflow measurement accuracy: Installed total accuracy shall be better than ±3% of reading for ducted installations, and better than ±5% of reading for non-ducted (outdoor air intake) applications.
   a. Minimum accurately-measured air velocity shall be no less than 50 FPM.
   b. Maximum accurately-measured air velocity shall be as required by application.
   c. Installed accuracy shall include the probe itself plus the electronics for converting probe signal to an electronic signal proportional to airflow.

6. Temperature accuracy shall be ±0.15°F.

7. Airflow and temperature sensors shall be calibrated to NIST-traceable standards for airflow/velocity.

8. Pressure drop: Unrecovered pressure drop shall not exceed 0.025 inches at 2000 FPM.

9. Communication: Controller/transducer shall provide hardwired (4-20 mA and/or 0-10 VDC) outputs and/or BACnet network outputs as required by application for all points indicated. Refer to Contract Drawing control schematics
   a. If AFMS is used for control of devices (refer to sequences of operations) BAS input points must be hardwired. Networked points are for monitoring only and are not acceptable for direct control applications.

10. Sensor Grid Density
    a. Sensor grid shall be per manufacturer published recommendation as required to achieve specified accuracy.
    b. Sensor nodes shall be distributed uniformly across the duct/plenum to obtain accurate measurement of average flow velocity.

11. Required Submittals: For each separate AFMS unit, provide the following:
    a. Sensor grid density and arrangement/configuration (e.g. 2 x 3, 4 x 3).
    b. Calculation of air velocity at scheduled minimum airflow.
    c. Calculation of air velocity at scheduled maximum airflow.
    d. Documentation that both the minimum and maximum air velocities are within the specified operating range of the selected airflow measurement station.

12. Manufacturers:
    a. For air handling units, outdoor air intakes, and ducts over 2 ft²:
       1) Ebtron Gold Series (GTX116-P)
       2) Or equal
b. For square ducts between 1 ft$^2$ and 2 ft$^2$:
   1) Ebtron Hybrid Series (HTX104-P), or Gold Series if both hardwired and
      networked I/O is required
   2) Or equal

c. For round ducts 4" to 14" diameter:
   1) Ebtron EF-X series
   2) Or equal
d. For fan inlets:
   1) Ebtron GTX108-F
   2) Or equal

C. Vortex-shedding Type

1. AFMS shall consist of one or more airflow sensors and associated controller/transducer.
2. Airflow probe shall span the entire area of the duct or fan inlet in which the AFMS is
   mounted, with sensor array density based on application per manufacturer's
   requirements.
3. Materials:
   a. Sensor Base & Shroud: Anodized Aluminum
   b. Shedder: ABS plastic
   c. Brackets: Galvanized steel
4. Operating limits
   a. Transmitter:
      1) Humidity: 0% to 90% non-condensing
      2) Temperature: -20ºF to +150ºF
   b. Sensor/Probe:
      1) Humidity: Non-condensing
      2) Temperature: -20ºF to +120ºF
5. Airflow measurement accuracy: Installed total accuracy shall be better than ±5% of
   reading for ducted installations.
   a. Minimum accurately-measured air velocity shall be no less than 50 FPM.
   b. Maximum accurately-measured air velocity shall be as required by application.
   c. Installed accuracy shall include the probe itself plus the electronics for converting
      probe signal to an electronic signal proportional to airflow.
6. Pressure drop: Unrecovered pressure drop shall not exceed 0.025 inches at 2000 FPM.
7. Communication: Controller/transducer shall provide hardwired (4-20 mA and/or
   0-10 VDC) outputs and/or BACnet network outputs as required by application for all
   points indicated. Refer to Contract Drawing control schematics.
   a. If AFMS is used for control of devices (refer to sequences of operations) BAS input
      points must be hardwired. Networked points are for monitoring only and are not
      acceptable for direct control applications.
8. Sensor Grid Density
   a. Sensor grid shall be per manufacturer published recommendation as required to
      achieve specified accuracy.
   b. Sensor nodes shall be distributed uniformly across the duct/plenum to obtain
      accurate measurement of average flow velocity.
9. Required Submittals: For each separate AFMS unit, provide the following:
   a. Sensor grid density and arrangement/configuration (e.g. 2 x 3, 4 x 3).
   b. Calculation of air velocity at scheduled minimum airflow.
   c. Calculation of air velocity at scheduled maximum airflow.
   d. Documentation that both the minimum and maximum air velocities are within the specified operating range of the selected airflow measurement station.

10. Manufacturers:
    a. For Lab Exhaust:
        1) Accutrol VTF
        2) Or equal

2.14 CARBON DIOXIDE SENSORS

A. General
   1. CO2 sensors are delicate optical instruments. Protect from shock. Store in manufacturer’s packaging until ready for installation. Recalibration may be required after rough handling.
   2. Detachable base with all field wiring termination on base.
   3. Provide wall-mounted sensors with display; duct-mounted sensors do not require display.
   4. Provide duct-mounted sensors with aspirating probe.
   5. Wall-mounted sensors may be combined/integrated with thermostat.
   6. Factory calibrated and set to 0-2000 PPM range
   7. Drift shall not exceed 2%.
   8. Response time shall be 1 minute or less.
   9. Sensor shall not require recalibration for a minimum of 5 years, guaranteed.
   10. If sensor is found to be out of calibration, DDC Contractor shall recalibrate or replace at no additional cost to the Owner within 5 years of purchase date.
   11. Rated ambient conditions:
       a. Air temperature: 32°F - 120°F
       b. Relative humidity: 0% - 95% non-condensing
   12. Include elevation adjustment
   13. Signal output: 4-20 mA or 0-10 V, or as BACnet networked device on secondary control LAN.

B. Dual Channel Self-Calibrating Sensor (Type 2)
   1. Non-dispersive infrared sensor utilizing single-beam, dual-wavelength technology with a single receiver. Dual-beam single-wavelength sensors, single beam sensors, and sensors with dual receivers are not acceptable.
   2. Accuracy: larger of ±40 PPM or ±3% of reading from 0 to 2,000 PPM at temperatures from 60°F to 90°F
   3. Sensor shall compensate for the aging of the infrared source utilizing a non-adsorbing wavelength to provide a reference for automatic recalibration. Reference and measurement channels shall both utilize the same light source and the same receiver.
   4. Manufacturers (order of preference)
       a. Vaisala GMW80 series (wall-mount) or GM20 series (duct mount)
       b. Dwyer CDT series (not CDD or CDW)
       c. No known equal
2.15 HUMIDITY SENSORS

A. General

1. Sensor shall be thin film capacitance type.
2. Sensor element shall be field-replaceable without requiring recalibration.
3. Shall include 2-wire transmitter producing a continuous 4-20 mA signal proportional to relative humidity (%RH) or output as required (see Paragraph 2.15A.12).
4. Temperature range: 32°F to 122°F
5. Humidity range: 0% to 100% RH
6. Sensor shall be factory-calibrated and NIST traceable.
7. Resolution: 0.1% RH
8. Repeatability: 0.5% RH at RH < 90%
9. Temperature Effect: Less than 0.06% per ºF at baseline of 70°F.
10. Response time at 70°F in still air: Less than 20 seconds
11. Provide sensor with cover suitable for wall (indoor space), duct or outdoor installation as required by application.
   a. For wall mounting: Aesthetically pleasing ventilated cover, designed for wall box mounting in occupied space, with insulated base.
   b. For duct mounting: Junction box for wiring connections and gasket to prevent air leakage and vibration noise. Sensor probe shall extend into duct at least 20% of duct width.
   c. For outdoor installation, provide one of the following:
      1) Provide outdoor humidity sensor with integrated flow-through radiation/rain shield. Sensors equipped with this kind of radiation shield (i.e. not fan aspirated) shall not be used for outdoor temperature measurement. For outdoor temperature, provide temperature sensor in aspirated enclosure per Paragraph 2.9D.
      2) Provide wall-mounted sensor in aspirated sensor enclosure satisfying Article 2.17. Combined measurement of outdoor temperature and humidity is acceptable when using an aspirated enclosure.
12. Sensor shall output relative humidity (%), dewpoint temperature, or wetbulb temperature as indicated on control drawings or as required by the application.
   a. Contractor shall select the model/options to provide required output, or shall configure sensor to provide required outputs, as appropriate to the sensor being used.
   b. Calculated outputs (dewpoint temperature, wetbulb temperature) for outdoor installation shall require an aspirated enclosure per Paragraph 2.15A.11.c.2.) (This ensures accurate measurement of drybulb temperature, which is required for accurate calculation of the dewpoint or wetbulb temperatures.)

B. Standard Accuracy (3%)

1. Accuracy at 70°F: no worse than ±3% over 0% - 90% RH; ±5% over 90% - 100% RH
2. Drift: no more than 1% per year
3. Manufacturers (order of preference)
   a. Viasala HMW82 (wall), HMD82 (duct), HMS82 (outdoor)
   b. Rotronic HF320-D (duct), HF320-S (wall mount, indoor occupied space), HF320-W (wall mount, indoor mechanical or hidden space)
   c. No known equal

C. High Accuracy (2%)

1. Accuracy at 70°F: no worse than ±2% over 0% - 90% RH; ±3% over 90% - 100% RH
2. Drift: no more than 0.5% per year
3. Manufacturers (order of preference)
   a. Viasala HMW92 series (wall), HMD60 series (duct), HMS112 (outdoor)
   b. Rotronic HF320-D (duct), HF320-S (wall mount, indoor occupied space), HF320-W (wall mount, indoor mechanical or hidden space)
   c. No known equal

D. Ultra High Accuracy (1%)
   1. Accuracy at 70°F: no worse than ±1% over 0% - 90% RH; ±2% over 90% - 100% RH
   2. Drift: no more than 0.5% per year
   3. Manufacturer warranty no less than 10 years
   4. Manufacturers (order of preference)
      a. Viasala HMT331 (wall) or HMT333 (duct)
      b. No known equal

2.16 SWITCHES AND STATUS INDICATORS

A. Flow Switch
   1. Thermal Type
      a. Calorimetric flow switch resistant to fouling and corrosion, suitable for liquid or gas.
      b. Shall not require more than the larger of one pipe diameter or 12 inches of straight piping for proper operation
      c. Adjustable switch point
      d. IFM or equal

B. Differential Pressure Switch
   1. Diaphragm with adjustable setpoint and adjustable differential.
   2. Snap-acting Form C contacts rated for the application.
   3. Automatic reset.
   4. For water, switch must tolerate differential pressure up to 60 PSI.
   5. For air, provide with manufacturer's recommended static pressure sensing tips.

C. Current Switch
   1. Solid-core or split-core
   2. Range as required by application
   3. Adjustable trip point
   4. Switch:
      a. Solid state
      b. Normally open
      c. Relay output: minimum 120 VAC or VDC, 0.3 Amps.
      d. Zero off state leakage
   5. Low Frequency Limit: 6 Hz
   6. LED trip indicator
   7. UL and CSA approved
   8. May be used to start other devices if so indicated on Contract Drawing control schematics.
9. Manufacturers (alphabetical order)
   a. Senva C-1220/1320/2220/2320
   b. Veris Industries H-308/608/708/808/908
   c. RE Technologies CS1150A/SCS1150A
   d. Or equal

D. Leak Detector, Spot
   1. Gold plated sensing probes or remote sensing pads, as required by application.
   2. Encapsulated in epoxy or polymer – no exposed metals other than probes.
   3. Adjustable, weather-proof stand.
   4. Automatically resets when conductive fluid is no longer present.
   5. Relay contact outputs rated at 1amp at 24 VAC or VDC. Relay contact quantity as required by application or indicated by Contract Drawing control schematics.
   6. Normally energized relay, will alarm when power is lost.
   7. LED power and alarm indicators [and audible alarm].
   8. Powered with 12-24 VAC or VDC from BAS panel.
      a. Battery power not acceptable.

9. Manufacturers (alphabetical order)
   a. DIT DD1
   b. Dwyer WD3-LP
   c. Kele WD-1x
   d. Veris MX1V
   e. Or equal

10. Not to be confused with Condensation Detector.

E. Leak Detector, Area
   1. Non-conductive, hydrophobic, polymer tape or cable
   2. Select cable/tape length as required to fully protect area indicated on Contract Drawings, per manufacturer instructions.
   3. Weather resistant sensor module.
   4. Automatically resets when conductive fluid is no longer present.
   5. Relay contact outputs rated at 1amp at 24 VAC or VDC. Relay contact quantity as required by application or indicated by Contract Drawing control schematics.
   6. Normally energized relay, will alarm when power is lost.
   7. LED power and alarm indicators [and audible alarm].
   8. Powered with 12-24 VAC or VDC from BAS panel.
      a. Battery power not acceptable.

9. Manufacturers (alphabetical order)
   a. DIT AT1-M2
   b. Dwyer WD
   c. Kele WD-2-T
   d. Veris LD310
   e. Or equal

10. Not to be confused with Condensation Detector.

F. Condensation Detector
   1. Condensation detector shall sense the presence of liquid water or water film on the surface to which it is mounted. A humidistat or detector which measures dewpoint or relative humidity is not acceptable.
2. Detector shall provide a binary input signal to BAS upon condensation detection, or upon detector failure.

3. Manufacturers:
   a. Consense (www.consense.com)
      1) CG-ICM-F for mounting to flat surfaces
      2) CG-ICM-P for mounting to pipes
   b. No Known Equal for HVAC applications. All other “condensation” detectors on the market actually measure humidity, or are intended for microelectronics applications.

4. Not to be confused with Liquid Water Detector.

G. Low Temperature Detector (freeze-stat)

1. Capable of detecting temperature drop in any one foot length of sensor. Install across entire face of coil or element being protected.

2. Rated ambient conditions:
   a. Air temperature: 0°F - 144°F
   b. Relative humidity: 5% - 95% non-condensing

3. Battery power not acceptable

4. Setpoint range: 15°F - 55°F. Set to 38°F unless otherwise indicated on plans or sequences.

5. DPST contacts: Main contacts and auxiliary contacts respond simultaneously on detection of temperature drop.

7. Junction box for wiring connections with gasket to prevent air leakage and vibration noise.

8. Manufacturers: (alphabetical order)
   a. Honeywell
   b. Johnson
   c. Siemens
   d. Or equal

2.17 ASPIRATED OUTDOOR SENSOR ENCLOSURES

A. General

1. Designed for installation in exposed outdoor locations.

2. Provide fan-aspirated radiation shield that combines both active and passive aspiration to minimize the effects of radiation.
   a. Motor-driven fan draws air through the sensor chamber and exhausts it through the top of the shield.
   b. Triple-walled sensor chamber shielded by flow-through plates.

3. Electronics mounted in watertight gasketed enclosure.

4. A single enclosure may be used for more than one instrument/sensor if designed and intended by the manufacturer to house multiple devices.

B. Manufacturers (order of preference)

1. Kele A21
2. Davis Instruments 7747
3. Or equal

2.18 METER INTERFACE UNIT

A. General
1. The Meter Interface Unit (MIU) is a protocol translator that converts common types of utility meter signal encoding to Modbus, for connection to the BAS.
2. DDC Contractor shall provide MIU devices as required to connect BAS to site utility meters if such connections are indicated in Contract Drawings or Specifications.
3. The MIU shall be installed such that it does not interfere with the utility’s ability to read the meter, e.g. using a radio-read or touch-read interrogator. DDC Contractor shall provide a signal splitter if required to achieve this functionality.

B. Operating Conditions
1. Operating Temperature Range: 0°F-104°F
2. Power Input: 10-36 VDC, with integral overcurrent protection
3. Power Consumption: 3 watts maximum
4. MIU shall support wire diameters between 16AWG and 26AWG
5. MIU shall comply with UL60950-1 for safety and FCC Part 15, Class A for RF emissions
6. MIU shall be lead-free and ROHS compliant

C. Meter Input Ports
1. The MIU shall include at least two input ports capable of reading pulse-output meters, or encoder-output meters conforming with AWWA Standard C707-05.
2. The flow meter communication protocol(s) shall be recognized automatically by the MIU, without user-intervention. At a minimum, the MIU shall be compatible with the following protocols:
   a. Sensus Variable Length, 4 to 9 Digit.
   b. Sensus Fixed Length, 4 to 6 Digit.
   c. Neptune E-Coder Plus, 8 to 9 Digit.
   d. Neptune ProRead Basic, 3-6 Digit.
   e. K-Frame, 6 Digit.
   f. Mechanical Contact Pulse, 2000 Hz. Max.
   g. Solid-State Contact Pulse, 2000 Hz. Max.
   h. Open-Collector Pulse, 2000 Hz. Max.
3. The MIU shall automatically sample the flow meter(s) at pre-programmed intervals, and compute flow rate(s) based upon a delta-Volume/delta-Time finite difference calculation (fixed delta-Time or fixed delta-Volume).

D. Serial Ports
1. The MIU shall include at least one RS-232 or RS-485 serial port.
2. The MIU shall support data output through the serial port(s) using at least the following protocols:
   a. MODBUS/RTU
   b. MODBUS/ASCII
3. It shall also be possible to configure the MIU by connecting to the serial port(s) with a laptop computer.
4. The port shall be switchable between data output mode and configuration mode using a dip switch or similar.
E. Ethernet Port

1. The MIU shall include at least one Ethernet port, which supports data output using at least the following protocols:
   a. MODBUS/TCP
   b. MODBUS/UDP
   c. Allen Bradley ETHERNET/IP

2. The Ethernet port shall support both DHCP and static IP addressing.

3. The Ethernet port shall also provide the following services:
   a. Ping server
   b. Web server, providing meter rate and totalization, statistics, and auxiliary I/O data. Web server can be disabled in configuration.
   c. Telnet server, for remote configuration and management. Telnet server can be disabled in configuration. **When configuration is complete, telnet server shall be disabled for security reasons.**

4. The Ethernet port shall be pre-programmed with a unique, valid, IEEE-approved MAC address.

F. Manufacturers

1. SCADAmetrics Ethermeter EM-100
2. SCADAmetrics Touch-Read Filter TRF-x
3. SCADAmetrics Radio-Read Filter RRF-x
4. No Known Equal

2.19 TIME CLOCKS

A. General

1. Voltage and current rating suitable for service
2. Enclosure with hinged cover, with lockable hasp

B. Electromechanical Type

1. Seven-day switch timer with seven-day dial
2. Synchronous timing motor
3. Battery backup, minimum 8 hour endurance
4. Switch trippers capable of providing up to 8 signals per day
5. Outputs: 2 normally-open, 2 normally-closed

2.20 ELECTRIC CONTROL DEVICES

A. Push Button Switch

1. Momentary contact push button
2. NEMA ICS 2
3. Oil tight, type 800T
4. Quantity of N.O. or N.C. contacts as required
5. Contacts shall be snap-action type, and rated for minimum 120 VAC operation.

B. Selector Switch

1. Maintained contact
2. NEMA ICS 2
3. Oil tight, type 800T
4. Contact arrangement as required
5. Contacts shall be rated for minimum 120 VAC operation

PART 3 - INSTALLATION

3.1 GENERAL

A. All installation requirements in Division 23 and Section 25 50 00 shall apply to the Work done under this Section.

B. Subject to direction by the General Contractor, DDC Contractor shall perform Work in accordance with the general sequence of events outlined in Article 3.1 General of Section 25 50 00. If it is necessary to deviate substantially from this schedule, DDC Contractor shall notify Commissioning Authority and Engineer of Record.

C. DDC Contractor shall coordinate with other trades as required by Section 25 50 00. This shall include submitting documentation and coordination plans as described in that Section.

D. DDC Contractor shall protect all products and retain them in manufacturer packaging until installed, as required by Section 25 50 00.

E. DDC Contractor shall perform all Work under this Section in accordance with the manufacturer’s instructions and the general workmanship requirements specified in Section 25 50 00 and in Division 23. DDC Contractor shall in addition observe the following requirements:
   1. All sensors and products shall be mounted rigidly and adequately supported.
   2. Wires attached to sensors shall be sealed leak-tight in their raceways or in the wall to prevent sensor readings from being affected by air transmitted from other areas.
   3. Sensors which provide data used to maintain a setpoint with variable-speed equipment (e.g. duct pressure sensor used for fan speed control, or end-of-loop differential pressure used for pump speed control) shall be hardwired directly to the same controller that controls the variable-speed equipment, which shall also be the controller where the variable speed control loop resides.

F. All products and devices shall be provided with enclosures, or installed in enclosures, as required by Section 25 50 00.

G. All power and control wiring shall be installed in accordance with Section 25 50 00, this Section, and other applicable codes and standards. All wiring and tubing shall be labelled and identified as specified in Section 25 50 00.

H. All products provided or installed under this Section shall be subject to testing, verification and commissioning as specified in Section 25 50 00. Provide Pre-Functional Test and Functional Test Reports as required by Section 25 50 00 for all products provided or installed under this Section.
3.2 ACTUATORS

A. Damper Actuators
   1. The actuator shall be direct coupled to shaft, without connecting linkage or jackshaft.
      a. Links or jackshafts are not acceptable unless specifically indicated in Contract Drawings.
      b. If installation requires linkages due to mechanical or space constraints, notify Engineer of Record in writing.
   2. For multiple-section dampers, provide one actuator for each section.
   3. Pre-compress dampers that have blade seals: Power actuator to approximately 5° open position, manually close the damper, and then tighten the linkage; or follow manufacturer’s instructions to achieve same effect.
   4. Check operation of damper-actuator combination to confirm that actuator modulates damper smoothly throughout stroke to both open and closed positions.

B. Valve Actuators
   1. Install damper to valve shaft with a “keyed” connection to prevent rotational slippage.
      a. Use only manufacturer-approved coupling adapters, if one is required.
      b. Compression-clamping actuator to a round valve shaft is not acceptable.
   2. Install so that actuators, wiring and tubing connections are accessible for maintenance.
   3. If possible, install valve so that the position indicator is visible from floor or other readily accessible location. However, do not install valve with steam pointing below horizontal or down.

C. Normal Position and Fail-Safe
   1. For all actuators, normal position is the position with zero control signal.
   2. Fail-safe actuators shall assume normal position upon loss of power.
   3. Unless otherwise noted in Contract Drawing schedules or control schematics, install actuators with normal position as shown in the following table. Provide fail-safe actuators where required.

3.3 WATER SENSORS AND DEVICES

A. Temperature Sensors

1. All temperature sensors in pipes shall be installed in thermowell with thermally-conductive grease. Direct immersion installation is not acceptable.
2. Thermowell shall penetrate pipe by lesser of 8 inches or half pipe diameter. For small pipes, well shall be installed in an elbow into pipe length.
3. Insulate top of thermowell with a patch of closed-cell insulation, to provide a complete thermal break but allow easy access to sensor.
4. Install test port adjacent to each thermowell.
5. Provide sufficient wiring (or flexible conduit, per installation location) to allow sensor to be removed from thermowell for calibration or replacement.

B. Pressure Sensors

1. Install with manifold that provides for isolation and venting. Pressure sensors shall have 3-valve manifold; differential pressure sensors shall have 5-valve manifold.
2. Manifold shall permit removal of sensor without shutting down hydronic system.
3. Manifold vent ports shall be usable as test ports, or provide separate test ports adjacent to sensor.

C. Flow Meters

1. Install per manufacturer’s recommendations for unobstructed straight length of pipe both upstream and downstream of sensor. If sufficient straight pipe is not available, contact Engineer of Record for guidance.
2. Install with isolation valves immediately upstream and downstream of meter. If hot-tapping an operating hydronic system, provide hot-tap isolation valve instead to enable sensor removal without water supply system shutdown.
3. For Insertion-Type meters
   a. Install meter in correct orientation relative to pipe so that turbine is aligned with fluid flow.
   b. Install using manufacturer-provided depth gauge to ensure that sensor is correctly positioned at center of pipe. Always place depth gauge against exterior of pipe, not against pipe insulation.
4. Test meter per the manufacturer’s startup and commissioning recommendations.
5. Complete all manufacturer’s startup documentation and include with Pre-Functional Test report (see Submittals in Part 1 and Testing and Commissioning in Part 3 of Section 25500).

D. BTU Meters

1. Install flow sensor per Paragraph 3.3C.
2. Install temperature sensors per Paragraph 3.3A.
3. Connect to signal converter unit for I/O. All I/O points shown as hardwired on Contract Drawing control schematics shall be installed as hardwired points.

3.4 AIR SENSORS AND DEVICES

A. Control dampers shall be installed per the requirements of Division 23.
B. Duct Temperature Sensors

1. If installing sensor near a coil:
   a. Upstream of coil, install a minimum of 6 inches from coil.
   b. Downstream of coil, install a minimum of 12 inches from coil if possible, 6 inches absolute minimum.
   c. No part of the sensor or its support elements or conduit shall be in contact with the coil, coil framing or coil support elements.

2. Single Point Duct Sensors
   a. Install probe at approximate midpoint of duct height.
   b. Install such that probe penetrates minimum 20% of duct width, to avoid boundary layer.

3. Averaging Duct Sensors
   a. Install sensor in serpentine manner with a minimum of four vertical passes ("M" pattern), covering full width and height of duct.
   b. The entire length of the sensor must be installed fully inside duct.
   c. Support at each bend with capillary clip.
   d. Where located in front of filers (e.g. mixed air temperature sensor), maintain access for filter removal.

C. Outdoor Air Sensors

1. Install sensor in aspirating enclosure. See Article 2.17.
2. Installation location shown on Contract Drawings is approximate.
3. DDC Contractor is responsible for selecting actual installation location to provide accurate readings without distortion from solar or building influences.
   a. Good locations are shielded from the sun and away from reflective surfaces, air intakes and exhausts, and heat producing equipment.
   b. Poor locations include above sun-exposed walls, near windows, doors and exhaust vents, under eaves, or near equipment.
   c. If no good location is available, notify Engineer of Record.

D. Room Sensors and Thermostats

1. Room sensors and thermostats shall be installed on concealed junction boxes properly supported by wall framing. Exception: Button-type sensors may be installed directly to wall without box if permitted by local code and AHJ.
2. Install all devices with insulated base.
3. For sensors mounted in exterior walls, seal all junction box openings with mastic sealant and pack junction box with fiberglass insulation.
4. For sensors on exposed unfurred columns, use Wiremold or equal raceway that is smallest required to enclose wiring and Wiremold or equal junction boxes that are narrowest required to enclose sensor and wiring connections. Color shall be per the architect; submit for approval prior to installation.
5. Install sensors in locations as shown on Contract Drawing mechanical floorplans. If installation in indicated location is not feasible, notify the Engineer of Record.
6. Unless otherwise noted on Contract Drawings, wall-mounted sensors shall be installed at same centerline elevation as adjacent electrical switches, 4 feet above the finished floor where there are no adjacent electrical switches, and within ADA limitations.
   a. Wall mounted CO2 sensors shall in all cases be installed between three and six feet above finished floor, to comply with code requirements.
7. Unless otherwise called out on Contract Drawing mechanical floorplans or zone schedule, install thermostat Types based on location:
   a. Open offices: Type 2  
   b. Private offices: Type 3  
   c. Corridors/hallways: Type 1  
   d. Conference/meeting rooms: Type 3  
   e. Classrooms, labs, multi-purpose rooms: Type 3  
   f. Lobbies, public spaces: Type 2  
   g. Equipment rooms and other back-of-house spaces: Type 2  
   h. Others not listed: Request clarification from Engineer of Record

E. Differential Pressure Sensors

1. Pressure transducers shall be installed in control enclosures. Do not install on monitored equipment, ductwork or other location subject to vibration.
   a. Exception: Terminal unit transducers may be installed on terminal unit.
   b. Exception: Filter differential pressure transducers shall be mounted on outside of filter housing or filter plenum with display clearly visible (replaces Magnehelic).

2. Connect with tubing as specified in Section 25 50 00. Label tubing as required by Section 25 50 00.

3. Terminate tubing at static pressure probe or port selected based on application. See Paragraph 2.12A.42.12A.3. Probes shall be securely fastened. Pitot tips shall point into directly airflow.

4. Install both high-pressure and low-pressure tubing with capped tee fittings near pressure transducer, for use as test ports.

5. Identify and label all pressure transducers. See Identification in Section 25 50 00.

6. Duct static pressure sensors shall be installed as follows:
   a. Connect low-pressure (reference) port to building pressure sensor high-pressure tubing with tee fitting. If there is no building pressure sensor, terminate low pressure tubing in appropriate location for building ambient pressure measurement, per Paragraph 3.4E.7.b.
   b. Connect high-pressure port to duct pressure probe.
   c. Install probe in location as shown on Contract Drawing mechanical plans. If installation location is unclear or not feasible, contact Engineer of Record for clarification.

7. Building static pressure sensors shall be installed as follows:
   a. Connect low-pressure (outdoor ambient) port to outdoor pressure probe located outside at high point of building, sheltered from wind.
   b. Connect high-pressure (building ambient) port to wall-plate pressure port appropriately located to provide consistent and accurate building pressure signal. Do not locate near elevators, exterior doors, atria, or HVAC diffusers.

8. Underfloor plenum pressure sensors shall be installed as follows:
   a. Connect low-pressure (reference) port to wall-plate pressure port located adjacent to zone thermostat. Tubing may alternatively terminate inside thermostat, if cover has openings to allow free air flow.
   b. Leave high pressure port open to plenum.
   c. Install pressure transmitter in underfloor plenum below low-pressure port location. Do not locate near plenum supply outlet.

F. Airflow Measurement Stations

1. Install AFMS as shown on Contract Drawing mechanical plans.
2. Install AFMS in accordance with manufacturer requirements, maintaining minimum straight duct run to ensure accuracy.

3. If installation location shown on plans is does not meet manufacturer requirements for minimum straight duct run, or if an alternative location would provide equal function and better accuracy, DDC Contractor shall request clarification from Engineer of Record.

3.5 SWITCHES AND STATUS INDICATORS

A. Current Switch
   1. Adjust current setpoint (i.e. ON/OFF signal threshold) as follows:
      a. For fan status, with discharge damper: Adjust so that fan status is OFF when fan discharge damper is fully closed while fan is running.
      b. For fan status, with belt-driven fan: Adjust so that fan status is OFF when fan belt is broken and motor is running.
      c. For pump status: Adjust so that pump status is OFF when pump is running with shutoff valves closed (i.e. pump is dead-headed).

B. Leak Detectors, Spot or Area
   1. Install to flat surface (bottom of drain pan, floor, etc) unless otherwise indicated on Contract Drawing control schematics.
   2. Set detector to react to 1/16” depth of water accumulation, maximum, unless otherwise indicated on Contract Drawing control schematics.
   3. Secure detector per manufacturer instructions.
   4. Do not use liquid water detector for applications where a condensation detector is indicated.

C. Condensation Detector
   1. For pipe installation (Consense model CG-ICM-P)
      a. Install detector to bare metal pipe, downstream of control valve, as close as feasible to radiant panel/chilled beam.
      b. Remove insulation for 2” around detector, to allow free circulation of air to detector. Clean pipe surface.
      c. Ensure that provided thermally conductive pad is between detector and pipe, and is in contact with bare metal of pipe. If conductive pad is missing, obtain replacement from manufacturer before installing detector. Do not install detector without thermal pad.
      d. Firmly secure detector to pipe using nylon zipties, as shown in manufacturer literature.
   2. For flat surface installation (Consense model CG-ICM-F)
      a. Install detector flat to back side of chilled beam/radiant panel, or to interior bottom surface of drip pan, as indicated on control drawings.
      b. Remove insulation from mounting surface. Clean surface with alcohol for good adhesion.
      c. Adhere detector with provided 2-way thermal tape. If tape is missing, obtain replacement from manufacturer before installing detector. Do not install detector without thermal tape; regular 2-way tape is not acceptable.
3. Detector may be damaged by dust, water or VOCs. It is recommended that the detector be installed only after other construction activities are complete.

4. Do not use condensation detector for applications where a liquid water detector is indicated.

D. Low Temperature Detector (freeze-stat)

1. Install with junction box for wiring connections.
2. Install with gasket to prevent air leakage and vibration noise.
3. Hardwire primary output to VFD emergency stop. Wire auxiliary output to BAS to indicate freeze-stat activation.

END OF SECTION
SECTION 255000 - BUILDING AUTOMATION HARDWARE AND NETWORKING

PART 1 - GENERAL

1.1 SUMMARY

A. The DDC Contractor shall furnish and install a complete Direct Digital Control Building Automation System in accordance with Contract Drawings, this Section, and other Division 25 Sections issued with this Specification.

B. DDC System shall consist of an internetwork of ANSI/ASHRAE 135 native BACnet DDC devices, interfaces and software, as well as sensors, actuators, control devices, enclosures, interconnecting conduit and wiring.

C. DDC System shall monitor and/or control the following systems in accordance with Contract Drawing control schematics and Section 25 90 00 “Building Automation Sequences of Operations”
   1. HVAC Systems
   2. Plumbing Systems
   3. Lighting Control Systems
   4. Power Meters or Power Monitoring Systems

D. Coordinate with other trades as required to fulfill requirements of Contract Drawings and this Section.
   1. Furnish selected control devices to equipment and systems manufacturers for factory installation and to contractors of other trades for field installation under other Sections and Divisions. Supervise and coordinate the installation of components furnished under this Section but installed under other Divisions of the Specification. See Paragraphs 3.4C and 3.4D.
   2. Coordinate with equipment manufacturers and contractors of other trades all installation, connection, and interface details required to integrate products by others (including but not limited to VFDs, gateways, and package unit controllers) to the DDC System. See Paragraph 3.4E.
   3. Test and Balance: Coordinate with TAB Contractor to determine setpoints and other parameters required to program Sequences of Operations per Paragraph 3.4F. Assist TAB Contractor in balancing tasks which require DDC System interaction per Paragraph 3.16D.
   4. Life Safety: The DDC System is not a life-safety system. Smoke alarm and smoke control system are by others. DDC Contractor shall provide hardwire interlock connections to the smoke/fire system, and shall connect to smoke detectors, smoke/fire alarm systems, and/or smoke control dampers for monitoring purposes only, as shown in Contract Drawing control schematics. See Paragraph 3.4F.5.
   5. Lighting Control: Lighting control system is provided by Division 26 and is separate and distinct from DDC System. DDC Contractor shall map sensor outputs from and control inputs to the lighting control system. See Paragraphs 3.4H and 3.7G.5.
   6. Meters: Connect DDC System to water, gas, and/or power meters for monitoring. Meters are installed by their respective Division. See Paragraph 3.4I.
   7. Commissioning: Perform commissioning activities and assist Commissioning Authority and/or Commissioning Coordinator in the execution of commissioning tasks per Article 3.16.

E. DDC Contractor shall read and respond to all parts of this Section.
1. To facilitate the Work under this Section, a searchable digital version of this document will be provided to the DDC Contractor upon request to the Engineer of Record.
   a. Searchable digital version includes live hyperlinked cross-references, such that clicking “see Paragraph XX” will jump to Paragraph XX.
   b. Searchable digital version is formatted with PDF “bookmarks” corresponding to the outline levels of the document, as an aid to navigation.
   c. DDC Contractor is strongly encouraged to request this digital version if it is not provided through standard channels.

2. It is understood that otherwise-acceptable products may not always meet every requirement of the Specification. Deviations and substitutions will be considered if they are submitted in accordance with this Section (see Paragraphs 2.1F and 2.1H).

3. If there are questions or concerns, please contact the Engineer of Record for clarification.

1.2 DDC SYSTEM REQUIREMENTS

A. Open and Non-Proprietary: The DDC BAS shall be based on open standards and protocols designed to maximize interoperability and future flexibility. Any equipment, device or implementation decision which “locks in” the system to a single manufacturer or product line is not acceptable.

   1. All DDC devices shall be ANSI/ASHRAE 135 native BACnet devices.
      a. All DDC devices shall be tested, certified, clearly stamped and listed by the BACnet Testing Laboratories (BTL), or the vendor shall provide proof that the device has been submitted to BTL for testing, prior to the bid date for this Project. (Throughout this Section, any requirement that a device must be BTL-listed shall also be satisfied by proof that the device has been submitted to BTL for testing.)
      b. The BACnet operating stack must be embedded directly in each individual DDC device at the media access controller level and in all operator interface and configuration applications.
      c. The use of communication gateways, bridges, and protocol translators is restricted. See Paragraph 2.7E.

   2. BACnet devices shall not use proprietary extensions, objects, services or properties (as described in Chapter 23 of ANSI/ASHRAE 135-2016) to replace basic functions already provided by BACnet. DDC system shall use standard BACnet objects, properties, services and functions whenever practical.
      a. Exception: Proprietary extensions that provide functionality that is part of the current revision of BACnet are acceptable in devices which were BTL listed under an earlier version of BACnet which lacked the function(s) in question.

   3. If Tridium Niagara platform is to be used, it shall be open license. Station Compatibility In/Out and Tool Compatibility In/Out shall be “All”. No compatibility restrictions are acceptable.

B. Modular and Expandable:

   1. The DDC system shall be modular in nature and implemented in such a manner that it can be expanded in both capacity and functionality through the addition of DDC controllers, devices and wiring. See Paragraph 2.3G.
   2. All software assets created for the project shall be available for re-use without additional licensing or cost to the Owner. See Article 1.10.
   3. DDC System shall be designed, and licenses shall be provided, to support expansion of the DDC System to an ultimate capacity greater than that originally installed. See Paragraph 2.3G for expandability requirements.
C. Standalone Capability: Each DDC controller shall be capable of performing local control strategies without reliance upon any other controller or network. See Paragraphs 2.2E, 2.8D and 3.10B.3.

D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NEC with all state and local amendments, by a qualified testing agency, and marked for intended location and application.

1.3 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01, apply to this Section, except as specifically noted in this Section.

B. Product and installation requirements for electrical wiring and devices in Division 26 and Division 27 apply to this Section, except as specifically noted in this Section.

C. Related Mechanical and Controls Specifications
1. Section 23 00 00 “HVAC General Requirements”
2. Section 25 05 14 “Variable-Frequency Drives for HVAC Equipment”
3. Section 23 05 93 “Testing, Adjusting and Balancing for HVAC”
4. Section 23 08 00 “Mechanical System Commissioning”
5. Section 25 30 00 “Building Automation Sensors and Control Devices”
6. Section 25 90 00 “Building Automation System Sequence of Operations”
7. Section 26 09 13 “Electrical Power Monitoring”
8. Section 26 09 23 “Lighting Controls”

D. Related Other Specifications
1. Division 01 “Operation and Maintenance Data”
2. Division 01 “General Commissioning Requirements”
3. Section 07 84 13 “Penetration Firestopping”
4. Section 07 92 00 “Joint Sealants”
5. Section 26 05 19 “Low Voltage Electrical Power Conductors”
6. Section 26 05 23 “Control Voltage Electrical Power Conductors”
7. Section 26 05 26 “Grounding and Bonding for Electrical Systems”
8. Section 26 05 29 “Hangers and Supports for Electrical Systems”
9. Section 26 05 33 “Raceways and Boxes for Electrical Systems”
10. Section 26 05 72 “Overcurrent Protective Devices Short-Circuit Study”
11. Section 26 08 00 “Commissioning of Electrical Systems”
12. Section 26 43 13 “Surge Protection for Low-Voltage Electrical Power Circuits”

1.4 DEFINITIONS

A. Accessible: A location that can be reached with no more than a ladder to assist access and without having to remove permanent partitions or materials.

B. AHJ: The Authority Having Jurisdiction. All requirements and exceptions noted in this Section are subject to the approval of the AHJ.

C. Analog: A continuously varying signal value, such as current, flow, pressure, or temperature.

D. BACnet Specific Definitions:
1. BACnet: Building Automation Control Network Protocol, ASHRAE 135. A communications protocol allowing devices to communicate data over and services over a network. Unless otherwise noted, all references are to the most recent version of the standard.

2. BACnet Interoperability Building Blocks (BIBBs): BIBB defines a small portion of BACnet functionality that is needed to perform a particular task. BIBBs are combined to build the BACnet functional requirements for a device.

3. BACnet/IP: Datalink standard that uses a reserved UDP socket to transmit BACnet messages over peer-to-peer networks. A BACnet/IP network is a collection of one or more IP subnetworks that share the same BACnet network number.

4. BACnet MS/TP: Datalink standard that uses token passing to coordinate the transmission of BACnet messages between a master device and one or more slave devices.

6. PICS (Protocol Implementation Conformance Statement): Written document that identifies the particular options specified by BACnet that are implemented in a device.

E. Binary: Two-state signal where a high signal level represents “ON” or “OPEN” condition and a low signal level represents “OFF” or “CLOSED” condition. “Digital” is sometimes used interchangeably with “Binary” to indicate a two-state signal.

F. Controller: Generic term for any standalone, microprocessor-based, digital controller residing on a network, used for local or global control. The three types of controllers are defined by BACnet, from most to least capable, are Building Controller, Advanced Application Controller, and Application-Specific Controller.

G. Control Network/Control LAN: Refers to any single digital data communication network used by the control system. These networks carry only control information and are distinct from the IT LAN/Owner’s LAN.

H. Control Internetwork: Refers collectively to the set of all Control Networks in the Project.

I. COV: Change of value.

J. DDC Contractor: Authorized representative of, and trained by, DDC System manufacturer and responsible for provision of DDC System and execution of Work described in this Section.

K. Distributed Control: Processing of system data is decentralized and control decisions are made at subsystem level. System operational programs and information are provided to remote subsystems and status is reported back. On loss of communication, subsystems shall be capable of operating in a standalone mode using the last best available data.

L. E/P: Voltage to pneumatic.

M. Furnish: To purchase, procure, acquire and deliver complete with related accessories. Synonymous with Supply.

N. Gateway: Bidirectional protocol translator that connects control systems that use different communication protocols.

O. General Contractor: The person or entity holding the master construction contract for the Project, responsible for coordinating and managing construction schedule and jobsite activities. For purposes of this Section, the term is synonymous with Project construction manager or management team.

P. Install: To erect, mount and connect complete with related accessories.
Q. Internetwork: A network of interconnected digital data communication networks. The Internet is an example of an internetwork. In the context of this Section, it refers to the entire DDC System control network including all levels of WAN and LAN.

R. I/O: System through which information is received and transmitted. I/O refers to analog input (AI), binary input (BI), analog output (AO) and binary output (BO). Analog signals are continuous and represent control influences such as flow, level, moisture, pressure, and temperature. Binary signals are discrete and generally represent on/off commands, or two position operating or alarm status signals. “Digital” (DI and DO) is sometimes used interchangeably with “Binary” (BI and BO).

S. I/P: Current to pneumatic.

T. IT LAN/Owner's LAN: Refers to the Project’s Information Technology network, used for normal business-related e-mail and Internet communication. Distinct from control networks.

U. LAN: Local area network, a digital data communication network typically confined to a single building or small campus.

V. Low Voltage: As defined in NEC with all state and local amendments for circuits and equipment operating at less than 50 V or for remote-control, power-limited signaling circuits.

W. Mobile Computing Device: A portable device with display, input and wireless networking capabilities. Includes “smart” mobile phones and tablet devices running iOS or Android operating systems.

X. Modbus: An open protocol for exchange of process data.

Y. MS/TP: Master-slave/token-passing, per IEEE 8802-3. A network protocol that uses twisted pair wire for low-speed communication.

Z. NiCS: Niagara Compatibility Statement

AA. Operator’s Interface Device: Provides the Operator with the ability to interact with the DDC System. Specifically a hardware device.

BB. Operator’s Workstation: A computer that provides the user’s interface with the DDC System. May also refer to the user interface software package, whether hosted on a controller or on a PC.

CC. Owner: The Project Owner or their designated Representative who is empowered to make decisions regarding the project. The Commissioning Authority is not the Owner’s Representative unless they have been specifically empowered to make project decisions by the Owner in writing.

EE. Peer to Peer: Networking architecture that treats all network stations as equal partners.

FF. POT: Portable Operator's Terminal, a handheld operator interface device with integral keypad or touch screen, designed specifically for interface with DDC System by a technician in the field.

GG. Provide: Furnish and Install, complete and ready for safe and regular operation.

HH. Router: Device connecting two or more networks at network layer.
II. Request-based Trim & Respond logic: A reset scheme that periodically resets the setpoint at an “upstream” system (e.g. air handler) using demand-based Requests from “downstream” devices (e.g. terminal units). The setpoint is adjusted at a defined, user-adjustable time-step frequency. Downstream devices can be made to have more or less impact on the reset by adjusting the device’s Importance multiplier (default = 1). For more detail and a worked example, see Sequences of Operations.

JJ. Supply: To purchase, procure, acquire and deliver complete with related accessories. Synonymous with Furnish.

KK. System Software: Refers to software providing engineering, operator’s interface, configuration/programming, and data collection/analysis functions. System Software functions may be provided by a single or multiple pieces of software, hosted on a variety of platforms.

LL. TAB: Test and Balance, a process to establish air and water flow rates at terminal units, systems, plants, control devices and other equipment. The TAB Contractor works with DDC Contractor to establish field-determined setpoints as described in the Sequences of Operations.

MM. TCP/IP: Transport Control Protocol/Internet Protocol, a suite of protocols that routes data through a network of networks to provide a host with access to the Internet.

NN. UPS: Uninterruptible power supply.

OO. USB: Universal Serial Bus.

PP. WAN: Wide area network, a telecommunications network that extends over large geographic distances, such as connecting multiple buildings or campuses in disparate locations.

QQ. Wiring: Refers to wire and cable, and also raceways, fittings, conduit, boxes, and related items.

RR. Work: Labor, materials, equipment, apparatus, controls, accessories, etc. Everything that is required for proper and complete installation.

SS. Zone/Control Zone: A defined indoor area that is controlled to maintain specified temperature or airflow. Zone maps shall be provided with Contract Drawing mechanical plans for each type of zone relevant to the Project. Different types of zones may overlap completely, or may be distinct, depending on the mechanical design being employed.

1. Radiant Control Zone: A portion of the building’s mass, typically floor or ceiling, which is controlled to a temperature setpoint based on temperature measurement by a slab-embedded sensor.

2. Thermal Space Control Zone: An indoor space (i.e. room or part thereof) in which the air temperature is controlled to a setpoint based on temperature measurement by a thermostat or space sensor.

3. Ventilation Control Zone: An indoor space in which the airflow and/or outdoor air rate is controlled to maintain adequate ventilation or prevent elevated CO₂ levels.

4. If only one zone map is provided with mechanical plans, it shall be assumed unless otherwise indicated to represent Thermal Space and Ventilation Control Zones which overlap completely. (This is typical for VAV systems, but not necessarily for other system types.)
1.5 CODES AND STANDARDS

A. Workmanship, materials and equipment together with the resultant complete and operational DDC System shall be in compliance with the Authorities Having Jurisdiction (AHJ) for the Project and the most restrictive of applicable local, state and federal codes and ordinances in cooperation with these plans and Specifications.

B. At a minimum, the installation shall comply with the applicable Sections of the current editions in effect thirty (30) days prior to receipt of bids of the following codes:
   1. ANSI/ASHRAE Standard 135: Data Communication Protocol for Building Automation and Control Networks (BACnet)
   3. California Code Title 24, if Project is located in California.
   4. International Building Code (IBC), for Projects outside of California
   5. International Mechanical Code (IMC), for Projects outside of California
   6. National Electric Code (NEC) with all state and local amendments
   7. Telecommunications Industry Association (TIA):
      a. ANSI/TIA-568-C.0: Generic Telecommunications Cabling for Customer Premises
      b. ANSI/TIA-568-C.1: Commercial Building Telecommunications Cabling Standards
      c. ANSI/TIA-568-C.2: Balanced Twisted Pair Telecommunications Cabling and Components
      d. ANSI-TIA-607-B: Generic Telecommunications Bonding and Grounding for Customer Premises
   8. Underwriters Laboratories (UL)
      a. UL-50: Enclosures for Electrical Equipment
      b. UL-508A: Industrial Control Panels
      c. UL-916: Energy Management Equipment

1.6 QUALIFICATIONS AND QUALITY ASSURANCE

A. Competitive Bidding
   1. To encourage competitive bidding and protect the Owner from vendor lock-in, only product lines with multiple installer/contractor options are permitted to bid on this spec.

B. DDC System Manufacturer Qualifications:
   1. Nationally recognized manufacturer of DDC systems and products from approved manufacturers listed in Article 2.1.
   2. Has produced DDC systems with similar requirements to those indicated for a continuous period of five years within time of bid.
   3. DDC systems and products that have been successfully tested and in use on at least ten past Projects of comparative size and complexity.
   4. Has complete published catalog literature, installation, operation and maintenance manuals for all products intended for use.
   5. Has full-time in-house employees for the following:
      a. Product research and development.
      b. Product and application engineering.
      c. Product manufacturing, testing and quality control.
      d. Technical support for DDC system installation training, commissioning and troubleshooting of installations.
e. Owner operator training.

6. All products used in this installation shall be new and currently under manufacture. Spare parts shall be available for at least five years after completion of this contract.

7. All products shall have been available from the manufacturer for a minimum of 6 months prior to date of proposal and previously installed and proven effective in installations of similar nature, not including test sites. This installation shall not be used as a test site for any new products unless explicitly approved by the Owner in writing.

8. All BACnet devices must either be certified as compliant with the BACnet standard through a listing by the BACnet Testing Laboratory (BTL) or the vendor must supply proof of having submitted the device for testing by BTL.

9. The DDC system and components shall be listed by Underwriters Laboratories UL 916 as an Energy Management System.

10. Manufacturer shall be ISO 9001 registered.

C. DDC Contractor Qualifications:

1. Authorized representative of, and trained by, DDC System manufacturer.

2. Contractor’s Project Manager Qualifications: Individual shall specialize in and be experienced with direct digital control system installation for not less than 3 years. Project Manager shall have experience with the installation of the proposed direct digital control equipment product line for not less than 2 Projects of similar size and complexity.

3. Contractor’s Programmer Qualifications: Individual(s) shall specialize in and be experienced with direct digital control system programming for not less than 3 years and with the proposed direct digital control equipment product line for not less than 1.5 years. Programmers must show proof of having successfully completed the most advanced programming training offered by the vendor of the programming application on the proposed product line.

4. Contractor’s Service Qualifications: The installer must be experienced in control system operation, maintenance and service. Contractor must document a minimum 5-year history of servicing installations of similar size and complexity. Installer must also document at least a 1-year history of servicing the proposed product line.

5. Contractor’s Response Time and Proximity

a. Installer must maintain a fully capable service facility within 50 miles of the subject Project. Service facility shall manage the emergency service dispatches and maintain the inventory of spare parts.

b. Installer must demonstrate the ability to meet the emergency response times listed in Paragraph 1.12B.1.

6. Electrical installation shall be by manufacturer-trained electricians

a. Exception: Roughing in wiring and conduit and mounting panels may be subcontracted to any licensed electrician.

b. Exception: Installation of low voltage power and signal wiring may be performed by contractors who are not licensed electricians, if permitted by local code, the General Contractor, and the AHJ.

7. Staffing resources of competent and experienced full-time employees that are assigned to execute work according to schedule.

8. Service and maintenance staff assigned to support Project during warranty period.

9. Product parts inventory to support on-going DDC system operation for a period of not less than five years after completion of Work.

D. Instruments for Calibration and Testing

1. All instruments required for field calibration, verification and testing of control devices, except for terminal unit balancing, shall be provided by the DDC Contractor.
2. All equipment used for testing and calibration shall be NIST/NBS traceable and calibrated within the preceding 6-month period. Certificates of calibration shall be submitted.
3. Test equipment used for testing and calibration of field devices shall be at least twice as accurate as respective field device (for example if field device is ±0.5% accurate, test equipment shall be ±0.25% accurate over same range).

1.7 MEETINGS

A. Preinstallation Meetings: At Engineer’s option, Contractor shall attend pre-installation meetings at Project site or Engineer’s office
   1. Before preparing DDC shop drawings
   2. Before commencing installation.

B. Commissioning Meetings: Contractor shall attend all commissioning meetings where their presence is requested by the General Contractor, the Commissioning Authority or the Engineer of Record. See Article 3.16.

1.8 SUBMITTALS

A. No work may begin on any segment of this Project until the related submittals have been reviewed for conformity with the design intent and the Contractor has responded to all comments to the satisfaction of the Engineer of Record.

B. Submit drawings and product data as hereinafter specified. Requirements of this Article supersede and take precedence over conditions in Division 1 or Division 23.

C. Submittal documentation and drawings shall consistently use the same abbreviations, symbols, nomenclature and identifiers.

D. Equipment and systems requiring approval of local authorities must comply with such regulations and be approved. Filing shall be at the expense of the BMS Contractor where filing is necessary. Provide a copy of all related correspondence and permits to the Owner, and include with O&M/Closeout documentation.

E. Submittals shall be provided in digital format.
   1. Provide a separate file for each submittal. For submittal packages, provide a separate file for each subsection (e.g. for Submittal Package 1, hardware cutsheets and shop drawings shall be provided as separate files).
   2. Product cutsheets, test forms and other text documents shall be provided in word-searchable digital format. Acceptable formats are MS Word, PDF (generated from another electronic document and word-searchable; scans of paper documents are not acceptable), and HTML; other formats require approval prior to submission.
   3. For submittals, drawings and schematics shall be provided in PDF format. For completion documents, drawings shall be provided in both PDF and AutoCAD-compatible format.
   4. Sequences of operations shall be submitted in MS Word format.
   5. Scanned paper documents are not acceptable
      a. Exception: original signed documents, such as qualifications, inspection certificates, and warranty documents.
   6. Hardcopy (paper) submittals are not acceptable and shall not be provided except as noted in Closeout Submittals (see Paragraph 1.9B).
   7. Submittals provided in the wrong format will be returned without action.
F. Submission and Resubmission Procedure

1. Optional Pre-Submittals: At DDC Contractor’s option, electronic submittals indicated below may be submitted unofficially via email directly to the Engineer of Record for review and comment prior to formal submission. Comments provided by the Engineer are not official and may be changed or additional comments may be provided on the formal submittal. The intent of pre-submittals is to reduce paperwork and review time, and to provide a venue to discuss technologies, products, designs or implementation strategies that are novel or unique.

2. Each submittal shall have a unique serial number that includes the associated Specification Section followed by a number for each sub-part of the submittal for that Specification Section, such as SUBMITTAL 255000-01. There is no requirement to assign particular serial numbers to any specific submittals – serial number assignment is arbitrary. The only requirements are that the serial numbers be sequential (to avoid confusing gaps) and, most importantly, **consistent across all submittal correspondence**.

3. Each resubmittal shall have the original unique serial number plus unique revision number such as SUBMITTAL 255000-01 REVISION 1.

4. Submit one copy of submittal in electronic format specified under each submittal package below. Submissions made in the wrong format will be returned without action.

5. Revise submittal
   a. Respond to all comments:
      1) Revise initial submittal to resolve review comments and corrections.
      2) Provide complete responses to comments or suggestions which are, in the opinion of the DDC Contractor, not practical to implement.
   b. Indicate any changes that have been made other than those requested.
   c. Clearly identify resubmittal by original submittal number and revision number.
   d. Resubmittals that are not responsive to all comments will be returned without action.

6. Resubmit revised submittals until no exceptions are taken.

7. Once submittals are accepted with no exceptions taken, provide
   a. Complete submittal of all accepted drawings and products in a single electronic file.
   b. Copies for coordination with other trades, if and as required by the General Contractor or Owner’s Representative.

G. Submittal Schedule:

1. Submittal schedule shall be as follows unless otherwise directed by the Owner’s Representative. Each entry in the following list is a separate submittal (some are “packages” of multiple items as described in the next paragraph, while others are individual items):
   a. Submittal Package 0 (Qualifications) shall be submitted with bid.
   b. Submittal Package 1 (Hardware and Shop Drawings) shall be submitted in accordance with schedule established by General Contractor or in bid documents.
   c. Submittal Package 2 (Programming and Graphics) and shall be submitted no less than 30 days before software is to be installed in field devices.
      1) Submit Site Conditions Report per Paragraph 3.3D as early as practical, but no later than Submittal Package 2.
   d. Submittal Package 3 (Testing Forms) shall be submitted no less than 3 weeks prior to beginning Pre-Functional Tests.
   e. Submit BAS Pre-Functional Test Report (Paragraph 3.16C) as soon as it is complete.
   f. Submit Setpoint Determination Report (Paragraph 3.16D.3) as soon as it is complete. Do not perform setpoint determination process until Pre-Functional Tests have been reviewed and accepted.
g. Submit BAS Functional Test Report (Paragraph 3.16E) as soon as it is complete. Do not perform Functional Tests until Setpoint Determination Report has been reviewed and accepted.

h. Submittal Package 4 (Training Materials) shall be submitted no less than 21 days prior to conducting first training class.

i. Submittal Package 5 (Post-Construction Trend Logs) shall be submitted after demonstration tests are accepted and systems are in full automatic operation. The list of points to be trended shall be submitted for approval 14 days prior to the start of the trend collection period.

2. All DDC submittals are considered “large and complex” as defined in General Requirements for Division 23. Allow 15 working days for review, unless Engineer of Record agrees to accelerated schedule in writing. This supersedes the submittal review period defined in Division 01.

3. If Project schedule requires deviation from this schedule, DDC Contractor shall provide notice along with a proposed alternative schedule including expected dates for each submission.

4. Submittal Package 6 (End-of-Warranty Trend Logs) shall be submitted 30 days prior to the end of the warranty period.

H. Submittal Packages

1. Submittal Package 0 (Qualifications)
   a. Provide DDC System manufacturer qualifications as specified in Paragraph 1.6A.
   b. Provide DDC Contractor and key personnel qualifications as specified in Paragraph 1.6C, including
      1) Names and resumes of key personnel assigned to the Project
      2) Brief description of qualifying past Projects including physical address, floor area, number of floors, building system cooling and heating capacity and building’s primary function
      3) Description of qualifying past Projects’ DDC systems, noting similarities to Project scope and complexity indicated
      4) Owner, engineer and contractor contact information for qualifying past Projects, including name, phone number and email address
   c. Format: Word-searchable format per Paragraph 1.8E.

2. Submittal Package 1 (Hardware, Shop Drawings, Coordination Plans, Schedule)
   a. Hardware
      1) Organize by Specification sub-Section and device tags as shown on Contract Drawings.
      2) Do not submit products that are not used even if included in Specifications.
      3) Include a summary table of contents listing for every submitted device:
         a) Tab of submittal file/binder where submittal is located
         b) Specification Paragraph, down to the lowest applicable heading number.
         c) Whether device is per Specifications or deviates from Specification.
         d) Whether device is a listed product or a substitution.
         e) Manufacturer
         f) Model number
         g) Device accuracy (where applicable)
         h) Accuracy as installed including wiring and A/D conversion effects (where applicable)
      4) Submittal shall include manufacturer’s description, product Specification sheets and complete technical data, including
a) For BACnet networked products, BTL-listed Protocol Implementation Conformance Statement (PICS) including a BACnet Interoperability Building Block (BIBB) table for each DDC device. Manufacturer-provided PICS which include features not certified by BTL or submitted to BTL for testing are not acceptable.

b) If Tridium Niagara platform is to be used, Niagara Compatibility Statement (NiCS) attesting that open-license Niagara shall be installed per Paragraph 1.2A.3.

c) Construction details, material descriptions, dimensions of individual components and profiles, and finishes

d) Operating characteristics

e) Electrical characteristics and power requirements

f) Performance curves

g) Operating range

h) Accuracy and repeatability over range

i) Control signal range

j) Default condition upon loss of power

k) Calibration data if applicable

l) Environmental operating conditions and limits

m) Furnished accessories

n) Operation and maintenance instructions including factors effecting performance.

5) Submit on all required System Software Functions (Article 2.4) whether those functions are provided by a software application, a dedicated appliance, or are embedded in a controller.

6) Note all deviations from this Section, per Paragraph 2.1F.

7) If product is a substitution, provide additional information as required in Paragraph 2.1H.

8) Each submitted piece of literature and drawings shall clearly reference the drawing sheet or Paragraph of this Section that the submittal is to cover.

   a) When manufacturer’s cut-sheets apply to a product series rather than a specific product, the data specifically applicable to the Project shall be highlighted or clearly indicated by other means.

   b) General catalogs shall not be accepted as cut sheets to fulfill submittal requirements.

9) Format: Word-searchable format per Paragraph 1.8E.

b. Shop Drawings

1) System architecture one-line diagram indicating schematic location of all control devices, workstations, LAN interface devices, gateways in addition to the following information:

   a) Data link of each LAN with physical characteristics and configuration.

   b) Each networked DDC device including location, service, device instance, MAC address and network number.

   c) Each IP networking device including location, service and IP address.

   d) Location of all interface devices including network interface jacks and workstation connections.

   e) Location of all MS/TP network termination points and end-of-line terminations.

2) Schematic flow diagram of each air and water system showing equipment and control devices. The schematics provided on Contract Drawings shall be the basis of the schematics with respect to layout and location of control points.
a) All physical points on the schematic flow diagram shall be indicated with names, descriptors, and point addresses identified as listed in the Point Summary Table (see Paragraph 3.10D). Label each input and output with the appropriate range.

3) Bill of Materials: With each schematic, provide a table of all equipment, controllers, devices and sensors to be provided and/or used including:
   a) Device tag as indicated in the schematic and used in actual field labeling.
   b) Device tag as indicated in the Contract Drawings if it differs from schematic device tag
   c) Description
   d) Proposed manufacturer and model number
   e) Range
   f) Quantity

4) In Bill of Materials or on a separate sheet, provide a schedule of all control valves including the unique equipment identifier, valve size, dimensions and installation/maintenance clearance, model number, close-off rating, flow, CV, pressure drop, pressure rating and location. The valve schedule shall also contain actuator selection data supported by calculations of the force required to move, close and seal the valve at design conditions. Indicate normal positions of fail-safe (i.e. spring-return) valves.

5) In Bill of Materials or on a separate sheet, provide a schedule of all control dampers. This shall include the unique equipment identifier, damper size, pressure drop, blade configuration, orientation and axis of frame, blade rotation, location and selection criteria of actuators, nominal and actual sizes, and manufacturer and model number. Indicate normal positions of fail-safe (i.e. spring-return) dampers.

6) Physical details for each control panel and/or enclosure, drawn to scale and showing all internal components, including controls, instruments, wiring and labeling. Indicate panel installation locations in plan and elevation.

7) Electrical schematic for each control panel and/or enclosure showing each point of connection and/or product requiring power with requirements (volts/amps/connection type) listed for each. Show all control power supplies including, as applicable, transformers, power-line conditioners, transient voltage suppression and high filter noise units, DC power supplies, and UPS units with unique identification for each.
   a) Electrical wiring diagrams shall include ladder logic type diagram for motor starter, control, and safety circuits
   b) Electrical wiring diagrams shall include detailed digital interface panel point termination diagrams with all wire numbers and terminal block numbers identified.
   c) Clearly differentiate between portions of wiring that are factory-installed and portions to be field-installed.

8) Wiring diagrams for all packaged equipment indicating all interconnecting wiring and termination of all wires including labels and point names.

9) Wiring diagrams and schematics for each sensor.

   c. Master Point Summary Table: Provide in Excel format per Paragraph 3.10D.4.
   d. Network performance: Document memory allocation projections and calculated and guaranteed system response times of the most heavily loaded LAN in the system. Submitted network shall be able to pass network performance tests described in Paragraph 3.16C.6.d.
e. Schedule of Work: Provide a schedule indicating at a minimum the intended sequence of work, start dates and durations for individual activities, delivery dates for major materials and equipment including anticipated lead times and milestones indicating possible restraints on work by other trades or construction delays.

f. Coordination Plans: Submit coordination plans as required in Article 3.4.

1) Submit all coordination plans with this submittal, except TAB coordination plan (Paragraph 3.4F.3) which is submitted with DDC Submittal Package 2, described below.

g. Do not include sequence of operations or control programming on shop drawings or equipment submittals; they are included in DDC Submittal Package 2, described below.

h. Format (see Paragraph 1.8E)

1) Provide table of contents.
2) Sheets shall be consecutively numbered.
3) Each sheet shall indicate name and location of Project.
4) Each sheet shall have a title indicating the type of information included and the mechanical/electrical system controlled.
5) Each Section shall have a title indicating the type of information being submitted.
6) Include legend and list of abbreviations.
7) Text documents (narratives and lists): Word-searchable format, ANSI A size.
8) Schedule of Work: Narrative text document or full-color Gantt chart, in PDF format.
9) Schematics: Word-searchable PDF format, ANSI B or ANSI C size.
10) Drawings, if applicable: AutoCAD-compatible format, ANSI B or ANSI C size.

3. Submittal Package 2 (Programming and Graphics)

a. A detailed description of point naming convention conforming to Paragraph 3.10C, to be used for all software and hardware points. Naming convention shall integrate with existing database, if applicable.

b. A list of all hardware and software points identifying their full text names, device addresses and descriptions.

c. Control Logic Documentation

1) To facilitate this submittal, a digital, searchable and cross-referenced version of the Sequences of Operations will be provided to the DDC Contractor upon request to the Engineer of Record.

2) Submit control logic program consistent with specified English-language Sequences of Operation for all control units.

a) Control logic programming shall be visual logic programming if that is used by the control system, line code otherwise.

b) Control logic shall be annotated to describe how it accomplishes the sequence of operation. Annotations shall be sufficient to allow an operator to relate each program component (block or line) to corresponding portions of the specified Sequence of Operation.

3) Submit as-programmed English-language Sequences of Operation with each control sequence updated to reflect any suggested changes made by the DDC Contractor. **Changes shall be clearly marked.** SOO shall be fully consistent with submitted programming.

a) All changes to SOO require review and approval of the Engineer of Record. DDC Contractor is strongly encouraged to provide an informal pre-submittal (see Paragraph 1.8F.1) of suggested or desired changes to control sequence logic.
b) Changes which are inconsistent with the intent of the SOO or may negatively impact energy consumption or occupant comfort are not acceptable and will be rejected.

c) Only SOO reviewed and accepted by the Engineer of Record shall be installed in DDC System.

4) Include control settings, setpoints, throttling ranges, reset schedules, adjustable parameters and limits.

5) Submit one complete set of programming and operating manuals for all digital controllers concurrently with control logic documentation.

d) Graphic screens of all required graphics, provided in final colors. Provide flowchart, page map, or other means of indicating how screens are related to each other and how operator is intended to navigate between them.

e) Description of points database, including database capacity and any limitations to expansion of database.

f) Description of trend archive database, including database capacity and any limitations to expansion of database.

g) Description of system operation under potential failure conditions, including:

   1) Loss of power.
   2) Loss of network communication signal.
   3) Loss of controller signals to inputs and outputs.
   4) Operator workstation failure.
   5) Server failure.
   6) Gateway failure.
   7) Network failure.
   8) Controller failure.
   9) Instrument failure.

h) Site Conditions Report per Paragraph 3.3D if not previously submitted.

i) Format

   1) Coordination plan: Word-searchable format per Paragraph 1.8E.
   2) Points list: Word-searchable format per Paragraph 1.8E.
   3) As-programmed Sequences of Operation: Microsoft Word format per Paragraph 1.8E.
   4) Programming

      a) Graphical programming: Native electronic file if interpreter is freely available (e.g. ALC Eikon); otherwise provide digital image (JPG, PNG, etc.) or PDF document of screens.

      b) Line code programming: Word-searchable format per Paragraph 1.8E.

   5) Programming and operating manual: Word-searchable electronic format per Paragraph 1.8E.

   6) Graphics: Digital images (JPG, PNG, etc.) or PDF document.

4. Submittal Package 3 (Testing Forms)

   a). Provide Pre-Functional Test forms (Paragraph 3.16B.1) for approval.

   b) Provide Setpoint Determination coordination plan and forms as required by Paragraphs 3.16B.2 and 3.4F for approval.

   c) Provide review of Functional Test forms (Paragraph 3.16B.3) for approval.

   d) Format: Word-searchable format per Paragraph 1.8E.

5. Submittal Package 4 (Training Materials)

   a) Provide training materials as described in Article 3.17.

   b) Format: Word-searchable format per Paragraph 1.8E.
6. Submittal Package 5 (Post-Construction Trend Test)
   a. Provide a list of points being trended and trend basis (time frequency or change-of-value). See Paragraph 3.6E for initial trends.
   b. Provide trend logs as required by Paragraph 3.16G.
   c. Format shall be XLS or CSV, organized as described in Paragraph 3.16G.2.d.

7. Submittal Package 6 (End-of-Warranty Trend Test)
   a. Provide a list of points being trended and trend basis (time frequency or change-of-value). Create a new list – do not simply re-use list provided with Submittal Package 5 – to ensure that any changes in trend logging are captured.
   b. Provide trend logs as required by Paragraph 3.16G.
   c. Format shall be XLS or CSV, organized as described in Paragraph 3.16G.2.d.

1.9 COMPLETION REQUIREMENTS

A. Procedure
   1. Until the documents required in this Section are submitted and accepted, the system will not be considered accepted and final payment to DDC Contractor will not be authorized.
   2. Before requesting acceptance of Work, submit one set of completion documents in digital format only for review and approval by Engineer of Record and by Commissioning Authority or Owner’s Representative.
   3. After review, furnish quantity of sets (digital and hardcopy) indicated below to Owner.

B. Documents. Provide in both paper and electronic format per Paragraph 1.9C
   1. Operation and Maintenance (O&M) Manuals: In addition to items specified in Division 1 and Division 23, include the following:
      a. Include all submittals (product data, shop drawings, control logic documentation, hardware manuals, software manuals, installation guides or manuals, maintenance instructions and spare parts lists) in maintenance manual.
      b. As-built versions of submittal shop drawings
      c. As-built versions of submittal product data
      d. As-built network architecture drawings showing all BACnet nodes including specific controller and device identification, description and location information.
      e. As-built Point Summary Table per Paragraph 3.10D
      f. English language Sequences of Operations updated to reflect final programming installed in the DDC System at the time of system acceptance.
      g. A BACnet Protocol Implementation Conformance Statement (PICS) for each type of controller and operator interface.
      h. Names, addresses, e-mail addresses and 24-hour telephone numbers of DDC Contractor and service representatives for DDC system and products.
      i. Operator's manual with procedures for operating control systems including logging on and off, handling alarms, producing point reports, trending data, overriding computer control and changing set points and variables.
      j. Programming manuals with description of programming language and syntax, of statements for algorithms and calculations used, of point database creation and modification, of program creation and modification, and of editor use.
      k. Engineering, installation, and maintenance manuals that explain how to:
         1) Design and install new points, panels, and other hardware
         2) Perform preventive maintenance and calibration
         3) Debug hardware problems
         4) Repair or replace hardware
l. Documentation of all programs created using custom programming language including set points, tuning parameters, and object database.

m. A copy of the Setpoint Determination Report per Paragraph 3.16D.3 which reflects the work described in the coordination plan (Paragraph 3.4F.3). Do not include the entire TAB Contractor’s report; include only those Sections related to the parameters used for control.

dl. List of recommended spare parts with part numbers and suppliers.

m. Complete original-issue documentation, installation, and maintenance information for furnished third-party hardware including computer equipment and sensors.

n. Licenses, guarantees, and warranty documents for all equipment and systems, including the start and end date for each.

o. Recommended preventive maintenance procedures for system components, including schedule of tasks such as inspection, cleaning, and calibration; time between tasks; and task descriptions.

p. Training materials as described in Article 3.17

2. Original issue CDs/DVDs for all software provided, including operating systems, programming language, operator workstation software, and graphics software. “Burned” copies of commercial software discs are not acceptable.

3. Complete copy of DDC System databases, user screens, graphics, setpoints and all configuration settings. Include all data necessary to recover from complete loss of server and/or controller programming, and to restore the DDC System in the same configuration as at the time of system acceptance.

4. Access Credentials: Provide usernames and passwords required to log into DDC System at all defined access levels (administrator, operator, etc.), as coordinated with Owner. Default passwords shall not be used. See Paragraph 2.4A.6.

5. Commissioning Reports: Completed versions of all Pre-functional, Functional, and Demonstration Commissioning Test reports, calibration logs, etc., per Article 3.16.

6. Copy of inspection certificates provided by the local code authorities.

C. Format of Completion Documents

1. Provide the type and quantity of media listed in table:

<table>
<thead>
<tr>
<th>Document</th>
<th>Paper (binder or bound)</th>
<th>Digital Archive DVD (see 1.9C.2)</th>
<th>On Data Archive Server</th>
</tr>
</thead>
<tbody>
<tr>
<td>Project Record Drawings</td>
<td>2</td>

<td>1</td>
</tr>
</tbody>
</table>
2. If Data Archive Server is “Not Required” per Article 2.6, disregard that column in the table above. If Data Archive Server is included, all information listed above shall be stored on the Data drive.

3. Archive DVD shall use Verbatim UltraLife Gold Archival Grade DVD-R. Other brands of DVD, or the use of thumb drives, are not acceptable, as those media are not suitable for long-term data storage.

4. Access credential information shall be provided in hardcopy in a marked, sealed envelope directly to Owner, Owner’s designated representative, building stationary engineer, or head of maintenance. Obtain signed receipt for transfer of credential information.

5. Project database, programming source files, and all other files required to modify, maintain, or enhance the installed system shall be provided in their source format and compiled format (where applicable).

6. Where digital copies are specified, comply with the format requirements in Paragraph 1.8E.
   a. Drawings and schematics shall be provided in both PDF and AutoCAD-compatible format.

D. Permanent on-site documentation: For each control panel or enclosure, provide documentation as required by Paragraph 3.12B.4.b.

1.10 OWNERSHIP OF PROPRIETARY MATERIALS

A. All Project-developed software and documentation shall become the property of the Owner. These include, but are not limited to:
   1. Project graphic images
   2. Record drawings
   3. Project database
   4. Project-specific application programming code
   5. All trend and runtime data
   6. All reports prepared from DDC System trend or runtime data
   7. All documentation

B. All software tools, including programming, graphics, and documentation associated with the Project, or required for maintenance, configuration, expansion, or troubleshooting, shall be provided at no additional cost to the Owner.

C. If any software is limited by time-period (e.g., annual) license or subscription:
   1. Provide software with a license for a minimum of 5 years as part of the base bid.
   2. License shall permit unlimited use of all features required by this Section and/or available upon installation for the duration of the license.
   3. License shall support expansion of the DDC System to an ultimate capacity greater than that originally installed. See Paragraph 2.3G for expandability requirements.
   4. Clearly indicate in bid which software is so licensed, the time period of the license (annual, etc.) and the periodic licensing fee that will be required after the initial five years.

D. The Owner shall be the named license holder of all software associated with the execution of this Project, or required for future maintenance, configuration, expansion, or troubleshooting.
1.11 WARRANTY

A. At the successful completion of the final testing, commissioning, and demonstration phase in accordance with the terms of this Specification, if equipment and systems are operating satisfactorily to the Owner and if all completion requirements per Paragraph 1.9 have been fulfilled, the Owner shall certify in writing that the DDC System has been accepted. The date of acceptance shall be the start of the warranty period.

1. The DDC System warranty period shall be independent of the warranty period for other building systems. Neither “substantial completion”, “beneficial use” nor the certificate of occupancy shall necessarily be deemed as the start of the DDC System warranty period. The start of the warranty period shall depend solely upon the acceptance of the completion requirements as outlined above.

B. Guarantee all materials, equipment, apparatus and workmanship (including programming) to be free of defective materials and faulty workmanship for at least the following periods from date of acceptance:

1. Controllers (BCs, AACs, and ASCs), routers and gateways: two years
2. Valve and damper actuators: two years
3. Temperature, humidity, and CO\textsubscript{2} sensors: five years
4. Programming: one year
5. All else: one year

C. Provide new materials, equipment, apparatus and labor to replace that determined by Owner to be defective or faulty.

D. Control system failures during the warranty period shall be adjusted, repaired, or replaced at no additional cost or reduction in service to the Owner. Contractor shall respond to the Owner’s request for warranty service within 24 hours during normal business hours.

E. Operator workstation software, Project-specific software, graphic software, database software, and firmware updates that resolve known software deficiencies shall be provided at no cost to the Owner during the programming warranty period.

F. Sequence of operation programming bugs (both due to programming misinterpretations and sequence errors) shall be corrected and any reasonable control sequence changes required to provide proper system operation shall be provided at no additional cost to the Owner during the programming warranty period.

G. For equipment with manufacturer’s warranty in excess of DDC System warranty periods described above, DDC Contractor shall provide Owner with original manufacturer’s warranty certificates.

1.12 WARRANTY MAINTENANCE

A. The Owner reserves the right to make changes to the DDC System during the warranty period. Such changes do not constitute a waiver of warranty. The DDC Contractor shall warrant parts and installation work regardless of any such changes made by the Owner, unless the DDC Contractor provides clear and convincing evidence that a specific problem is the result of such changes to the DDC System.

B. At no cost to the Owner, provide services for software and hardware components during the warranty period as specified below:
1. Emergency Service: Any malfunction, failure, or defect in any hardware component or failure of any control programming that would result in property damage or loss of comfort control shall be corrected and repaired following notification by the Owner to the DDC Contractor.
   a. Response by telephone or via internet connection to the DDC System to any request for service shall be provided within two hours of the Owner’s initial request for service.
   b. In the event that the malfunction, failure, or defect is not corrected, at least one technician, trained in the system to be serviced, shall be dispatched to the Owner’s site within eight hours of the Owner’s initial request for such services.

2. Normal Service: Any malfunction, failure, or defect in any hardware component or failure of any control programming that would not result in property damage or loss of comfort control shall be corrected and repaired following notification by the Owner to the Contractor.
   a. Response by telephone or via internet connection to the DDC System to any request for service shall be provided within eight working hours of the Owner’s initial request for service.
   b. In the event that the malfunction, failure, or defect is not corrected, at least one technician, trained in the system to be serviced, shall be dispatched to the Owner’s site within three working days of the Owner’s initial request for such services, as specified.

3. Service Telephone Numbers: Contractor shall specify a maximum of three telephone numbers for Owner to call in the event of a need for service. At least one of the lines shall be attended continuously (24/7). Alternatively, pagers/SMS can be used for technicians trained in system to be serviced. One of the three paged/texted technicians shall respond to every call within 15 minutes.

4. Technical Support: Contractor shall provide technical support by telephone throughout the warranty period.

5. Documentation: Record drawings and software documentation shall be updated as required to reflect any and all changes made to the system or programming during the warranty period.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Subject to compliance with the requirements of this Specification, provide products by the following manufacturer:
   1. Automated Logic Corporation: www.automatedlogic.com

B. To encourage competitive bidding and protect the Owner from vendor lock-in, only product lines with multiple installer/contractor options are permitted to bid on this spec. DDC manufacturers and/or contractors with exclusive territories that restrict bidding to a single installer within the project’s geographic region are not acceptable.

C. All DDC System networked devices specified herein including controllers, routers, and software shall be provided by one of the manufacturers listed above.
   1. OEM and/or private-labelled controllers, or software, developed by a third party and labelled or otherwise represented as being a product of one of the allowable manufacturers listed above shall not be accepted.
2. Non-networked system components specified herein (including sensors, valves, dampers, etc.) need not be manufactured by the above manufacturers.

D. The DDC System product line selected shall be the most current and complete offering from the manufacturer and shall currently be actively manufactured and supported at the time that this Project is bid.
   1. This Project shall not be used as a test site. First release and test version hardware, software and firmware shall not be used on this Project under any circumstances.

E. DDC System devices and spare components or equivalent shall be readily available for a minimum of five (5) years after the completion and final acceptance of this Project.

F. Deviations from Specification
   1. DDC Contractor shall thoroughly review this specification and note all items which do not comply with the listed requirements.
   2. For each item not fully in compliance, DDC Contractor shall provide a brief narrative describing the discrepancy. Include for each item a reference to the applicable paragraph of this document.
   3. Document all deviations from this Section.
      a. In general, deviations which do not compromise the performance, efficiency, or interoperability goals of the Project will be permitted.
      b. All deviations must be documented at this time. Deviations discovered later in the Project process, particularly after installation has begun, shall not be accepted.
      c. Acceptance or rejection of deviations from the requirements of this Section is at the discretion of the Engineer of Record.
   4. Include review and narratives with Submittal Package 1.

G. DDC Contractor Feedback
   1. DDC Contractor may at their option provide comments and feedback about elements of this and other Division 25 Sections which are in his/her opinion onerous, adding unnecessary cost, or potentially reducing the quality or efficiency of the DDC System. Contractor is encouraged to suggest alternative solutions.
   2. Items so noted will be reviewed by the Engineer of Record. Suggestions which do not compromise the performance, efficiency or interoperability goals of the Project may be accepted by the Engineer of Record.
   3. Requests to allow networked devices or control systems that are not fully BACnet compliant will not be accepted.
   4. If Engineer of Record does not respond to feedback/suggestions, this shall not be taken as a sign of acceptance. Unless explicitly indicated in writing by Engineer of Record, DDC Contractor is responsible for meeting all requirements of this and related Sections, regardless of perceived difficulty or cost.
   5. Include comments and feedback with Submittal Package 1.

H. Substitutions
   1. Substitutions shall be considered only after an extensive function-by-function comparison, additional reference checks, and the approval of the Engineer of Record.
   2. If DDC Contractor wishes to provide product from a manufacturer not listed in this Part of the Section, submit the following information to support the product under consideration:
      a. Product details: Submit complete documentation of the product. Provide literature, cutsheets etc. that document the product’s compliance with all relevant codes, standards, certifications, and listings required per this Section. Provide explanations for any requirements which cannot be substantiated from product literature.
b. Comparison: Submit extensive and detailed comparison of the product relative to this Section. Submit a copy of the applicable portions of this Section, with a note or comment for each requirement, indicating whether the proposed product complies or suggesting why compliance with a particular requirement is not necessary or appropriate for the needs of the design and the Project.

c. References: Ten completed buildings that are comparable in size, principal occupancy, climate type, and system types which have successfully utilized the product.

d. Substitution requests which are not accompanied by adequate documentation per this Paragraph shall be returned without further action.

3. All requested substitutions shall be submitted with Submittal Package 1.

4. DDC Contractor shall not supply or install any hardware or software that is a substitution relative to the basis of design without written approval from the Engineer of Record.

2.2 PERFORMANCE REQUIREMENTS

A. Environmental Conditions

1. All DDC System components provided under this Specification shall operate under ambient environmental conditions of 32°F to 122°F dry-bulb and 10% to 90% relative humidity, non-condensing as a minimum.

   a. It is the DDC Contractor’s responsibility to identify locations subject to more extreme conditions, particularly rooftop and outdoor installations, and provide products suitable for those locations.

2. Sensors and control elements shall be constructed of material suitable and rated for the media sensed under the ambient environmental temperature, pressure, humidity, and vibration conditions encountered for the installed location.

3. Power Conditions: Networked components of the DDC System shall be able to operate at 90% to 110% of nominal voltage rating and shall perform an orderly shutdown below 80%.

4. Noise Immunity: Networked components of the DDC System shall be protected against electrical noise of 5 to 120 Hz and from keyed radios with up to 5 watts power located within 36 inches of device or enclosure.

B. DDC System Speed

1. The communication speed between the controllers, routers, and operator interface devices shall be sufficient to ensure fast system response time under all loading conditions, including during collection of specified trend data.

   a. In no case shall delay times between an event, request, or command initiation and its completion be greater than those listed herein, assuming no other simultaneous operator activity.

   b. Reconfigure LAN or provide additional capacity as necessary to accomplish these performance requirements.

2. I/O Response Time

   a. Object scan: All input points connected to DDC system shall update at least every five seconds for use by DDC controllers.

   b. Object command: All devices shall begin to respond to an automatic (generated by software) command of a binary or analog object within 2 seconds.

   c. Operator command: All devices shall begin to respond to a manual (generated by operator) command of a binary or analog object within 5 seconds.
d. Graphics Refresh: The maximum time between an operator's selection of a graphic and it completely painting the screen and updating at least 50 points shall be less than 10 seconds.

3. Alarm Response
   a. The maximum time between a device going into alarm and the annunciation of the alarm shall not exceed 10 seconds for a Level 1 or Level 2 alarm, or 20 seconds for other alarms.
   b. Each workstation on the DDC LAN shall receive alarms within 5 seconds of other workstations.

4. Processing Speed
   a. Program Execution Frequency: Custom and standard applications shall be capable of running as often as once every second. Contractor shall be responsible for selecting execution times consistent with the process under control.
   b. Control Loop Performance: Programmable controllers shall be able to execute DDC PID control loops at a selectable frequency of at least once per second. The controller shall scan and update the process value and output generated by this calculation at this frequency.

C. Accuracy and Precision
   1. DDC Contractor shall select sensors, wiring method, transmitters, A/D conversion bits, etc. to provide an end-to-end (fluid to display) sensor accuracy and resolution as specified herein.
      a. DDC sensors shall provide end-to-end accuracy equal to or better than the following:

<table>
<thead>
<tr>
<th>Measured Variable</th>
<th>Accuracy</th>
</tr>
</thead>
<tbody>
<tr>
<td>Space Temperature (drybulb)</td>
<td>±1.0°F</td>
</tr>
<tr>
<td>Slab-Embedded Temperature</td>
<td>±0.5°F</td>
</tr>
<tr>
<td>Ducted Air Temperature (drybulb)</td>
<td>±0.5°F</td>
</tr>
<tr>
<td>Mixed Air Temperature (drybulb)</td>
<td>±1.0°F</td>
</tr>
<tr>
<td>Outdoor Air Temperature (drybulb)</td>
<td>±0.5°F</td>
</tr>
<tr>
<td>Outdoor Air Relative Humidity</td>
<td>±3% RH</td>
</tr>
<tr>
<td>Space Relative Humidity</td>
<td>±5% RH</td>
</tr>
<tr>
<td>Air Flow (terminal)</td>
<td>±10% of span*</td>
</tr>
<tr>
<td>Air Flow (measuring stations)</td>
<td>±5% of span</td>
</tr>
<tr>
<td>Air Flow (pressurized spaces)</td>
<td>±5% of span</td>
</tr>
<tr>
<td>Air Pressure (ducts)</td>
<td>±0.05 in-wg</td>
</tr>
<tr>
<td>Air Pressure (space)</td>
<td>±0.01 in-wg</td>
</tr>
<tr>
<td>Carbon Dioxide (CO₂)</td>
<td>±75 PPM</td>
</tr>
<tr>
<td>Carbon Monoxide (CO)</td>
<td>±5% of reading</td>
</tr>
<tr>
<td>Chilled and Condenser Water Temperature (at central plant)</td>
<td>±0.2°F</td>
</tr>
<tr>
<td>Chilled and Condenser Water Temperature (general)</td>
<td>±0.5°F</td>
</tr>
<tr>
<td>Hot Water Temperature</td>
<td>±1.0°F</td>
</tr>
<tr>
<td>Water Differential Temperature (at central plant or BTU meter)</td>
<td>±0.25°F</td>
</tr>
<tr>
<td>Water and Gas Flow</td>
<td>±2% of span</td>
</tr>
<tr>
<td>Water Pressure (differential or absolute)</td>
<td>±2% of span</td>
</tr>
<tr>
<td>Non-Utility Power Meters (Amps, Volts, Watts, Power Factor)</td>
<td>±2% of reading</td>
</tr>
</tbody>
</table>

* Applies to 10% - 100% of scale
Note that in many cases accuracy is specified relative to full span (i.e. from minimum to maximum value that will be measured in the application), not full range (i.e. capabilities of sensor). This means that if a sensor’s range is twice what is required for the application (i.e. range is 2 times span) then its accuracy over range must be twice as accurate as specified in this Section.

b. DDC sensors shall provide end-to-end (fluid to display) resolution no worse than half of the specified accuracy.
c. Long-term electronic drift shall not exceed 0.4% per year.

2. Values displayed on graphical screens and recorded in database shall have the following precision:
   a. Values less than 1: three decimal places
   b. Values less than 10: two decimal places
   c. Values between 10 and 999: one decimal place
   d. Values over 1000: integer values only

D. Control Stability
   1. Except as noted in Sequences of Operation, tune all control loops to obtain the fastest stable response without hunting, offset, or overshoot.
   2. Control loops shall maintain each controlled variable at setpoint within the following tolerances:

<table>
<thead>
<tr>
<th>Controlled Variable</th>
<th>Tolerance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Space Temperature (drybulb)</td>
<td>±1.5°F</td>
</tr>
<tr>
<td>Ducted Air Temperature (drybulb)</td>
<td>±2.0°F</td>
</tr>
<tr>
<td>Humidity</td>
<td>±5% RH</td>
</tr>
<tr>
<td>Duct Air Pressure</td>
<td>±0.1 in-wg</td>
</tr>
<tr>
<td>Building or Relief Plenum Air Pressure</td>
<td>±0.01 in-wg</td>
</tr>
<tr>
<td>Air Flow</td>
<td>±10%</td>
</tr>
<tr>
<td>Air Flow (pressurized spaces)</td>
<td>±5%</td>
</tr>
<tr>
<td>Chilled Water Temperature</td>
<td>±1.0°F</td>
</tr>
<tr>
<td>Condenser Water Temperature</td>
<td>±2.0°F</td>
</tr>
<tr>
<td>Hot Water Temperature</td>
<td>±3.0°F</td>
</tr>
<tr>
<td>Water Flow</td>
<td>±10%</td>
</tr>
<tr>
<td>Water Differential Pressure</td>
<td>±1.5 PSI</td>
</tr>
<tr>
<td>Other</td>
<td>±2 x accuracy</td>
</tr>
</tbody>
</table>

   3. Control loop shall return its controlled variable to specified tolerances within 3 minutes of any disturbance (equipment startup excepted).

E. Standalone Operation
   1. System design shall eliminate dependence on any central device for alarm generation and control execution. Each controller shall operate independently, performing its own control, alarm management and trend data collection. See Paragraph 2.8D.
   2. All logic, data and sensor inputs required to perform the specified Sequence of Operation, trending and alarming as outlined in this Specification and the Sequence of Operations shall reside in each individual DDC controller, with the exception of certain global points (see Paragraph 3.10B.3).
   3. Should network communications fail, each controller shall automatically continue to execute local control strategies based on local sensor inputs and last-known or default values for global points.
F. Overrides

1. Values for all points, including real (hardware) points and virtual (software) points used in Sequences of Operations (Section 25 90 00) shall be capable of being overridden by the user with appropriate access level.
   a. If DDC System is unable to provide this functionality for hardware points, each hardware point shall be equated to a software point and the software point shall be used in all sequences.

2. Operator overrides shall remain in effect until they expire (timed overrides) or are released/cancelled (indefinite overrides). The DDC System shall not reset active overrides during a data scan/update.

3. The graphical user’s interface shall be designed to make it obvious when a point has been overridden. See Paragraph 3.7A.7.

G. Command Priority

1. The system shall observe the BACnet command priorities, including the following (from highest to lowest):
   a. Life Safety (Priority Level 1 & 2).
   b. Manual Operator Command (Priority Level 5 or 8).
   c. Energy Management (Priority Level 9).
   d. Normal Automatic Control (Priority Level 10 or greater).

2. Operator overrides shall have a higher command priority than automatic/programmed commands generated by the Sequence of Operations.

3. The Superuser (see Paragraph 3.6C.1) shall have a higher (i.e. more dominant) command priority than other users.

H. Alarms and Events

1. The system shall support a minimum of 50 configurable event notification categories. The user shall be able to assign any event or alarm to one or more category.

2. All events shall be generated at the control module level and shall record time and date from the originating local control module.

3. Alarm properties shall be defined using BACnet Event templates, including all the following information:
   a. Name
   b. Verbose description
   c. Alarm level
   d. Whether acknowledgement is required
   e. Whether alarm can clear automatically (i.e. whether acknowledgement of return to normal operation required)
   f. Event reporting action

4. Event Reporting Actions shall be configurable to automatically respond to any individual alarm/event or any alarm/event category. At least the following actions shall be supported:
   a. Display a message (the event message or another predefined message, including images) in a pop-up window at the graphical interface
   b. Save/export message to a text file
   c. Run an external program or routine
   d. Write property to any BACnet device, allowing alarm to change equipment operating mode
   e. Generate an audible annunciation at the operator’s workstation
   f. Notify operators by email, SMS/text-message, or pager
5. System shall support custom lists of individuals to be notified for any individual alarm/event or any alarm/event category.

I. Protection of Products
   1. Enclosures: Control products shall be protected with integral or secondary enclosures as described in Article 2.13.
      a. Products shall operate without performance degradation under ambient environmental temperature, pressure and humidity conditions at installed location.
      b. Active environmental control of enclosures is only acceptable under certain conditions. See Paragraph 2.14C.
   2. Surge Protection: Protect all control products connected to AC power circuits from power line surges to comply with requirements of IEEE C62.41. See Paragraph 2.15F.
   3. Power Conditioning: Protect susceptible control products connected to AC circuits from power irregularities and noise. See Paragraph 2.15G.
   4. Ground Fault: Protect all control products from ground faults and ground loops by providing suitable grounding. Products shall not fail due to ground fault condition.

J. Backup Power or UPS
   1. HVAC systems and equipment served by a backup power source or UPS shall have associated DDC system products that control such systems and equipment also served from a backup power source or UPS. See also Paragraph 3.13C.
   2. The Data Archive Server, if provided, shall have a UPS. See Article 2.6.
   3. See Paragraph 2.15D for UPS device requirements.
   4. Additional DDC System components that shall be an emergency power circuit shall include the following:
      a. None required
   5. Additional DDC System components that shall be provided with uninterruptible power shall include the following:
      a. None required

K. Continuity of Operation after Electric Power Interruption
   1. Upon availability of backup power or return to normal power conditions, equipment and associated controls shall automatically return to the operating state occurring immediately before loss of normal power, without need for operator intervention.
   2. Equipment startup shall be automatically staggered to avoid creating demand spikes, per Paragraph 2.8S.4.

2.3 SYSTEM ARCHITECTURE

A. General
   1. The system shall be configured as a distributed processing internetwork capable of expansion as specified herein.
   2. All control products provided for this Project shall comprise an interoperable Native BACnet System. All control products provided for this Project shall conform to ASHRAE Standard 135.
   3. Provide hardware and software resources sufficient to meet the functional requirements specified in this Section. Include all items not specifically described in this Section that are necessary to implement, maintain, and operate the system in compliance with the functional intent of this Specification.
B. Networking Requirements

1. The DDC internetwork shall be open and non-proprietary, and available to other companies for use in making future modifications to DDC system.

2. The ASHRAE 135 BACnet communication protocol shall be sole and native networking protocol used throughout entire DDC system. Only native BACnet control devices shall be used without explicit written permission by the Engineer of Record.

3. Communication gateways, bridges, protocol translators or any other device that translates any proprietary communication protocol to BACnet are not acceptable as a part of the Work under this Section, with specific exceptions. See Paragraph 2.7E.

4. DDC System shall communicate via a dedicated control internetwork that is not shared with other building systems or tenant data and communication networks.
   a. The Owner’s IT network shall not be used for control purposes.
      1) Exception: Supervisory Network may utilize existing Wide Area Network (WAN) if DDC System spans multiple buildings, with permission of Owner.
   b. If permitted by Owners, control internetwork may share router hardware and physical network infrastructure if there is sufficient capacity. Control internetwork must be logically separated from IT network (e.g. by vLAN).
   c. Any use of Owner’s IT infrastructure requires written permission from Owner. DDC Contractor shall coordinate with Owner and Owner’s IT staff.

5. DDC System as provided under this Section shall implement the following BACnet data links only:
   a. BACnet/IP
   b. BACnet Master-Slave/Token-Passing (MS/TP)
      1) MS/TP network backbone speeds shall be 76,800 bps if possible, and no less than 38,400 bps in any case.
      2) Speeds of 9,600 bps or 19,200 bps shall be permitted to connect with specific devices that cannot support higher speeds.
      3) No other speeds shall be acceptable.
   c. Point-to-Point (PTP), for dial-up access, only if required.
   d. BACnet Ethernet (ISO 8802.3).
   e. All other BACnet data links shall be excluded from this Project. Other non-BACnet data links and protocols such as TCP/IP, SMTP, and HTTP, are permitted as required elsewhere in this Section.

6. MS/TP networks are limited as follows:
   a. No single MS/TP network shall exceed a wire run length of 2,000 feet.
   b. Repeaters/amplifiers shall not be used.
   c. Only MS/TP Master devices are permitted. MS/TP slave devices shall not be used.
   d. No single MS/TP network shall exceed 32 full-load nodes.
      1) For the purposes of this Specification, any devices that do not support both the Read Property Multiple (RPM) service and Data Segmentation for both Transmit and Receive, shall be considered full-load nodes.
   e. No single MS/TP network shall exceed 64 devices total, regardless of load level.

7. Irrespective of other network connectivity requirements or lack thereof, the DDC System shall be configured such that devices supporting SMTP can send (but not receive) email over the public internet. This capability shall be used to notify operators of events and alarms as detailed elsewhere in this Section.
8. Wireless communication in any control LAN is not acceptable without review and approval by the Engineer of Record. DDC Contractors who wish to use wireless devices or networking are strongly encouraged to use the pre-submittal process (see Paragraph 1.8F.1).

C. Network Architecture: The DDC network shall consist of no more than three levels of networks.

1. A Supervisory Control Network may be used to connect building controllers, servers and operator workstations.
   a. Supervisory Network may be a Local Area Network, or it may span multiple buildings or locations as a Wide Area Network (WAN).
   b. Supervisory Network link layer shall be Ethernet (IEEE802.3).
   c. Supervisory Network networking layer shall be BACnet/IP and shall share a common network number for the Ethernet backbone, as defined in ASHRAE Standard 135.
   d. Supervisory Network, including all routers and switches, shall support no less than 100 Mbps.
   e. Powerline communications is not acceptable.

2. A Primary Control LAN shall connect advanced application controllers to building controllers and to other advanced application controllers. The Primary LAN communicates exclusively control information.
   a. Each Primary LAN shall be contained within a single building. A single Primary LAN shall not span multiple buildings.
   b. Primary LAN link layer shall be Ethernet (IEEE802.3) or MS/TP.
   c. Primary LAN networking layer shall be BACnet/IP, BACnetEthernet, or MS/TP as defined in ASHRAE Standard 135.
   d. If a Primary LAN communications trunk is severed, the network shall reconfigure itself into separate LANs and continue operations without interruption or requiring operator intervention.
   e. Primary LAN, including all routers and switches, shall support no less than 100 Mbps.
   f. Powerline communications is not acceptable.

3. Secondary Control LANs shall connect application specific controllers to other application specific controllers and to terminal control devices such as networked thermostats. Each Secondary Control LAN shall connect to a Primary Control LAN via a BACnet router, or via an advanced application controller or building controller.
   b. Secondary LAN link layer shall be Ethernet (IEEE802.3) or MS/TP.
   c. Secondary LAN networking layer shall be BACnet/IP or BACnet MS/TP as defined in ASHRAE Standard 135.
   d. Secondary LAN speed and bandwidth shall be dictated by the number of controllers on the LAN, response time and trending requirements, but shall be no less than 38.4 kbps (BACnet MS/TP) or 10 Mbps (BACnet/IP).

4. The network architecture, and number and type of LANs shall be transparent to operator. All I/O points residing on any LAN shall be capable of global sharing between all DDC System networks.

5. To the extent feasible, Secondary Control LANs shall be configured so that the control network architecture parallels the mechanical system architecture. For example, a Secondary LAN of VAV controllers should connect directly to the advanced application controller or building controller which controls the air handler that serves the VAV boxes.
D. System Software

1. DDC System Software shall include a BTL-listed BACnet Advanced Workstation (B-AWS) that supports full-featured supervision, configuration, programming and control of the DDC System. See Paragraph 2.4C.
   a. DDC Contractor shall configure laptops, desktops and servers running B-AWS software to connect to the control internetwork. Portable devices running B-AWS shall be able to connect at any Ethernet port on the control internetwork.

2. DDC System Software shall include an Operator’s Web Interface (OWI) that supports complete supervisory access to DDC system and limited control functions via a web browser, without additional software requirements. See Paragraph 2.4B.

3. DDC System Software may include applications to store, manage, retrieve and/or analyze long-term trend data, if required in Article 2.4.

4. All actions shall be able to be performed over the DDC System internetwork. Systems that require direct connection to DDC field devices or controllers for any of these services are not acceptable.

5. All System Software shall be provided and licensed to the Owner per Paragraphs 1.2B.2 and 1.10B.

E. Servers and Operator’s Interface Devices

1. Provide interface device hardware for operators as detailed in Article 2.5.

2. Provide a Data Archive Server if required in Article 2.6.

F. Operator Means of Access

1. DDC Contractor shall configure hardware and software to support the following means of access to the DDC System:
   a. Desktop or portable computer running B-AWS software via hardwired connection to control internetwork or any controller
   b. Portable computer using B-AWS for remote access via hardwired or wireless internet connection and Owner’s VPN tunnel, if required in Paragraph 2.4C.11
   c. Any supported browser using OWI through hardwired connection to control internetwork.
   d. Any supported browser using OWI for remote access via hardwired or wireless connection to Owner’s IT network, and/or via internet connection and Owner’s VPN tunnel if required in Paragraph 2.4B.10.
   e. Portable Operator’s Terminal (POT) via hardwired connection to control internetwork or any controller. Required only if POT is provided per Paragraph 2.5C.
   f. Mobile computing device ("smart" phones, tablets, etc.) using app supplied by DDC System manufacturer or DDC Contractor, via wireless connection to control internetwork. Required only if such an app is available and is desired by Owner.

2. Access to DDC System, regardless of operator means used, shall be transparent to operator.

3. Provide network ports for hardwired connection to controls internetwork. Connect to Supervisory Network if installed, or to Primary LAN if Supervisory Network is not included in Project. Network ports shall be easily accessible, properly protected, clearly labeled (see Article 3.16), and installed at the following locations as applicable to the Project:
   a. Each mechanical equipment room.
   b. Each boiler room.
   c. Each chiller room or outdoor chiller yard.
   d. Each cooling tower location.
   e. Each different roof level with roof-mounted air-handling units or rooftop units.
4. DDC System shall be able to accommodate at minimum five simultaneous operators that are accessing DDC system through any of the means indicated, without impacting performance.

G. Future Expandability

1. System architecture shall be modular. DDC System shall be able to be expanded to an ultimate capacity of at least twice the initial capacity with no impact on performance.
2. Initial network infrastructure shall be designed and installed to support ultimate capacity.
3. Additional DDC controllers and associated wiring shall be all that is needed to achieve ultimate capacity.
4. All controllers (VAV controllers and Application Specific Controls excepted) shall be provided with at least 20% spare point capacity. See Paragraphs 2.9C, 2.10C and 2.11C.
5. Operator interfaces installed initially shall not require hardware and software additions and revisions for ultimate capacity.
6. System architecture shall allow modifications without having to remove and replace existing network equipment.
7. Where any licensing is required, provide sufficient licenses for expansion to ultimate capacity (as above, NOT unlimited capacity) for a minimum of 5 years from start of DDC System warranty.

H. Special Network Architecture Requirements

1. Variable speed equipment: For any equipment such as pumps or fans which use variable speed control to maintain a measured value at a setpoint (e.g. duct static pressure or end of loop differential pressure), the following requirements apply in order to avoid poor control due to network lag or latency, and to maintain stand-alone operational capability in the event of a network failure.
   a. The control loop that calculates the speed command that is sent to the equipment shall be maintained in a DDC controller. Using the VFD’s onboard logic for this purpose is not acceptable, unless explicitly shown that way in Contract Drawing control schematics.
   b. The sensor(s) used for control shall be hardwired directly to the controller which calculates the speed command. Passing the sensor measurement through the network, or hardwiring to a different controller, is not acceptable.
   c. The controller which calculates the speed command shall be hardwired directly to the equipment which receives the speed command. Passing the speed command signal through the network is not acceptable.

2. Gateways: Where gateways are used, some points which are critical to proper operation shall be hardwired to the BAS, as indicated in the Contract Drawing control schematics. These points shall be hardwired even when they are available through the gateway.

2.4 SYSTEM SOFTWARE FUNCTIONS

A. General

1. The DDC System shall be provided with software and/or firmware which performs the functions described in this Article.
2. All System Software functions shall be hosted on one or more of the following platforms. Different functions may be hosted on different platforms, as dictated by system design and control products selection.
   a. Running as application software on the Data Archive Server, if one is present or provided
   b. Embedded in a BACnet Building Controller (B-BC)
c. Embedded in a BACnet control device dedicated to the purpose

3. The device(s) hosting the System Software shall reside on the Supervisory Network if one is present or provided, or on the Primary Control LAN otherwise. Communication shall be BACnet/IP.

4. Devices hosting System Software shall be always on and always connected to the control internetwork.
   a. Exception: This is not required for portable computers hosting the Advanced Workstation (B-AWS) interface.

5. All System Software functions shall be provided by native BACnet applications or devices. In each case, the BACnet operating stack must be embedded in the application core.

6. Security shall be multilayered, supporting at least five access levels with unique credentials for each user. See Paragraph 3.6C.

7. User Interface
   a. Each operator’s interface shall be a full-color graphical user interface (GUI) that supports multiple simultaneous information windows on a single screen.
   b. All interfaces shall be dynamic with displayed data automatically updated from the BACnet internetwork without user intervention or command.
   c. Operator shall be able to easily and intuitively navigate between graphic displays.
      1) Page elements shall be hyperlinked such that clicking on an element will “drill down” to the next level of detail.
      2) Every page shall have a “back” button to return to the previous level and a “home” button to return to the top level.
      3) Use colors in a consistent, logical and intuitive way. For example, indicate normal status with green and alarm status with red.
      4) See also Article 3.6J.
   d. Operator shall be able to individually change the size and location of on screen windows.
   e. The windowing environment shall allow the user to display and interact with several different views simultaneously.
      1) Example: Operator shall be able to compare the performance and operating characteristics of two systems side-by-side.
      2) Example: Operator shall be able to display and acknowledge alarm information without interrupting other work in progress.
      3) This functionality may be provided by support of multiple separate browser windows (for web-based interfaces) or by support of multiple window views within a single application.
   f. All interface elements and windows shall be legible and useable at any display resolution XGA (1024 x 768 pixels) or higher.
      1) Using a higher-resolution screen shall not result in text that is too small to read, or control elements that are too small to select accurately.
      2) Using a screen with a different aspect ratio shall not create distortion of windows, images or graphics.
   g. To the extent practical, all interfaces and windows shall use a common color scheme and common set of symbols and graphics. See also Article 3.6J.

8. Search Function: Provide a search capability that will search all Sequences of Operations for a given point name to determine all sequences that use or control the point.
9. Online Help: Provide a hypertext-based help system to assist the user in operation and modification of the system. Help shall be available for all system applications and shall be context-sensitive to provide information that is relevant to the active window or screen.

B. Operator’s Web Interface (OWI)

1. The Operator’s Web Interface (OWI) provides day-to-day monitoring and basic operation of the DDC System and BACnet internetworks through a web browser interface.
   a. The OWI shall provide the functions required for a BACnet Operator’s Workstation (B-OWS). The OWI shall be listed as a B-OWS or B-AWS by BACnet Testing Laboratories (BTL). Alternatively, non-listed software may be provided for this function but in that case DDC Contractor assumes all responsibility for compatibility, communication, or interoperability issues related to OWI software.
      1) The OWI shall allow the operator to access graphics, point displays, and trends, to create exception schedules, and to perform overrides of variables or points displayed on the control graphics.
      2) The OWI is not required to provide for configuration or programming of the DDC System.
   b. The OWI shall be based on server/thin-client architecture, designed around open standards of Web technology and HTML 5 graphics, which provides operators with complete supervisory access to the DDC System via a web browser. No Java plugins, ActiveX components, or any special software other than a web browser shall be required to access the full functionality described in this Paragraph. The current versions of the following standard web browsers shall be supported at a minimum:
      1) Apple Safari
      2) Google Chrome
      3) Microsoft Edge
      4) Microsoft Internet Explorer
      5) Mozilla Firefox

2. The OWI shall meet all requirements of Paragraph 2.4A in addition to the requirements described in this Paragraph.

3. The OWI shall support at a minimum the BACnet Interoperability Building Blocks (BIBBs) required for B-OWS.

4. User Interface
   a. With the proper credentials the operator shall be able to manually adjust all data point values (hardware or software) in the system, alter or lock control loop output values, set schedules, and command points to manual override, timed override and automatic mode.
   b. All graphical interface objects including animations shall be stored in the DDC System. Applications shall not require system graphics to be pre-loaded on the client browser.
   c. Operators shall have the ability to dynamically create messages associated with individual objects in any information window/view or associated to the window/view itself. These messages are persistent until erased and may be viewed and modified by other operators during other sessions.

5. Alarm/Event Processing
   a. The OWI shall display and log events from any BACnet object in the system and shall support operator configuration of alarm limits, differentials, states and reactions.
      1) The operator shall be able to view all current and past alarms/events from any location in the internetwork.
2) With the proper credentials, an operator shall be able to acknowledge and clear alarms.
3) Alarm log shall satisfy requirements of Paragraph 3.7L.3.

b. Also see Paragraph 2.2H for alarm/event capabilities.

6. Scheduling
   a. The interface shall support viewing existing schedules per Paragraph 3.7K.
   b. A properly-credentialed operator shall be able to create exception schedules from the daily, weekly, or monthly views.

7. Trend Logs
   a. OWI shall support the viewing and manipulation of trend data. Trend log creation/setup is not a required feature for the OWI.
   b. The interface shall be able to display trend data as timeseries graphs (i.e. two-axis (x, y) graphs that simultaneously display values relative to time).
      1) Graph shall be able to display at least eight objects in different colors, even if objects have been trended at different time intervals.
      2) Where trended values are COV, software shall automatically fill the trend samples between COV entries.
      3) A graph legend shall identify each variable plotted.
      4) Multiple scales shall be possible, one for each object, with range set automatically by the software but capable of being manually adjusted by the operator.
      5) Data shall be able to dynamically update at operator-defined intervals, including on a 1 second interval for loop tuning.
      6) It shall be possible to zoom-in on a particular section of a trend for more detailed examination and pan through historical data by simply scrolling the mouse.
      7) It shall be possible to pick (or float mouse over) any sample on a trend and have the numerical value displayed.
      8) These capabilities shall be intrinsic to the interface and shall not require the download of data to a separate application.
   c. The operator shall have the ability to pan through a historical trend and copy the data viewed to the clipboard using standard Windows keystrokes.
   d. Trend log data shall be able to be exported as tables in CSV or XLS formats. Interface shall be able to export at least 25 trends to a single file; solutions which require exporting each trend one at a time shall not be accepted.
   e. Graphical representations of trend data log data shall be able to be saved/exported as an image file in a common format (JPG, PNG, GIF, or TIFF).
   f. Trend log data stored on controllers and data stored on the Archive Server (if any) shall be integrated seamlessly, in the same table or graph, without additional effort from the operator.

8. Runtime Logging and Totalization
   a. The system shall provide runtime totalization for every binary object in the system which indicates the operation of equipment.
   b. The operator shall be able to create, view, and reset runtime logs via the interface.
   c. Runtime data shall be stored locally in the BACnet device which holds the binary object, using standard BACnet objects and properties.
   d. Runtime logs shall record total accumulated active time and total accumulated active transitions since last reset. Logs shall also record the timestamp and state for the last 100 transitions on a rolling basis.
1) Runtime data shall be preserved until reset by the operator. It shall not be overwritten, nor shall it be archived.

9. Provide an audit trail feature that automatically records the date, time, user, and action associated with all user access and changes to the DDC System.

10. Remote Access

a. DDC Contractor shall connect the device hosting the OWI to the Owner’s IT LAN or WAN. This connection shall permit any authorized user to access the OWI from any browser on the Owner’s IT network, but shall not permit access from outside the Owner’s network or via the World Wide Web.

b. DDC Contractor shall configure OWI for secure offsite access through a Virtual Private Network (VPN) tunnel.

1) The VPN tunnel and associated hardware and software shall be the responsibility of Owner’s IT staff.

2) VPN tunnel shall use login credentials established and maintained by Owner’s IT staff. These credentials shall be distinct from the DDC System user/password database described in Paragraph 3.6C.

3) Under no circumstances shall the B-OWI be accessible via the World Wide Web or over the public internet through means other than the VPN tunnel.

c. DDC Contractor shall coordinate with Owner’s IT department.

d. The OWI host device shall be configured to be always connected. See Paragraph 2.4A.4.

e. All communication on the IT LAN/WAN or the Internet shall utilize Secure Socket Layer (SSL) or Transport Layer Security (TLS) technology.

f. Proper credentials shall be required in order to log into OWI regardless of means of connection.

C. BACnet Advanced Workstation (B-AWS)

1. The BACnet Advanced Workstation (B-AWS) provides for the complete configuration, monitoring, modification, programming and operation of the entire DDC System.

2. The Advanced Workstation shall:

a. Comply with the minimum requirements of ASHRAE Standard 135 Annex L for a B-AWS and shall be certified and listed by the BACnet Testing Laboratories (BTL) as a B-AWS prior to the bid date for this Project.

b. Meet all requirements and provide all functions in Paragraph 2.4A.

c. Meet all the requirements and provide all functions in Paragraph 2.4B, except as follows:

1) The B-AWS may be a client-based application is not required to follow the thin client model or support access via web browser as described in Paragraph 2.4B.1.b.

2) The remote access provisions and connections described in Paragraph 2.4B.10 do not apply to the B-AWS. See Paragraph 2.4C.11 instead.

d. Meet all requirements and provide all functions described in this Paragraph (2.4C).

3. DDC System Configuration and Programming Capabilities

a. The B-AWS shall provide a complete engineering tool for the configuration of the system, allowing a properly-credentialed user to create, delete or modify any configuration parameter, program, graphic, trend log, alarm, schedule or BACnet object in the DDC System.

b. The B-AWS shall provide a complete programming environment for the creation and modification of control logic algorithms using graphics (wire sheet), text (line code) or some combination.
c. Provide a library of DDC algorithms, intrinsic control operators, arithmetic, logic and relational operators for implementation of Sequences of Operations. Include at least the following:

1) Proportional (P-only), proportional-integral (PI), and proportional-integral-derivative (PID) control loops.
2) Software tools for tuning control loops and adjusting gains.
3) Fully implemented intrinsic control operators including sequence, reversing, ratio, time delay, time-of-day, high-signal select, low-signal select.
4) Standard logic operators such as AND, OR, NOT, and XOR (exclusive OR).
5) Operators for basic arithmetic
6) Relational operators such as is-equal, not-equal, greater-than and less-than
7) Operators for square root, raise to a power (i.e. \( x^y \)), log, natural log, absolute value, and minimum/maximum value from a list
8) Basic trigonometric operators such as sine, cosine, and tangent
9) Psychrometric parameters: calculation of wetbulb, dewpoint, and enthalpy from drybulb temperature and relative humidity.

d. Include a search capability that will search all control sequences for a given point name to determine all sequences that use or control the point.

4. Groups
   a. The user shall be able to assign BACnet objects, parameters or points to groups manually, by type, or using wildcard search.
   b. A properly-credentialed user shall be able to apply batch modifications or overrides to an entire group with a single action.
   c. A single object or point may belong to more than one group. If multiple overrides conflict on a single object, the one with the highest assigned priority shall prevail.
   d. See Paragraph 3.6F.2 for initial configuration of groups.

5. Security
   a. Authorized users (see Paragraph 3.6C.1) shall have the ability to configure credentials for all other operators.

6. User Interface
   a. In addition to the other override capabilities described above, a user with proper credentials shall be able to
      1) Manually adjust control loop tuning parameters (gains) and employ loop tuning tools.
      2) Apply overrides (manual, timed, or return to automatic operation) to all members of a defined group of BACnet objects (see Paragraph 2.4C.4).
      3) View a list or generate a report of all points and objects currently in override.
      4) Globally release (i.e. return to automatic operation) all overridden points and objects.
      5) View and modify the status and present value of any BACnet object or property in the DDC System, including all real and virtual input and output points.
   b. A properly-credentialed user shall be able to create, edit, install and remove control programming from any device on the DDC system.
   c. A properly-credentialed user shall be able to
      1) Create new and edit existing graphical pages, views and displays, including read-only web pages served by the OWI (if applicable).
      2) Link graphical interface pages to DDC points, objects and control logic to create new dynamic control interfaces which are available through the OWI.
a) Graphic images may reside anywhere on the DDC System; however, all dynamic data and attributes must reside in its associated controller or device.

d. B-AWS software shall support at a minimum BMP, GIF, TIF, JPG, EMF, PNG, SWF and DIB graphic file formats and allow for the use of custom animation objects and URL hyperlinks.

e. See also Paragraph 3.6J

7. Scheduling

a. The B-AWS shall allow properly-credentialed users to create, delete, modify and view binary, analog and multistate BACnet Schedule objects and parameters.

b. All capabilities of the interface described in Paragraph 3.7K shall be available.

8. Trend Logs

a. The B-AWS shall support creation of custom trends for any object in the system.

   1) Trends shall be created using the BACnet Trend Log and BACnet Trend Log Multiple objects.

   2) Trends may be created with any sampling frequency or Change of Value (COV) threshold.

   3) Trends may be active indefinitely, or defined with specific start and end times.

b. Trend data shall be sampled and initially stored locally in the BACnet device which holds the object being trended. No additional server or device shall be required for collection or short-term storage of trend data.

c. All trend log display, visualization and export functions supported by the Operator’s Web Interface shall also be available through B-AWS. See Paragraph 2.4B.7.

9. System Diagnostics: Provide fully automatic verification of internetwork communication with automatic alarming in the event of communications failure.

10. DDC System Configuration/Programming Backup and Restore

a. The B-AWS shall allow a properly-credentialed user to backup, restore and/or clear configuration data and control programming from any device on the DDC System internetwork.

b. The B-AWS shall be able to perform automated network backup of configuration, control programming and graphics in all devices on the DDC System internetwork according to operator configurable schedule and storage directory structure.

c. If Data Archive Server is provided, the DDC Contractor shall configure automatic backup of the DDC System configuration, programming and graphics once per week or as requested by building maintenance staff. Configure system to retain at least last four backups.

11. Remote Access by VPN Tunnel

a. DDC Contractor shall configure DDC System to support the following means of secure offsite access to B AWS via a Virtual Private Network (VPN) tunnel.

   1) Remote Desktop: Using Microsoft Remote Desktop or equivalent software, configure to allow access to B-AWS running on Data Archive Server from any machine with the appropriate VPN client and credentials installed.

   2) Portable Workstation: Coordinate with Owner’s IT staff to configure laptop running B-AWS software (see Paragraph 2.5B) to connect to DDC System remotely via VPN tunnel. Full B-AWS functionality shall be available through this connection.

b. The VPN tunnel and associated hardware and software shall be the responsibility of the Owner’s IT.

c. DDC Contractor shall coordinate with Owner’s IT department.
d. VPN tunnel shall use login credentials established and maintained by Owner’s IT. These credentials shall be distinct from the DDC System user/password database described in Paragraph 3.6C.
e. Under no circumstances shall the B-AWS be accessible via the World Wide Web or over the public internet through means other than the VPN tunnel.

D. BACnet Trend Archive Software

1. Trend Archive software shall acquire trend log data from networked control devices and archive it for long-term storage in a BQL or SQL database. This does not supersede the requirement for local short-term storage of trend and runtime data on individual BACnet devices.

2. Trend Archive software may be installed on the Data Archive Server or may be embedded in a control device.

3. Trend Archive software shall reside on the Supervisory Control Network or the Primary Control LAN, and shall communicate via a BACnet/IP data link.

4. Connection to multiple BACnet/IP network segments and BACnet internetworks shall be supported with a single installation instance.

5. Trend Archive software shall be capable at a minimum of performing the following tasks automatically without user intervention:
   a. Manage the connection to the internetwork based upon configurable data acquisition thresholds, retrieving data only when necessary rather than streaming data.
   b. Retrieve data from all BACnet Trend Log and BACnet Trend Log Multiple objects from any BACnet device on the internetwork.
   c. Store acquired data in a standard BQL/SQL database, accessible by third-party applications.
   d. If temporarily unable to access the database, build a storage queue of data to be written to the database when it becomes available.

6. Continuous streaming of trend data consumes excessive network bandwidth and is not acceptable.

7. Trend Archive software shall support at a minimum the following BACnet Interoperability Building Blocks (BIBBs):
   a. Data Sharing-ReadProperty-A (DS-RP-A)
   b. Data Sharing-ReadProperty-B (DS-RP-B)
   c. Data Sharing-ReadPropertyMultiple-A (DS-RPM-A)
   d. Data Sharing-ReadPropertyMultiple-B (DS-RPM-B)
   e. Data Sharing-WriteProperty-A (DS-WP-A)
   f. Trending-Automated Trend Retrieval-A (T-ATR-A)
   g. Trending-Automated Multiple Value Retrieval-A (T-AMVR-A)
   h. Trending-Archival-A (T-A-A)
   i. Device Management-Dynamic Device Binding-A (DM-DDB-A)
   j. Device Management-Dynamic Device Binding-B (DM-DDB-B)
   k. Device Management-Dynamic Object Binding-B (DM-DOB-B)

8. Trend Archive software shall not limit the size of the database file. Quantity of archived data shall be limited only by the SQL license or the available hard drive space.

E. Database Management Software

1. Provide standards-compliant BQL or SQL relational database for long term storage of trend data.

2. Database shall be fully compatible with other DDC System software, such as the BACnet Trend Archive application.
3. Database shall support Java Database Connectivity (JDBC) and Open Database Connectivity (ODBC) or shall include the necessary drivers and software bridges to enable real-time access of data via XML/SOAP.
4. Database file(s) shall reside on the Data drive, not the Boot drive.
5. Database shall support reading and writing of data while running. Data retrieval shall not impact or interrupt retrieval and storage of data from networked control devices.
6. Some database implementations, notably Microsoft SQL Server Express, limit the allowable size of the database file. DDC Contractor shall either provide a SQL implementation that does not impose an inherent limit on database file size OR shall provide work-arounds for this limit as described in Paragraph 3.6B.5.b.
7. Database management software shall regularly perform automatic data integrity checks.
8. Configure database so that, in the event that it runs out of space, oldest data is overwritten by newest data so that the longest possible continuous data record is maintained. **Ceasing to record trend data due to lack of space is not acceptable.**
9. Manufacturers: Microsoft SQL Server Express (free, but limited), Microsoft SQL Server, MySQL/MariaDB, PostgreSQL (free), SQLite, or equal

F. Trend Analysis and Reporting Software
   1. Not required.

2.5 HARDWARE DEVICES FOR OPERATOR’S INTERFACE

A. Operator’s Desktop Workstation
   1. Data Archive Server, if provided, shall act as operator’s desktop workstation. See Article 2.6. If no Data Archive Server is specified, then an operator’s desktop workstation is not required.

B. Operator’s Portable Workstation
   1. Operator’s portable workstation shall be a laptop computer (not tablet) with the following minimum specs
      a. Certifications
         1) Energy Star
         2) EPEAT Silver or better
      b. CPU: minimum dual-core, 1GHz, 64-bit
      c. RAM: 8 GB minimum, expandable to 16 GB
      d. Hard Drive (boot and data drive) for operating system and all software
         1) SATA 3.0 (6 MB/s)
         2) Solid state (SSD)
         3) 128 GB minimum
      e. Optical Drive: not required
      f. Network Interfaces:
         1) Wired: 1000 base-T Ethernet with RJ45 connector port
         2) Wireless: 802.11g/n/ac network adapter
      g. I/O Ports, minimum:
         1) Two USB 2.0 ports
         2) One USB 3.0 port
         3) One microphone/line-in and one headphone/stereo-out connector
         4) One HDMI or DisplayPort output
h. Display:
   1) Built-in, not detachable
   2) Flat panel LCD with LED backlight
   3) 14” minimum size
   4) 1024x768 or better native resolution
   5) Screen must be able to maintain its position relative to keyboard without a table or additional support, to facilitate use with one hand while holding device with the other. (Some modern convertible units, like the Microsoft Surface, cannot do this.)

i. Keyboard: Built-in

j. Touchpad: Built-in

k. External Mouse:
   1) Three button mouse with scrollwheel
   2) Wireless USB or Bluetooth

l. Operating System: Windows 10 Professional, 64-bit

m. Installed Software:
   1) Browsers (install all three)
      a) Microsoft Internet Explorer or Microsoft Edge
      b) Firefox
      c) Google Chrome
   2) Office suite: LibreOffice (free), Apache OpenOffice (free), or Microsoft Office
   3) PDF reader: Adobe Acrobat Reader or equal
   4) BACnet Advanced Operator Workstation (B-AWS) software per Paragraph 2.4C.
   5) Simulation tools, if required per Paragraph Error! Reference source not found.
   6) Trend Analysis Software if required per Paragraph 2.4F.

2. Provide one device.

3. Device shall be purchased as a complete system from a single major manufacturer (e.g. Dell, HP, etc.) with manufacturer warranty, as a current product offering. Discontinued, refurbished, or used hardware is not acceptable.

4. Provide padded carry bag with shoulder strap. Laptop must fit snugly without excessive movement.

C. Portable Operator's Terminal (POT)

1. If DDC System manufacturer produces a POT for the product line being installed, DDC Contractor shall provide 1 POT unit included in Project cost. If no POT is available from the manufacturer, none are required.

2. POT shall include a network cable and jack for connection to DDC controllers, network ports or instruments with an integral network port.

3. POT shall be powered through network connection.

4. Connection of POT to DDC system shall not interrupt or interfere with normal network operation in any way, prevent alarms from being transmitted, or preclude central initiated commands and system modification.

5. POT shall give operator the ability to do the following:
   a. Display and monitor the value of any analog, binary or virtual output point.
   b. Display or override the value of any analog, binary or virtual input point.
   c. Display and monitor I/O point in alarm.
   d. Add a new or delete an existing I/O point.
   e. Enable and disable I/O points, initiators, and programs.
Display and change time and date.
Display and change schedules.
Display or reset run-time counters and run-time limits.
Display and change control application and DDC parameters.
Display and change programmable offset values.
Access DDC controller initialization routines and diagnostics.

D. Mobile Computing Device
1. Mobile computing devices ("smart" phones, tablets, etc.) will be provided by Owner if required.
2. DDC Contractor shall install and configure manufacturer-produced iOS or Android "apps" designed for use with DDC system, if available from the manufacturer.
3. Install and configure apps on all compatible devices provided by Owner.
4. Provide Owner with unlimited license, including perpetual free updates, for all apps.
5. For at least the duration of the Warranty Period, allow Owner to install apps on additional devices without requiring DDC Contractor involvement and at no additional cost.

2.6 DATA ARCHIVE SERVER

A. General
1. General
   a. Data Archive Server performs the following functions:
   b. Provide robust storage of DDC System configuration and programming
   c. Provide a database for long-term storage of trend data
   d. Host the BACnet Trend Archive Software
   e. Host for the Advanced Workstation (B-AWS) software
2. Include boot drive (Hard Drive #1) capacity sufficient for operating system, applications which perform specified System Software Functions (see Article 2.4), and additional software applications as specified below.
3. Include data drive (Hard Drive #2) capacity sufficient
   a. To archive complete copies of all DDC programming and associated data, including DDC controller programs and databases. This archive shall be sufficient to completely recreate the DDC controller programming and configuration in the event of a total loss of field-level memory and storage.
   b. To store no less than 48 consecutive months of historical data for all I/O points connected to system, including alarms, event histories, transaction logs, trends and other information indicated.

B. Server Rack Configuration
1. Data Archive Server shall be installed in the datacenter/IT room, as indicated on Contract Drawings mechanical floorplans.
2. Provide the following in addition to the requirements of 2.6C.
   a. Case: Rack-mount case, 1U height, suitable for standard EIA 19" rack
   b. Display: none required
   c. Keyboard: none required
   d. Mouse: none required
   e. Optical Drive: none required
3. Configure for on-site access via Microsoft Remote Desktop or equivalent. Coordinate with Owner’s IT. Do not configure to permit access from offsite unless specifically required.
C. Server Hardware

1. Purchased as a complete system from a single major manufacturer (e.g. Dell, HP, Compaq, etc.) with manufacturer warranty, as a current product offering – discontinued, refurbished, or used is not acceptable.

2. Server shall be a desktop computer with the following minimum specs
   a. Certifications
      1) Energy Star
      2) EPEAT Silver or better
   b. CPU: minimum quad-core, 2GHz, 64-bit, latest generation Intel Core i5 or equal
   c. RAM: 16GB minimum, expandable to 32 GB
   d. Hard Drive #1 (Boot drive) for operating system and all application software
      1) SATA 3.0 (6 MB/s)
      2) Solid state (SSD)
      3) 128 GB minimum
   e. Hard Drive #2 (Data drive) for trend database, and for backup of DDC programming and system configuration
      1) SATA 2.0 (3 MB/s) or better
      2) Solid state (SSD) or spinning media (HDD)
      3) Minimum 2 drives of 1TB (i.e. 1000 GB) each, or more if necessary to satisfy requirements outlined in 2.6A.2, configured in RAID 1 (100% redundancy).
         a) Configure to automatically notify operator in the event of failure of either drive in RAID 1 array.
   f. Network Interface:
      1) 1000 base-T Ethernet with RJ45 connector port
      2) Wireless networking is not acceptable
   g. I/O Ports, minimum:
      1) Front panel:
         a) Two USB 2.0 ports
         b) One USB 3.0 port
         c) One microphone and one headphone connector
      2) Back Panel:
         a) Four USB 2.0 ports
         b) Two USB 3.0 ports
         c) One stereo line-in and one stereo output connector
         d) One 9-pin serial port.

3. Backup Drive
   a. Provide external hard drive (HDD) equal or larger in capacity to boot drive, with USB 3.0 connection.
   b. Configure for automatic backup of boot drive per Paragraph 3.8A.4.

4. Uninterruptible Power Supply (UPS)
   a. Per Paragraph 2.15D
   b. Sufficient to power server at full load for five minutes, including display if provided.
   c. Configure to automatically shut down server before UPS is depleted and notify building engineer via email, and automatically restart server when power is restored.
D. Server Software

2. Install software including the following:
   a. Browsers (install all three)
      1) Microsoft Internet Explorer or Microsoft Edge
      2) Firefox
      3) Google Chrome
   b. Office suite: LibreOffice (free), Apache OpenOffice (free) or Microsoft Office
   c. PDF reader: Adobe Acrobat Reader or equal

3. Install software to provide required System Software Functions.
   a. BACnet Advanced Operator Workstation (B-AWS) software per Paragraph 2.4C.
   b. Simulation tools, if required per Paragraph Error! Reference source not found.
   c. BACnet Trend Archive software if required per Paragraph 2.4D.
   d. Database Management software if required per Paragraph 2.4E.
   e. Trend Analysis Software if required per Paragraph 2.4F.

4. Store on Data drive a complete copy of DDC System databases, user screens, graphics, setpoints, settings and all other data necessary to recover from complete loss of system programming. See Paragraph 1.9B.3

2.7 NETWORK COMMUNICATION DEVICES

A. General

1. These shall be microprocessor-based communication devices providing data routing, protocol translation, and/or message transmission on the DDC internetwork as described below.

2. Devices may be independent or may be embedded within a DDC controller.

3. Each independent device (i.e. not embedded within a controller) shall have its own microprocessor, RAM, battery, real-time clock, communication ports, and power supply.

4. Device memory shall be protected in the event of a power failure, per Paragraph 2.8J.1.

B. Supervisory Network Router

1. The Supervisory Router shall act as a router between the Supervisory Network and the Primary LAN.

2. Supervisory Router functions may be performed by a Building Controller, or by a separate device.

C. Controller Local Area Network Interface Device (LANID)

1. Each Controller LANID shall act as a gateway/router between the Primary LAN and a single Secondary LAN, and shall supervise communications on a polling Secondary LAN.

2. Controller LANID functions may be provided by a Building Controller or Advanced Application Controller, or by a separate device.

D. BACnet Broadcast Message Routing

1. Provide a BACnet/IP Broadcast Management Device (BBMD) for each subnet on the internetwork.

2. DDC System shall support the ability for a common BBMD Broadcast Distribution Table (BDT) to be configured once and then sent to all BBMDs.
3. BBMD shall be configured for two-hop distribution. Multicast messaging and one-hop distribution are not acceptable.

4. The DDC Contractor shall provide a spreadsheet documenting the following information, which shall be included with Closeout documents
   a. The identity, physical location and network address of all BBMD in the control system.
   b. The broadcast distribution table for each BBMD.

5. The DDC Contractor shall be responsible for maintenance and configuration of all system BDTs for the duration of the warranty period.

E. BACnet Gateways and Network Devices

1. Contractor shall provide network-connected equipment with a native BACnet interface, if such is available. The use of equipment with a different communications protocol (e.g. Modbus) plus a gateway is not acceptable if equivalent product is available with a native BACnet interface.

2. Resource meters (measuring water consumption, energy use, etc.) which communicate via network interface (as opposed to analog or pulsed binary output) shall support native BACnet communication and shall be considered gateways for purposes of this Section.

3. Communication gateways, bridges, protocol translators or any other device that translates any proprietary communication protocol to BACnet are generally not acceptable. Exceptions are as follows:
   a. Protocol translators as required to communicate to existing building systems or legacy control systems are not prohibited.
   b. Equipment-specific gateways and dedicated controllers are not prohibited provided that both of the following are true:
      1) The device to be controlled is not available with a native BACnet communication interface.
      2) The gateway is supplied, recommended or endorsed by the manufacturer of the equipment it is to control.

4. Each gateway shall be responsible for the interface between the BACnet DDC System and no more than one other piece of equipment. Secondary or parallel control networks utilizing non-BACnet protocols are not acceptable.
   a. Exception: Plant equipment with an integrated controller provided by the manufacturer may directly control associated ancillary equipment (e.g. a chiller’s onboard controller may control its associated pumps) if so depicted on Contract Drawing control schematics.

5. Gateways shall be able to
   a. Read and view all readable object properties from non-BACnet network to BACnet network and vice versa, using standard BACnet services.
   b. Write to all writeable object properties to non-BACnet network from BACnet network and vice versa, using standard BACnet services.

6. Gateways shall support the following BACnet communications services and features at a minimum:
   a. Data Sharing Subscribe Change of Value, Server (DS COV B) (not required for resource meters)
   b. Data Sharing Read Property Multiple, Server (DS RPM B)
   c. Device Management Dynamic Device Binding, Server (DM-DDB-B)
   d. Device Management Dynamic Object Binding, Server (DM-DOB-B)
   e. Device Management Device Communication Control, Server (DM DCC B)
   f. BACnet transmit and receive frame segmentation (not required for resource meters)
g. Post-installation, field-configurable maximum information frames, APDU frame timeout, APDU segment timeout and APDU retries.

7. Point information from any gateway shall be available for use in a control sequence by any other controller, directly through the BACnet internetwork. The use a communications server between control panels and gateways is not acceptable.

8. Gateways may perform only single-pass (i.e. directly to/from BACnet without intermediary protocols) translation from non-BACnet protocol to BACnet and vice versa.

9. Every logical BACnet device represented by a gateway shall have a Device Object instance number assigned which shall be unique throughout the entire internetwork. This includes all physical devices as well as any logical BACnet devices that are physically represented by gateways.

10. Each gateway shall have the capacity to expand the number of BACnet objects of each type supported by 20% to accommodate future system changes.

11. Gateways, and any devices represented by gateways, which have time-of-day information shall synchronize date and time using standard BACnet services.

12. Gateways shall have the ability to collect and archive trend data to the Data Archive Server, if provided.

13. For each gateway, provide an interoperability schedule showing each point or event on legacy side that BACnet network will read, and each parameter that BACnet network will write to.

14. Provide all hardware, software, licenses and configuration tools required for gateway configuration and communication.

15. Provide backup copy of all programming and parameters for all gateways, including interoperability schedule, as part of the Project data archive (see Paragraph 1.9B.3).

16. All gateways shall meet the requirements of UL 916 CE FCC part 15 Subpart B - Class A with surge and transient protection circuitry for power and communications.

F. Wireless Networking and Communications

1. Wireless networking and communications devices shall not be used in the DDC System BACnet control internetwork without specific written permission from the Engineer of Record. No portion of the trunk of the Supervisory Network, Primary LAN or Secondary LAN may rely on a wireless data link.

   a. Exceptions will be considered with adequate documentation and time to review. If DDC Contractor wishes to use wireless devices or wireless communication, a pre submittal per Paragraph 1.8F.1 is required. Do not submit wireless devices for the first time with Submittal Package 1.

2. Wireless networking is permitted on the Supervisory Network or Primary LAN only for the purpose of connecting a portable computer running the BACnet Advanced Workstation, accessing the Operator’s Web Interface, or accessing other System Software functions.

   a. Secure wireless access point with WPA2 and minimum 8-character password.

      1) Do not use passwords that are also used for DDC System login credentials.
      2) Change all default passwords.
      3) Provide password information to Owner per Paragraphs 1.9B.4 and 1.9C.2.

   b. Hardwired connection points to the control internetwork per Paragraph 2.3F.3 are required regardless of availability of wireless connections.

3. If the Operator’s Web Interface is accessible through the Owner’s IT LAN (see Paragraph 2.4B.10), the terminal connection may be made over a wireless link if supported by the Owner’s IT LAN.
2.8 DDC CONTROLLERS

A. General

1. DDC controllers shall perform monitoring, logging and control functions as specified. All specified controller functions shall be resident in the controller.

2. Every DDC controller shall be a tested, certified, and stamped native BACnet device, listed by the BACnet Testing Laboratories (BTL) or submitted by the manufacturer to BTL for listing, prior to the bid date for this Project.
   a. The BACnet operating stack must be embedded directly in each individual device at the media access controller level.
   b. The firmware of every DDC device shall be the same major version as the product that was certified by BTL or has been submitted to BTL pending certification. (In other words, if the device was certified with firmware version 2.0, firmware version 2.1 would be acceptable, but firmware version 3.0 would not. However, if firmware version 3.0 has been submitted to BTL and the certification testing process is ongoing, then it would be acceptable.)

3. DDC controllers shall include a real-time operating system resident in ROM or EEPROM, which shall execute independently from any other device in the system.

4. Controller software shall include a BACnet-compliant command prioritization scheme to allow functional override of control functions. Note that per Paragraph 2.2F, it is a requirement that any point can be overridden by the operators. This is required for all input and output points, and all hardware and software points.

B. Control Loops

1. All DDC controllers shall support at minimum
   a. Two-position (on/off) control
   b. Proportional-only control
   c. Proportional plus integral (PI) control
   d. Proportional-integral-derivative (PID) control

2. Control loop algorithms shall be an intrinsic function, requiring no additional programming or hardware.

3. Both direct- or reverse-acting control loops shall be supported.

4. Control loops shall incorporate anti-windup technology or software.

5. All control loop gains shall be independently adjustable.

6. To avoid excessive wear on modulating actuators, controller shall use anti dithering software or programming to limit the frequency of small re-positioning commands.

7. DDC System shall be provided with loop tuning tools for calculation of proportional, integral, and derivative gains for stable control loop operation. Loop tuning tools provided with the BACnet Advanced Workstation software is acceptable.

C. Programmability: All controllers shall be fully programmable and support custom control strategies, programs and databases that are completely modifiable over the BACnet internetwork once installed.

1. Control systems that exclusively utilize configurable-only ‘canned’ programs or programmable read only memory (PROM) application programming are not acceptable in any controller.

2. All controllers delivered as a part of this Specification shall be programmed using a single common programming language, means and method via the operator’s interface. Devices that require specific custom applications for configuration shall not be acceptable.

3. Control programming shall employ the BACnet protocols for Standard Command Priorities.
4. The controller must be capable of supporting software (virtual) points to be used in Sequences of Operations, monitored and overridden just as if they were real digital or analog points.
5. The user shall be able to add, delete, or modify objects in real time without taking the controller offline or impacting the operation of the controlled equipment.
6. Programming shall provide all the necessary mathematics, logic, utility and control functions necessary to execute the specified sequence of control.

D. Standalone Operation: Each DDC controller shall be capable of full and complete operation as a completely independent unit and as a part of a system wide distributed network. See 1.2C.
   1. Each controller shall contain software to perform full PID loop control.
   2. The complete operational database and application program for the controlled equipment shall reside in each individual controller.
   3. Each individual mechanical system or piece of equipment shall be controlled by no more than one controller with sufficient capacity to be connected to all field devices and sensors associated with that system and/or piece of equipment. See Paragraph 3.10B.1.
   4. DDC devices that require any supervisory server software or hardware or any external platform to manage execution or network management are not acceptable.
   5. Controllers with modular back planes that allow plug-in point modules as an integral part of the controller, and I/O point expander boards plugged directly into the main controller board, are acceptable with respect to a controller's requirement for standalone functionality.

E. Communication
   1. Data shall be shared between networked controllers and other network devices. Point information from any controller (including BCs, AACs, and ASCs) and from any gateway shall be capable of being used in a control sequence in any other panel.
   2. Communication software shall include error detection, correction and re-transmission to ensure data integrity.
   3. Each controller shall be capable of locally executing global strategies for the DDC System based on information from any object in the internetwork. Control systems that require a higher-level host processor for update, time stamps, global point data, COV transfer, online control instruction, or communications control between panels is not acceptable.

F. Input and Output Point Interface
   1. Input and output points shall be protected so shorting of point to itself, to another point, or to ground will not damage controller.
   2. Input and output points shall be protected from voltage up to 24 V (AC or DC) of any duration so that contact will not damage controller.
   3. Each output point shall have a programmable signal value which is output in the event of a failure. The controller shall transmit and maintain this failure signal in the event of a system malfunction as long as power is available at the controller. This failure signal shall be determined on a per point basis.
   4. Analog Inputs (AI) points:
      a. AIs shall include monitoring of low-voltage (0-10 VDC or 0-5 VDC), current (4 - 20 mA) and resistance signals from thermistor and RTD sensors.
      b. AIs shall be compatible with, and field configurable to, sensor and transmitters installed.
      c. Controller AIs shall perform analog-to-digital (A-to-D) conversion with a minimum resolution based on the type of controller (specified in subsequent Sections) or as required to comply with specified accuracy requirements.
      d. Signal conditioning including transient rejection shall be provided for each AI.
      e. Each point shall be capable of being individually calibrated for zero and span.
f. Each point shall be a discrete input to the controller board. Multiplexing to a separate manufacturer’s board is unacceptable.

g. Incorporate common-mode noise rejection of at least 50 dB from zero to 100 Hz for differential inputs, and normal-mode noise rejection of at least 20 dB at 60 Hz from a source impedance of 10,000 ohms.

5. Analog Output (AO) points:
   a. Controller AOs shall perform analog-to-digital (A-to-D) conversion with a minimum resolution based on the type of controller (specified in subsequent Sections) or as required to comply with specified accuracy requirements.
   b. Output signals shall have a range of 4-20 mA or 0-5 VDC or 0-10 VDC as required for proper control of output device. Pulse-width modulated (PWM) analog signals are not acceptable.
   c. Each point shall be capable of being individually calibrated for zero and span.
   d. AOs shall not exhibit a drift of greater than 0.4% of range per year.

6. Binary Input (BI) points:
   a. Controller BIs shall accept contact closures or pulses and shall ignore transients of less than 5 ms duration.
   b. BIs shall be isolated and protected against an applied steady-state voltage of up to 48VAC peak.
   c. BIs shall include a wetting current of at least 12 mA and shall be protected against effects of contact bounce and noise.
   d. BIs shall sense “dry contact” closure without external power (other than that provided by the controller) being applied.
   e. BIs configured for pulse counting shall be capable of counting at least 10 pulses per second. Buffer shall be provided to totalize pulses.
   f. Software multiplexing of an AI and resistors is unacceptable.

7. Binary Output (BO) points:
   a. Controller BOs shall include relay contact closures or triac outputs for momentary and maintained operation of output devices.
      1) Relays shall include at least 180 V of isolation. Electromagnetic interference suppression shall be provided on all output lines to limit transients to non-damaging levels. Minimum contact rating shall be 1/2 amp at 24VAC or 24VDC.
      2) Triac outputs shall include at least 48V of isolation. Minimum contact rating shall be 1 amp at 24VAC or 24VDC.
   b. Each point shall be configurable as normally open or normally closed.
   c. Each point shall be a discrete output from the controller board. Multiplexing to a separate manufacturer’s board is unacceptable.

8. Universal Input (UI) points:
   a. Shall incorporate all of the features of BI points and AI points.

9. Universal Output (UO) points:
   a. Shall incorporate all of the features of BO points and AO points.

G. Scheduling: All controllers shall support the standard BACnet Schedule and BACnet Calendar objects
   1. Schedule objects shall reside in each individual device. Scheduling that requires an ongoing active connection to a workstation or server shall not be acceptable.
   2. BACnet Schedule objects shall support binary, analog, and multi-state values.
   3. Each calendar day shall support up to a minimum of ten (10) transitions.
4. BACnet Schedule objects shall be able to directly command any BACnet object in the internetwork without requiring custom programming.

H. Time Synchronization

1. Operators shall be able to set the time and date in any device on the network that has a real-time clock.
2. The operator shall be able to set the time and date for an individual device (for override/testing purposes) or for all devices simultaneously.
3. Automatic time synchronization shall be provided using BACnet services.

I. Timed Override

1. All controllers shall support operator-initiated timed overrides of hardware and software objects with user-configurable override periods. When the override period has expired, the controller shall automatically return the object to the automatic state without any additional action on the part of the Operator.
2. The timed override functionality shall exist entirely in the controller. A workstation shall not be required for the execution of the time period nor for returning the object to automatic.

J. Memory: Each controller shall have sufficient memory to support its operating system, database, and programming requirements.

1. Configuration and software shall be retained (retention of locally-stored trend data is not required) in the event of a power outage without requiring a download from higher level controllers by one or more of the following means:
   a. Volatile RAM shall have a replaceable battery backup using a lithium battery with a rated service life of 10,000 hours continuous and a rated shelf life of at least 10 years.
   b. Volatile RAM shall have an automatically rechargeable battery backup using a lithium battery with a rated service life of 100 hours continuous and a rated shelf life of at least 10 years.
   c. EEPROM, EPROM, or NVROM non-volatile memory.

2. Provide sufficient internal memory for the specified Sequences of Operations and trend logging, plus an additional 25% free memory capacity to support future programming changes.

K. Trend Logs

1. All controllers shall be able to store trend data locally; network connections shall not be required for trending to occur.
   a. Provide sufficient memory to record the specified number of records (data value and time of occurrence) for each hardware point on the controller (counting every point, not just points currently in use) and an equal number of software points.
   b. Local storage shall be sufficient to record at least one week of data at a 5 minute interval for every required point.
      1) Exception: Application-specific controllers shall have sufficient capacity to record at least one day (24 hours) of data.
   c. Battery-backed or nonvolatile memory is not required for trend storage.

2. All controllers shall support standard BACnet Trend Log and BACnet Trend Log Multiple objects.
3. At each controller, newly acquired trend data shall overwrite the oldest trend data so as to preserve the longest possible contiguous data set in local storage.
L. Runtime Logs: All controllers shall support logging and reporting of runtime for every binary object in the system.
   1. Runtime data shall be sampled and stored in each individual BACnet device using standard BACnet objects and published properties. A separate server or database shall not be required for storage of runtime logs.
   2. Runtime data shall include at a minimum total accumulated active time and total accumulated active transitions since last reset, as well as the timestamp and state for the last 100 transitions on a rolling basis. Runtime data shall be stored in an efficient fashion such that it does not grow with time or consume inordinate amounts of memory on the device.

M. Alarm Processing: Controller software shall support alarm/message processing and buffering as specified. A controller’s ability to report alarms shall not be affected by either operator activity, execution of programs or communications with other controllers on the network.

N. Software Updates and Downloads
   1. Operating System Firmware:
      a. All controllers shall permit operating system firmware updates at any time after installation, utilizing the BACnet network.
      b. Operating system firmware that requires chip replacement or flash modification is not acceptable.
   2. Application Software:
      a. It shall be possible to upload or download site-specific programming (control logic, graphics, schedules, etc.) to/from any controller via direct connection or over the network.
      b. It shall be possible to initiate uploads and downloads manually, via schedule or automatically upon detection of loss or change of programming.

O. Interface Connection: All controllers shall support a communications port for connection of a portable operator’s terminal (POT) or portable operator’s interface device using a physical data link. (Terminal unit controllers may optionally provide this connection via a communicating thermostat.) It shall be possible to perform all program and database back-up, system monitoring, control functions, and controller diagnostics through this port. Connecting to this port shall not interrupt normal operation of permanently connected servers or workstations.

P. Communicating Sensors: All controllers shall support and be capable of monitoring and controlling a network of communicating space sensors without consuming physical hardware input/output points on the device.

Q. Maintenance and Support: Include the following features to facilitate maintenance and support:
   1. Means to quickly and easily disconnect controller from network.
   2. Means to quickly and easily connect to field test equipment.
   3. Means to quickly and easily disconnect sensors, actuators and other attachments from controller.
   4. Visual indication (diagnostic LEDs) that controller electric power is on, of communication fault or trouble, and that controller is receiving and sending signals to network.

R. Self-Test and Failure Response
   1. Each controller shall continually check the status of its processor and memory circuits. If an abnormal operation is detected, the controller shall:
      a. Cease operation
b. Place each point in a predetermined failure state
   c. Generate an alarm notification
2. Each controller shall have resident self-diagnostic software or firmware that can detect an open or shorted sensor circuit and trigger a programmed response.
3. Each controller shall be able to detect a loss of connection to its LAN(s). In that event
   a. Controller shall store the loss of communication alarm along with the time of event, for transmission when network connection is restored.
   b. All control functions shall continue based on last known values or a programmable fail-state value.

S. Loss of Power
1. Controller firmware shall provide for orderly shutdown upon loss of power.
2. Loss of power to any controller shall not adversely affect any other controller.
3. Upon a loss of power, all software, database parameters and data (except locally-stored trend data) shall be protected from memory loss as described previously in this Article.
4. Staggered Start
   a. Upon DDC System startup or restart after power loss, all controllers on the internetwork shall automatically coordinate among themselves to prevent controlled equipment from starting simultaneously.
   b. The operator shall be able to configure the order in which equipment is started and the time delay between start events.
5. When power is restored, controllers shall automatically resume function as described in Paragraph 0.

T. Controller Application Category
1. Permissible controller application categories are based on the type of equipment being controlled and point count, per the following table:

<table>
<thead>
<tr>
<th>Application Category</th>
<th>Examples</th>
<th>Acceptable Controller</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>ASC</td>
</tr>
<tr>
<td>0</td>
<td>Monitoring of variables that are not used in a control loop, sequence logic, or safety.</td>
<td>X</td>
</tr>
<tr>
<td>1</td>
<td>• Fan coil units&lt;br&gt;• Terminal units/VAV boxes&lt;br&gt;• Miscellaneous heaters&lt;br&gt;• Exhaust fans and pumps&lt;br&gt;• Packaged units with self-contained controls&lt;br&gt;• Ceiling fans</td>
<td>X</td>
</tr>
<tr>
<td>2</td>
<td>• Lab zones without fume hoods</td>
<td>X</td>
</tr>
<tr>
<td>3</td>
<td>• Air handling units&lt;br&gt;• Hot water/boiler plant&lt;br&gt;• Lab zones with fume hoods&lt;br&gt;• Air-cooled chiller&lt;br&gt;• Any application requiring more than 10 input or 10 output points</td>
<td>X</td>
</tr>
<tr>
<td>4</td>
<td>• Water-cooled chilled water plant&lt;br&gt;• Building-wide supervisory control</td>
<td></td>
</tr>
</tbody>
</table>
2.9 BUILDING CONTROLLERS

A. General
1. A dedicated building controller shall be provided for control of each large point count major mechanical system and/or piece of equipment. See
   a. Multiple pieces of equipment comprising one mechanical system may be controlled by a single building controller provided that all of the points associated with the system are hosted by the controller.
2. Building controllers shall comply with all of the requirements of Paragraph 2.8 as well as the requirements detailed below.
3. Building controllers shall meet the requirements of ASHRAE Standard 135 Annex L for a BACnet Building Controller (B-BC) and support all BIBBs required by that device profile. They shall be certified and listed by the BACnet Testing Laboratories (BTL) as a B-BC prior to the bid date for this Project.
4. All building controllers shall have a real-time clock. Controller shall utilize the BACnet Time Synchronization service and be configurable to adjust automatically for Daylight Savings Time.
5. Each building controller shall have a power switch integral to the controller board, or a separate dedicated switch inside the enclosure.

B. Communication
1. Building controllers shall be peer-to-peer devices that reside on and communicate with other devices on DDC system Supervisory Network or Primary LAN.
2. Building controllers shall also perform routing if connected to a network of advanced application controllers.
3. Building controllers shall provide, at a minimum, the following intrinsic physical network ports which can be enabled and used simultaneously:
   a. One ISO8802-3 Ethernet port capable of at least 100 Mbps.
   b. Two EIA-485 ports capable of at least 76.8 kbps.
4. Building controllers shall provide the following simultaneous communication protocols and/or data links at a minimum:
   a. BACnet protocols:
      1) One BACnet/IP per ASHRAE/ASNI Standard 135 Annex J
      2) One BACnet Ethernet per ASHRAE/ASNI Standard 135.7. BACnet Ethernet may be used at DDC Contractor’s option, but is not required.
      3) Two Master-Slave Token Passing (MS/TP) per ASHRAE/ASNI Standard 135.9
   b. Modbus protocols:
      1) Remote Terminal Unit (RTU) Master or Slave
      2) TCP Master or Slave
   c. Simple Mail Transfer Protocol (SMTP), with at least the following capabilities:
      1) Transport Layer Security (TLS) for SMTP
      2) Compatibility with standard free email services (e.g., Gmail, Yahoo!)
      3) The ability to manage custom TLS certificates from SMTP
      4) The ability to transmit a simple test email to verify SMTP configuration
   d. Simple Network Management Protocol (SNMP)
5. Building controller shall provide stand-alone remote annunciation of alarms via e-mail via SMTP without additional hardware.
6. Building controllers shall support the following BACnet communications services and features in addition to those required for a B-BC device:
   a. Data Sharing Subscribe Change of Value, Client and Server (DS COV A, DS COV B)
   b. BACnet transmit and receive frame segmentation
   c. Post-installation, field-configurable maximum information frames, APDU frame timeout, APDU segment timeout and APDU retries.

C. Input and Output Point Requirements
   1. Each Analog Input point shall have an A/D converter of no less than 12 bits resolution.
   2. Each Analog Output point shall have a D/A converter of no less than 10 bits resolution.
   3. Each controller shall have a minimum of 20% spare input and output points beyond what is required to meet the contract drawings and sequence of operations.
      a. If software-selectable Universal I/O points are available, provide 20% spare UI points and 20% spare UO points.
      b. If software-selectable Universal I/O points are not available, provide 20% spare of each type (AI, AO, BI, and BO) of point.

D. Scheduling: Building controllers shall support the Weekly Schedule and Exception Schedule properties in addition to the requirements of Paragraph 2.8G.
   1. It shall be possible to schedule events based on
      a. A specific date
      b. A range of dates
      c. Any combination of Month of Year (1-12, any), Week of Month (1-5, last, any), Day of Week (M-Sun, Any)
      d. Wildcard (example, allow combinations like second Tuesday of every month)
   2. Exception Schedules shall be configurable for any calendar day.
      a. Device shall support a minimum of 100 Exception Schedules.
      b. Each Exception Schedule and holiday shall be individually configurable including name, priority, transition values and times.
      c. The operator shall have the ability to configure Exception Schedules to be active on specific dates, date ranges, recurring date patterns or as commanded by BACnet Calendar objects or other override objects.

2.10 ADVANCED APPLICATION CONTROLLERS

A. General
   1. A dedicated advanced application controller shall be provided for control of each mechanical system and/or major piece of equipment.
      a. A building controller may be used in place of and serve the function of an advanced application controller.
      b. Multiple pieces of equipment comprising one mechanical system may be controlled by a single advanced application controller provided that all of the points associated with the system are hosted by the controller.
   2. Advanced application controllers shall comply with all of the requirements of Article 2.8 as well as the requirements detailed below.
   3. Advanced application controllers shall meet the requirements of ASHRAE Standard 135 Annex L for a BACnet Advanced Application Controller (B-AAC) and support all BIBBs required by that device profile. They shall be certified and listed by the BACnet Testing Laboratories (BTL) as a B-AAC prior to the bid date for this Project.
4. All advanced application controllers shall have a real-time clock. Controller shall utilize the BACnet Time Synchronization service and be configurable to adjust automatically for Daylight Savings Time.

5. Each advanced application controller shall have a power switch integral to the controller board, or a separate dedicated switch inside the enclosure.

B. Communication

1. Advanced application controllers shall be peer-to-peer devices that reside on and communicate with other devices on DDC system Primary LAN.

2. Advanced application controllers shall also perform routing over a Secondary LAN if connected to a network of application-specific controllers.

   a. Advanced application controllers shall be capable of automatically discovering BACnet slave devices on a Secondary LAN and shall be capable of serving as a proxy for BACnet slave devices.

3. Advanced application controllers shall provide, at a minimum, the following intrinsic physical network ports which can be enabled and used simultaneously:

   a. One ISO8802-3 Ethernet port capable of at least 100 Mbps.
   b. Two EIA-485 ports capable of at least 76.9 kbps.

4. Advanced application controllers shall provide the following simultaneous communication protocols and/or data links at a minimum:

   a. BACnet protocols:
      1) One BACnet/IP per ASHRAE/ASNI Standard 135 Annex J
      2) One BACnet Ethernet per ASHRAE/ASNI Standard 135.7. BACnet Ethernet may be used at DDC Contractor’s option, but is required only if needed for compatibility with existing or legacy systems.
      3) Two Master-Slave Token Passing (MS/TP) per ASHRAE/ASNI Standard 135.9

   b. Modbus protocols:
      1) Remote Terminal Unit (RTU) Master or Slave
      2) TCP Master or Slave

   c. Simple Network Management Protocol (SNMP)

5. Advanced application controllers shall support the following communications services and features, in addition to those required for a B-AAC device:

   a. Data Sharing Subscribe Change of Value, Client and Server (DS COV A, DS COV B)
   b. Data Sharing Read Property Multiple, Client and Server (DS RPM A, DS RPM B)
   c. BACnet transmit and receive frame segmentation
   d. Post-installation, field-configurable maximum information frames, APDU frame timeout, APDU segment timeout and APDU retries.

C. Input and Output Point Requirements

1. Each Analog Input point shall have an A/D converter of no less than 12 bits resolution.

2. Each Analog Output point shall have a D/A converter of no less than 8 bits resolution.

3. Each controller shall have a minimum of 20% spare input and output points beyond what is required to meet the contract drawings and sequence of operations.

   a. If software-selectable Universal I/O points are available, provide 20% spare UI points and 20% spare UO points.
   b. If software-selectable Universal I/O points are not available, provide 20% spare of each type (AI, AO, BI, and BO) of point.
D. Scheduling: Advanced application controllers shall support the Weekly Schedule and Exception Schedule properties in addition to the requirements of Paragraph 2.8G.

1. It shall be possible to schedule events based on
   a. A specific date
   b. A range of dates
   c. Any combination of Month of Year (1-12, any), Week of Month (1-5, last, any), Day of Week (M-Sun, Any)
   d. Wildcard (example, allow combinations like second Tuesday of every month)

2. Exception Schedules shall be configurable for any calendar day.
   a. Device shall support a minimum of 100 Exception Schedules.
   b. Each Exception Schedule and holiday shall be individually configurable including name, priority, transition values and times.
   c. The operator shall have the ability to configure Exception Schedules to be active on specific dates, date ranges, recurring date patterns or as commanded by BACnet Calendar objects or other override objects.

2.11 APPLICATION-SPECIFIC CONTROLLERS

A. General

1. A dedicated application-specific controller shall be provided for control of each mechanical terminal unit or minor mechanical equipment (e.g. exhaust fan).
   a. An advanced application controller may be used in place of and serve the function of an application-specific controller.

2. An application-specific controller shall not be used for any control task exceeding 10 inputs or 10 outputs. In such cases, an advanced application controller or building controller shall be used.

3. Application-specific controllers shall comply with all of the requirements of Paragraph 2.8 as well as the requirements detailed below.

4. Application-specific controllers shall meet the requirements of ASHRAE Standard 135 Annex L for a BACnet Application Specific Controller (B-ASC) and support all BIBBs required by that device profile. They shall be certified and listed by the BACnet Testing Laboratories (BTL) as a B-ASC prior to the bid date for this Project.

B. Communication

1. Application-specific controllers shall reside on and communicate with other devices on a DDC system Secondary LAN.

2. If connected to a Secondary LAN using BACnet MS/TP protocol:
   a. Controller shall automatically detect the speed (baud) of the MS/TP network and then configure the controller's communication speed to match.
   b. Controller shall be capable of efficiently communicating at a speed of 76.8 kbps under normal network operational conditions with all devices executing the specified sequences of operation at the specified performance criteria.

3. Application-specific controllers shall also communicate with the Primary or Supervisory Network via connection to an advanced application controller or building controller.

4. Application-specific controllers shall provide, at a minimum, the following intrinsic physical network port:
   a. One EIA-485 port capable of at least 76.8 kbps.
5. Application-specific controllers shall provide the following simultaneous communication protocols and/or data links at a minimum:
   a. BACnet protocol: One Master-Slave Token Passing (MS/TP) per ASHRAE/ASNI Standard 135.9
6. Application-specific controllers shall support the following BACnet communications services and features at a minimum:
   a. Data Sharing Subscribe Change of Value, Client and Server (DS COV A, DS COV B)
   b. Data Sharing Read Property Multiple, Client and Server (DS RPM A, DS RPM B)
   c. BACnet transmit and receive frame segmentation
   d. Post-installation, field-configurable maximum information frames, APDU frame timeout, APDU segment timeout and APDU retries.

C. Input and Output Point Requirements
1. Each Analog Input point shall have an A/D converter of no less than 10 bits resolution.
2. Each Analog Output point shall have a D/A converter of no less than 8 bits resolution.
3. Each controller shall have at least one spare AI point and one spare BI point, or one spare UI point, beyond what is required to meet the contract drawings and sequence of operations.

2.12 VAV TERMINAL UNIT CONTROLLERS
A. VAV terminal unit (aka. VAV box) controllers shall meet the requirements for application specific controllers specified above, in addition to the requirements of this Section. Actuators and airflow sensors may be integral to the controller or separate, but shall in all cases meet the requirements outlined below.
B. Damper Actuators: See Actuators in Section 25 30 00.
C. Differential Pressure Airflow Sensor: See Terminal Unit Velocity Pressure Sensor in Section 25 30 00.
D. Test and Balance (TAB) Calibration
1. Airflow sensor calibration shall be performed using the operator’s interface or a dedicated handheld configuration tool connected locally to the air terminal unit.
2. Where dedicated software or hardware is required for airflow sensor calibration, the following must be provided to the Owner as a part of this Specification at a minimum:
   a. One copy of the TAB and airflow calibration software/application. Install software on operator’s portable workstation or on laptop computer provided by Owner.
   b. All software updates and support for five years from the completion and acceptance of the Project TAB report.
   c. See also Paragraph 3.16D.

2.13 LAB CONTROLLERS

2.14 ENCLOSURES
A. General Enclosure Requirements:
1. Products shall be protected with enclosures meeting the following minimum requirements unless more stringent requirements are indicated, or required by the AHJ. Products not available with integral enclosures complying with requirements indicated shall be housed in protective secondary enclosures. Installed location shall dictate the following NEMA 250 enclosure requirements:
   a. Outdoors, Protected: Type 4.
   b. Outdoors, Unprotected: Type 4.
   c. Indoors, Heated with Filtered Ventilation: Type 1.
   d. Indoors, Heated with Non-Filtered Ventilation: Type 1.
   e. Indoors, Heated and Air Conditioned: Type 1.
   f. Mechanical Equipment Rooms:
      1) Chiller and Boiler Rooms: Type 3R.
      2) Air-Moving Equipment Rooms: Type 1.
   g. Localized Areas Exposed to Washdown: Type 4.
   h. Within Duct Systems and Air-Moving Equipment: Type 3R.
   i. Within Return Plenums: Type 1
      1) Exception: An enclosure is not required for terminal unit controllers mounted directly to the terminal unit unless ambient hazards dictate otherwise.

2. Include enclosure door with tab and slot for padlock.
3. Include wall-mounted enclosures with brackets suitable for mounting enclosures to wall or freestanding support stand as indicated.

B. Internal Arrangement:
1. Mount products within enclosure on removable internal panel(s).
2. Internal layout of enclosure shall group and protect pneumatic, electric, and electronic components that are associated with a controller, but are not an integral part of controller.
3. Include a barrier between line-voltage and low-voltage electrical and electronic products.
4. Factory or shop install products, tubing, cabling and wiring complying with requirements and standards indicated. Field construction and assembly of enclosures is not acceptable.
5. Terminate field cable and wire using heavy-duty terminal blocks.
6. Include spare terminals for every unused point on all controllers in the panel.
7. Include spade lugs for stranded cable and wire.
8. Install a maximum of two wires on each side of a terminal.
9. Include enclosure field power supply with a toggle-type switch located at entrance inside enclosure to disconnect power.
10. Provide enclosure with a line-voltage nominal 20 amp GFCI duplex receptacle for service and testing tools. Install as described in Paragraph 3.11B.5.
11. Provide each enclosure with a surge suppressor, electrical disconnect, control fuse, and control transformer sized as required by the application.
12. Provide permanent identification tags for enclosure, and for control products within enclosure, per Article 3.12.
13. Route tubing cable and wire located inside enclosure within a raceway with a continuous removable cover.
14. Label each end of cable, wire and tubing in enclosure per Article 3.12.
15. Size enclosure internal panels to provide space to mount one relay for each Binary or Universal Output, including unused or spare points.
16. Provide one spare relay for any panel with 10 or fewer Binary or Universal Outputs. Provide two spare relays for any panel with more than 10 Binary or Universal Outputs.
C. Environmental Conditions:
  1. Evaluate temperature and humidity requirements of each product to be installed within each enclosure.
  2. Calculate enclosure internal operating temperature considering heat dissipation of all products installed within enclosure and ambient effects (solar, conduction and wind) on enclosure.
  3. Enclosure shall be internally insulated if necessary to maintain acceptable operating conditions.
  4. Enclosure shall be ventilated if necessary to maintain operating conditions below maximum operating temperature of product with most stringent requirement.
     a. NEMA Type 1 enclosures may be passively ventilated.
     b. All other enclosures requiring ventilation shall utilize temperature-controlled ventilation fans with filtered louvers. See Paragraph 2.14E.1.
  5. The use of electric heat, air conditioning, or humidification for enclosure environmental control is to be avoided if possible. If application as designed would require these measures, contact Engineer of Record for approval before installing these measures. DDC Contractor is encouraged to suggest changes to design or alternative installation locations that would eliminate the need for these measures. See Paragraphs 2.14E.2, 2.14E.3, and 2.14E.4.

D. NEMA 250 enclosures, All Types:
  1. Enclosure shall be NRTL listed according to UL 50, UL 50E, or UL 508A.
  2. Construct enclosure of minimum 16 gauge steel, stainless steel, or aluminum.
  3. Seam and joints are continuously welded and ground smooth.
  4. Finish enclosure inside and out with polyester powder coating that is electrostatically applied and then baked to bond to substrate.
  5. Corner-formed door, full size of enclosure face. Double-door enclosures shall have overlapping door design to provide unobstructed full-width access. Enclosures more than 36” high shall have continuous piano hinge full length of door.
  6. Gaskets as required to exclude foreign materials in accordance with enclosure Type.
  7. Removable steel or aluminum internal panel with a polyester powder coating that is electrostatically applied and then baked to bond to substrate.
  8. Internal panel mounting hardware, grounding hardware and sealing washers.
  9. Grounding stud on enclosure body.
 10. Thermoplastic pocket on inside of door for record Drawings and Product Data.
 11. Freestanding enclosures shall have
     a. Nominal 4 inch tall integral lifting base with predrilled holes for attachment to mounting surface.
     b. No fewer than two lifting eyes or tabs on top of enclosure.

E. Accessories:
  1. Ventilation Fans, Filtered Intake and Exhaust Grilles:
     a. Number and size of fans, filters and grilles as required by application.
     b. Compact cooling fans engineered for 50,000 hours of continuous operation without lubrication or service.
     c. Fans capable of being installed on any surface and in any position within enclosure for spot cooling or air circulation.
     d. Thermostatic control with adjustable set point from 32°F to 140°F.
     e. Maximum operating temperature of 160°F.
     f. Fans shall have thermally-protected split capacitor motors and permanently lubricated ball bearings.
     g. Dynamically balanced impellers molded from polycarbonate material.
Fan brackets, finger guards and mounting hardware provided with fans to complete installation.

Removable Intake and Exhaust Grilles: stainless or chrome steel to match fan size.

Filters: Washable foam or aluminum, of a size to match intake grille.

2. Electric Heater: Not to be installed without written authorization from Engineer of Record. If authorized, heater shall have the following features:
   a. Aluminum housing with brushed finish.
   b. Thermostatic control with adjustable set point from 0°F to 100°F.
   c. Capacity: 100, 200, 400, and 800 watts as required by application.
   d. Fan draws cool air from bottom of enclosure and passes air across thermostat and heating elements before being released into enclosure cavity. Heated air is discharged through the top of heater.

3. Air Conditioner: Not to be installed without written authorization from Engineer of Record. If authorized, air conditioner shall have the following features:
   a. Electric-powered, self-contained air-conditioning unit specially designed for electrical enclosures to maintain temperature inside enclosure below ambient temperature outside enclosure.
   b. Thermostatic control with adjustable set point from 60°F to 120°F.
   c. Enclosure side or top mounting with unit capacity as required by application.
   d. Designed for closed-loop cooling with continuous operation in ambient environments up to 125°F.
   e. HFC refrigerant.
   f. Reusable and washable air filter.
   g. High-performance, industrial-grade, and high-efficiency fans.
   h. Furnished with power cord and polarized plug for power connection.
   i. Condensate management system with base pan side drain.
   j. Mounting hardware, gaskets, mounting template and instruction manual furnished with unit.
   k. Outdoor units equipped with head pressure control for low ambient operation, compressor heater, coated condenser coil and thermostat.

4. Thermoelectric Humidifier: Not to be installed without written authorization from Engineer of Record. If authorized, humidifier shall have the following features:
   a. ABS plastic enclosure.
   b. Capacity of 8 oz. of water per 24 hours.
   c. Built-in drain captures moisture and plastic hose directs moisture to outside enclosure through a drain.
   d. Controlled to maintain enclosure relative humidity at an adjustable set point.
   e. Unit power supply shall be internally wired to enclosure electrical power source.

5. Window Kit:
   a. Scratch-resistant acrylic or polycarbonate window, 1/4 inch thick, mounted directly in enclosure door material or in a metal frame matching door material.
   b. Enclosure types, except NEMA 250 Type 1, shall have a continuous gasket material around perimeter of window and frame to provide watertight seal.
   c. Window kit shall be factory or shop installed before shipment to Project.

7. Slot and tab latch with identically keyed padlock.

2.15 ELECTRIC POWER DEVICES

A. Power Supplies & Control Transformers
1. Control transformers and power supplies shall be UL-Listed.
2. Provide Class 2 current-limiting type or over-current protection in both primary and secondary circuits for Class 2 service per NEC requirements.
3. Transformer shall be properly sized for application. Limit connected loads to 80% of rated capacity.
4. EM/RF shall meet FCC Class B and VDE 0871 for Class B, and MIL-STD 810C for shock and vibration.
5. Line voltage units shall be UL Recognized and CSA Approved.

B. DC Power Supplies: DC power supply output shall match output current and voltage requirements. Power supply shall be full-wave rectified type with the following minimum Specifications:
   1. Output ripple: 5.0 mV maximum peak-to-peak.
   2. Regulation: 1.0% line and load combined.
   3. Response: 100 ms for 50% load changes.
   4. Built-in overvoltage and overcurrent protection and able to withstand a 150% current overload for a minimum of three (3) seconds without tripping or failure.

C. Power Contactors: General-purpose AC magnetic contactor complying with NEMA ICS 2.

D. Control Relays
   1. All control relays shall be UL listed, enclosed, with LED energized indicator.
   2. All relays shall have contact rating, configuration and coil voltage suitable for the application.
   3. Control relays for use on electrical systems of 120 volts or less shall have, as a minimum, the following:
      a. AC coil pull-in voltage range of +10%, -15% or nominal voltage.
      b. Coil sealed volt-amperes (VA) not greater than 4 VA.
      c. Silver cadmium Form C (SPDT) contacts in a dustproof enclosure, with 8 or 11 pin type plug.
      d. Pilot light indication of power-to-coil and coil retainer clips.
   4. Relays used for across-the-line control (start/stop) of 120V motors, 1/4 HP, and 1/3 HP, shall be rated to break minimum 10 Amps inductive load.
   5. Relays used for stop/start control shall have low voltage coils (30 VAC or less), and shall be provided with transient and surge suppression devices at the controller interface.

E. Uninterruptable Power Supplies
   1. Provide unit with integral line-interactive, power condition topology to eliminate all power contaminants. It shall provide continuous, regulated output power without engaging batteries during brown-out, surge, and spike conditions
   2. Load served shall not exceed 75 percent of UPS rated capacity, including power factor of connected loads.
   3. UPS shall provide 5 minutes of battery power at connected full load.
   4. UPS shall be Energy Star certified.
   5. Performance:
      a. Input Voltage: Single phase, 120VAC, +20% to -30%.
      b. Power Factor: Minimum 0.97 at full load.
      c. Output Voltage: Single phase, 120 VAC ±3% steady state
      d. On-Battery Output Voltage: True sine wave.
      e. Inverter overload capacity shall be minimum 150 percent for 30 seconds.
      f. Recharge time shall be a maximum of eight hours to 90 percent capacity after full discharge to cutoff.
g. Transfer Time: 6 ms.
h. Surge Voltage Withstand Capacity: IEEE C62.41, Categories A and B; 6 kV/200 and 500 A; 100-kHz ringwave.

6. Engagement shall be automatic during fault or overload conditions.
7. Include front panel with power switch and visual indication of power, battery, fault and temperature.
8. Include an audible alarm of faults and front panel silence feature.
9. UPS shall include dry contacts (digital output points) to signal low battery condition and battery on (primary utility power failure).
10. Batteries shall be sealed lead-acid or NiMH type and be maintenance free. Battery replacement shall be front accessible by user without dropping load.

F. Transient Voltage Protection and Surge Suppression Devices
1. Device shall be designated as 120V surge suppression devices for electronic equipment.
2. Devices shall be designed, manufactured, tested and installed in compliance with ANSI/IEEE C62.41 and C62.45, NEMA, NEC and UL 1449 and 1283.
3. Devices must be labeled for UL 1449.
4. Clamping voltage for 120V power systems shall be 400V.
5. Devices shall include visual indicator when surge device has been used and is no longer providing protection.
6. Do not use fuses for surge protection

G. Power Conditioning Devices
1. Devices shall be designated as 120V power conditioning devices for electronic equipment.
2. Devices shall be designed, manufactured, tested and installed in compliance with ANSI/IEEE C62.41 and C62.45, NEMA, NEC and UL 1449 and 1283.
3. Devices must be labeled for UL 1449 and UL 1283.
4. Performance:
   a. At 85% load, output voltage shall not deviate by more than ±1% of nominal when input voltage fluctuates between -20% to +10% of nominal.
   b. During load changes from zero to full load, output voltage shall not deviate by more than ±3% of nominal.
   c. Accomplish full correction of load switching disturbances within five cycles, and 95% correction within two cycles of onset of disturbance.
   d. Total harmonic distortion shall not exceed 3.5% at full load.
5. Devices shall include visual indicator when surge device has been used and is no longer providing protection.

2.16 POWER WIRE AND RACEWAYS

A. Comply with Division 26 requirements for power wiring, and all applicable local codes and/or requirements of AHJ.

B. All insulated wire to be copper conductors, UL labeled for 90 ºC minimum service.

2.17 CONTROL AND COMMUNICATION WIRE AND RACEWAYS

A. General:
1. Comply with Division 26 and Division 27 requirements for low voltage wiring, ANSI/TIA 568 and 607, BICSI Telecommunications Distribution Methods Manual, and all applicable local codes and/or requirements of AHJ.
2. All insulated wire to be copper conductors, UL labeled for 90 °C minimum service.
3. Wire gauge shall be per manufacturer’s recommendations for application and distances installed.
4. Wiring shall be UL Listed for the intended application.
5. Overall flexible, lead-free jacket. For conductors not concealed in raceways, use UL-listed plenum-rated insulation.
6. Continuous runs without splices between termination points.

B. Ethernet LAN: Category 5e or 6 100 Base-T (IEEE 802.3u)

C. MS/TP LAN: 100% shielded twisted pair, rated for maximum planned network speed. Wire shall meet or exceed the requirements specified in Part 9.2.1 of the BACnet standard.

D. Signal wire: 100% shielded

E. Raceways and Conduit: Comply with Division 26 and Division 27 Specifications for low-voltage wiring

2.18 PIPING AND TUBING

A. Pneumatic Control Tubing and Piping:
1. Products in this paragraph are intended for
   a. Main air and signal air to pneumatically controlled instruments, actuators and other control devices and accessories.
   b. Signal air between pressure instruments, such as sensors, switches, transmitters, controllers and accessories.

2. Metal tubing: Copper, Type L hard or soft seamless, ASTM B88
   a. Intermediate connections with cast-bronze solder joint fittings, ANSI B1.18; or wrought-copper solder-joint fittings, ANSI B16.22
   b. Connections to equipment with brass compression-type fittings.
   c. Solder shall be ASTM B32, 95/5 tin antimony, Bridgit or Silvabrite.
   d. Use plastic-coated copper tubing in wet locations.

3. Plastic tubing: Fire resistant virgin polyethylene ASTM D 2737
   a. Self-extinguishing per ASTM D635
   b. Meets stress-crack test ASTM D1693 60T
   c. Use UL 94 flame-retardant harness for multiple tubing.
   d. Use compression or push-on brass fittings.

4. Isolation valves: Threaded or soldered 2-piece bronze ball valves suitable for intended service and pressure.

B. Process Tubing:
1. Products in this paragraph are intended to connect sensors and instruments to liquid and steam systems.
2. Copper Tubing:
   a. Seamless phosphor deoxidized copper, soft annealed or drawn tempered with chemical and physical properties according to ASTM B 75.
b. Performance, dimensions, weight and tolerance according to ASTM B 280.
c. Diameter, as required by application, of not less than nominal 0.25 inch.
d. Wall thickness, as required by application, but not less than 0.030 inch.

3. Copper Tubing Connectors and Fittings:
   a. Intermediate connections with cast-bronze solder joint fittings, ANSI B1.18; or
      wrought-copper solder-joint fittings, ANSI B16.22
   b. Connections to equipment with brass compression-type fittings.

4. Stainless Steel Tubing:
   a. Seamless Type 316 stainless steel, Grade TP, cold drawn, annealed and pickled,
      free from scale.
   b. Chemical and physical properties according to ASTM A 269.
   c. Diameter, as required by application, of not less than nominal 0.25 inch.
   d. Wall thickness, as required by application, but not less than 0.035 inch.

5. Stainless Steel Tubing Connectors and Fittings:
   a. Connectors and fittings shall be stainless steel, with stainless-steel collets, flareless
      type.
   b. Connect instruments to tubing with connectors having compression connector on one
      end and IPS or NPT thread on other end.

PART 3 - EXECUTION

3.1 GENERAL

A. The DDC System, all of its components, its execution and compliance with this Section and related Sections is the responsibility of the DDC Contractor.

1. Unless otherwise noted, all DDC System devices and components as required to satisfy the intent of the Sequences of Operations and the requirements of the Contract Drawings and Specification shall be provided as a part of this Section.

2. All control system components shall be installed in locations as required to properly sense the controlled medium and perform according to the intent of the specified Sequence of Operations and the requirements of the Contract Drawings and Specification.

B. All control products shall be assembled in a workshop environment by skilled technicians, and shall be subjected to a quality assurance process by DDC Contractor prior to delivery to jobsite. Field assembly is not acceptable.

1. Control panels and enclosures shall be shop-built by DDC Contractor, and shall be delivered to the jobsite ready for mounting and external wiring connections.

2. Control devices, including sensors and instrument, which are shipped loose shall be assembled/installed in their final configuration to the greatest degree practical.

3. Terminal unit controllers shall be mounted to terminal units by DDC Contractor at his/her shop, or by terminal unit manufacturer at factory. Field installation of terminal unit controllers shall not be acceptable.

C. Install systems and materials in accordance with manufacturer’s instructions, roughing-in drawings, details and control schematics indicated on Contract Drawings.
D. DDC Contractor shall perform Work under this Section in accordance with the following general sequence of events, subject to direction by the General Contractor. Coordination of Work and Project schedule shall be by the General Contractor, but DDC Contractor shall notify the Commissioning Authority and the Engineer of Record if jobsite circumstances, Project schedule, or General Contractor instructions require substantial deviation from this sequence of events.

1. Submit Submittal Package 0 (Qualifications) and receive approval.
2. Submit Submittal Package 1 (Hardware, Shop Drawings, Coordination Plans, Schedule) and receive approval.
3. Initiate installation of DDC System hardware, devices and wiring.
4. Develop point database and application software.
5. Simulate sequencing and debug programming off-line to the extent practical.
6. Submit Submittal Package 2 (Programming and Graphics) and receive approval.
7. Complete installation of DDC System hardware, devices and wiring.
8. Install point database and application software in controllers.
9. Submit Submittal Package 3 (Testing Forms) and receive approval.
10. Perform BAS Pre-functional Tests (start up, calibration and tuning) and submit BAS Pre-Functional Test Report for approval.
12. Assist in TAB tests and setpoint determination as specified in Article 3.4 and Paragraph 3.16D. Submit Setpoint Determination Report for approval.
14. Submit Package 4 (Training Materials) and receive approval.
15. Schedule Demonstration Tests, only after receiving approval of BAS Functional Test Report.
17. Train Owner’s personnel on system operation and maintenance.
18. Provide Completion Requirements documentation including hardcopy to Owner.
19. Provide DDC System access credentials to the Owner per Paragraph 1.9B.4.
20. Submit Package 5 (Post-Construction Trend Logs) in format specified for review and approval.
21. Receive approval of successful Trend Log review, or retest as required.
22. Complete all items in Completion Requirements per Article 1.9 and submit documents (electronically) for approval.
23. Receive approval of Completion Requirements documentation.
24. Provide Completion Requirements documentation including hardcopy to Owner.
25. Update all DDC System Software and device firmware to latest versions.

E. Coordinate Work and Work schedule with other trades prior to construction under the direction of the General Contractor.
3.2 DELIVERY, STORAGE AND HANDLING

A. The DDC Contractor shall be responsible for his/her work and equipment until finally inspected, tested and accepted.

B. The DDC Contractor shall protect his/her work against theft or damage, and shall carefully store material and equipment received on site that is not immediately installed.
   1. Close all open ends of work with temporary covers or plugs during storage and construction to prevent damage/contamination by foreign objects and construction debris.
   2. Provide factory-shipping cartons for each piece of equipment and control device. Maintain cartons during shipping, storage and handling as required to prevent equipment damage, and to eliminate dirt and moisture from equipment.
   3. Store equipment and materials inside and protect from weather.

3.3 EXAMINATION AND SITE CONDITIONS REPORT

A. The DDC Contractor shall thoroughly examine the Contract Drawings and Project Specification for control device and equipment locations.

B. The DDC Contractor shall inspect the site to verify that the equipment may be installed as shown. Any discrepancies, conflicts, or omissions shall be documented and submitted in the Site Conditions Report. If space appears inadequate for installation, including required or indicated clearances, that concern shall be documented and submitted in the Site Conditions Report.

C. Examine walls, floors, roofs, and ceilings for suitable conditions where product will be installed.

D. Prepare written report of site conditions. Report shall describe any conditions detrimental to performance of the Work, or it shall declare that the site conditions have been reviewed and no such detrimental conditions have been identified. Submit report to Engineer of Record for review and approval no later than Submittal Package 2 (see Paragraph 1.8G.1.c.1).

E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.4 COORDINATION WITH OTHER TRADES

A. Where the mechanical work will be installed in close proximity to, or will interfere with work of other trades, the DDC Contractor shall assist in coordinating space requirements.

B. Coordinate and schedule work with all other trades in the same area, or with work that is dependent upon other trades to facilitate mutual progress. Report all conflicts and anticipated delays to the General Contractor for resolution immediately upon identification.

C. Control Products for Factory Installation
   1. Furnish selected control devices and products to equipment and systems manufacturers for factory installation as specified in Contract Drawing equipment schedules and control schematics.
   2. If DDC Contractor is not installing controllers to terminal units at their own shop (see Paragraph 3.1B.3), furnish terminal unit controllers to terminal unit manufacturer for factory mounting and integration. Field installation of terminal unit controllers is not acceptable.
   3. Submit coordination plan for manufacturer integration with DDC Submittal Package 1 (see Paragraph 1.8H.2.f).
a. Coordination plan shall list devices furnished, destination company name and address, and anticipated date of shipment.

4. DDC Contractor is responsible for delivering equipment to manufacturers in a timely fashion to facilitate mutual progress and meet the Project schedule. Immediately notify General Contractor of any anticipated or probable delays in product availability or delivery which could impact construction schedule.

5. DDC Contractor is responsible for coordinating, supporting, and verifying the installation of controls products by manufacturers. Provide all reasonable support required to ensure correct installation of control products.

6. Verify correct function of control products upon receipt of equipment with control product installed.

D. Control Products for Installation by Others

1. Furnish control devices and products to contractors of other trades for field installation as coordinated with those trades or as directed by the General Contractor.

2. DDC Contractor shall meet with contractors of other trades to coordinate details of the interface between the control products and the equipment or location where they are to be installed.

a. The project Commissioning Coordinator as well as the Owner or the Commissioning Authority shall be present for these meetings.

b. DDC Contractor shall provide all information and documentation regarding the correct installation, configuration and operation of said control products.

c. DDC Contractor shall provide details of the proposed interface to the DDC System including PICS for BACnet equipment, hardware and software identifiers for interface points, network identifiers, wiring requirements communications speeds, and required network accessories.

d. DDC Contractor shall review with contractors of other trades the control and interface requirements of the equipment where the control devices are to be installed, to ensure that there are no unresolved issues regarding the integration of these products into the DDC System.

e. Submit coordination plan documenting this meeting with DDC Submittal Package 1 (see Paragraph 1.8H.2.f).

1) Coordination plan shall list devices furnished, the trade to which they are furnished, and the equipment or location where they are to be installed.

2) The coordination plan shall indicate agreement by contractors of other trades to install these devices as discussed in this meeting.

3. If the DDC Contractor is unable to coordinate effectively with contractors of other trades, it is the DDC Contractor’s responsibility to notify the General Contractor and the project Commissioning Coordinator and seek resolution. If coordination remains impossible after such notification, the DDC Contractor shall notify the Commissioning Authority and the Owner in writing.

4. DDC Contractor is responsible for delivering equipment to other contractors in a timely fashion to facilitate mutual progress and meet the Project schedule. Immediately notify General Contractor of any anticipated or probable delays in product availability or delivery which could impact construction schedule.

5. DDC Contractor is responsible for supporting and verifying the installation of controls products by contractors of other trades. Provide all reasonable support required to ensure correct installation of control products.

6. DDC Contractor shall verify correct function of control products after installation.
E. Products by Others for Integration with DDC System

1. As required by the needs of the project or as directed by the General Contractor, DDC Contractor shall coordinate with contractors of other trades who are furnishing equipment that is to be installed or configured by the DDC Contractor, or is to interface with the DDC System network.

2. This requirement applies to all equipment that is installed, configured or connected by the DDC Contractor, including but not limited to VFDs, gateways, and package unit controllers.

3. DDC Contractor shall meet with contractors of other trades to coordinate details of the interface between said equipment and the DDC System.

   a. The project Commissioning Coordinator as well as the Owner or the Commissioning Authority shall be present for these meetings.
   b. DDC Contractor shall obtain from equipment manufacturers and/or other contractors all information and documentation regarding the correct installation, configuration and operation of said equipment.
   c. DDC Contractor shall obtain from equipment manufacturers and/or other contractors details of the proposed interface to the DDC System including PICS for BACnet equipment, hardware and software identifiers for interface points, network identifiers, wiring requirements communications speeds, and required network accessories.
   d. DDC Contractor shall ensure that there are no unresolved issues regarding the integration of these products into the DDC System.
   e. Submit coordination plan documenting this meeting with DDC Submittal Package 1 (see Paragraph 1.8H.2.f).

      1) Coordination plan shall list equipment furnished to the DDC Contractor, the trade or manufacturer providing said equipment, the expected installation location, and the means of connection or interface to the DDC System.

4. If the DDC Contractor is unable to coordinate effectively with contractors of other trades, it is the DDC Contractor's responsibility to notify the General Contractor and the project Commissioning Coordinator and seek resolution. If coordination remains impossible after such notification, the DDC Contractor shall notify the Commissioning Authority and the Owner in writing.

F. Setpoint Determination

1. DDC Contractor and TAB (Test and Balance) Contractor shall coordinate to determine the correct values for setpoints and other parameters required to program Sequences of Operations.

2. DDC Contractor shall provide a list of setpoints and other parameters to be determined by the TAB Contractor.

   a. See “Information to be Coordinated with Test and Balance Contractor” in Part 3 of Sequences of Operations for required setpoints identified by Engineer of Record.
   b. The list of setpoints provided in Sequences of Operations may not be complete. DDC Contractor is responsible for identifying all setpoints which require TAB coordination and are necessary for correct execution of Sequences of Operations.

3. TAB Contractor shall develop necessary test processes and forms in accordance with Division 23. DDC Contractor shall review and comment on planned tests to ensure that they will provide information required to correctly program Sequences of Operations.

4. Submit Setpoint Determination Plan with DDC Submittal Package 3 (see Paragraph 1.8H.4.b). (Plan will also be separately submitted by TAB Contractor under Division 23.)

   a. Plan shall include a brief narrative description of the means and methods to be used to determine specified setpoints and other system parameters.
   b. Plan shall also include copies of the data record sheets to be used during testing.
   c. Coordination plan shall be signed by both DDC Contractor and TAB Contractor.
5. After setpoint determination is complete, provide Setpoint Determination Report. See Paragraph 3.16D.3.

G. Life Safety: DDC System provided under this Section is not rated for and shall not perform life-safety control functions. The control system shall interact with life-safety systems only via hardwired interlock, or for monitoring purposes, as detailed below.

1. Duct smoke detectors required for air handling unit shut down are provided under other Divisions and Sections of this Specification. The DDC Contractor provide a hardwired interlock from duct smoke detectors to shut down HVAC equipment as shown in the Contract Drawing control schematics.

2. Fire/smoke alarm system is provided under another Division of this Specification. The DDC Contractor shall provide a hardwired interlock from nearest fire alarm panel to shut down HVAC equipment as shown in the Contract Drawing control schematics.

3. Smoke and fire-smoke duct isolation dampers and actuators are provided under other Divisions and Sections of this Specification. No BAS connection is required or permitted.

H. Networked Lighting Control System Integration

1. As shown in Contract Drawing control schematics, connect to lighting control system and map across points as indicated and as required to execute control logic described in Sequences of Operations.

2. Map all points shown on Contract Drawing control schematics from lighting control system to BAS. At a minimum (regardless of control schematics), for each room under the lighting control system, map the following points:
   a. Lighting zone status
   b. Occupancy sensor status, if applicable
   c. Local switch status, if applicable
   d. Room ambient light level, if applicable
   e. Dimming level (dimming percent or number of fixtures energized)
   f. Lighting zone demand response status

3. All points mapped from the lighting control system shall be trended in accordance with Paragraph 3.6E.

4. For each lighting control zone, map the lighting schedule to a schedule in the BAS. Schedule mapping shall have read/write capability so that changes made at the BAS are reflected in the lighting control system and changes made in the lighting control system are reflected in the BAS. In other words, lighting schedule shall be synchronized between BAS interface and lighting control system interface.

5. Coordinate with Division 26 and submit coordination plan for lighting system integration with DDC Submittal Package 1 (see Paragraph 1.8H.2.f).
   a. A coordination meeting with Division 26 is strongly encouraged.
   b. Plan shall include a narrative description of the expected tie ins between the DDC System and lighting control system, along with a list of points to be mapped, and schematics and drawings as required to support a seamless integration.
   c. Coordination plan shall be signed by both DDC Contractor and Division 26 Contractor.

I. Resource Meter Integration

1. As shown in Contract Drawing control schematics, connect to pulse output of utility water, gas or electric meters installed by others. Coordinate with appropriate trades and/or utilities to determine quantity of resource represented by each pulse. Trend cumulative consumption of each meter separately. Verify that consumption reported by DDC System matches actual meter reading. Submit verification with Functional Test Report.
2. As shown in Contract Drawing control schematics, connect electric circuit power meters, "smart" breakers, and network-enabled meters to DDC System.
   a. Networked-connected resource meters shall communicate using native BACnet without requiring a protocol translator. See Paragraph 2.7E.
   b. Coordinate with Division 26 to install and test, and submit coordination plan for meter integration with DDC Submittal Package 1 (see Paragraph 1.8H.2.f).
      1) A coordination meeting with Division 26 is strongly encouraged.
      2) Plan shall include a narrative description of the expected tie ins between the DDC System and meters, along with a list of points to be mapped, and schematics and drawings as required to support a seamless integration.
      3) Coordination plan shall be signed by both DDC Contractor and Division 26 Contractor.

3. After installation, verify that information reported by DDC System matches actual consumption. Submit verification with Functional Test Report. DDC Contractor is responsible for ensuring accuracy of meter information reported by DDC System.

J. Testing and Commissioning
   1. Coordinate with and assist TAB Contractor in balancing tasks which require DDC System interaction per Paragraph 3.16D.
   2. Perform commissioning activities and assist Commissioning Authority and/or Commissioning Coordinator in the execution of commissioning tasks per Article 3.16.

3.5 GENERAL WORKMANSHIP REQUIREMENTS

A. DDC System installation shall be performed by professionals in a workmanlike manner consistent with industry standards for performance and in compliance with the Contract Documents, Division 26 and 27 Specifications, the National Electric Code (NEC) and any/all applicable local codes and/or Authorities Having Jurisdiction.

B. DDC Contractor shall continually monitor the field installation for code compliance and quality of workmanship.

C. Installation of all control devices and products shall follow manufacturer’s recommended installation procedures. If there is a conflict between manufacturer’s recommendation and any Specification, code requirement or AHJ requirement, notify the Engineer of Record in writing.
   1. DDC Contractor shall have all work inspected as required by local and/or regional code enforcing authorities and/or AHJ.

D. Install products to satisfy more stringent of all requirements indicated.

E. Install products level or plumb, parallel or perpendicular to building construction.

F. Support products, tubing, piping wiring and raceways. Brace products to prevent lateral movement and sway or a break in attachment. Comply with all seismic requirements.

G. Penetrations
   1. Fabricate openings and install sleeves in ceilings, floors, roof, and walls required for installation of products. Before proceeding with drilling, punching, and cutting, check for concealed work to avoid damage. Patch, flash, grout, seal, and refinish openings to match adjacent condition.
   2. Firestop penetrations made in fire-rated assemblies. Comply with Division 7 requirements.
3. Seal penetrations made in acoustically rated assemblies. Comply with Division 7 requirements.
4. Penetrations through and mounting holes in the building exterior associated with the DDC System installation shall be sealed and made water-tight.

H. Provide sufficient slack wire and flexible connections to allow for vibration of piping and equipment.

I. Dielectric isolation shall be provided where dissimilar metals are used in installation for connection and support.

J. Welding Requirements:
   1. Restrict welding and burning to supports and bracing.
   2. No equipment shall be cut or welded without approval. Welding or cutting will not be approved if there is risk of damage to adjacent Work.
   3. Welding, where approved, shall be by inert-gas electric arc process and shall be performed by qualified welders according to applicable welding codes.
   4. If requested on-site, show satisfactory evidence of welder certificates indicating ability to perform welding work intended.

K. Fastening Hardware:
   1. Stillson wrenches, pliers, and other tools that damage surfaces of rods, nuts, and other parts are prohibited for work of assembling and tightening fasteners.
   2. Tighten bolts and nuts firmly and uniformly. Do not overstress threads by excessive force or by oversized wrenches.
   3. Lubricate threads of bolts, nuts and screws with graphite before assembly.

L. Install products in locations that are readily accessible as defined by Chapter 1, Article 100, Part A of the National Electric Code (NEC) and that will permit service, maintenance, repair or replacement from floor, equipment platforms, or catwalks without removal of permanently installed furniture and equipment.

M. All control devices mounted outdoors shall be protected by a weather-shield, integral outdoor enclosure, etc. and from ambient elements in such a manner as to not impede design functionality and/or sensing. See Paragraph 2.2H.

N. Corrosive Environments:
   1. Avoid or limit use of materials in corrosive airstreams and environments, including, but not limited to, the following:
      a. Laboratory exhaust-air streams.
      b. Process exhaust-air streams.
   2. When conduit is in contact with a corrosive airstream and environment, use Type 316 stainless-steel conduit and fittings or conduit and fittings that are coated with a corrosive resistant epoxy coating.
   3. Where products are located in a corrosive environment and are not corrosive resistant from manufacturer, field install products in NEMA 250, Type 4X enclosure constructed of Type 316L stainless steel.
O. Cleaning

1. Clean up all debris resulting from its activities daily. Remove all cartons, containers, crates, and other debris generated by Work in this Section as soon as their contents have been removed. Waste shall be collected and disposed of in accordance with Project waste disposal procedures. All recyclable materials shall be sorted into the appropriate bins.

2. Materials stored on-site shall be protected from weather and stored in an orderly manner, neatly stacked, or piled in the designated area assigned by the Owner’s Representative.

3. At the completion of work in any area, clean all work and equipment of dust, dirt, and debris.

4. Use only cleaning materials recommended by the manufacturer of the surfaces to be cleaned and on surfaces recommended by the cleaning material manufacturer.

P. All damage to and openings in ductwork, piping insulation, and other materials and equipment resulting from Work in this Section shall be properly sealed, repaired, or re-insulated by experienced contractors of the trade involved. Repair insulation to maintain integrity of insulation and vapor barrier jacket. Use hydraulic insulating cement to fill voids and finish with material matching or compatible with adjacent jacket material.

Q. At the completion of Work, all equipment furnished under this Section shall be checked for paint damage, and any factory-finished paint that has been damaged shall be repaired and repainted to original finish.

3.6 SYSTEM SOFTWARE INSTALLATION

A. General

1. DDC Contractor shall install and completely configure all System Software, supplemental software, networking stacks and interfaces on all servers and interface devices specified in this Section.

2. DDC Contractor shall tune and adjust software as required to obtain a fully functioning system that provides stable control.

3. Maintain all programming, graphics and data files in a logical system of directories with self-explanatory file names.

4. All programming developed for the Project is the property of the Owner, per Article 1.10.

B. System Software Packages

1. Operator’s Web Interface (OWI): Provide and configure per Paragraph 2.4B.

2. BACnet Advanced Operator Workstation (B-AWS): Provide and configure per Paragraph 2.4C.

3. Simulation Tools: Provide and configure if required in Paragraph Error! Reference source not found.

4. Trend Archive Software:
   a. Provide if required in Paragraph 2.4D. If “Not Required” then DDC Contractor may disregard the remainder of this Paragraph.
   b. Configure to automatically manage network connections, retrieve data at configured intervals, and store data in provided SQL Trend Database.
   c. Software shall identify any of the following fault conditions and generate a Level 4 alarm at the operator’s graphical interface.
      1) Communication failure
      2) Corrupt data is retrieved from control device
      3) Device is offline unexpectedly
      4) SQL database/access errors
      5) Archive service failures
d. In the event of a database access failure, the Trend Archive software shall build a storage queue of data to be written to the SQL database when it becomes available.

5. Trend Database Software

a. Provide and configure if required in Paragraph 2.4E. If “Not Required” then DDC Contractor may disregard the remainder of this Paragraph.

b. If database software limits the size of the database file, configure system to automatically create and start using a new database file when the current file approaches maximum size, so that multiple database files shall reside on Data drive. Generate a Level 5 alarm notification when this occurs.

c. Configure database to perform the following functions automatically without user intervention:

1) Regularly perform automatic database integrity checks. In the event of a failed integrity check, generate a Level 3 alarm.

2) Configure database so that, in the event that it runs out of space, oldest data is overwritten by newest data so that the longest possible continuous data record is maintained. If this occurs, generate a Level 4 alarm noting that storage is full. This alarm shall recur no more often than once per week.

6. Trend Analysis Software

a. Provide and configure if required in Paragraph 2.4F. If “Not Required” then DDC Contractor may disregard the remainder of this Paragraph.

b. Trend Analysis and Reporting (TAR) software shall provide fully-customizable analysis and reporting of trend and runtime log data from multiple data sources in standard data formats. The use of proprietary data formats is not acceptable.

c. Reports shall be generated in HTML format natively. Reports shall be converted to PDF when transmitted as email attachments.

d. It shall be possible to filter data by name, mnemonic, object instance and engineering units at a minimum. Users shall have the ability to define persistent filters with custom names for simple organization and access.

e. TAR software shall support the display of user-defined data in each report including static values, dynamic archived data, calculations and formulas with the following capabilities at a minimum.

1) Display data as bar, pie and line charts and in a tabular format.

2) Display raw data with sample date and time stamps.

3) Apply mathematical functions, transforms and conditional operations to data.

4) Filter data based on inequalities, including ranges (e.g. filter for values greater than X and less than Y).

5) Display data at user-defined sample intervals over a customizable date range. (e.g. daily energy consumption for one month).

6) Display data as a contribution by comparing data for a configurable time period (e.g. energy sub-meters as components of total energy consumption for the month).

7) Display data as an aggregate value for a user-defined day, week, month or year over a configurable time period (e.g., analyze energy costs on Monday mornings for the year to optimize system initialization).

8) Interactive, dynamic report-sourced data field components that can be modified by report users for analysis of imported data (e.g., current price of energy or energy conservation measure efficiency).

9) Interactive, dynamic component that can be manipulated by report users for adjusting the displayed date range of the report.

10) Formatted WYSIWYG custom text field for the addition, modification of descriptive text, report narratives, contact information, corporate/client letterhead, hyperlinks, etc.
11) GIF, JPG and/or PNG image components, and customizable text, images, and watermarks.

f. Graphical displays of data shall have at least the capabilities described in Paragraph 2.4B.7.b.

g. DDC Contractor shall provide pre-built sample templates for each of the specified report components for easy replication by report software users.

h. Report format and data shall be fully customizable by the user including the following at a minimum:

1) Custom component, chart, background and line colors.
2) User-defined component, data, legend, title and axis labels.
3) User-defined font and font size.

i. Reports shall be created through a simple drag-and-drop, graphically-oriented operator interface.

j. Any report shall support a minimum number of unique, active data objects totaling the greater of 100 objects or 10% of the total number of hardware objects installed as Work under this Section.

k. Report templates and individual reports shall be saved to the Data Archive server. Authorized users shall be able to characterize reports by report title, report author, user-defined category, created and updated dates.

l. TAR software shall support automated e-mail distribution of any report as a hyperlink or PDF attachment to a user-defined recipient list at configurable times, days and dates with custom messages.

C. Security

1. System security permissions shall be multilayered, supporting at least 5 access levels with distinct viewing and editing privileges definable for each level. Initially define the following access levels:

a. Observer: Can view all parts of the DDC System interface but cannot override points, or issue commands or exert other control functions.

b. Regular Operator: Observer access plus the ability to perform all tasks listed in Paragraph 3.17D.3.

c. Advanced Operator: Observer access plus the ability to perform all tasks listed in Paragraphs 3.17D.3 and 3.17D.4.

d. System Administrator: Observer access plus the ability to perform all tasks listed in Paragraphs 3.17D.3 and 3.17D.5.

e. Superuser: Full and unrestricted access to all control system functions.

2. Each operator shall be required to log on to the system with a unique user name and password in order to view, edit, add or delete data.

3. User registration shall require an email address associated with each user, which is used to notify operator of errors and alerts as described elsewhere in this Section.

4. DDC Contractor shall coordinate with Owner or building maintenance staff for initial users, passwords, email addresses and associated access levels.

a. DDC System user/password database must be configured before system acceptance.

b. Configure exactly one (1) Superuser account (see above) in addition to accounts requested by Owner.

c. The usernames “admin” and “administrator” shall not be used. If either username is hard coded into the software, disable the associated account and create a new account with equivalent privileges under a different username.

d. Default passwords shall not be used and shall be changed if present.

e. Passwords assigned to each user shall be unique to that user. Use minimum 8 character passwords.
5. All System Software Functions and host devices shall share a common set of usernames and passwords. The user database shall synchronize automatically and transparently among the devices hosting these functions.
6. Active Directory integration support shall be provided for assigning and enforcing security credentials and policies for operators.
7. Each operator shall be automatically logged-off of the system after a configurable period of inactivity.
8. Security data shall be stored and transmitted in an encrypted format, with 256 bit encryption.
9. Provide credentials information to Owner at closeout per Paragraphs 1.9B.4 and 1.9C.2.

D. Sequences of Operation Programming
1. Create controller application programs as required to execute specified Sequences of Operations.
2. Program all Sequences of Operations as written. It is the Contractor’s responsibility to request clarification when clarification is needed.
3. Embed comment statements in the programming sufficient to clearly describe each Section of the program. Comments shall reflect the language of the specified Sequences of Operations.
4. All setpoints, timers, deadbands, PID gains, and other parameters shall be adjustable by a properly-credentialed operator, whether or not they are indicated as adjustable in sequences. Software points shall be used for these variables. Fixed scalar numbers shall not be embedded in application programs except for physical constants and conversion factors.
5. All programming specific to the Project shall be written in a manner that will ensure programming quality and uniformity. Contractor shall ensure:
   a. Programs are developed by one programmer, or a small group of programmers with rigid programming standards, to ensure a uniform style.
   b. Programs for like functions and similar equipment are identical, to reduce debugging time and to ease maintainability.
      1) When there are small variations in equipment configuration (e.g. VAV zone with a CO2 sensor vs. VAV zone with an occupancy sensor), provide a single program with a software “switch” to set operating configuration, rather than providing two separate programs.
   c. Programs are thoroughly debugged before they are installed in the field.
6. Document all programming and configuration as built, and submit for review and approval at the following Project stages:
   a. Prior to downloading into the panel, with Submittal Package 2 (Paragraph 1.8H.3.c)
   b. At the completion of Functional Performance testing, after all remediation and corrections are complete and Functional Test Report has been accepted.
   c. At the end of the warranty period (see Paragraph 1.12B.5).
7. Provide a search capability that will search all control sequences for a given point name to determine all sequences that use or control the point.

E. Trends
1. DDC System shall support trend logs using standard BACnet trend objects, per Paragraph 2.8K.
2. Trend data shall be sampled and stored in controller memory. If Data Archive Server is provided, trend data shall be uploaded from panels to server on a user-defined interval, manual command, or automatically when the controller trend buffer becomes full.
3. All time-basis trends shall be synchronized so as to record data at the same time for ease of side-by-side comparison. Trends with the same time basis but offset timestamps (e.g. one point trends at 1:00, 1:05, 1:10, etc while another point trends at 1:02, 1:07, 1:12, etc.) shall not be accepted.

4. DDC Contractor shall set up trends for all points listed in points schedules on Contract Drawing control schematics. Unless otherwise indicated, trend all listed points as follows:
   a. Binary points shall be trended on a change-of-value (COV) basis.
   b. Analog points shall be trended on a time basis with a frequency of 5 minutes.
   c. If an analog point is indicated for COV trending with a value in engineering units (e.g. “2°F COV”), provide trend which records a timestamp and point value every time the point value changes at least the given increment.
   d. If an analog point is indicated for COV trending with a percentage value (e.g. “±10% COV”), provide trend which records a timestamp and point value every time the point value changes by at least that percentage of its current value.

5. In addition, DDC Contractor shall set up trends of setpoints as follows:
   a. All fixed setpoints shall be trended on a COV basis, with one minimum of one data point recorded per day, at noon. (The minimum single data point provides a reference for subsequent trend analysis.)
   b. All occupant-adjustable setpoints (e.g. at thermostats) shall be trended on a COV basis, with one minimum of one data point recorded per day, at noon.
   c. For setpoints that are reset by a parameter (e.g. reset supply air temperature setpoint based on outdoor air temperature), trend both the setpoint and the resetting parameter on a time basis. Setpoint trend frequency shall be the same as the trend frequency for the physical point controlled by the setpoint, typically 5 minutes.
   d. For setpoints reset by Request-based Trim & Respond logic (see Paragraph 1.4II), trend the setpoint and the number of requests on a time basis. Trend frequency shall be equal to the time step of the Trim & Respond loop.

6. In addition, DDC Contractor shall set up trends of system parameters including the following:
   a. Trend signal value for all control loops, except those that drive a single AO point that is already being trended.
      1) For example, do not trend both the speed of a fan and the analog output of the point commanding the fan speed, as their values will always be the same.
      2) For example, do trend the value of zone heating and zone cooling PID loops, as their output does not correlate directly to any command sent to physical equipment.
   b. Trend all global overrides such as demand response signals and after-hours (i.e. “janitor button”) system operation.
   c. Trend all performance calculations, such as equipment efficiency or plant load, described in Sequences of Operations.

7. In addition, DDC Contractor shall map and set up trends of all equipment points listed in “Trends” in Part 1 of Sequences of Operations.

8. DDC Contractor shall not create duplicate trends of a single point. If a single point referenced for trending in this or other Sections appears more than once, that does not indicate that multiple trends shall be created. Create only one trend for any given physical or virtual point, unless specifically instructed otherwise.
F. Groups

1. As described in Paragraph 2.4C.4, properly-credentialed operators shall be able to assign BACnet objects, parameters or points to groups manually, by type, or using wildcard search, and shall be able to apply batch modifications or overrides to an entire group with a single action.

2. DDC Contractor shall configure the following groups:
   a. All zones, by Zone Group: Assign each zone to a Zone Group, as defined in the Sequence of Operations.
   b. All zones by floor
   c. All equipment by system/function
      1) Assign all devices associated with each major system or subsystem (e.g. chiller plant, boiler plant, air handler) to a separate group.
      2) If there are multiple independent units (e.g. air handlers), create a separate group for each one. If there are multiple interdependent units (e.g. boilers in a plant) put all interdependent units in the same group.
      3) Include with each system group all associated devices (e.g. pumps for plants) and sensors (including physically distance differential pressure or flow sensors, if used for control).
      4) For each air handler, all terminal units for a given air handler should be in a distinct group; i.e. separate from the air handler (so that overrides can be applied to the terminal units) and separate from groups of terminal units associated with other air handlers.
   d. All equipment by floor: Assign all networked control devices to a separate group based on the floor that the device serves (not necessarily where the device is physically located).

3. A single object or point may belong to more than one group. If multiple overrides conflict on a single object, the one with the highest assigned priority shall prevail.

G. DDC System Timekeeping

1. DDC Contractor shall provide a time master that is installed and configured to synchronize the clocks of all BACnet devices.
2. All trend sample times shall be synchronized.
3. The frequency of time synchronization message transmission shall be selectable by the operator.
4. System shall automatically change time/date for Daylight Savings Time and leap years.
5. Also see Paragraph 2.8G.4.

H. Schedule Configuration

1. Configure normal operating schedules. Schedules shall be applied to zone scheduling groups (see Paragraph 3.6F) as described in Sequences of Operations.
2. Configure holiday schedules for federal and state holidays, unless otherwise noted or instructed by Owner.
3. Configure exception schedules as requested by Owner.
4. The schedule objects shall reside in each individual controller or device. Each controller shall locally store schedule objects related to its controlled equipment or systems.

I. Alarm/Event Programming, Configuration and Handling

1. Contractor shall define five alarm levels/categories:
   a. Level 1: Critical/life safety
   b. Level 2: Significant equipment failure
   c. Level 3: Non-critical equipment failure/operation
2. DDC Contractor shall program alarms and associated alarm levels per Sequences of Operations using BACnet Event templates as described in Paragraph 2.2H.3. Alarm messages shall use verbose English language names and descriptions such that the source, location and nature of the alarm is easily understood.

3. Adjust alarm parameters as required to minimize nuisance alarms while identifying genuine alarm and fault conditions.

4. DDC Contractor shall configure alarm handling as follows:

<table>
<thead>
<tr>
<th>Criticality</th>
<th>Level 1</th>
<th>Level 2</th>
<th>Level 3</th>
<th>Level 4 &amp; 5</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alarm</td>
<td>Critical</td>
<td>Not Critical</td>
<td>Not Critical</td>
<td>Not Critical</td>
</tr>
<tr>
<td>Acknowledgement</td>
<td>Required*</td>
<td>Required</td>
<td>Not Required</td>
<td>Not Required</td>
</tr>
<tr>
<td>Acknowledgement of Return to Normal</td>

<td>Y</td>
<td>N</td>
<td>N</td>
</tr>
<tr>
<td>Remove from current alarm log</td>
<td>After Acknowledged</td>
<td>After 2 weeks</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*Level 1 alarms must be acknowledged individually.
**Level 1 alarm notifications shall repeat every hour until acknowledged.

5. Notifications shall be sent to all users of Advanced Operator or higher access level (see Paragraph 3.6C.1) or otherwise as specified by Owner.

6. See Paragraph 3.7L for alarm interface requirements.

J. Graphics Library

1. DDC Contractor shall provide a library of standard HVAC graphic components for the future creation of custom graphics that are consistent with the delivered graphical user interface.

2. Graphical elements shall be professionally rendered isometric three-dimensional static and animated images in a standard (e.g. JPEG, GIF, BMP or PNG) graphics format.

3. Graphic library shall include all of the equipment images and symbols used in the Project, as well as all standard symbols and images for common components (e.g. dampers, valves, sensors) even if they were not used in the delivered graphical user interface.

4. Newly created graphics shall be able to be fully integrated with existing graphics and user interface elements. System shall allow user to attach animations, BACnet objects, points and hyperlinks to graphics.
3.7 GRAPHICAL USER INTERFACE

A. General

1. Graphical user interface shall be an intuitive multi-window image-based interface for navigating, monitoring, and controlling devices within the DDC System.
   a. Interface shall be constructed to have the look and feel of a single application. All graphical screens shall be designed and laid out to provide a uniformly high quality and consistent user experience across displays for different systems.
   b. Graphical elements shall be hyperlinked such that clicking on an element will “drill down” to the next level of detail. (E.g. clicking on an air handler graphic in a system-level schematic will display the interface screen for that air handler; clicking on a fan icon will display detailed information about that fan and its associated VFD.)
   c. When clicking a link, the operator shall have the option of opening the new view in the same window, or in a new window with e.g. a right-click selection. The default shall be to open the new view in the same window.
   d. Every page shall have a “back” button to return to the previous screen and a “home” button to return to the top level or site overview page.
   e. Use colors in a consistent, logical and intuitive way.

2. On all screens, status lamps and displayed text associated with a device (e.g. fan status, or sensor reading) shall correspond to the condition of the device:
   a. Normal operation: Text shall be white, black or other neutral color as appropriate to the background. Status lamps shall be green, or operation may be indicated by an animation.
   b. Manually disabled or offline: Grey (select a shade that provides visible contrast with the background).
   c. Level 1 or Level 2 alarm condition: Red text and lamp.
   d. Levels 3 through 5 alarm condition: Yellow text and lamp.

3. All equipment shall be identified on graphics by the unit tag as scheduled on the drawings.
4. All devices and controlled equipment that appear multiple times (e.g. VAV boxes) shall use a single graphic template so that any updates are automatically applied to all applications with a single action. Displayed points shall be automatically populated using wild cards for point names in graphic template.
5. Display global readings such as time, outdoor air temperature, humidity, and wind speed (as applicable/available) in the upper left corner of every graphic page.
6. Clicking on the display of any point on any graphics page shall open an override screen as described in Paragraph 3.7B.7. It shall be possible to override any input or output, hardware or software point as required by Paragraph 2.2F.
7. Any point that is overridden by the operator shall indicate the overridden condition on every graphic page where that point appears. Override shall be indicated by flashing icon or text, or other means so that status is visually obvious at a glance.
8. If controllers support supervised manual override, points in supervised manual override shall also be indicated on graphics, in a fashion similar to but distinct from operator overrides performed through the DDC System interface.
9. For each graphic page, provide a text box for use by operators to record operational notes about the system. Text box shall expand or scroll in order to accommodate an arbitrary amount of text, without covering or obscuring system graphics.
10. All users shall be required to log in with proper credentials per Paragraph 3.6C to access any control graphic.
11. Contract Drawings in AutoCAD format will be made available to DDC Contractor upon request for use in developing backgrounds for graphic screens. These drawings are provided without guarantee that they will be suitable for the Contractor’s purpose.
B. I/O Points and Setpoints

1. The current value and point name of every I/O point and setpoint shall be shown on at least one graphic page and in its appropriate physical location relative to building and mechanical systems.

2. Verbose names (English language descriptors) shall be included for each point on all graphics. This may be accomplished by a pop-up that appears when hovering the mouse over the displayed point.

3. All analog points and setpoints shall be displayed with appropriate engineering units.

4. For all controlled analog points, display the current setpoint adjacent to the current value of the point.

5. Adjustment of Setpoints: All setpoints shall be adjustable directly within the graphics screen where they appear. It shall not be necessary to open a separate window to make a setpoint adjustment.
   a. Adjusting a setpoint is not the same as overriding it. It shall be possible to override a setpoint (see below) as well, but overrides shall not be used in place of adjustable setpoints. Both features shall be provided.
   b. Adjustments are permanent until changed.
   c. Fixed setpoints shall be adjustable.
   d. For setpoints that are reset by another parameter, both the setpoint range and the reset parameter range shall be adjustable. E.g. If a supply temperature setpoint is reset by outdoor air temperature, it shall be possible to adjust the minimum and maximum values of the supply temperature setpoint and also to adjust the minimum and maximum values of outdoor air temperature against which the setpoint is reset.
   e. For setpoints that use a Request-based Trim & Respond reset logic (see Paragraph 1.4II), all parameters shall be adjustable.
   f. For setpoints that automatically reset, it shall be possible to use an override to lock the current setpoint to a fixed value.
   g. It shall be possible to constrain the range of a setpoint in programming, such that it cannot be adjusted outside of this range. Setpoints shall be able to be overridden to any value irrespective of these constraints.

6. For all setpoints, display the original as-designed or as-balanced setpoint next to the current setpoint. The as-designed setpoint is for reference by future operators and is static: it is not used for control and shall not be able to be adjusted or overridden – the use of an image element rather than a BACnet object is recommended. The as-designed setpoint shall be clearly identified as such.

7. Override of Points: All physical and virtual points shall be able to be overridden per Paragraph 2.2F
   a. When any point is clicked on any graphics page, open a window that displays all of the object’s BACnet properties with an interface allowing points to be locked, overridden or returned to automatic control.
   b. The operator shall be able to establish timed overrides which automatically release after a period of time, and indefinite overrides which remain in effect until released or changed.
   c. Overrides shall require the user to click accept/apply before changes take effect. In other words, simply changing a value in a dialog box does not trigger the override – the operator must positively apply the change.
   d. A point in override shall indicate that status on every page where it appears, as described in Paragraph 3.7A.7 and shall appear in the summary of overridden points, as described in Paragraph 3.7J.9.
C. User Interface Architecture

1. Interface shall consist of a collection of graphical interface pages that provide the operator with various ways to view and control the DDC System and its components, as described below.

2. Graphical interface pages shall be displayed in a multi-window environment to support operator multi-tasking.
   a. User shall be able to close any window without affecting other windows.
   b. User shall be able to minimize any window without closing it.
   c. Interface shall be able to support an arbitrary number of windows, limited only by the memory and processor capacity of the host computer.

3. Graphical interface pages shall be connected by hyperlinks. When following a link, the user shall be able to choose to open the new interface page in a new window or in the same window.

4. Each window shall be to display a variety of graphical interface pages serving different purposes, including at least the following:
   a. Site and building overviews as described in Paragraph 3.7D
   b. System navigation tree as described in Paragraph 3.7D.3
   c. BACnet network map as described in Paragraph 3.7F
   d. Floor plan graphics as described in Paragraph 3.7G
   e. Equipment graphics as described in Paragraph 3.7H
   f. Controller and network device graphics as described in Paragraph 3.7I
   g. Summary pages as described in Paragraph 3.7J
   h. BACnet properties and point overrides as described in Paragraph 3.7B.7
   i. Schedules: Create, modify, view and apply normal, holiday and exception schedules as described in Paragraph 3.7K.
   j. Alarms/Events: View, sort and acknowledge current and historical events. See Paragraphs 3.6I and 3.7L.
   k. Trend and Runtime Logs: Create new trend logs, and display current or historical trend and runtime data, including control of colors, date range, axis and scaling, as specified by Paragraphs 2.4B.7 and 2.4C.8.
   l. Logic Programming and Configuration: An interface for programming controllers with sequence of operation logic per Paragraphs 2.4C.3 and 3.6D.

D. Site/Building Overview

1. If DDC System serves multiple buildings, provide a site overview graphic showing at least all connected buildings. Clicking on a building shall display the associated building overview graphic. If DDC System serves only one building, site overview may be omitted.

2. For each building, provide an overview consisting of floorplan(s) with all mechanical equipment shown in its approximate physical location.
   a. Clicking on any equipment shall open the associated equipment control graphic (Paragraph 3.7H).
   b. For each floor, provide a “zone map” button to open the floor plan graphic (Paragraph 3.7B).
      1) If there are multiple zone types, provide a compound button or multiple adjacent buttons so that user may select the zone map for a specific type of zone.
      2) If there is only one zone type and space permits, the building overview may be combined with the floor plan graphic described in Paragraph 3.7G. All equipment and all zones must be easily identified and selected.
   c. If utility meters are connected to DDC System, display real-time data on building overview roughly where physical utility connection occurs.
d. Multiple floors may be shown in a single overview as long as all elements are large enough to easily see and select.

3. Display global readings such as outdoor air temperature, humidity, and wind speed (as applicable) prominently on site overview and each building overview.

E. System Navigation Tree
1. Provide hierarchical "tree" of equipment controlled by DDC System, similar to the Windows Explorer navigation tree.
2. Tree structure shall be based on the physical relationships between the devices being controlled (e.g. the VAV boxes served by an AHU shall be shown as "children" of that AHU).
3. Only controlled equipment and devices that provide control functions shall be displayed in this view. Devices dedicated to routing, protocol translation or other pure networking functions shall not be displayed.
4. Zones may be displayed in relation to their terminal units if doing so does not clutter the interface. Doing so may not be appropriate if there are multiple zone types, or if the relationship between zones and terminal units is not straightforward.
5. Display each piece of equipment as a separate object, even if they are attached to the same controller (e.g. multiple pumps serving a single plant shall be shown individually, as "child" objects of the plant equipment that they serve).
6. Navigation tree shall support expansion and collapse of individual levels of the tree, or of all levels simultaneously.
7. Clicking on any element of the tree shall open the graphic page for that equipment or zone.

F. Network Map
1. Provide an interactive graphical map of DDC System devices based on the actual connectivity of the BACnet internetwork.
2. Show all BACnet networked devices including routers, switches and controllers.
3. Show actual network architecture, including Supervisory Network (if applicable) and all Primary and Secondary Control LANs, with controllers as connected.
4. Clicking on any element shall open the graphic page for that controller or network device (Paragraph 3.7I).

G. Floor Plan Graphics
1. For each floor, provide one or more zone maps overlaid on floor plan graphics.
   a. Contract Drawing mechanical plans may show multiple types of zone (See Paragraph 1.4SS). In that case, provide color coded zone maps for each type of zone as described below.
   b. If mechanical plans do not distinguish between Thermal Space Control and Ventilation zones, assume that each non-Radiant zone combines the characteristics of both a Thermal Space Control zone and a Ventilation zone. (This is the case for conventional VAV zones.) The map of these zones shall display the information listed in both Paragraphs 3.7G.2 and 3.7G.3.
2. Thermal Space Control Zones
   a. Provide separate zone map for Thermal Space Control zones as shown on plans.
   b. Display the associated zone (air) temperature and setpoint at each zone.
   c. Also indicate zone temperature relative to active (occupied or unoccupied) setpoint graphically by coloring the zone area according to the following scheme:
      1) Red: Space temperature is above cooling setpoint by more than the adjustable threshold.
      2) Yellow: Space temperature is above cooling setpoint by less than the adjustable threshold.
3) Green: Space temperature is between cooling and heating setpoints and space is in Occupied Mode.
4) Gray: Space temperature is between cooling and heating setpoints and space is in Unoccupied Mode.
5) Light blue: Space temperature is below heating setpoint by less than the adjustable threshold.
6) Dark blue: Space temperature is below heating setpoint by more than the adjustable threshold.
7) The initial value of the adjustable threshold shall be 3°F. Threshold shall be adjustable for each zone individually or for all zones together.

d. Display occupancy sensor status for zones with occupancy sensors connected to DDC System or mapped from lighting control system.

3. Ventilation Control Zones:
   a. If Ventilation Control zones are indicated on mechanical plans, provide a separate zone map for Ventilation Control zones.
      1) For zones with a CO₂ sensor, display CO₂ reading and setpoint (PPM), and the value of the CO₂ control loop (%signal). Also indicate CO₂ level graphically by coloring the zone area according to the following scheme:
         a) Red: CO₂ reading is above setpoint for more than 10 minutes.
         b) Green: CO₂ reading is below setpoint.
         c) Blue: CO₂ reading is less than outdoor ambient or 400 PPM if no ambient CO₂ sensor (indicating sensor or measurement problems)
      2) Display zone airflow and airflow setpoint for zones with airflow measurement at the terminal unit.
   b. If Ventilation Control Zones are not indicated as a separate zone type on mechanical plans, display setpoints and current readings for CO₂ and airflow on Thermal Space Control zone map alongside temperature values. In that case, do not apply color coding based on CO₂ level.

4. Radiant Control Zones
   a. If Radiant Control zones are indicated on mechanical plans, provide a separate zone map for Radiant Control zones.
   b. Display the zone temperature (i.e. mass temperature from slab-embedded temperature sensor) and setpoint as numerical values at each zone.
   c. Also indicate zone temperature relative to active (occupied or unoccupied) setpoint graphically by coloring the zone area according to the same scheme used for Thermal Space Control zones (Paragraph 3.7G.2.c).
      1) The initial value of the adjustable threshold shall be 1°F. Threshold shall be adjustable for each zone individually or for all zones together.
   d. For radiant zones, also display current position of hydronic zone control valves and cumulative total number of open/close cycles in the last hour, and in the last 24 hours.
   e. Radiant zone setpoint is typically based on predicted outdoor temperatures plus adjustments (based on air temperatures in overlapping Thermal Space Control zones, and other factors). For each Radiant zone, provide details about how the current setpoint value was determined, including predicted outdoor temperature, any setpoint adjustments, and basis of said adjustments. This information may be provided in a pop-up box or linked page.

5. Lighting Control Zones:
   a. Provide a map of lighting zones overlaid on floor plan for each floor.
b. Lighting status shall be indicated by the following color scheme:
  1) Green: lights on by schedule or occupancy sensor
  2) Yellow: lights on by timed override or virtual switch (e.g. switch-on, auto-off)
  3) Red: lights on by manual override or physical switch
  4) Gray: lights off

c. Display ambient light level in footcandles on graphic for each lighting zone.
d. Display current active dimming level (dimming percentage or number of fixtures on vs off, as appropriate) on graphic for each lighting zone.
e. If lighting zone is subject to demand response load shed, indicate such on graphic.
f. For all zones with occupancy sensors, display the status of the sensor on the zone maps for lighting (duplicating display required for Thermal Space Control, above). This applies to all occupancy sensors, whether connected directly to DDC System or mapped from lighting control system.

6. Color schemes described above shall dynamically update in real time as zone conditions change.

7. Clicking on any zone in any map shall jump to the graphical page for the equipment serving that zone, if any. (Spaces with no associated equipment or sensors shall not provide links.)

8. For each zone participating in a Trim & Respond scheme (see Paragraph 1.4II) to reset airflow/static pressure or supply air temperature, display current number of Requests generated by that zone and the zone's Importance multiplier. Importance multiplier shall be adjustable.

9. For each zone subject to scheduling, provide a link or other means to identify all the schedules that apply to that zone, including the priority of each schedule.

10. If multiple views are necessary to show all areas of a single floor, provide a graphic building key plan that links to larger scale partial floor plans. Provide links from each larger scale graphic floor plan screen back to the building key plan and to each of the other graphic floor plan screens for that floor. The key plan view may be combined with the building overview (Paragraph 3.7D.2) so long as each part of the key plan is readily visible and selectable.

H. Equipment Graphics

1. Provide one or more equipment graphics pages for each piece of equipment controlled or monitored by the DDC System.

2. Equipment graphics shall be based on the Contract Drawing control schematics and/or mechanical schematics and details.

3. Animations or color shall be used to indicate on/off status of mechanical components.

4. Position of every valve and damper shall be shown adjacent to the device. Two-position devices may indicate state solely by animation of the graphic element, but all modulating devices shall also indicate commanded position and (if available) position feedback.

5. Hydronic system piping shall be labelled with type of water and also color-coded as follows:
   a. Heating hot water supply: Red
   b. Heating hot water return: Orange
   c. Chilled water supply: Light/bright blue
   d. Chilled water return: Dark blue
   e. Condenser water from tower to chiller: Dark yellow or orange (but distinct from HHWR color)
   f. Condenser water from chiller to tower: Bright yellow
   g. Domestic hot water: Light green
   h. Domestic cold water: Dark green
   i. Greywater: Purple
   j. When there is more than one loop of a given type (e.g. high and low temperature chilled water), they shall be distinguished by labels. Label each type of pipe on every screen where it appears.
6. Flow in hydronic pipes shall be indicated by animation or by the appearance of arrows when flow is present.

7. Each equipment page shall display all physical I/O points and relevant virtual points including setpoints and setpoint reset parameters. See Paragraph 3.7B.
   a. Setpoints and actual point values shall always appear on the equipment page.
   b. For setpoints reset by request-based Trim & Respond logic, also display on the equipment page the current number of Requests and the last action taken by the logic block ("trim", "respond", or "hold").
   c. Provide the ability to view and adjust all setpoint reset parameters (including all parameters used for Trim & Respond logic, where applicable). If space on the equipment page is insufficient, parameters may be viewed and adjusted from linked page or pop-up box.

8. Where multiple Mode-dependent setpoints exist (e.g. chiller with a regular cooling setpoint or reset, and a lower setpoint for dehumidification), all setpoints shall be displayed at all times, with the active setpoint clearly indicated. For example, the active setpoint may be in a bright neutral color while the inactive setpoints are in grey.

9. Complex systems (e.g. chiller and boiler plants) shall have a graphic page for the system as a whole, showing all associated sensors and ancillary equipment. Clicking on any piece of equipment shall open graphic page for that equipment.

10. Pages for terminal units shall include links to the associated air handler and to the floor plan where the zone is located.

11. Pages for terminal units shall also display information about the zone served. Information displayed shall depend on the type of zone; see Paragraphs 3.7G.2 and 3.7G.3, as applicable.

12. Each equipment page shall have a link to open the graphics page for its associated controller. See Paragraph 3.7I.

13. For each piece of equipment generating Trim & Respond reset requests, display current number of Requests generated by that equipment and the equipment’s Importance multiplier. Importance multiplier shall be adjustable. (See Sequences of Operations for explanation of Importance multiplier.)

14. For each piece of equipment subject to scheduling, provide a link or other means to identify all the schedules that apply to that equipment, including the priority of each schedule.

15. On graphics page for each system or subsystem, provide links to display the English-language control sequences and the O&M and submittal information.
   a. Information shall be in a text format that can be searched or copy/pasted to another application. Information shall not be editable from this interface.
   b. Links shall provide this information only for the associated equipment shown on the page, or shall jump to the appropriate bookmark in a longer document.
   c. Linking to the entire sequence or O&M document, without bookmarks, shall not be accepted.

16. For all equipment with runtime alarms specified in Sequences of Operations, show on graphic adjacent to equipment the current runtime, runtime alarm setpoint, alarm light, date of last runtime counter reset, and alarm reset/acknowledge button which resets the runtime counter.

17. For all equipment with lead/lag or lead/standby operation specified in Sequences of Operations, show on graphic adjacent to equipment the current lead/lag order and manual buttons or switches to allow manual switching of lead device by the operator.

I. Controller and Network Device Graphics
   1. Provide a graphic page for each controller, gateway and networked device in DDC System.
   2. Controller graphics shall consist of an image of the physical networked device and its connected points.
Page shall display all physical input and output points, with point names, current values, and override status shown.

Point information shall be displayed adjacent to or otherwise associated with the actual physical point connection on the device.

Each point shall display any configured BACnet Events/alarms.

Clicking on any point shall open the BACnet properties and override page (Paragraph 3.7B.7) for that point.

3. Graphics pages shall provide physical location of controller, and also display MAC address, network number, Device Identifier Object Property, and Device Object Name Property. See Paragraph 3.9C.

4. Graphics pages for gateways shall display the gateway interoperability schedule. See Paragraph 3.9D.

5. Each controller graphics page shall include links back to the equipment graphics page(s) for the equipment controlled by the device.

J. Summary Pages

1. Summary pages shall be text-based tables that provide key information about listed equipment.

2. Summary pages shall be linked from pages that represent individual examples of the device being summarized (e.g. each VAV box graphic shall have a link to a summary of VAV boxes).

3. Each summary shall display information about one type of equipment or zone. All equipment of that type (e.g. all AHUs, all VAV boxes, etc) shall appear in a given summary.

4. Each summary shall occupy a single graphical page. If there are more items than will fit in a single screen, provide means to scroll through the page so that all items can be viewed.

5. Each line of a summary shall link back to page for the equipment or zone it summarizes.

6. Provide a summary page for all equipment of each type, including but not limited to the following equipment and information (as applicable/available):

a. Air handlers: operating mode; on/off status; supply air temperature; supply air temperature setpoint; fan speed; duct static pressure; duct static pressure setpoint; damper positions; coil valve positions; outdoor airflow; supply airflow.
   1) If setpoints are reset by Trim & Respond logic (see Paragraph 1.4II), also include: total reset Requests received, separately for each type of Request
   2) If unit generates Trim & Respond Requests to reset plant setpoints, also include the following, separately for each type of Request: total reset Requests generated; cumulative %Request-Hours; Importance multiplier

b. Single-zone air handlers and fancoils: As for air handlers, plus zone temperature, zone temperature setpoint; CO₂ level (PPM); CO₂ control loop value (%signal).

c. Radiant Control zones: Zone (mass) temperature; zone (mass) temperature setpoint; hydronic zone control valve position; cumulative total number of valve open/close cycles in the last hour, and in the last 24 hours.

d. Thermal Space Control zones: Airflow; airflow setpoint; damper position; discharge air temperature; coil valve position; zone temperature; zone temperature setpoint; occupancy sensor status.
   1) If unit generates Trim & Respond Requests to reset air handler setpoints, also include the following, separately for each type of Request: total reset Requests generated; cumulative %Request-Hours; Importance multiplier

e. Ventilation Control zones: Airflow, airflow setpoint, damper position; CO₂ level (PPM); CO₂ control loop value (%signal); occupancy sensor status
1) If unit generates Trim & Respond Requests to reset air handler static pressure setpoint, also include: total reset Requests generated; cumulative %Request-Hours; Importance multiplier

f. If Ventilation zones are not distinct from Thermal Space Control zones, provide a single zone summary page including information from both zone types above.

7. Provide a summary page for each Zone Group (Paragraph 3.6F.2.a).
8. Provide a summary page for each group of equipment (Paragraph 3.6F.2.c).
9. Provide a summary page that lists all points currently overridden through the DDC System. Each item on list shall link back to the page associated with the overridden point.

K. Schedules

1. Support all scheduling functions required by Paragraph 2.8G.
2. Provide interface to create, edit, delete and view binary, analog and multistate BACnet Schedule objects and parameters.
3. Hierarchical Schedules: The system shall allow operators to define schedules in terms of systems of related equipment.
4. Group Schedules: The system shall allow operators to apply any schedule to any group, as defined in Paragraphs 2.4C.4 and 3.6F.
5. User shall be able to apply priority level to any schedule.
6. Conflicting schedules shall be resolved as follows
   a. First, the schedule with the highest priority shall prevail.
   b. If conflicting schedules have equal priority, the schedule with the smallest scope (i.e. fewest zones, or fewest devices) shall prevail.
7. Provide at least the following schedule views for any object or set of objects:
   a. Daily view showing all scheduled transitions, including start and end times and transition action, in a timeline or date-keeper format.
   b. Views showing all scheduled transitions for the calendar week, for the calendar month, and for the next 30 days. Transition indications may be abbreviated in these views. Clicking on a day shall bring up the daily view with full details of the scheduled transitions.
   c. Schedule summary: Show normal versus holiday versus override schedules, and the net operating schedule that results from all contributing schedules.

L. Alarms and Events

1. Alarms shall be displayed on the interface graphics for the system that the alarm is associated with (e.g. a fan alarm shall be shown on the graphic of its associated air handler).
   a. Display brief description of alarm (e.g. “failure to run”, “low pressure”, etc.) next to image of device or sensor status/output.
   b. Alarm notice and device status/output text shall appear in color based on alarm condition, per Paragraph 3.7A.2.
2. When there are unacknowledged alarms, a lamp or icon indicating this shall be displayed at the interface.
   a. This indicator shall be clearly visible but not obtrusive, and shall not cover other interface elements.
   b. This indicator shall flash for critical alarms.
3. Each new alarm shall appear in the log of current alarms
   a. Alarms shall be recorded in the log with at least the following information:
      1) Date and time of the alarm
2) Level of the alarm
3) Source of alarm
4) Description of the alarm
5) Equipment tags for devices in alarm
6) Possible causes of the alarm, if provided by the fault detection routines (see Sequence of Operations)

b. Operator shall be able to acknowledge or reset alarms from the alarm log screen. Alarms may be acknowledged in batches, except for Level 1 alarms.
c. When alarms are acknowledged (or time out), they shall be removed from the current alarm log and stored permanently in the alarm history log, recording time of acknowledgement and identity of the acknowledging operator.
d. Operator shall be able to view all current and historical alarms from any location in the internetwork.
e. Operator shall be able to sort alarms based on level, time/date, and current status within both the current and the historical alarm logs.
f. Alarm logs shall be able to be exported as a spreadsheet or CSV formatted file.

3.8 DATA ARCHIVE SERVER INSTALLATION

A. General
1. Install Data Archive Server in location shown on Contract Drawing mechanical plans.
2. Connect to UPS per Paragraph 2.15D. Configure to automatically shut down server before UPS is depleted and notify building engineer via email, and automatically restart server when power is restored.
3. Install and configure software as required by Paragraph 2.6D.
4. Configure external hard drive (Paragraph 2.6C.3) for automatic backup of Data Archive Server boot drive.
   a. Configure Windows Backup to perform incremental backup of boot drive once per day.
   b. Backup shall provide the ability to quickly and easily restore the entire boot drive and resume operation in the event of drive failure.
   c. Other equivalent means of backup are acceptable, if coordinated with Owner's IT. If backup is provided by Owner's IT infrastructure, DDC Contractor shall provide written proof of coordination.
5. Store on Data drive a complete copy of DDC System databases, user screens, graphics, setpoints, settings and all other data necessary to recover from complete loss of system programming. See Paragraph 1.9B.3

3.9 CONTROL INTERNETWORK INSTALLATION AND CONFIGURATION

A. General
1. BACnet network numbers and Device Object IDs shall be unique throughout the internetwork.
2. If the DDC System provided under this Section is to integrate with an existing building control network, DDC Contractor shall coordinate assignment of network numbers and Device Object IDs with the Owner or facility staff to ensure that no duplicate network numbers or device IDs occur.
B. Network Resilience

1. Interruption or fault at any point on the Supervisory Control Network or Primary Controller LAN shall not interrupt communications between other nodes on the network.
2. If a network is severed, two separate networks shall automatically be formed and communications within each network shall continue uninterrupted.
3. The system shall automatically monitor the operation of all network devices and annunciate any device that goes off-line because it is failing to communicate.

C. Network Device Naming Convention

1. MAC Address:
   a. Every network device shall have an assigned and documented MAC address unique to its network.
   b. Ethernet Networks: Document MAC address assigned at its creation.
   c. MS/TP networks: Assign from 00 to 64.

2. Network Numbering:
   a. Assign as BBBFF, where:
      1) BBB = 1-655 assigned to each building
      2) FF = 00 for building backbone network, 1-35 indicating floors or separate systems in the building.
   b. Provide ability to change network number through device switches or operator interface.

3. Device Object Identifier Property Number:
   a. Assign as XXFFBBB, where:
      1) XX = number 0 to 40
      2) FF = 00 for building backbone network, 1-35 indicating floors or separate systems in the building
      3) BBB = 1-655 assigned to each building.
   b. Provide to change device instance number by device switches or operator interface.

4. Device Object Name Property Text:
   a. For each device, assign unique device name using BACnet Object Name property.
   b. Names shall be a plain English description of function, device type, and service location. Example "B001 HHW Primary Pump P-3".
   c. If the device appears on an equipment schedule, include the scheduled equipment tag in the device name.

D. Gateways

1. Connect hardwired and networked points as indicated on Contract Drawing control schematics. Make hardwired connections for points shown as hardwired, even if the same point is available through the gateway.
2. DDC Contractor must coordinate in advance all details of the installation, configuration and interface for all gateway devices. See Paragraph 3.4E.
3. Provide backup copy of all programming and parameters for all gateways, including interoperability schedule, as part of the Project data archive (see Paragraph 1.9B.3).
4. Plant-level equipment shall be connected at a Primary control network. All other equipment may be connected to a Secondary control network.
3.10 DDC CONTROLLER INSTALLATION

A. Physical Installation

1. Controllers and associated devices shall be assembled into panels or enclosures by DDC Contractor in a workshop environment, per Paragraph 3.1B.
2. Install controllers in enclosures as required by field conditions and this Section.
3. Install all controllers in readily accessible location per Paragraph 3.5L.
4. Install controllers such that they can be quickly and easily disconnected from the network.
5. For every controller, provide a dedicated power switch if the controller does not include one built in.
6. Connect controllers to power such that both the control component and the equipment are powered from the same panel.
7. Connect controllers to a power source of equal reliability (normal, emergency, uninterruptable, etc.) to the power source of the equipment being controlled.
8. HVAC systems and equipment served by a backup power source or UPS shall have associated DDC system products that control such systems and equipment also served from a backup power source or UPS.
9. Connect sensors, actuators and other attachments such that they can be quickly and easily disconnected for service. All wiring connections shall be made to field-removable, modular terminal strips.

B. Functional Installation

1. Each controller shall be installed and configured to permit standalone operation without requiring other network devices to execute local control strategies. See Paragraphs 1.2C, 2.8D, and 2.8E.3.
2. Configure DDC System to share data between networked controllers and other network devices.
   a. Point information from any controller (including BCs, AACs, and ASCs) and from any gateway shall be capable of being used in a control sequence in any other panel.
   b. The use of a computer or another DDC device as a communications server between control panels and/or gateways is not acceptable.
3. Each individual mechanical system or piece of equipment shall be controlled by no more than one controller with sufficient capacity to be connected to all field devices and sensors associated with that system and/or piece of equipment.
   a. All points associated with and common to one unit or other complete system or equipment shall reside within a single controller (including I/O expander boards as allowed below). Point data which may be transmitted over the LAN are limited to the following exceptions:
      1) Global points such as outdoor air temperature.
      2) Requests sent from zones to systems or systems to plant, used to trigger equipment operation or reset setpoints.
      3) Mode information sent from zones to systems or systems to plant, used to select or change operating logic.
      4) Notwithstanding these exceptions, all operations required to maintain a controlled variable at setpoint must still be performed entirely within a single controller.
   b. Sensors used to measure error between a controlled variable and a setpoint shall always be hardwired directly to the controller, even if the sensor is physically remote from the controller (e.g. an end-of-loop differential pressure sensor). Transmitting the sensor signal to the controller over the LAN is not acceptable.
   c. Control of a single piece of mechanical equipment performed by or distributed among multiple controllers, even within the same cabinet, is not acceptable.
4. Configure controllers for automatic safe restart after a loss of power:
   a. If programming is intact, the controller shall resume full operation without operator intervention. All monitored functions shall be updated.
   b. If battery backup has been exhausted or programming is lost for any reason, the controller shall automatically report this condition and prepare to receive a download over the network.
   c. The controller shall automatically reset its clock such that time dependent functions occur on schedule without a manual reset.
   d. The DDC Contractor shall pre-configure staggered start such that the startup surge or inrush current of each major piece of equipment (air handling unit, boiler plant, chiller plant, etc.) has time to resolve before the next start event.

C. Point Structure and Naming

   1. The following applies to all physical I/O points, virtual points, and application program parameters.
   2. Points shall be named and identified in a completely consistent and rigorous fashion throughout the DDC System.
      a. Consistency shall extend to capitalization, use of separator characters, etc. For example, points named AHU-1.ReturnAirTemp and Ahu2.return_air_temp in the same Project would not be acceptable.
   3. Point Naming Convention
      a. DDC Contractor may name points according to the standards established by Project Haystack, or shall use the alternate convention described in the next paragraph.
   4. Point Naming Convention – Alternate
      a. Name every point with the following format:
      b. The use of another separator character, other than period ("."), in point names is acceptable as long as it consistently applied throughout.

c. Example: Heating hot water supply temperature from Boiler 1 in Building 1 would be named 001.HVAC.Heatplant.B-1.HHWS.Temperature
d. Suggested additions to and deviations from the point naming convention shall be submitted for review and approval by the Engineer of Record.

D. Point Summary Table

1. DDC Contractor shall provide a Point Summary Table which shall serve as the master list of all physical points for the Project.
2. Table shall include the following information:
   a. Building identification (number or name) if more than one in Project
   b. System type
   c. Equipment type
   d. Point suffix
   e. Full point name (see Point Naming Convention above)
   f. Point description
   g. Ethernet backbone network number
   h. Network number
   i. Device ID
   j. Device MAC address
   k. Object ID (object type, instance number)
   l. Engineering units
   m. Device make and model number
   n. For sensors, range of device
   o. Device physical location description if applicable. Include floor and column line intersection to one decimal place (e.g. line 6.2 and line A.3).

3. Provide a Point Summary Table on each shop drawing schematic, for the points associated to that schematic only.
4. Also provide a Master Point Summary Table in electronic format as a single Excel spreadsheet listing all physical points in the Project.
   a. Each parameter listed above shall be a separate column heading, such that it is possible to filter or sort by any point parameter.
   b. Submit digital version of Point Summary Table with Submittal Package 1.

5. DDC Contractor shall provide Point Summary Table (with updates as required) to the Commissioning Authority as a reference and guide during the commissioning process.
6. DDC Contractor shall maintain Point Summary Table current and up-to-date throughout the duration of the Project.
7. Project closeout documents shall include an accurate as-built Point Summary Table.

E. Point Programming

1. Connect and configure I/O points for all points shown on Contract Drawing control schematics
   a. Points indicated on control schematics as hardwired must be connected as hardwired points
   b. Points indicated as networked may be hardwired or networked, at the option of the DDC Contractor, unless otherwise indicated on control schematics.

3. Set up and configure trends for all points per Paragraph 3.6E.
4. Provide templates customized for point type, to support efficient input of individual point information in a standardized format using standard BACnet Objects, including long-name field.

5. Program at least the following information for each analog input point:
   a. Name
   b. Address
   c. Scanning frequency or COV threshold
   d. Engineering units
   e. Offset calibration and scaling factor for engineering units
   f. High and low signal bounds (reasonableness values), which shall prevent control logic from using shorted or open circuit values
   g. Default value to be used when the actual measured value is not reporting or is out of bounds
   h. Alarms as specified in Sequence of Operations.
   i. Selectable averaging function that shall average the measured value over a user defined number of scans for reporting

6. Program at least the following information for each analog output point:
   a. Name
   b. Address
   c. Output updating frequency
   d. Engineering units
   e. Offset calibration and scaling factor for engineering units
   f. Output range
   g. Default value to be used when normal control logic is unavailable
   h. For VFD minimum speed command, program as described in Paragraph 3.10G.

7. Program at least the following information for each binary input point:
   a. Name
   b. Address
   c. Engineering units (on/off, open/closed, freeze/normal, etc.)
   d. Debounce time delay
   e. Alarms as specified in Sequence of Operations.
   f. Runtime logging and totalization, per Paragraph 2.8L
   g. For equipment status, set ON/OFF signal threshold as described in Paragraph 3.10F.

8. Program at least the following information for each binary output point:
   a. Name
   b. Address
   c. Output updating frequency
   d. Engineering units (on/off, open/closed, freeze/normal, etc.)
   e. Minimum on-time
   f. Minimum off-time
   g. Runtime logging and totalization, per Paragraph 2.8L
   h. Default value to be used when normal control logic is unavailable

9. Each point associated with a hardware device, sensor or instrument shall have its BACnet long-name point description field filled out with the following information:
   a. Device manufacturer
   b. Device model number
   c. Description of point function
   d. For sensors, range
   e. For space sensors, room number where the sensor is located
10. All hardware and software points, including all physical inputs and outputs, shall be able to be overridden by the operator as required by Paragraph 2.2F.1.

F. Equipment Status Binary Input Threshold Adjustment
   1. Current switch sensing status of fan with discharge damper: Fan status is OFF when fan discharge damper is fully closed.
   2. Current switch sensing status of fan with belt-driven fan: Fan status is OFF when fan belt is broken.
   3. Current switch sensing status of pump: Pump status is OFF when pump is dead headed.
   4. For differential pressure sensor used as a flow switch: Pump status is ON when all valves are open (i.e. pump is out on its curve).

G. Variable Frequency Drive (VFD) Programming
   1. The speed analog output sent to VFDs shall be configured such that 0% speed corresponds to 0 Hz and 100% speed corresponds to maximum speed configured in the VFD.
   2. Speed signal shall scale linearly from 0% to 100%. For example, if the maximum speed is 80Hz (as is the case with some fan arrays), then a 50% speed command signal would correspond to device speed of 40Hz.
   3. For each piece of equipment, the minimum speed shall be stored in a single BMS software point. This value shall be written to the VFD’s minimum speed setpoint via the drive’s network interface. In the case of a hard-wired VFD interface, the minimum speed shall be the lowest speed command sent to the drive by the BMS.
   4. Determine minimum speed as specified in Paragraph 3.16C.8.

H. Loop Tuning
   1. Tune all control loops to obtain the fastest stable response without hunting, offset or overshoot.
   2. A loop shall be deemed stable if, within 3 minutes after being perturbed while in normal operation, it returns to setpoint within tolerances listed in Paragraph 2.2D.2.
   3. Record tuning parameters and response test results for each control loop in the Pre-Functional Test report.

3.11 ENCLOSURES

A. Installation of Enclosures
   1. Install all control devices and accessories in specified enclosures (see Paragraph 2.14A), with products installed as required by Paragraph 2.14B.
   2. Install each controller and associated control accessories in a single enclosure. Enclosure shall serve as central tie-in point for control devices such as switches, transmitters, transducers, power supplies and transformers.
   3. Do not house more than one controller in a single enclosure. Exception: Controllers for different parts of the same mechanical plant (e.g. controllers for pumps, cooling tower, and chiller) may be housed together in the same enclosure provided all other requirements of this Section are met.
   4. Unless otherwise directed by the AHJ, all enclosures shall be located such that visual observation and adjustment can be accomplished while standing flatfooted on the floor in a convenient location adjacent to the equipment served. Install all equipment in readily accessible location per Paragraph 3.5L.
   5. Attach wall-mounted enclosures to wall using steel struts that are hot dipped galvanized or epoxy-coated for corrosion resistance. Install plastic caps on exposed cut edges of strut.
   6. To the extent practical, align adjacent enclosures horizontally for a neat and workmanlike appearance.

8. Provide permanent identification tags for enclosure, and for control products within enclosure, per Article 3.12.

B. Wiring of Enclosures

1. Interconnections between internal termination points and face and/or panel-mounted devices shall be prewired with color-coded stranded conductors neatly installed in plastic troughs and/or tie-wrapped.

2. Provide insulated, modular, feed-through, clamp-style recessed captive screw-type terminal blocks suitable for rail-mounting with end plates and partitions for the termination of all field wiring in temperature control panels. Terminals for field connections shall be UL-Listed for 600 volt service, individually identified per control drawings with adequate clearance for field connections.
   a. Prewire all controller input and output points (including spare points) to terminal blocks, such that field wiring connections are made at the terminal block rather than on the controller.
   b. Field wiring to equipment with integral terminals and/or unitary equipment shall not be required to have terminal blocks.

3. All high-voltage wiring consistent with the definitions of NEC Class 1 and all low-voltage wiring consistent with the definitions of NEC Class 2 must be strictly separated by barriers, raceways or sub-panels according to the requirements of the NEC Chapter 7 Article 725.

4. Label each end of cable, wire and tubing in enclosure per Article 3.12.

5. Provide enclosure with a line-voltage nominal 20 amp GFCI duplex receptacle for service and testing tools.
   a. Wire receptacle on hot side of enclosure disconnect switch and include with a 5 amp circuit breaker.
   b. Where multiple enclosures are installed in close proximity, only one receptacle is required per six feet of wall.
   c. Label enclosure to indicate presence of service outlet.

6. Provide each enclosure with a surge suppressor, electrical disconnect, control fuse, and control transformer sized as required by the application.

D. Documentation: Provide as required by Paragraph 3.12B.4.b.

3.12 IDENTIFICATION

A. General

1. Manufacturers’ nameplates and UL or CSA labels to be visible and legible after equipment is installed.

2. Identifiers shall match that shown on submitted and approved control shop drawings or Contract Drawing control schematics or schedule.

3. All plug-in components shall be labeled such that removal of the component does not remove the label.

B. Equipment and Devices

1. General
a. Nameplates and tags shall be black lettering on white background. White lettering on black background is not acceptable (hard to read in dark, dirty conditions).

2. Valve actuators, damper actuators and sensors:
   a. Provide minimum 1 inch high laminated white phenolic nameplate with engraved or raised black lettering, ½ inch high.
   b. Indicate device function (for example “Return Air Damper” or “CHW Supply Temp”).
   c. Include device tag, matching submitted shop drawings.
   d. Permanently affix on or immediately adjacent to device. Valve actuators may be hung with metal chain. Do not attach with wire.

3. Controllers and control products:
   a. Provide minimum 1 inch high laminated white phenolic nameplate with engraved or raised black lettering, ½ inch high.
   b. Indicate controller identification (matching shop drawings) or control product function, and equipment being controlled.
   c. Permanently affix on or immediately adjacent to controller (on removable backplane if inside an enclosure).
   d. If control product is installed in an enclosure, provide tags on the control products and duplicate tags on front of enclosure so that enclosure contents may be easily identified.

4. Panels and Enclosures
   a. Provide 2 inch high laminated white phenolic nameplate with engraved or raised black lettering, 1 inch high. Permanently affix to exterior of enclosure.
      1) Indicate panel identifier and service.
      2) Indicate the electrical panel and circuit number from which enclosure is powered.
   b. Provide permanent documentation for each enclosure, including the following:
      1) A complete set of as-built schematics, tubing, and wiring diagrams and product literature applicable to control products in that enclosure. Install documentation in a pocket on inside of door. (For enclosures with windows, attach pocket to interior bottom of enclosure.)
      2) A points list for all points in enclosure on laminated card, permanently affixed or chained to interior of enclosure so that it cannot be lost.

5. Building pressure pickups
   a. Each space pressure sensor pickup (e.g. for building pressure, or reference for duct static pressure) shall be colored so as to contrast with the pickup mounting surface, and shall be labelled indicating its service and purpose.
   b. Pickups in occupied spaces, this identification shall be visible but discrete: Pickup indicator shall be no more than ½ inch in diameter, and label shall be no more than 1/2 inch high with ½ inch high text.
   c. Pickups in unoccupied or back-of-house spaces shall be clearly visible: Pickups indicator shall be at least 1 inch in diameter, and label shall be at least 1 inch high with ½ inch high text.

6. Terminal units:
   a. Provide 2 inch high laminated white phenolic nameplate with engraved or raised black lettering, 1 inch high indicating device tag.
      1) For units above drop ceilings, permanently affix to bottom of terminal unit such that it is visible from below with a ceiling tile removed.
2) For units above a hard ceiling, permanently affix to side of terminal unit such that it is visible from nearest access hatch.

7. Identify room sensors and thermostats related to terminal boxes or valves by indicating associated device with indelible marker on sensor body hidden by cover.

C. Wiring and Tubing

1. Provide self-laminating, self-adhesive typed labels. Marker pen, including indelible marker, is not acceptable. Hand-written labels are not acceptable.
2. Permanently label or code each point of field terminal strips to show the instrument or item served.
3. All wiring, cabling and tubing, including that within factory fabricated panels, shall be labeled at each end within 2 inches of termination.
   a. Label shall indicate origination and destination devices.
   b. Power wire labels shall include service, voltage, and breaker source.
   c. Communication wire labels shall include the BAS address, BACnet object instance, or termination number.
   d. Sensor and signal wire labels, and pneumatic tubing labels, shall include device function being sensed (e.g. "CHW Supply Temp") or controlled (e.g. "Return Air Damper"). Label text shall match nameplate used at sensor or control device.
4. Labels shall be applied at field I/O connection and at all intermediate connections throughout length to controller connection.

3.13 POWER WIRING INSTALLATION

A. The selection and installation of line and low-voltage power wiring and wiring connections, including subpanels, conduit and raceways, required for Work in this Section shall be provided by the DDC Contractor except as specifically indicated on Division 26 Drawings.

1. Review electrical drawings and panel schedules for panel locations and quantity of extra circuits available for controls power.
   a. Use circuits specifically marked as “for controls” first.
   b. Circuits marked “spare” may be used if no “for controls” circuits are available but do not use all available “spare” circuits. In all cases leave minimum two “spare” circuits in each panel.
2. Extend power to all DDC devices, including 120V power, from an acceptable power panel.
3. Coordinate with Division 26 during shop drawing development for final connection location.

B. General requirements for obtaining power include the following:

1. Electrical service to controls panels and control devices shall be provided by isolated circuits, with no other loads attached to the circuit, clearly marked at its source. The location of the breaker shall be clearly identified in each panel served by it.
2. Obtain power from a source that feeds the equipment being controlled such that both the control component and the equipment are powered from the same panel. Where equipment is powered from a 460V source, obtain power from the electrically most proximate 120V source fed from a common origin.
3. Where control devices are located in or on new equipment, coordinate with the equipment manufacturer and feed the control with the same source as the equipment. If the equipment’s control transformer is large enough and of the correct voltage to supply the controls, it may be used. If the equipment’s control transformer is not large enough or not of the correct voltage to supply the controls, provide separate transformer(s).
4. Controllers shall use separate power transformers from those used by actuators and other end devices that use half wave rectification.
   a. Exception: Zone level controllers and actuators may share a common power transformer.

5. Unless transformers are provided with equipment, DDC Contractor shall provide transformers for all low voltage control devices including terminal units. Transformer(s) shall be located in control panels in readily accessible locations.

C. Emergency, Uninterruptible, and Backup Power

1. Where a controller controls multiple systems on varying levels of power reliability (normal, emergency, or uninterruptible/backed-up), the controller shall be powered by the highest level of reliability served.
2. See Paragraph 2.2J for additional requirements.
3. See Paragraph 2.15D for UPS device requirements.

D. Work shall comply with NEC with all state and local amendments, all provisions of the NEC including articles 210 and 310, and all requirements of Division 26 Specification for power wiring.

1. All high voltage wiring shall meet the requirements of NEC Class 1.
2. All low-voltage wiring shall meet the requirements of NEC Class 2 and shall be sub-fused as required to comply with current limits.
3. Run wiring in raceway or conduit as required by codes and Specifications.
4. Do not run power wiring and signal or communication wiring in the same raceway or conduit, regardless of voltages.

E. Maximum allowable voltage for wiring to control products shall be 120V. If only higher voltages are available, provide step-down transformers at connection to power source.

F. All field wiring shall be properly labeled at each end per Paragraph 3.12C.

G. The DDC Contractor shall verify integrity of all wiring to ensure continuity and freedom from shorts and grounds after the installation is complete.

H. Provide transient voltage and surge suppression for all workstations and controllers either internally or as an external component.

3.14 CONTROL AND COMMUNICATION WIRING INSTALLATION

A. General

1. Wiring and raceways for control communications and signaling shall be sized, selected and provided by the DDC Systems Contractor.
2. Provide dedicated wiring for signal transmission between sensors, actuators, controllers, routers, gateways, and local and remote peripherals.
3. Power-line communication is not acceptable.
4. All control communication and signal wiring shall be installed as continuous lengths, if that length is commercially available. When required, terminal blocks in junction boxes shall be used to join wire lengths. There shall be no wire-to-wire splices between termination points.
5. Terminate all control and/or interlock wiring.
6. All work shall comply with NEC requirements, Divisions 26 and 27, and all local codes and requirements of the AHJ.
   a. All high voltage wiring used for control shall meet the requirements of NEC Class 1.
1) Control wiring shall not exceed 120V.

b. All low-voltage wiring shall meet the requirements of NEC Class 2. Low-voltage power circuits shall be sub-fused when required to meet Class 2 current-limit.

1) Some low-voltage wiring may be run outside of conduit per Paragraph 3.14B.2.

B. DDC Contractor shall protect control and communication wiring from physical damage and electrical or RF noise.

1. Install wiring in UL listed raceway or conduit when located in unconcealed or inaccessible locations, locations where wires may be damaged including equipment rooms, or as required by code or AHJ.

2. Low voltage control communication and signal wiring may be installed without conduit or raceway in concealed, protected, and accessible locations (such as above suspended ceiling) if noise immunity is ensured. Cables shall be UL listed for the specific application or installation location (e.g. ceiling plenums).

3. Do not install communication or signal wiring in raceway or enclosures containing high- or low-voltage power wiring. Junction boxes, enclosures and panels containing high-voltage wiring and equipment may not be used for low-voltage wiring except for the purpose of interfacing the two (e.g., relays, transformers, CTs, etc.).

4. Run direct current signal wires separately from alternating current conductors. Where allowed by code, AC and DC wiring routes shall only cross at a 90 degree angle.

5. DDC Contractor is fully responsible for noise immunity and for cost to rewire in conduit if electrical or RF noise affects performance.

C. All wiring shall be installed in a neat and workmanlike manner. Follow all manufacturers’ installation recommendations.

1. Wiring not in conduit shall be installed as follows:
   a. Routed parallel or perpendicular to building and/or mechanical lines.
   b. Supported by or anchored as follows. Do not lay wiring on the ceiling.
      1) Wire that is not used for Ethernet, TCP/IP, or BACnet IP networking may be secured to structural members or to supports for ductwork, piping, and raceways.
      2) Wire that is used for Ethernet, TCP/IP, or BACnet IP networking (i.e. “category” cable) shall be supported from below by J-hooks, trays, or similar means. Do not kink or twist category cabling, and do not zip-tie it to its supports.
   c. Neatly tied at 5 foot intervals and at least 1 foot above ceiling tiles and light fixtures.
   d. Installed in sleeves where it passes through walls and floors. Maintain fire, smoke, envelope and pressure ratings of each space.

2. All wire and cable installed in ceiling return plenums must be rated for plenum installation. If uncertain, contractor shall assume that above-ceiling spaces are plenums.

3. All wiring within enclosures shall be neatly bundled and anchored to permit access and prevent restriction to devices and terminals.

4. All wire-to-device connections shall be made at a terminal block or terminal strip.

5. All wire to wire connections for power shall be at a terminal block. Communication wire shall be continuous, with no wire-to-wire connections.

D. Shielding

1. Maintain continuous shielding of all communications and signal wiring.

2. Shields shall be grounded only at controller or power source end and floated at other end, unless otherwise recommended by the controller manufacturer.

3. Float shields through termination points, maintaining only on single grounding point and insulating from ground at all other points.
E. Network Wiring

1. All MS/TP network wiring shall be installed in accordance with the requirements and methods specified in Chapter 9.2 of the BACnet standard.
2. All BACnet/IP network wiring shall be installed in accordance with the requirements of ANSI/TIA-568.
3. All networks (main and sub-networks) shall utilize network diagnostic devices if available. Network diagnostic devices shall be installed per manufacturer’s instructions.

F. Raceways and Conduit

1. DDC Contractor is responsible for sizing and selection of raceways and conduits in accordance with code and Division 26 and 27 Specifications.
2. Raceway must be rigidly installed, adequately supported per code, properly reamed at both ends, and left clean and free of obstructions. Raceways and pull boxes may not be hung on flexible duct strap or tie rods. Raceways may not be run on or attached to ductwork.
3. Conceal all raceways, except within mechanical, electrical, or service rooms.
4. Install raceway to maintain a minimum clearance of 6 inches from high-temperature equipment.
5. Raceway Sections shall be joined with couplings per code.
6. Terminate with fittings at boxes. Install insulated bushings on all raceway ends not terminating in boxes. Seal top end of all vertical raceways.
7. Flexible metal raceways and conduit shall not exceed 3 feet in length and shall be supported at each end.
   a. Flexible metal raceway less than ½ inches electrical trade size shall not be used.
   b. In areas exposed to moisture liquid-tight, flexible metal raceways shall be used.
8. Include one pull string in each conduit 1 inch or larger.

G. Identification

1. Use color-coded conductors consistently throughout the entire DDC System installation.
2. All field wiring shall be properly labeled at each end per Paragraph 3.12C.
3. Color code each junction box cover plate to indicate wiring type using enamel paint, as follows:
   a. Green = low-voltage signal wiring
   b. Yellow = line-voltage signal wiring
   c. Blue = pneumatic tubing
   d. Power wiring does not require markings.

H. Equipment Failsafe: Wire binary outputs to either the normally-closed or normally-open contacts depending on desired action in case of system failure.

1. Unless otherwise indicated in Contract Drawings or Specification, wire to disable equipment in event of system failure.
2. Exception: The following shall be wired to enable in the event of system failure.
   a. Hot water pumps
   b. Coil recirculation pumps provided for freeze protection

I. Hardwire Interlocks: Provide as described below and shown on Contract Drawing control schematics to ensure equipment shutdown occurs even in the event of control system failure. The use of software interlocks alone is not acceptable

1. Hardwire device NC contact to equipment starter upstream of HOA switch, or to VFD enable contact.
2. Where multiple pieces of equipment are controlled by a device without sufficient contacts, provide a relay at the device for the required number of contacts.
3. Provide hardwire interlock for the following devices where indicated on Contract Drawing control schematics or in Sequences of Operations:
   a. Duct smoke detector
   b. Fire alarm system contact
   c. High discharge static pressure
   d. Low mixing plenum pressure
   e. Freeze-stats
   f. Cooling tower vibration switch

J. Maintain updated as-built wiring diagrams with terminations identified at the jobsite.

K. The DDC Contractor shall verify integrity of all wiring to ensure continuity and freedom from shorts and grounds after the installation is complete. Communication wiring shall be tested to verify noise immunity and signal-to-noise ratio.

3.15 CONTROL AIR TUBING INSTALLATION

A. General
1. Pneumatic tubing shall be sized by the DDC Contractor.
2. All control air piping shall be installed in a neat and workmanlike manner parallel to building lines with adequate support.
3. Piping above suspended ceilings shall be supported from or anchored to structural members. Tubing shall not be supported by or anchored to electrical raceways or ceiling support systems.
4. Pneumatic tubing shall not be run in raceway containing electrical wiring.
5. All pneumatic tubing shall be concealed except in equipment rooms or unfinished areas.

B. Installation methods and materials
1. Concealed and inaccessible: Use hard or soft copper tubing, or FR plastic in metal raceway. Room thermostat drops in stud walls in areas with lay in ceiling may be FR plastic tubing.
2. Concealed and accessible (including ceiling return air plenums): Use hard or soft copper tubing or FR plastic tubing, subject to the following limitations
   a. FR tubing shall be enclosed in metal raceway when required by local code.
   b. Quantity of FR tubing per cubic foot of plenum space shall not exceed manufacturer’s published data for Class 1 installation.
3. Exposed to view or damage: Use hard drawn copper. FR plastic in metal raceway is acceptable where environment is within temperature limits of plastic tubing.
   a. Where copper tubing is used, a section 12 inches or less of FR plastic tubing is acceptable at final connection to control device.
4. Serving fire or fire-smoke dampers: Use hard copper tubing for mains and exposed piping. Use hard or soft copper tubing for branches and concealed piping.
5. Inside panels: Use plastic tubing.
7. Plastic tubing: No concealed splices. Continuous runs through concealed areas.
8. Copper tubing: Use only tool-made bends.
C. Fittings and Sleeves
   1. Where FR tubing exits the end of raceway or junction box, provide a snap-in nylon bushing. Where FR tubing exits control panels, provide bulkhead fittings.
   2. Where copper tubing exits junction boxes or panels, provide bulkhead fittings.
   3. Brass-barbed fittings shall be used at copper-to-FR tubing junctions. Plastic slipped over copper tubing is not acceptable.
   4. Sleeve through concrete surfaces in minimum 1 inch sleeves, extended 6 inches above floors and 1 inch below bottom surface of slabs.

D. Number-code or color-code tubing at each end for identification and servicing of control system. Code shall be as indicated on approved shop drawings.

E. Provide cartridge-type desiccant dryers for air lines passing through outside air stream or through unheated spaces where temperatures are below 30°F.

F. Testing and Commissioning:
   1. Make test on sectional piping during progress of installation to ensure no leakage.
   2. Test entire piping system by placing it under 20 PSI pressure for 24 hours. Trend log pressure during test and submit test results with Pre-Functional Test Report.

3.16 TESTING AND COMMISSIONING

A. General
   1. Perform tasks in the order outlined in Paragraph 3.1D, subject to direction of the General Contractor.
      a. Notify the Commissioning Authority and the Engineer if jobsite circumstances, Project schedule, or General Contractor instructions require substantial deviation from this sequence of events.
   2. Comply with Commissioning Requirements as specified in Division 1.
      a. DDC Contractor shall provide a qualified technician who shall execute all Pre-Functional and Functional Tests in the presence of the Commissioning Authority.
      b. All deficiencies identified shall be corrected and demonstrated to the Commissioning Authority after resolution for acceptance.
      c. DDC Contractor shall fulfill all obligations as outlined in the Commissioning Plan including post occupancy/Warranty testing as deemed necessary by the Commissioning Authority.
   3. Coordinate with Work specified in Sections 23 08 00 and 26 08 00.
   4. Unless specifically prohibited by Owner, DDC Contractor shall provide remote access to DDC System for duration of commissioning process.
      a. DDC Contractor shall set up a Commissioning User account with read-only access, including the ability to view all graphical pages and view and download trends.
      b. Provide account login credentials to Engineer of Record and Commissioning Authority.
      c. Establish and verify account access prior to performing Functional Tests.

B. Test Forms
   1. Pre-Functional/Point-to-Point Test Forms
      a. DDC Contractor shall prepare forms to verify correct installation and document proper startup of the DDC System and its components.
b. Provide forms for all checks and tests described in Paragraph 3.16C.
c. Each form shall be typewritten and have a header or footer where the technician performing the test can indicate his/her name and the date of the test.

2. Test and Balance forms shall be provided by Test and Balance (TAB) Contractor. However, Setpoint Determination Report is the joint responsibility of TAB Contractor and DDC Contractor. In accordance with Paragraph 3.4F, DDC Contractor shall coordinate with TAB Contractor and submit a coordination plan including a copy of the TAB forms to be used in setpoint determination.

3. Functional Test procedures and associated forms shall be prepared by Commissioning Authority
   a. DDC Contractor shall review Functional Test requirements in Paragraph 3.16E to understand the scope and level of effort required for the testing process.
   b. Functional Tests procedures and associated forms shall be provided to DDC Contractor, after Submittal Package 2 has been reviewed and accepted.
   c. DDC Contractor shall review tests and provide comments as follows:
      1) If any proposed testing procedure risks damaging equipment or voiding equipment warranty, provide suggested alternative test procedure to avoid these concerns.
      2) Recommend changes that will improve ease, accuracy or speed of testing.
      3) Verify that proposed test procedures will generate the expected responses when tested against the specified Sequences of Operations. Identify any discrepancies between the apparent intent of the Sequences of Operations and the apparent intent of the associated test procedure.
   d. Provide comments in digital format per Paragraph 1.8E. Preferred format is Microsoft Word documents with Track Changes enabled.

4. DDC Contractor shall prepare Functional Tests procedures and associated forms, after Submittal Package 2 has been reviewed and accepted.
   a. DDC Contractor shall prepare forms to verify correct execution of Sequences of Operations logic and correct operation of all alarms, interlocks, and schedules without compromising system integrity or damaging any piece of equipment.
   b. Provide forms for all checks and tests described in Paragraph 3.16E.
   c. Each form shall have a header or footer where the technician performing the test can indicate his/her name and the date of the test.

5. Submit forms for approval in Submittal Package 3 (Testing Forms) per Paragraph 1.8H.4.
6. All forms shall be provided in digital format per Paragraph 1.8E.

C. Pre-Functional and Point-to-Point Tests

1. General Checks
   a. Inspect the installation of all devices. Review the manufacturer's installation instructions and validate that the device is installed in accordance with them.
   b. Ensure devices are properly installed with adequate clearance for maintenance.
   c. Ensure that wiring and tubing are run in a neat and workman-like manner, either bound or enclosed in raceway.
   d. Verify that all sensor locations are as indicated on drawings and are away from heat sources and other causes of erratic operation.

2. Electrical Checks
   a. Verify integrity/safety of all electrical connections.
   b. Power to all controllers and actuators. Confirm emergency or uninterruptible power where specified.
   c. Verify that shielded cables are grounded only at one end.
d. Verify proper electrical voltages and amperages, and verify that all circuits are free from faults.
e. Check power supplies for proper voltage ranges and loading.
f. Ensure that terminations are safe, secure and labeled in accordance with Article 3.12.
g. Check for adequate grounding of all panels and devices.

3. For each controller serving central plant or central air handling equipment, and for a sampling of 20% of all other controllers selected by CxA or Engineer of Record, perform the following tests:

   a. Network Resilience
      1) Disconnect controller from Primary Control LAN.
      2) Verify the event is annunciated at operator’s interface and recorded in event log.
      3) Verify that the controlling LAN reconfigures per Paragraph 2.3C.2.d.

   b. Standalone Operation
      1) Disconnect controller from Primary or Secondary Control LAN.
      2) Verify the event is annunciated at operator’s interface and recorded in event log.
      3) Verify that isolated controllers continue to perform normally per Paragraph 2.2E.

   c. Loss of Power
      1) Disconnect controller from power source. Wait for 30 seconds, then reconnect power.
      2) Verify that controller configuration and programming is retained, and that controllers resume function automatically, per Paragraph 2.8S

4. For each individual point on each individual controller (i.e. 100% testing), perform Point Verifications and Point-to-Point Tests. **Note that all connected points on every controllers must be tested. Testing only a sample of controllers is not acceptable for point-to-point tests.**

   a. Binary Outputs:
      1) Verify proper installation
      2) Verify correct normal position
      3) Verify correct response to command including parity of response (i.e. verify that a command OFF turns equipment off and not on).

   b. Binary Inputs:
      1) Verify proper installation
      2) Verify signal from device maps to correct signal at graphical interface.
      3) Verify input signal thresholds are correct per Paragraph 3.10F.

   c. Analog Outputs
      1) Verify proper installation
      2) Verify correct normal position.
         a) Test all fail-safe actuators by disconnecting power and verifying direction of travel.
      3) Verify correct response to command including direction of movement.
      4) Verify correct start and span (maximum and minimum stroke)
a) Verify that all automatic valves and dampers close completely upon a closed command. Adjust valve stem and damper blade travel as required.
b) Verify/adjust output range for points sending commands (e.g. setpoint) to other equipment.
d) Analog Inputs
   1) Verify installation of sensors.
   2) Verify correct signal and mapping at graphical interface.
   3) Calibrate sensors that require field calibration, if any, per points lists on Contract Drawing control schematics.
      a) Calibration shall be performed using instruments that meet the requirements of Paragraph 1.6D.
      b) Adjust calibrating parameters in software (such as slope and intercept) as required.
      c) A calibration log shall be kept and initialed by the technician indicating date and time, sensor and hand-held readings, and calibration constant adjustments and included in the Pre-functional Test Report.
      d) Inaccurate sensors must be replaced if calibration is not possible.

5. Control Loops
   a. Verify that all control loops are tuned for stability and fast response per Paragraph 3.10H, to meet the requirements of Paragraph 2.2D.
   b. For all loops, document P/I gains, tuning parameters, chosen setpoints, time delays, and loop execution speed in Pre-Functional Test report.

6. Network Communication Tests
   a. Verify adequate signal strength on all networks.
   b. Verify that network wire runs do not exceed maximum length.
   c. Verify a maximum of 32 full-load nodes and 64 devices total per MS/TP network, per Paragraph 2.3B.6.
   d. With all system and communications operating normally, perform the following network response tests.
      1) Tests shall be performed after trends per Paragraph 3.6E have been set up and are operational.
      2) Alarm annunciation test
         a) Randomly select a device whose failure will generate a Level 1 or 2 alarm and manually shut it off.
         b) The status points for the device must indicate the change of state of the device at the Operator Workstation within 10 seconds per Paragraph 2.2B.3.
         c) The test shall be repeated for four devices in each building.
      3) Clock synchronization test
         a) Randomly select a controller on a Secondary Control LAN.
         b) Compare that controller's clock signal to the system clock.
         c) Test passes if sampled time signal is within 2 seconds of system clock time.
         d) Test 5% of devices on Secondary Control LANs, minimum of three devices.
4) If the system fails any test, the system architecture shall be revised as required. Provide additional capacity (install more trend memory, more controllers with trend storage capability, network repeaters to allow an increase in network speed, etc.) and repeat tests.

7. Alarms and Interlocks
   a. Test each software alarm separately. Record date and time, alarm description, action taken or signal value sent to initiate the alarm, and observed response.
      1) Verify alarm levels are correct per Sequences of Operations and this Section.
      2) Confirm that each alarm is annunciated correctly per Paragraphs 3.7L.1 and 3.7L.1.
      3) Confirm that each alarm is routed to appropriate devices and individuals per Paragraph 3.6I.4.
   b. Test each hardware interlock separately.
      1) Trip interlock using field (physical) contacts.
      2) Verify appropriate equipment response including normal position of fail-safe actuators. Note position of each fail-safe actuator separately on test forms.
   c. Coordinate with Division 26 to test fire and life safety systems alarm contacts and interlocks.

8. VFD Minimum Speed
   a. DDC Contractor is responsible for determining the minimum speed for each variable frequency drive (VFD).
   b. Unless otherwise indicated, minimum speed for VFD-driven fans and pumps shall be the greater of 10% or the minimum required for visible motion.
      1) As described Sequences of Operations, minimum speed for some equipment may be related to a flow setpoint or maintaining minimum flow. For that equipment, the minimum speed shall not be higher (though it may be lower) than the speed required to maintain the minimum flow setpoint.
   c. Determine the minimum speed as follows:
      1) Start the fan or pump.
      2) Manually set speed to 6 Hz (10%) unless otherwise indicated in Sequences of Operations. For cooling towers with gear boxes, use 20% or whatever minimum speed is recommended by tower manufacturer.
      3) Observe fan/pump in field to ensure it is visibly rotating.
      4) If not, gradually increase speed until rotation is observed.
      5) The speed at this point shall be the minimum speed setpoint for this piece of equipment.
      6) Record minimum speeds in log and store in software point.
   d. Minimum speed shall be established independently for each piece of equipment. Exception: For multiple pieces of identical equipment used for identical applications, the results of one test may be applied to all.
   e. Note that for fans and pumps, there is no minimum speed required for motor cooling. Power drops with cube of speed, causing motor heating to be minimal at low speeds.
   f. This work shall be done only after fan/pump system is fully installed and operational.
   g. Program VFD minimum speeds in accordance with Paragraph 3.10G.

9. User Interface Checks
   a. All user interface elements and graphics are functional.
   b. Graphics are properly bound to physical devices or virtual points.
   c. Links and page jumps are functional and logical.
d. Point information updates in a timely fashion as required by Paragraph 2.2B.2.
e. Events and alarms are annunciated timely as required by Paragraph 2.2B.3.

10. Pre-Functional Test Report
   a. After submitted test forms have been accepted, DDC Contractor shall perform all
      listed tests, take corrective action as required for failed tests, and repeat tests until a
      passing condition is obtained.
   b. Document results on forms and submit for approval as Pre-Functional Test report.
   c. Pre-Functional Tests including in particular point-to-point tests (Paragraph 3.16C.4)
      must be performed and documented for every individual point in the system. Testing
      a sample or subset of points shall not be acceptable. The Pre-Functional Test report
      shall not be accepted, nor shall further work be authorized, until all point-to-point
      tests have been completed to the satisfaction of the Engineer of Record and
      Commissioning Authority.
   d. Report shall be word-searchable electronic format per Paragraph 1.8E. All
      information on forms shall be typed. Hand-written forms, or typed forms with
      hand-written results, shall not be acceptable.

D. Test and Balance
   1. Coordinate with Work performed under Division 23 Test and Balance (TAB). DDC
      Contractor shall support TAB Contractor per Paragraphs 3.4F and 3.4J in execution of tests
      that require interaction with or overrides of the DDC System.
   2. Calibration Software
      a. Software shall be provided to TAB Contractor free of charge on at least a temporary
         basis to allow calibration of terminal box airflow controls and other Work specified
         under Division 23 TAB.
      b. DDC Contractor shall loan TAB Contractor a POT or portable device with software
         installed for the duration of Work specified under Division 23 TAB.
      c. Provide sufficient training to those performing Work specified under Division 23 TAB
         to allow them to use the software for balancing and airflow calibration purposes.
         Contractor shall provide a single training session for this purpose.
   3. Setpoint Determination
      a. Perform Pre-Functional Tests described in Paragraph 3.16B before performing
         setpoint determination.
      b. DDC Contractor shall provide a list of setpoints and other parameters to be
         determined by the TAB Contractor. TAB Contractor shall develop Setpoint
         Determination Plan to establish correct values for these parameters. DDC Contractor
         shall review Setpoint Determination Plan to ensure that planned tests will provide
         information required to correctly program Sequences of Operations. DDC Contractor
         shall submit Setpoint Determination Plan. See Paragraph 3.4F.
      c. DDC Contractor shall submit Setpoint Determination Report, which shall consist of
         the relevant subset of Test and Balance forms, documenting results of all tests and
         final setpoints determined. DDC Contractor shall use these values for initial BAS
         programming.
         1) In Setpoint Determination Report, DDC Contractor shall flag any values that
            seem anomalous, outside of expected range, or otherwise problematic.
         2) Submit report for approval before scheduling Functional Tests.

E. Functional Tests
   1. Functional Tests shall test all control logic in a formal manner to verify that Sequences of
      Operation were programmed accurately and provide the intended system behavior.
2. If Functional Test procedures are prepared by others, DDC Contractor shall review tests and provide comments as follows:
   a. If any proposed testing procedure risks damaging equipment or voiding equipment warranty, provide suggested alternative test procedure to avoid these concerns.
   b. Recommend changes that will improve ease, accuracy or speed of testing.
   c. Verify that proposed test procedures will generate the expected responses when tested against the specified Sequences of Operations. Identify any discrepancies between the apparent intent of the Sequences of Operations and the apparent intent of the associated test procedure.

3. Functional Test report shall not be performed until all required trend logs (Paragraph 3.6E) are set up and recording, and read-only remote access via the Commissioning User login account is available (Paragraph 3.16A.4). Functional Tests performed in the absence of trends shall not be accepted.

4. Each functional test shall consist of a series of defined steps.
   a. For each step, test form shall include descriptions of an action/override to initiate the step and the expected system response.
   b. For each step, technician performing test shall record actual system response and any notes or comments.
   c. Expected response and actual response shall be described qualitatively (e.g. “fan speed increases”) or quantitatively (e.g. “setpoint increases by 1.5°F”) as appropriate.
   d. Technician shall describe all observed responses. Where quantitative results are expected, technician shall record specific values observed. Simply checking “OK” or “PASSED” shall not be sufficient.

5. Functional tests shall verify at least the following, with additional tests as required by Commissioning Authority:
   1) Equipment and occupancy schedules: Override system clock to verify equipment starts and stops on appropriate times/days.
   2) Equipment startup dependencies, sequencing (e.g. verify that HHW pump starts before boiler fires), and lockouts (e.g. verify that boiler will not fire if HHW pump is disabled): Override status points of triggering equipment and verify response of dependent equipment.
   3) Minimum on- and off-times: Override runtime counters and trigger events and verify that equipment remains running or remains stopped for appropriate period of time.
   4) Lead/lag staging: Override staging triggers (e.g. temperature readings, T&R Requests, calculated loads, etc.) and verify automatic start of lag equipment.
   5) Lead/standby staging: With system operating, disable lead equipment and verify that standby equipment starts automatically.
   6) Rotation: Override runtime counters and verify that lead device rotates as intended.
   7) All setpoint reset logic: Override resetting parameter (e.g. outdoor air temperature) and verify correct reset of setpoint.
   8) For all Trim & Respond (see Paragraph 1.4II) setpoint reset loops:
      a) Request generation: Override conditions at source of Requests (e.g. terminal unit or air handler) to verify that correct quantity and type of Request is generated. Verify that Requests are removed when override is removed.
      b) Setpoint reset: Override number of Requests seen by controlled equipment (e.g. air handler or plant) and verify correct reset of setpoint. Adjust number of responses to observe trimming, responding and holding of setpoint.
c) Setpoint reset range: By adjusting Requests at controlled equipment, cause Trim & Respond loop to cycle setpoint from minimum value to maximum and then back to minimum. Confirm that loop does not get “stuck” at either end of setpoint range.

9) Correct handling of all failure conditions, including equipment failover and alarm notification: Override equipment to produce failure conditions and observe system response.

6. Testing schedule shall be coordinated with the Commissioning Authority and/or Commissioning Coordinator.

7. Functional tests may be witnessed by Owner’s Representative at the Owner’s option.

8. All accepted Functional Tests shall be conducted by the DDC Contractor with results confirmed and signed by the Contractor’s technician.

   a. After submitted test forms have been accepted, DDC Contractor shall perform all listed tests, take corrective action as required for failed tests, and repeat tests until a passing condition is obtained.
   b. Document results on forms and submit for approval as Functional Test report.
   c. All Functional Tests must be documented as passing and Functional Test report must be accepted by the Engineer of Record and Commissioning Authority before Demonstration Tests are scheduled. **Tests which are noted as passing but fail during demonstration shall incur additional costs to DDC Contractor, above and beyond cost of remediating failed test.** See Paragraph 3.16H.5.
   d. Report shall be word-searchable electronic format per Paragraph 1.8E. All information on forms shall be typed. Hand-written forms, or typed forms with hand-written results, shall not be acceptable.

F. Demonstration Tests

1. Demonstration tests consist of representative sample of Pre-Functional Tests randomly selected by the Commissioning Authority, and (potentially all) Functional Tests as chosen by the Commissioning Authority.

2. Schedule the demonstration with the Commissioning Authority and Owner’s Representative at least 1 week in advance.

3. Demonstration Tests shall not be scheduled until the Functional Test report has been accepted.

4. The Contractor shall supply all personnel and equipment for the demonstration, including, but not limited to, instruments, ladders, etc.

5. Contractor-supplied personnel shall be those who conducted the Functional tests or who are otherwise competent with and knowledgeable of all project-specific hardware, software, and the HVAC systems.

6. The system will be demonstrated following procedures that are the same or similar to those used in the Pre-Functional and Functional Tests. The Commissioning Authority will supply the test forms at the site at the start of the tests.

7. Demonstration tests shall be witnessed by CxA. Demonstration tests undertaken without CxA shall not be considered valid.

8. Demonstration tests may be witnessed by Engineer of Record at the EOR’s option.

9. Demonstration tests may be witnessed by Owner’s Representative at the Owner’s option.

10. Contractor shall conduct tests as directed by and in the presence of the Commissioning Authority and complete test forms. Completed forms shall be submitted as the Demonstration Test report to the Commissioning Authority after tests are complete.

11. Demonstration Tests shall be successfully completed and accepted prior to Substantial Completion.
G. Trend Reviews
   1. Trends shall be fully configured to record and store data per Paragraph 3.6E.
   2. Post-Construction Trend Test
      a. Provide table of points to be trended along with trend basis. Submit for review and
         approval by the by Commissioning Authority a minimum of 14 days prior to start of
         Trend Period.
      b. Collect data for three-week Trend Period. Trend Period shall not commence until
         Demonstration Tests have been successfully completed and accepted.
      c. At end of Trend Period, DDC Contractor shall review data to verify that system is
         operating correctly. Identify system faults. Perform remedial work as required and
         verify correction with no less than 3 days additional trends.
      d. Export data to spreadsheet (XLS or CSV format) for review.
         1) Data shall be provided as a single electronic file
         2) Organize data into tabs, with one tab for each individual system or major piece
            of equipment.
         3) First tab shall be a table of contents indicating the equipment or devices
            associated with each tab. Identify equipment using tags from Contract Drawing
            equipment schedules.
         4) Second tab shall summarize data anomalies and system faults. Provide graph
            of data for each incident. Summarize identified issues and what if any remedial
            work was performed.
         5) Provide additional post-remediation trends on separate tabs.
      e. Provide data to Owner and Commissioning Authority. Data will be analyzed by
         Commissioning Authority.
      f. DDC System shall be accepted only if third-party analysis of trend data indicates
         proper system operation without malfunction, without alarm caused by control action
         or device failure, and with smooth and stable control of systems and equipment in
         conformance with this and related Sections.
      g. Perform additional remedial work as directed by Commissioning Authority or
         Engineer of Record and provide proof-of-correction trends as required.
   3. End-of-Warranty Trend Test
      a. No more than 60 days before end of Warranty Period, DDC Contractor shall export
         all trend data from start of Post-Construction Trend Period.
      b. Provide data to Commissioning Authority in spreadsheet form as described above.
      c. DDC System shall be accepted and Warranty Period considered complete only if the
         trend review indicates proper system operation without malfunction, without alarm
         caused by control action or device failure, and with smooth and stable control of
         systems and equipment in conformance with this and related Sections.
      d. Perform additional remedial work as directed by Commissioning Authority and
         provide proof-of-correction trends as required.

H. Remedial Work
   1. Repair or replace defective Work, as directed by Owner’s Representative in writing, at no
      additional cost to the Owner.
   2. Restore or replace damaged Work due to tests as directed by Owner’s Representative in
      writing, at no additional cost to the Owner.
   3. Restore or replace damaged Work of others, due to tests, as directed by Owner’s
      Representative in writing, at no additional cost to the Owner.
   4. Remedial Work identified by site reviews, review of submittals, demonstration test, trend
      reviews, etc. shall be performed to the satisfaction of the Owner’s Representative, at no
      additional cost to the Owner.
5. Contractor shall compensate Owner’s Representatives, Commissioning Authority, and/or Engineer of Record on a time and material basis at standard billing rates for any additional time required to witness additional demonstration tests or to review additional BAS trends beyond the initial tests, at no additional cost to the Owner.

3.17 TRAINING

A. Coordinate schedule and materials with Owner and Commissioning Authority.

B. Provide preliminary training as required such that operating staff can respond to occupant needs and other operating requirements during start-up and commissioning phase.

C. Formal Training

1. Training shall be conducted after all commissioning is complete and systems are fully operational. Training shall not start until Functional Testing is complete and the Functional Test Report has been submitted and accepted.

2. Provide training sessions for personnel as required by Owner.

3. Training Schedule

   a. Schedule training to provide Owner with at least 10 business days advance notice.

   b. Training shall occur within normal business hours at a mutually agreed on time. Unless otherwise agreed to, training shall occur Monday through Friday, except on U.S. Federal holidays.

   c. Training shall be scheduled within 30 days of the completion (including acceptance) of Functional testing, unless otherwise authorized by the Owner.

   d. All training sessions shall occur within a four week period.

   e. Each complete training session shall occur on a different day, to facilitate maximum attendance. Schedule training sessions as required to accommodate Owner’s needs.

4. Attendance Tracking

   a. Request from Owner in advance of training a proposed attendee list with name, phone number and e-mail address.

   b. Provide a preprinted sign-in sheet for each training session with proposed attendees listed and blank spaces to add additional attendees. Participant tracking can also be performed electronically.

      1) Include training session number, date and time, instructor name, phone number and e-mail address, and brief description of content to be covered during session.

      2) List attendees with columns for name, phone number, e-mail address and a column for attendee signature or initials.

   c. Circulate sign-in sheet at beginning of each session and solicit attendees to sign/initial.

   d. At end of each training day, send Owner and Commissioning Authority e-mail with an attachment of scanned copy (PDF) of circulated sign-in sheet or equivalent digital participant record for each session.

5. On-Site Training

   a. Include additional 40 hours total of on-site training to assist personnel in becoming familiar with site-specific issues, systems, Sequences of Operations, etc.

   b. Owner will provide conditioned classroom or workspace with ample desks or tables, chairs, power and data connectivity for instructor and each attendee.
c. Instructor shall provide training materials, Projector and other audiovisual equipment used in training.
d. Training shall be provided by factory-trained instructors experienced in presenting this material. DDC Contractor staff may provide training, if so qualified.
e. Training may be in non-contiguous days at the request of the Owner.

D. Training Content and Levels

1. Operators are divided into three levels of expertise and shall receive training including but not limited to the tasks listed for each training level.

2. DDC Contractor shall provide training for personnel in numbers and at levels requested by Owner. Coordinate with Owner and Commissioning Authority.
a. At a minimum plan to train 2 Regular Operators, 1 Advanced Operator, and 1 System Administrator.

3. Regular Operators shall be trained to perform the following tasks:
   a. Proficiently operate the system
   b. Understand control system architecture and configuration
   c. Understand BAS system components
   d. Understand system operation and Sequences of Operations
   e. Operate the workstation and peripherals
   f. Log on and off the system
   g. Access graphics, point reports, and logs
   h. Adjust and change system set points, time schedules, and holiday schedules
   i. Recognize malfunctions of the system by observation of the printed copy and graphical visual signals
   j. Understand and acknowledge alarms
   k. Understand system drawings, and Operation and Maintenance manual
   l. Understand the Project layout and location of control components
   m. Print point and predefined reports

4. Advanced Operators shall be trained as Regular Operators plus the following tasks:
   a. Make and change graphics on the workstation
   b. Create, delete, and modify alarms, including annunciation and routing
   c. Create, delete, and modify point trend logs, and graph or print these both on an ad-hoc basis and at user-definable time intervals
   d. Create, delete, and modify reports
   e. Add, remove, and modify system’s physical points
   f. Create, modify, and delete programming
   g. Add control panels
   h. Add Operator Workstations
   i. Create, delete, and modify system displays — both graphical and otherwise
   j. Perform BAS system field checkout procedures
   k. Perform BAS controller unit operation and maintenance procedures
   l. Perform workstation and peripheral operation and maintenance procedures
   m. Perform BAS system diagnostic procedures
   n. Configure hardware including PC boards, switches, communication, and I/O points
   o. Maintain, calibrate, troubleshoot, diagnose, and repair hardware
   p. Adjust, calibrate, and replace system components
   q. Maintain software and prepare backups

5. System Administrators shall be trained as Regular Operators plus the following tasks:
   a. Maintain software and prepare backups
   b. Create and print custom reports, including tenant billing summaries
   c. Interface with Project-specific, third-party operator software
d. Add new users and understand password security procedures

E. Training Materials

1. Provide each attendee with a color hard copy of all training materials and visual presentations.
2. Hard-copy materials shall be organized in a three-ring binder with table of contents and individual divider tabs marked for each logical grouping of subject matter. Organize material to provide space for attendees to take handwritten notes within training manuals.
3. In addition to hard-copy materials included in training manual, provide each binder with a sleeve or pocket that includes a DVD or flash drive with PDF copy of all hard-copy materials.
4. Additionally, store an electronic copy of training materials and training videos (if applicable) on Data Archive Server (if provided) and Operators Portable Workstation.
5. Training materials shall include step-by-step instructions (including illustrations, screen captures, etc.) for how to perform all task identified in Paragraph 3.17D such that a new operator, who has not attended the training in person and has minimal familiarity with this DDC System, can easily follow the instructions and successfully perform all of the identified tasks.

F. Video of Training Sessions:

1. Trainer shall provide or arrange for a digital video and audio recording of each training session. Create a separate recording file for each session.
2. Stamp each recording file with training session number, session name and date.
3. Provide Owner with two copies of digital files on DVDs or flash drives for later reference and for use in future training.
4. Owner retains right to make additional copies for intended training purposes without having to pay royalties.

G. During the warranty period, provide unlimited live support for all trained operators. DDC Contractor or DDC System Manufacturer shall provide a direct customer support channel for user questions and feedback, preferably as a message or chat application native to the Operator’s Interface.

END OF SECTION
SECTION 255005 – LABORATORY MONITORING AND CONTROL SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

A. Related Documents:
   1. Drawings and general provisions of the contract, including general and supplemental conditions, and Division 01 sections apply to this Section.
   2. Review these documents for coordination with additional requirements and information that apply to work under this Section.

B. Section Includes:
   1. Laboratory Monitoring and Control System
      a. Laboratory fume hood face velocity monitoring and controls.

1.2 RELATED SECTIONS

A. Division 8 – Doors and Windows
B. Section 115313 – Laboratory Fume Hoods and Other Air Containment Units
C. Section 233600 – Air Terminal Units
D. Section 255000 – Building Automation Hardware and Networking
E. Section 253000—Building Automation Sensors and Control Devices
F. Division 01 Section “General Requirements”
G. Division 01 Section “Special Procedures”

1.3 SYSTEM DESCRIPTION

A. Lab Airflow Control System
   1. The intent of this Specification is to define the hardware and control requirements for the laboratory airflow control system (LACS). The system specified shall be based on variable fume hood exhaust volume with sash position reset control of fume hoods, synchronization of supply and exhaust airflows, and control of lab room temperature via reheat coils and airflow reset. The BAS shall integrate to the LACS through BACnet® interface directly from room control panels.
   2. Low-pressure drop laboratory airflow control valves including supply and exhaust valves as listed in schedule and on drawings per specification 233600.
3. Integral electronic pressure independent controller with standard “Native BACnet” interface for lab air valves.
4. Associated room control panels for laboratory airflow control system including supply and exhaust valves as listed in schedule and on drawings.
5. All associated room and duct temperature sensors as required for laboratory airflow control system spaces.
6. Fume hood controllers, sash sensors and monitors as required for laboratory airflow control system spaces. Fume hoods per Division 11.

1.4 SUBMITTALS

A. Comply with Division 01, Section “General Requirements” and Division 23, Section “Common Results for HVAC”, review of materials.
B. Follow requirements of Section 255000 - Building Automation Hardware and Networking.
C. Minimizing energy consumption is of primary importance in the system design; therefore any airflow control valve considered for this project must be submitted with test data showing the Minimum Operating Pressure of the valve as tested in accordance with ANSI/ASHRAE STD 130 Paragraph 5.3. The submitted test data must be in the form of an xy plot, with the y axis representing differential pressure measured across the fully opened valve and the x axis representing airflow volume measured through the fully opened valve. The test data for each size valve must include the entire published operating range of the valve.
D. Literature for submitted valve must show both a curve and spreadsheet of minimum operating pressure drop versus CFM throughout its operating range.
E. Operation and Maintenance Data:
   1. Submit operation and maintenance data under provisions of Division 01 Section “General Requirements” Paragraph 1.8.H “Operation and Maintenance Data”
   2. The LACS supplier shall provide a full documentation package to the Owner on completion of the project. Documentation shall include as-built drawings, device lists, and controller configuration lists for each controller.

1.5 WARRANTY

1. At the successful completion of the final testing, commissioning, and demonstration phase in accordance with the terms of this Specification, if equipment and systems are operating satisfactorily to the Owner and if all completion requirements per Paragraph 1.9 have been fulfilled, the Owner shall certify in writing that the DDC System has been accepted. The date of acceptance shall be the start of the warranty period.
2. Guarantee all materials, equipment, apparatus and workmanship (including programming) to be free of defective materials and faulty workmanship for at least the following periods from date of acceptance:
   a. Controllers (BCs, AACs, and ASCs), routers and gateways: five years
   b. Valve and damper actuators: five years
c. Temperature, humidity, and CO2 sensors: five years
d. Programming: one year
e. All else: one year

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS – LABORATORY MONITORING AND CONTROL SYSTEMS

A. Accutrol LACS
B. Or equal.

2.2 BUILDING AUTOMATION SYSTEM COMPATIBILITY

A. The BAS shall integrate to the LACS through BACnet® interface directly from room control panels.

2.3 FUME HOOD FACE VELOCITY MONITORING AND CONTROL SYSTEM

A. The fume hood controller(s) function as stand-alone units, modulating the hood exhaust valves as required via the factory-mounted electronic high speed actuators. The fume hood controller has a local display which includes visual and audible alarm indicators. The fume hood controller will be capable of communicating read points indicating the calculated face velocity (fpm), face velocity set point (fpm), exhaust volume (CFM), sash position (% open), alarm status, DI status and emergency status to the BAS via BACnet MS/TP communications protocol.

B. The fume hood controller shall be a BTL listed device. The fume hood controllers will be capable of providing the local (BAS) room controller with two mutually independent discrete analog outputs configured for either (face velocity, exhaust volume, sash position, or valve position) with the following signal types available; 0-10v, 2-10v, 0-5v, 1-5v, 0-20mA or 4-20mA. Fume hood alarms will be hardwired from the fume hood controller alarm relay output to the local (BAS) controller. The occupied/unoccupied room status will be communicated via a hard wired digital input to each of the fume hoods in a given lab/room.

C. Display
   1. The fume hood display provides the average face velocity value with alarm and emergency purge LEDs
   2. The local display includes a mini USB port for connecting the PC with the fume hood controller configuration software. All configurable fume hood control and alarm parameters can be accessed and modified using the pc-based user interface software

D. Sash Sensor
   1. Fume hood sash sensors shall measure position of sash via electrical sensor cable and calculate sash area based on that measured position. The sensor shall be designed to be mounted to the fume hood sash counter-weight cable system. Face velocity controller
shall be capable of supporting up to three vertically-moving sashes, with each sash connected to a vertical sash sensor.

2.4 ROOM LEVEL CONTROLLERS

1. Controller shall be programmable and capable of achieving sequences described in 25 90 00 Sequences of Operation
2. The controller shall be provided with a dual ARM processor and a built-in web server, with 16 Mbyte NOR Flash and 64 Mbyte SDRAM. The controller shall support BACnet and Modbus. The room level controller shall be powered by 24V AC/DC Power.
3. The controller shall be provided with a minimum of 30 input and output (IO) points which comprise of 8 digital inputs, 8 universal inputs, 8 digital outputs, 2 open collector outputs and 4 analog outputs. The controller shall be also be provided with an Ethernet port and 2 RS485 ports.
4. The controller shall be fully configurable via a lap-top computer or a PC utilizing a user-friendly Graphic User Interface software package. Display of current readings of all flows, outputs, tuning values, setpoints, and status values shall be available through this interface. Entry of control setpoints, and scaling and tuning constants shall also be provided by this interface.
5. Power voltage requirements for the controllers shall be 24V AC/DC. Power can be provided by individual or centralized power transformers, provided by the installing contractor.
6. The Controller shall have inputs and outputs per controls schematics.

PART 3 - EXECUTION

3.1 HOLD AND INSPECTION

A. Refer to provisions of Division 01 Section “Special Procedures” for hold points for inspection, witnessing testing, etc.

3.2 FUME HOOD VELOCITY CONTROLLER SYSTEM INSTALLATION

A. Start-up shall be performed by a factory-authorized representative.

B. The adjustable parameters within the fume hood velocity controller shall be tuned to maintain the setpoint of 110 fpm +10 fpm. The low alarm shall be set to 80 fpm and the high alarm shall be set to 150 fpm. The display averaging period shall be set for 5 seconds. The alarms shall be set to unlatch in the event that air velocity returns to normal.

1. Set initial alarm resume setting to 5 minutes.
C. Program minimum flow set point to maintain 25 CFM / square foot of work surface at the fume hood. As fume hood sash is lowered, ensure this minimum flow rate is maintained. This setting will override the face velocity set point at low sash positions. This may result in the average velocity exceeding the set point value, resulting in high alarm condition.

3.3 PROGRAMMING

A. Controllers shall be programmed per 25 90 00 Sequences of Operation

3.4 MAINTENANCE AND OPERATING AND TRAINING INSTRUCTION

A. See Division 01, Section “General Requirements”.

END OF SECTION
SECTION 259000 - BUILDING AUTOMATION SEQUENCES OF OPERATIONS

PART 1 - GENERAL

1.1 SUMMARY

A. Section provides logic sequences of operations for a Direct Digital Control of building systems, subsystems, and equipment by a Building Automation System provided in accordance with the Related Specifications.

B. Explanatory Notes

1.2 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01, apply to this Section, except as specifically noted in this Section.

B. Related Specifications:
   1. Section 23 00 00 “HVAC General Requirements”
   2. Section 23 05 93 “Testing, Adjusting and Balancing for HVAC”
   3. Section 25 30 00 “Building Automation Instrumentation and Control Devices”
   4. Section 25 50 00 “Building Automation Hardware and Networking”

C. Electronic Version Available
   1. To facilitate the Work under this Section, a searchable digital version of this document will be provided to the DDC Contractor upon request to the Engineer of Record.
   2. Digital version includes live hyperlinked cross-references, such that clicking “see Paragraph XX” will jump to Paragraph XX.
   3. Digital version is formatted with PDF “bookmarks” corresponding to the outline levels of the document, as an aid to navigation.
   4. DDC Contractor is strongly encouraged to request this digital version if it is not provided through standard channels. The sequence logic may be challenging to follow in “dead tree” format.

1.3 DEFINITIONS

A. Industry Standard Definitions
   1. Analog Input (AI): Proportional input signal (typically 0-10 VDC or 4-20 mA) to BAS.
   2. Analog Output (AO): Proportional command signal (typically 0-10 VDC or 4-20 mA) from BAS.
   3. Binary Input (BI): On/off output input signal or contact closure to BAS.
   4. Binary Output (BO): On/off output command signal or contact closure from BAS.
   5. BAS: Building Automation System. Equivalent to Energy Management and Control System (EMCS), Building Management System (BAS), etc.
   6. DDC: Direct digital control, the control of building equipment by a programmable computer.
B. Definitions Particular to this Specification

1. Enabled/Disabled (for equipment): Indicates whether a piece of equipment is available to respond to a command (to run, or modulate, etc.) The statement "X is enabled" means that X is available to run but not necessarily running.

2. Enabled/Disabled (for control loops): Indicates whether the control loop is actively calculating an error signal and is available to use for control. Disabled control loops are inactive; they do not accumulate error and they are not used for control. See also Paragraphs 1.1A.1.a through 1.1A.1.a.

3. Mode: The dominant Operating Mode of an air handling unit (e.g. Occupied, Unoccupied, Warm-up, etc.) Often scheduled but may be in response to building conditions. See Paragraphs 3.3C.6 and 3.3H.8.a.

4. Occupied/Unoccupied: Refers to a zone (or collection of zones) that is scheduled for potential occupancy (or not). People may or may not be present.

5. Populated/Unpopulated: Refers to a zone where people are currently present (or not), as indicated by occupancy sensor, CO2 measurement, or other means. Note that Populated/Unpopulated status is independent of and unrelated to Occupied/Unoccupied status, which is a function of schedule.

6. Request-based Trim & Respond logic: A reset scheme that periodically resets the setpoint at an "upstream" system (e.g. air handler) using demand-based Requests from "downstream" devices (e.g. terminal units), adjusting the setpoint at defined time-step frequency. For more detail and a worked example, see Paragraph 3.3A.14.

7. Zone/Control Zone: A defined indoor area that is controlled to maintain specified temperature and/or airflow.
   a. Thermal Control Zone (aka "thermal zone" or simply "zone"): An indoor space (i.e. room or part thereof) in which the air temperature is controlled to a setpoint based on temperature measurement by a thermostat or space sensor. Outdoor air ventilation is also provided for regularly occupied spaces. Thermal control and ventilation may be provided by separate devices (e.g. radiant panel plus DOAS terminal unit) or by a single device (e.g. VAV-reheat terminal unit).

C. Also see "Definitions" in Part 1 of Section 25 50 00.

1.4 SUBMITTALS

A. General

1. See "Submittals" in Part 1 of Section 25 50 00 for complete DDC Building Automation System submittal requirements, submittal process, schedule of submittals, and required submittal format.

2. The remainder of this document focuses on submittal requirements specifically related to the software and sequences. Additionally, all submittals described in Section 25 50 00 are mandatory.

3. All BAS-related submittals, including those related to software and sequences as well as hardware, shall conform to the requirements described in Section 25 50 00.

4. Non-conforming submittals shall be returned without action.

B. Submittals shall be provided in searchable digital format, as required by Section 25 50 00.

1. Provide a separate file for each submittal.

2. Product cutsheets, test forms and other text documents shall be provided in a word searchable digital format. Acceptable formats are MS Word, PDF and HTML; other formats require approval prior to submission.

3. Drawings and schematics shall be provided in PDF format.

4. Sequences of operations shall be submitted in MS Word format.
5. PDFs shall be generated from another electronic document shall be word-searchable; scans/images of paper documents will not be accepted.
6. Image scans may be submitted only for original signed documents, such as qualifications, inspection certificates, and warranty documents.
7. Hardcopy (paper) submittals are not acceptable and shall not be provided except as specified during Closeout/Completion (see Section 25 50 00).
8. Submittals provided in the wrong format will be returned without action.

C. Parameters Determined in Balancing
1. Article 3.2 lists parameters and setpoints that must be determined during Test and Balance, to support BAS programming.
2. As described in Section 25 50 00, DDC Contractor shall coordinate with Test and Balance Contractor to develop a coordination plan for determining these parameters. DDC Contractor shall also submit these parameters for review after they have been determined, in the Setpoint Determination Report. See Articles “Submittals” in Part 1 and “Coordination with Other Trades” in Part 3 of Section 25 50 00.
3. When submitting these parameters for review, DDC Contractor shall flag any values that seem anomalous, outside of expected range, or otherwise problematic.
4. DDC Contractor shall not commence with functional testing or verification until these parameters have been established and programmed, and documentation has been submitted to and accepted by the Engineer of Record. Any testing performed prematurely shall be repeated in full after these parameters have been determined and accepted.

D. DDC Contractor Review of Sequences of Operations
1. DDC Contractor shall review these Sequences of Operations and document to Engineer of Record any concerns with regards to the ability to implement the sequences as written. The DDC Contractor shall identify and address any of the following conditions:
   a. Apparent errors in control sequence logic.
   b. Discrepancies or inconsistencies within the control sequences.
   c. Missing information required for programming.
   d. Control logic which might damage equipment or violate manufacturer warranties.
   e. Control logic elements which cannot be implemented due to inherent limitations of the control hardware or software system to be used.
   f. Suggest alternative; control strategies, or implementations which provide improved functionality or equivalent functionality with less effort.
2. DDC Contractor is strongly encouraged to provide this feedback via an informal pre-submittal (see Section 25 50 00) to resolve any issues or concerns in advance of formal submission.
3. DDC Contractor shall submit both English-language Sequence of Operations and the actual control logic (in line code or visual logic) as part of the regular submittal process. See “Submittals” in Part 1 of Section 25 50 00.
   a. The intent and implementation of submitted Sequences of Operations and submitted programming logic shall match and be fully consistent with each other.
   b. DDC Contractor shall document any as-programmed changes or discrepancies relative to the Sequences of Operations provided in this Section. Changes shall be clearly marked.
   c. The Engineer of Record may reject any control logic changes which have not been pre-approved. DDC Contractor shall be responsible for all re-programming, re-testing and other work required to correct or refine control logic changes which were not pre-approved by the Engineer of Record.
4. All changes to Sequences of Operations require review and approval of the Engineer of Record.
5. Changes which are inconsistent with the intent of the Sequences of Operations or that may negatively impact energy consumption or occupant comfort are not acceptable will be rejected.

6. Only the Sequences of Operations reviewed and accepted by the Engineer of Record shall be installed and or programmed into the DDC System.

1.5 COORDINATION

A. DDC Contractor is responsible for coordinating with other trades, equipment manufacturers, and commissioning agents to facilitate the Work of this and related Sections. The full scope of DDC Contractor coordination responsibility is outlined in Part 1 and Part 3 of Section 25 50 00.

B. Relative to the Work of this Section, DDC Contractor shall coordinate with the TAB (Test and Balance) Contractor to establish the correct values for the field-determined critical control parameters required to program the Sequences of Operations.

1. DDC Contractor shall provide a list of setpoints and other parameters to be determined by the TAB Contractor.
   a. See Article 3.2 for required setpoints identified by Engineer of Record. This list may not be complete. DDC Contractor is responsible for identifying all setpoints which require TAB coordination and are necessary for correct execution of Sequences of Operations.

2. The DDC Contractor shall review and comment on TAB test procedures and forms that relate to the setpoints in Article 3.2 before the contractor begins work (and others as identified by the DDC Contractor or Engineer of Record) to ensure that they will provide information required to correctly program Sequences of Operations.

3. Submit Setpoint Determination Plan with DDC Submittal Package 3 (see “Submittals” in Part 1 of Section 25 50 00).
   a. Plan shall include a brief narrative description of the means and methods to be used to determine specified setpoints and other system parameters.
   b. Plan shall also include copies of the data record sheets to be used during testing.

4. DDC Contractor shall support work by the TAB Contractor as necessary, to facilitate the determination of critical control setpoints.

5. After setpoint determination is complete, DDC Contractor shall submit Setpoint Determination Report, documenting results of all tests and the final setpoints that were determined (refer to 1. above). The DDC Contractor shall use these values for initial BAS programming.
   a. In the Setpoint Determination Report, the DDC Contractor shall flag any values that seem anomalous, outside of the expected range, or otherwise problematic.

1.6 TRENDS

A. General

1. Trends shall be configured, recorded, and stored as described in Section 25 50 00.

2. Standard BACnet trend objects shall be used exclusively.
3. All time-basis trends shall be synchronized to record data at the same time for ease of side-by-side comparison. Trends with the same time basis but offset timestamps (e.g. one-point trends at 1:00, 1:05, 1:10, etc while another point trends at 1:02, 1:07, 1:12, etc.) shall not be accepted.

4. DDC Contractor shall not create duplicate trends of a single point. If a single point referenced for trending in this, or other Sections appears more than once, that does not indicate that multiple trends shall be created. Create only one trend for any given physical or virtual point, unless specifically instructed otherwise.

B. Trend Intervals and Basis (unless otherwise indicated)

1. Binary points shall be trended on a change-of-value (COV) basis.

2. Analog points shall be trended on a time basis with a frequency of 5 minutes or as scheduled/indicated on Contract Drawing control schematics and/or this Section.
   a. If an analog point is indicated for COV trending with a value in engineering units (e.g. “2°F COV”), provide trend which records a timestamp and point value every time the point value changes at least the given increment.
   b. If an analog point is indicated for COV trending with a percentage value (e.g. “±10% COV”), provide trend which records a timestamp and point value every time the point value changes by at least that percentage of its current value.

3. Fixed and manually-adjustable setpoints shall be trended on a COV basis, with a minimum of one data point recorded per day, at noon. (The minimum single data point provides a reference for subsequent trend analysis.)

4. Zone and System Modes shall be trended on a COV basis, with one minimum of one data point recorded per day, at noon.

5. Setpoints which are reset by control logic shall be trended on a time basis with a frequency of 5 minutes or as indicated by the Control drawings.
   a. Exception: Setpoints that are reset by a Request-based Trim & Respond logic (see Paragraph 3.3A.14) shall be trended with the same frequency as the Trim & Respond time step T. The number of requests (see below) shall be trended on the same frequency.
   b. If a setpoint is reset by another data point, that point shall be trended at the same time (e.g. if SAT is reset on OAT, both OAT and SAT shall be trended simultaneously).

C. Data and Points to Be Trended

1. All hardwired and networked points listed in points schedules on Contract Drawing control schematics.

2. All zone temperatures, including radiant mass temperatures (measured by embedded slab sensor) if applicable.

3. All alarms, including alarms generated by dedicated equipment controllers and alarms calculated by these Sequences.

4. The Operating Mode of each zone (see Paragraph 3.3C.6)

5. The System Mode of each air handling unit (see Paragraph 3.3H.8.a)

6. The status of each zone with an occupancy sensor, whether that sensor is directly connected to the BAS or is mapped from an interconnected lighting control system.

7. All setpoints used for control, and their associated actual values (e.g. trend both CHW supply temp setpoint and actual CHW supply temp). This includes setpoints which are “fixed” (i.e. only adjustable through operator’s interface), adjustable by occupants, or reset by control logic, including but not limited to:
   a. All zone heating and cooling setpoints (including local setpoint adjustments)
   b. Terminal unit discharge air temperature setpoints
   c. Air handler supply air temperature setpoints
d. Hydronic plant (i.e. chiller, boiler, heatpump etc) CHW and/or HHW supply and/or return temperature setpoints.

e. Domestic hot water plant DHW supply and/or return temperature setpoints

f. Building and space pressure setpoints

g. Duct static pressure setpoints

h. Hydronic loop differential pressure setpoints

8. Signal value output of all control loops, except those that drive a single AO point that is already being trended.

9. The number of requests for each Trim & Respond loop. Each type of request for each Trim & Respond loop shall be trended separately, including but not limited to:

   a. All zone heating, cooling and pressure reset requests (in terminal unit sequences, under System Requests), separately for each zone and request type

   b. All air handler CHW Supply Temperature Reset Requests and HHW Supply Temperature Reset Requests (in AHU sequences under Plant Requests), separately for each zone and request type

10. All plant requests such as cooling plant requests and heating plant requests.

11. All global override events (e.g. demand response, or after-hours override operation).

12. All resource and utility meters connected to the DDC system.

13. All calculated performance parameters (e.g. kW/ton) described in these Sequences.

14. All equipment loads calculated and/or used for control (e.g. chiller %FLA) in these Sequences.

15. All of the listed network points for the following equipment. These points are in addition to those shown on the Contract Drawing control schematics. However, DDC Contractor shall not create duplicate trends: if the same point appears on both the drawings and in the lists below, create only one trend.

   a. Variable Frequency Drive (VFD)

PART 2 - PRODUCTS (not applicable)

PART 3 - EXECUTION

3.1 CONTROL PARAMETERS PROVIDED BY ENGINEER OF RECORD

A. General
1. None for this equipment.

B. Generic Thermal Control Zones
1. Outdoor Air Ventilation Requirements
   a. The parameters required to calculate minimum outdoor airflow for each zone shall be scheduled on the drawings
   b. California Title 24 ventilation requires the following parameters:
      1) \( V_{occ-min} \): Zone minimum outdoor airflow for occupants, per Title 24 prescribed CFM-per-occupant requirements.
      2) \( V_{area-min} \): Zone minimum outdoor airflow for building area, per Title 24 prescribed CFM-per-ft\(^2\) requirements.

2. CO2 Setpoints
   a. All occupancy types: 800 ppm

3. Thermal Control Zone Temperature Setpoints
   a. Zone Temperature default setpoints shall be based on zone type as scheduled on the drawing: M0.04.
   b. When zones are unoccupied, they shall be controlled to their “standby” setpoints.

C. Thermal Control Zone Group Assignments and Scheduling
1. Zones shall be assigned to Groups as shown in the following table.
2. Zone Groups and default schedules shall be confirmed with Owner prior to programming.

<table>

D. CH/HHW Plant (Air Source Heat Pump: ASHP-1,2,3 & Pumps)
   1. Supply Temperature Setpoint
      a. HWS setpoint shall be 100 deg F.
      b. CHWS setpoint shall be 55 deg F.

E. Lab Supply Air Valve, 4-pipe Heating & Cooling Switchover
   1. The design airflow setpoints for each zone shall be scheduled on the drawings
      a. Vcool-max: The zone maximum cooling airflow setpoint
      b. Vmin: The zone minimum airflow setpoint
      c. Vheat-max: The zone maximum heating airflow setpoint

F. Lab Exhaust Air Valve, General
   1. The design airflow setpoints for each zone shall be scheduled on the drawings
      a. Vmax: The occupied general exhaust
      b. Vmin: The unoccupied general exhaust

G. Lab Exhaust Air Valve, Fume Hood
   1. The design airflow setpoints for each zone shall be scheduled on the drawings
      a. Vmax: The exhaust airflow setpoint with hood full open
      b. Vmin: The exhaust airflow setpoint with hood full closed

H. VAV Supply Terminal Unit, 4-pipe Heating & Cooling Switchover
   1. The design airflow setpoints for each zone shall be scheduled on the drawings
      a. Vcool-max: The zone maximum cooling airflow setpoint
      b. Vmin: The zone minimum airflow setpoint
      c. Vheat-max: The zone maximum heating airflow setpoint
   2. MinDAT: The minimum cooling discharge air temperature shall be 55°F unless otherwise scheduled on the drawings.
   3. MaxΔT: The maximum heating discharge air temperature above zone heating setpoint shall be 30°F unless otherwise scheduled on the drawings.

I. Typical Cooling-only FCU Zone
   1. SA Temperature Setpoint: 55°F

J. Air Handling Unit System Modes
   1. No parameters required.

K. Multiple Zone VAV Air Handling Unit
   a. Min_ClgSAT= 55°F: The lowest supply air temperature setpoint
   b. Max_ClgSAT= 70°F: The highest supply air temperature setpoint (chosen to maximize heat recovery)
   c. OAT_Min = 55°F: The bottom of the OAT reset range
   d. OAT_Max = 70°F: The top of the OAT reset range
   2. The ventilation setpoints shall be scheduled on the drawings
      a. California Title 24 ventilation requires the following parameters:
1) **AbsMinOA**: The design minimum outdoor air rate when all zones with CO₂ sensors or occupancy sensors are unpopulated

2) **DesMinOA**: The design minimum outdoor airflow with areas served by the system occupied at their design population, including diversity where applicable

3. **Economizer High Limit Lockout**: Economizer shall be disabled whenever the outdoor air conditions exceed the economizer high limit as specified below.
   a. All units: $T_{OA} >$

L. **Lab Exhaust Fans**
   1. Minimum Airflow velocity: 2,000 FPM
   2. Minimum Airflow velocity if someone is on Observation Deck: 4,000 FPM

M. **BAS Fire Alarm Mode**
   1. None for this section

N. **Lab Exhaust Heat Recovery**
   1. None for this section

O. **Exhaust Fan, Temperature Controlled**
   1. None for this equipment.

P. **Domestic Hot Water Plant**
   1. None for this section

Q. **Resource Meters**
   1. None for this equipment.

3.2 **FIELD-DETERMINED CRITICAL CONTROL PARAMETERS**

A. **General**
   1. As required in Article 1.5 of this Section and Part 3 of Section 25 50 00, DDC Contractor shall coordinate with and support TAB Contractor to determine the parameters listed in this Article for all equipment included in the Scope of Work under this Section.
   2. DDC Contractor shall obtain these values from TAB Contractor and program the BAS accordingly. If DDC Contractor is unable to obtain these values for any reason, or if the values obtained are not appropriate or do not make sense, DDC Contractor shall notify General Contractor and Engineer of Record in writing to request guidance.

B. **CH/HHW Plant (Air Source Heat Pump: ASHP-1,2,3 & Pumps)**
   1. Secondary Hydronic Loop Differential Pressure Setpoint

C. **Terminal Units**
   1. For all pressure-independent (i.e. possessing an airflow measurement device, a modulating damper, and closed-loop control to maintain airflow at setpoint) terminal units:
      a. DDC Contractor shall program independent K-factor (airflow sensor pickup gain) values for each terminal unit based on data obtained from Test and Balance (TAB) Contractor.
b. The use of manufacturer tables for K-factor value is not acceptable.

D. Stand-Alone Exhaust Fans

1. For each independent exhaust fan (controlled by schedule, temperature or occupancy sensor) that are not part of an air handler or building relief system determine the following parameters:
   a. Fan speed setpoint MaxSpeed: The speed which provides the exhaust airflow rate scheduled on the plans.
   b. Minimum fan speed (VFD motor frequency), determined according to “VFD Minimum Speed” in Part 3 of Section 25 50 00.
   c. Max_DSP: The exhaust duct static pressure setpoint at design (maximum scheduled airflow) conditions

E. Air Handling Units

1. Multiple Zone VAV Air Handling Unit
   a. Max_DSP: The supply duct static pressure setpoint at design (maximum scheduled airflow) conditions
   b. Minimum Fan Speeds (VFD motor frequency), determined according to “VFD Minimum Speed” in Part 3 of Section 25 50 00 for
      1) Supply Fan
      2) Return Fan
   c. Return fan airflow differential S-R-CFM-DIFF (for Return Fan Control with Airflow Tracking, see Paragraph 3.3K.6) is the differential in CFM between supply airflow and return airflow required to maintain building pressure at +0.05”.
      1) Measure differential at minimum supply airflow and design supply airflow. S-R-CFM-DIFF shall be the average of the two measurements.
      2) All return fans that normally operate with the air handler should be on.
      3) A handheld sensor reading may be used only if a permanent building pressure sensor is not provided.

F. BAS Fire Alarm Mode

1. Duct Static Pressure setpoint
   a. DSP_FA: The exhaust duct static pressure setpoint at a minimum flow condition whereby exhaust is maintained at the furthest fume hood air valve or the exhaust fan is at it’s minimum speed, whichever is higher. Refer to next section for procedure to determine.

2. Bypass Damper:
   a. BD_P1: The bypass damper position which avoids underpressurizing the labs & preventing the doors from opening when the system initially enters fire alarm mode. The procedure to determine shall be as follows:
      1) Turn off all supply and exhaust fans serving the building.
      2) Fully close the dampers of all lab supply air valves and VAV boxes.
      3) Fully close all exhaust VAV terminals except the ones serving lab fume hoods.
      4) Fully open the BD on the roof.
      5) For each LEV serving lab fume hood, command the damper position to where it can provide design air flow rate. (This is assuming all lab fume hoods are in use when fire occurs, which is the worst case.)
      6) Turn on the exhaust fans to design flow rate.
7) Measure and record the air flow rate at the furthest lab fume hood. If the furthest lab fume hood has no measurable air flow, gradually close the BD on the roof until the furthest lab fume hood get measurable air flow.

8) Measure and record the opening force for each lab door. The door opening force shall not exceed the 2016 CBC requirement.

9) If any of the lab door opening force exceeds the 2016 CBC requirement, gradually open the BD until lab door opening force meets the 2016 CBC requirement.

10) Measure and record the bypass damper position BD_P1

b. BD_P2: The bypass damper position which enables the fan to run at minimum speed and achieve flow at the furthest fume hood. The procedure to determine shall be as follows:

1) Turn off two exhaust fans, run only on exhaust fan at the minimum speed.
2) Fully close the BD on the roof.
3) Measure and record the air flow rate at each lab fume hood. If any of the lab fume hood has no measurable air flow, increase the exhaust fan speed until all lab fume hoods get measurable air flow.
4) Measure and record the opening force for each lab door. The door opening force shall not exceed the 2016 CBC requirement.
5) If any of the lab door opening force exceeds the 2016 CBC requirement, gradually open the BD until lab door opening force meets the 2016 CBC requirement.
6) Repeat Step. 7 until all lab doors met the 2016 CBC requirement.
7) Measure and record the air flow rate at each lab fume hood.
8) Measure and record opening force of each lab door again.
9) Measure and record the bypass damper position BD_P2.
10) Measure and record the setpoint of DSP_FA. This number will be used for exhaust fan control in fire alarm mode.

c. T: The time it takes the fan(s) to slow from design maximum speed to one fan running at minimum fire alarm speed.

3.3 SEQUENCES OF OPERATIONS

A. General

1. Unless otherwise indicated, control loops shall be enabled and disabled based on the status of the system being controlled to prevent wind-up.
2. When a control loop is enabled or re-enabled, it and all its constituents (such as the proportional and integral terms) shall be set initially to a Neutral value.
3. A control loop in Neutral shall correspond to a condition that applies the minimum control effect, i.e. valves/dampers in normal position, VFDs at minimum speed, etc.
4. When there are multiple outdoor air temperature sensors, the system shall use the valid sensor that most accurately represents the outdoor air conditions at the equipment being controlled.

a. Outdoor air temperature sensors at air handler outdoor air intakes shall be considered valid only when the supply fan is proven on and unit is in Occupied Mode or any other Mode in which the economizer is enabled.
b. The outdoor air temperature used for graphics display, optimum start, plant lockout, and other global sequences shall be the average of all valid sensor readings. If there are four or more valid outdoor air temperature sensors, discard the highest and lowest temperature readings.

5. The term "proven" (i.e. "proven on"/ "proven off") shall mean that the equipment’s BI status point matches the state set by the equipment’s BO command point.

6. The term “software point” shall mean an analog variable, and “software switch” shall mean a digital (binary) variable, that are not associated with real I/O points. They shall be read/write capable (e.g. BACnet analog variable and binary variable).

7. The term “control loop” or “loop” is used generically for all control loops. These will typically be PID loops, but proportional plus integral plus derivative gains are not required on all loops. Unless specifically indicated otherwise, the following guidelines shall be followed:
   a. Use proportional only (P-only) loops for limiting loops (such as zone CO2 control loops, etc.).
   b. Do not use the derivative term on any loops unless field tuning is not possible without it.

8. To avoid abrupt changes in equipment operation, the output of every control loop shall be limited by a user adjustable maximum rate of change, with a default of 25% per minute.

9. All setpoints, timers, deadbands, PID gains, etc. listed in sequences shall be adjustable by the user with appropriate access level whether indicated as adjustable in sequences or not. Software points shall be used for these variables. Fixed scalar numbers shall not be embedded in programs except for physical constants and conversion factors.

10. Values for all points, including real (hardware) points used in control sequences shall be capable of being overridden by the user with appropriate access level (e.g. for testing and commissioning). If hardware design prevents this for hardware points, they shall be equated to a software point and the software point shall be used in all sequences.

11. Alarms
   a. There shall be 5 levels of alarm
      1) Level 1: Life Safety Message
      2) Level 2: Critical Equipment Message
      3) Level 3: Urgent Message
      4) Level 4: Normal Message
      5) Level 5: Maintenance Notification
   b. All alarms generated by the BAS shall include at least the following information:
      1) Date and time of the alarm
      2) Level of the alarm
      3) Description of the alarm
      4) Equipment tags for the units in alarm
      5) Possible causes of the alarm, if provided by the fault detection routines
      6) The Source per Paragraph 3.3A.12.a.1) which serves the equipment in alarm
   c. Maintenance Mode
      1) Operators shall have the ability to put any piece of equipment in/out of maintenance mode via switch on graphics.
      2) All alarms associated with a device in maintenance mode will be suppressed, except for life safety alarms which shall not be suppressed.
      3) Every device that is in maintenance mode shall issue Level 3 alarm daily, indicating the device is still in maintenance mode. The timing of this alarm shall be adjustable by operators; initially it shall occur at 9AM.
d. Entry Delays
   1) All alarms shall have an adjustable delay time such that the alarm is not triggered unless the alarm conditions are met continuously for the duration of the delay period.
   2) Default entry delays apply to all alarms unless otherwise indicated:
      a) Level 1 alarms: 1 second
      b) Level 2 alarms: 10 seconds
      c) Level 3 alarms: 1 minute
      d) Level 4 alarms: 5 minutes
      e) Level 5 alarms: 15 minutes

e. Exit Hysteresis
   1) Each alarm shall have an adjustable time-based hysteresis (default: 5 seconds) to exit the alarm. Once set, the alarm does not return to normal until the alarm conditions have ceased for the duration of the hysteresis.
   2) Each alarm shall have an adjustable time-based hysteresis to exit the alarm. Once set, the alarm does not restore to normal until the alarm conditions have ceased for the specified duration.
      a) The time-to-exit hysteresis for all alarms shall be 5 seconds unless otherwise indicated.
   3) Each analog alarm shall have an adjustable % of limit-based hysteresis (default: 0% of the alarm threshold, i.e. no hysteresis; alarm exits at the same value as the alarm threshold) the alarmed variable required to exit the alarm. Alarm conditions have ceased when the alarmed variable is below the triggering threshold by the amount of the hysteresis.
   4) Each analog alarm shall have a % of limit-based hysteresis for the value of the alarmed variable required to exit the alarm. Once set, the alarm does not restore to normal until the alarmed variable is below (or above, as appropriate to the alarm) the triggering threshold by the specified amount.
      a) The % of limit-based hysteresis for all (analog) alarms shall be 0% of the alarm threshold (i.e. no deadband; alarm exits at the same value that triggers alarm) unless otherwise indicated.

5) Exit hysteresis is independent of latching periods (below).

f. Latching
   1) Any alarm can be configured as latching or non-latching.
      a) A latching alarm requires acknowledgement from the operators before it can return to normal even if the exit deadband has been met.
      b) A non-latching alarm does not require acknowledgement
   2) Default latching status shall apply to all alarms unless otherwise indicated:
      a) Level 1 alarms: Latching
      b) Level 2 alarms: Latching
      c) Level 3 alarms: Non-latching
      d) Level 4 alarms: Non-latching
      e) Level 5 alarms: Non-latching

g. Post-Exit Suppression Period
   1) To minimize nuisance alarms, each alarm shall have an adjustable suppression period.
2) Any given alarm may not re-occur until the alarm has been cleared for the suppression period. (Suppression periods apply separately to each alarm for each piece of equipment. Other alarms from the same equipment, or the same alarm from other equipment, is not affected by the suppression period.)

3) Default suppression periods shall apply to all alarms unless otherwise indicated:
   a) Level 1 alarms: 0 minutes
   b) Level 2 alarms: 5 minutes
   c) Level 3 alarms: 24 hours
   d) Level 4 alarms: 7 days
   e) Level 5 alarms: 7 days

h. Time-Based Suppression (for zones)
   1) After a change in setpoint, zone reset requests (see Paragraph 3.3A.14.c) and zone temperature alarms are suppressed for a period of time, as given below.
      a) This includes automatic changes in setpoint (e.g. due to occupancy sensor, or change in zone Mode) as well as changes made by the occupants.
   2) After any change in setpoint, calculate a time delay period based on the difference between the controlled variable (e.g. zone temperature) at the time of the change and the new setpoint. The default time delay period shall be:
      a) For thermal zone temperature alarms: 10 minutes per °F of difference up to a maximum of 120 minutes.
      b) For thermal zone temperature cooling requests: 5 minutes per °F of difference up to a maximum of 30 minutes.
      c) For thermal zone temperature heating requests: 5 minutes per °F of difference up to a maximum of 30 minutes.
   3) Time-based suppression periods are independent of post-exit suppression periods. They are not cumulative.

i. Operator Acknowledgement of Alarms
   1) For both latching and non-latching alarms, the operators may acknowledge the alarm.
   2) Acknowledging an alarm clears the alarm, the exit deadband, and the suppression period. An acknowledged alarm can re-occur as soon as the entry delay elapses.

12. Hierarchical Alarm Suppression
   a. For each piece of equipment or space controlled by the BAS, define within BAS programming the device’s relationship (if any) to other equipment in terms of “source”, “load”, or “system”.
      1) A component is a “source” if it provides resources to a downstream component, such as a chiller providing chilled water to an AHU.
      2) A component is a “load” if it receives resources from an upstream component, such as an AHU that receives chilled water from a chiller.
      3) The same component may be both a load (receiving resources from an upstream source) and a source (providing resources to a downstream load).
      4) A set of components is a “system” if they share a load in common (i.e. collectively act as a source to downstream equipment, such as a set of chillers in a lead/lag relationship serving air handlers).
a) If a single component acts as a source for downstream loads (e.g. an AHU as a source for its VAV boxes), then that single source component shall be defined as a "system" of one element.

b) For equipment with associated pumps (chillers, boilers, cooling towers):

   (1) If the pumps are in a one-to-one relationship with equipment they serve, the pumps shall be treated as part of the system to which they are associated (i.e. they are not considered loads) since a pump failure will necessarily disable its associated equipment.

   (2) If the pumps are headered to the equipment they serve, then the pumps may be treated as a system, which is a load relative to the upstream equipment (e.g. chillers) and a source relative to downstream equipment (e.g. air handlers).

c. SystemOK shall be true when all of the following are true:

1) The system is proven on.
2) The system is achieving its temperature and/or pressure setpoint(s) for at least 5 minutes
3) The system is ready and able to serve its load

d. SystemOK shall be false while the system is starting up (i.e. before reaching setpoint) or when enough of the system’s components are unavailable (in alarm, disabled, or turned off) to disrupt the ability of the system to serve its load. This threshold shall be defined by the design engineer for each system.

   1) By default, Level 1 through Level 3 component alarms (indicating equipment failure) shall inhibit SystemOK. Level 4 and Level 5 component alarms (maintenance and energy efficiency alarms) shall not affect SystemOK.

   2) The operator shall have the ability to individually determine which component alarms may or may not inhibit SystemOK.

e. The BAS shall selectively suppress (i.e. fail to announce; alarms may still be logged to a database) alarms for load components if SystemOK is false for the source system which serves that load.

   1) If SystemOK is false for a cooling water system (i.e. chiller, cooling tower, or associated pump) then only high temperature alarms from the loads shall be suppressed.

   2) If SystemOK is false for a heating water system (i.e. boiler or associated pump) then only low temperature alarms from the loads shall be suppressed.

   3) If SystemOK is false for an airside system (air handler, fan coil, VAV box, etc.) then all alarms from the loads shall be suppressed.

f. This hierarchical suppression shall cascade through multiple levels of load-source relationship, such that alarms at downstream loads shall also be suppressed.

g. The following types of alarms will never be suppressed by this logic:

   1) Life/safety and Level 1 alarms

   2) Failure-to-start alarms (i.e. equipment is commanded on, but status point shows equipment to be off)

   3) Failure-to-stop/hand alarms (i.e. equipment is commanded off, but status point shows equipment to be on)
13. VFD Speed Points
   a. The speed analog output sent to VFDs shall be configured such that 0% speed corresponds to 0 Hz and 100% speed corresponds to maximum speed configured in the VFD.
   b. Speed signal shall scale linearly from 0% to 100%. For example, if the maximum speed is 80Hz (as is the case with some fan arrays), then a 50% speed command signal would correspond to device speed of 40Hz.
   c. For each VFD, the minimum speed shall be stored in a single BAS software point.
      1) This value shall be written to the VFD’s minimum speed setpoint via the drive’s network interface every 15 minutes.
      2) If the VFD speed command is hardwired, software shall ensure that the minimum speed is the lowest speed command ever sent to the drive by the BAS.
   d. Determine minimum speed as described under “Testing and Commissioning” in Part 3 of Section 25 50 00.

14. Request-Based Trim & Respond (T&R) Setpoint Reset Logic
   a. Trim & Respond logic is a type of demand-based setpoint reset for air handlers and plants. It periodically resets the setpoint at an “upstream” system (e.g. air handler) based on Requests from “downstream” devices (e.g. terminal units), adjusting the setpoint at define time-step frequency.
   b. Trim & Respond setpoint reset logic and zone/system reset Requests where referenced in sequences shall be implemented as described below.
   c. A “Request” is a call to reset a static pressure, or temperature setpoint, generated by downstream zones or air handling systems. These Requests are sent upstream to the plant or system that serves the zone or air handler that generated the Request.
      1) For each downstream zone or system, and for each type of setpoint reset Request listed for the zone/system, provide the following software points:
         a) Importance Multiplier (default = 1)
         b) Request-Hours Accumulator: Only when System OK (see Paragraph 3.3A.12) is true for the zone/system. Every X minutes (default 5 minutes), add X divided by 60 times the current number of Requests to the request-hours accumulator point.
         c) Run-Hours Total: For each zone or system, count the number of hours operating in any Mode other than Unoccupied Mode.
            (1) The BACnet Runtime Log object shall not be used for this purpose, as this variable must be reset periodically whereas the Runtime Log must show an accurate figure for total equipment operating hours.
            d) Cumulative%Request-Hours: This is the zone/system Request-Hours divided by the zone/system Run-Hours since the last reset, expressed as a percentage.
            e) The Request-Hours Accumulator and the Run-Hours Total are reset to zero periodically as noted here.
               (1) Reset automatically for an individual zone/system whenever the Run-Hours Total for that zone/system exceed 400 hours.
               (2) Reset manually by an operator command. This command will simultaneously reset the request-hours point for all zones served by the system, or for all systems served by the plant.
f) For each system/plant receiving requests from downstream zones/systems, provide an operator's interface screen that will display for each zone/system the quantity of Requests that are currently active and the current Cumulative Request-Hours. Provide this information for each type of Request separately.

g) A Level 4 alarm shall be generated if any of the following is true; the zone Importance Multiplier is greater than zero, the zone/system Cumulative Request-Hours exceeds 70%, or the total number of zone/system run hours exceeds 40.

2) See zone and air handling system control sequences for the logic to generate Requests.

3) Multiply the number of Requests determined from zone/system logic times the Importance Multiplier and send this result to the system/plant that serves that zone/system. See the system/plant logic to see how Requests are used in the Trim & Respond logic.

d) For each upstream system or plant setpoint being controlled by a T&R loop, define the following variables. Initial values are defined in system/plant sequences below. Values for trim, respond, time step, etc. shall be tuned to provide stable control of the applicable system/plant.

<table>

</tr>
</tbody>
</table>

e) Trim & Respond logic shall reset setpoint within the range SPₘᵋᵣᵣ to SPₘₐₓ. When the associated device (e.g. fan, pump) is off, the setpoint shall be SP₀. The reset logic shall be active while the associated device is proven on, starting Tₜ after initial device start command. When active, every time step T, trim the setpoint by SPₜᵦᵣᵣ. If there are more than I Requests, respond by changing the setpoint by SPₐₑᵢₛ* (R-I), (i.e. the number of Requests minus the number of Ignored Requests), but no more than SPₐₑᵢₛ-ₘₐₓ. In other words, every time step T:

Change setpoint by SPₜᵦᵣᵣ
If R>I, also change setpoint by (R-I)*SPₐₑᵢₛ but no larger than SPₐₑᵢₛ-ₘₐₓ

### Equipment Rotation and Staging Order

15. For each set of parallel devices, the BAS shall maintain a device order queue from first to last.

a. Upon a call to stage up, the BAS shall start the highest-ordered non-operating device in the queue. Upon a call to stage down, the BAS shall stop the lowest-ordered operating device in the queue. See device-specific sequences, below, for control logic that generates staging calls.

b. When a rotation event is triggered by logic, or an operating device goes into Alarm or into Hand (see Paragraph 3.3A.15.e), the BAS shall update the device order queue and start or stop equipment as required so that the highest-ordered equipment is operating to meet the load.

1) Unless otherwise indicated, the off device shall first be started and proven on before the device that it is replacing is shut off.

2) If rotation requires more than a single pair of devices to be stopped and started, the first pair of device start/stops shall be complete before the next pair begins.

d. Device Ordering and Rotation Events: The BAS shall be programmed to support all of the following ordering and rotation strategies. The operator shall select which strategy is in effect.

1) Automatic Even Wear Rotation

a) Upon a rotation event, the device queue is ordered from least run hours to most run hours, such that the device with the least run hours is the first device and the device with the most run hours is the last device.

b) A rotation event is triggered by any of the following:

   1. Automatically when the device with the most run hours has 30% more run hours than the device with the fewest run hours. The operator may define hours during which rotation events are not allowed to occur. If a rotation event is triggered during this lockout period, its execution will be delayed until the end of the lockout period.

   2. Automatically upon a call to stage up or down.

   3. Devices that are In Alarm or In Hand (see below) shall not subject to Even Wear Rotation.

   4. Manually triggered by the operator.
2) Periodic Rotation
   a) The order of devices changes at each rotation event so that the first device becomes the last device and each lower-order device advances by one position in the queue. Initial order shall be the order of device tags (e.g. three pumps would be ordered P-1, P-2, P-3 first to last).
   b) Devices that are in Alarm or in Hand (see below) shall not subject to Periodic Rotation.
   c) Rotation events occur on a user-defined schedule. Initial schedule shall be for rotation to occur weekly, at noon on Sunday.

3) Manual Ordering and Rotation
   a) The order of devices is set directly by the operator.
   b) The operator shall not be able to change the order of devices in Alarm or in Hand (see below).
   c) Rotation events occur when manually triggered by the operator.

4) It shall be possible to effectively mix these strategies. For example, the operator may set the device order manually, and then switch to Periodic Rotation which will subsequently rotate devices in the order established manually by the operator.

e. Alarm & Hand Operation

1) In Alarm: If the lead device has an alarm condition or has been manually switched off, a Level 2 alarm shall be generated and the device shall be set to the last position in the device order until alarm clears (if non-latching) or is acknowledged by operator (if latching). Staging of remaining devices shall follow the prevailing device ordering logic. A device in alarm can only move up in the staging order if another device goes into alarm. Alarm conditions include the following:
   a) Variable Speed Fans and Pumps
      (1) VFD critical fault is ON, or
      (2) Status point not matching its on/off command for 3 seconds after the device has been commanded on for 15 seconds, or
      (3) Supervised HOA at control panel in OFF position, or
      (4) Loss of power (e.g. VFD DC Bus voltage = zero)
   b) Constant Speed Fans and Pumps
      (1) Status point not matching its on/off command for 3 seconds after the device has been commanded on for 15 seconds, or
      (2) Supervised HOA at control panel in OFF position
   c) Chillers
      (1) Chiller alarm contact, or
      (2) Chiller is manually shut off as indicated by the status of the Local/Auto switch from chiller gateway, or
      (3) Chiller status remains off 5 minutes after command to start
   d) Boilers
      (1) Boiler alarm point is ON, or
      (2) If its leaving water temperature remains 15°F below setpoint for 30 minutes.
2) Hand Operation: If a device is on in Hand (e.g. via an HOA switch or local control of VFD), the device shall be set to the lead device and a Level 4 alarm shall be generated. The device will remain as lead until the alarm is reset by the operator. Hand operation is determined by

a) Variable Speed Fans and Pumps
   (1) Status point not matching its on/off point for 15 seconds while the device is commanded off, or
   (2) VFD in local “hand” mode, or
   (3) Supervised HOA at control panel in ON position

b) Constant Speed Fans and Pumps
   (1) Status point not matching its on/off point for 15 seconds while the device is commanded off, or
   (2) Supervised HOA at control panel in ON position

c) Chillers: Chiller is manually turned on as indicated by the status of the local/auto switch from chiller gateway.

16. Damper/Valve Position
   a. Knowledge of damper and valve position are required for proper generation of Trim & Respond reset requests.
   b. The following are acceptable methods for determining position:
      1) Analog actuator. Position may be assumed to be equal to position command signal sent to actuator.
      2) Floating actuator. Provide position feedback via analog input from actuator.

B. Generic Thermal Control Zones

1. Except as noted, this section applies to all single zone systems and sub-zones of air handling systems, such as VAV boxes, fan-powered boxes, and other terminal units.
   a. This includes low-mass radiant devices such as metal ceiling panels.
   b. This does not include high-mass radiant slab systems.

2. CO₂ Control Loop: For any zone with a CO₂ sensor
   a. See Paragraph 3.1B.2 for CO₂ setpoints.
      1) Setpoints assume an ambient concentration of 400 ppm; if the system includes an ambient CO₂ sensor, subtract 400 from these setpoints and add the ambient CO₂ sensor reading.
   b. During Occupied Mode, a P-only loop shall maintain CO₂ concentration at setpoint; reset from 0% at 200 PPM below setpoint, to 100% at setpoint.
   c. Zone CO₂ control loop signal is used to reset zone outdoor air requirements and ventilation setpoints. See Paragraphs 3.3B.3 and 3.3B.4.
   d. Loop is disabled and output set to zero when the zone is not in Occupied Mode.

3. Zone Minimum Outdoor Air Requirements
   a. For every zone that requires mechanical ventilation, the zone minimum outdoor airflow and setpoints shall be calculated depending on the governing standard or code for outdoor air requirements. Zones that do not require mechanical ventilation may disregard this section.
   b. In accordance with California Title 24, BAS shall calculate zone outdoor air setpoints as follows:
1) See Paragraph 3.1B.1 for zone outdoor air requirements Voc-min and Varea-min.

2) For each zone in Occupied Mode, calculate the zone minimum outdoor air setpoints:
   a) Zone-Abs-OA-min is equal to
      (1) 25% of Varea-min if the zone has an occupancy sensor and is unpopulated (i.e. scheduled Occupied but with no occupants currently present in the zone), else
      (2) Varea-min if the zone has a CO₂ sensor, else
      (3) Zone-Des-OA-min
   b) Zone-Des-OA-min is equal to
      (1) 25% of Varea-min if the zone has an occupancy sensor and is unpopulated (i.e. scheduled Occupied but with no occupants currently present in the zone), else
      (2) The larger of Varea-min and Voc-min otherwise.

3) For any zone in any Mode other than Occupied Mode, Zone-Abs-OA-min and Zone-Des-OA-min shall equal zero.

4) Each zone in Occupied Mode shall send the current values of Zone-Abs-OA-min and Zone-Des-OA-min to its associated air handler.

4. Zone Minimum Airflow Setpoint
   a. Zone minimum airflow setpoint logic applies only to terminal units with modulating VAV dampers served by recirculating air handlers.
      1) Vmin is the scheduled minimum for zone primary airflow. Vmin* is the active (i.e. currently-applicable) primary airflow minimum, which is reset as described below. See terminal unit sequences for application of Vmin and Vmin*.
         a) Note that Vmin* is the current minimum airflow. It is not the current airflow setpoint (called Vspt in terminal unit sequences) which may be higher.
      2) Other airflow parameters (Vcool-max, Varea-min) used below are scheduled values. See terminal unit sequences.
   b. For ventilation in accordance with California Title 24, the zone minimum airflow Vmin* shall be equal to Vmin except as follows:
      1) If the zone is in any mode other than Occupied Mode: Vmin* = 0.
      2) If the zone has an occupancy sensor and is unpopulated (i.e. scheduled Occupied but with no occupants currently present in the zone): Vmin* = 25% of Varea-min.
      3) If the zone has a CO₂ sensor, the CO₂ control loop (see Paragraph 3.3B.2) shall be used to reset Vmin*, from the zone minimum airflow setpoint Vmin at 0% loop signal to the maximum cooling airflow setpoint Vcool-max at 50% loop signal, as shown below.
4) For each zone, the CO₂ control loop signal is also sent to the air handler that serves the zone, where it is used to reset the outdoor airflow setpoint. See Paragraph 3.3K.3.a.

5. Time-Averaged Ventilation (TAV)
   a. This logic applies only to terminal units with modulating VAV dampers. It does not apply to and is not used with single-zone air handling units.
   b. For each terminal unit, determine the lowest controllable minimum airflow V_m. This value shall be stored as a software point at each terminal unit.
      1) Determine the velocity pressure sensor reading VP_m in inches H₂O that will give a reliable flow indication. If this information is not provided by the sensor manufacturer, determine the velocity pressure that will result in a digital reading from the transducer and A/D converter of 12 bits or counts (assuming a 10 bit A/D converter). This is considered sufficient resolution for stable control.
      2) Determine the minimum velocity v_m for each VAV box size and model. If the VAV box manufacturer provides an amplification factor F for the flow pickup, calculate the minimum velocity v_m as

\[
v_m = 4005 \sqrt{\frac{VP_m}{F}}
\]

Where F is not known it can be calculated from the measured CFM at 1 inch signal from the VP sensor

\[
F = \left( \frac{4005A}{CFM@1"} \right)^2
\]

where A is the nominal duct area (ft²), equal to
3) Calculate the minimum airflow setpoint allowed by the controls (Vm) for each VAV box size as

\[ Vm = \frac{\pi D^2}{24 A} \]

where \( D \) is the nominal duct diameter (inches).

c. When the active airflow setpoint (Vspt) is non-zero and is less than the lowest airflow to which the terminal unit can reliably control (Vm), the airflow setpoint shall be pulse width modulated as follows:

1) The TAV ratio shall be determined as: \( TAV_{ratio} = \frac{Vspt}{Vm} \)
2) The initial default value of the total cycle time (TCT) shall be 15 minutes
3) Open period: The VAV damper is modulated by a control loop to maintain measured airflow at \( Vm \). The duration of the open period, OP, is the larger of:
   a) 1.5 minutes or
   b) TCT multiplied by TAV_{ratio}
4) Closed period:
   a) During the closed period, the VAV damper shall be fully shut and the damper control loop shall be disabled with output set to 0. The duration of the closed period is \( CP \), where \( CP = TCT - OP \).
   b) At the end of each closed period, the VAV damper shall be commanded to the last position from the previous open period prior to re-enabling the airflow control loop.
5) During TAV mode, each cycle shall consist of an open period and a closed period which alternate until Vspt is greater than Vm.
6) When entering TAV mode, start with an initial open period of duration \( RNDM \times OP \), where RNDM is a random number between 0.0 and 1.0.

6. Zone Temperature Setpoints

a. Each zone shall have separate occupied and unoccupied heating and cooling setpoints.
b. The active setpoints shall be determined by the Operating Mode of the Zone Group (see Paragraph 3.3C.6).
   1) The setpoints shall be the occupied setpoints during Occupied Mode, Warm-up Mode, and Cool-down Mode.
   2) The setpoints shall be the unoccupied setpoints during Unoccupied Mode, Setback Mode, and Setup Mode.
c. See Paragraph 3.1B.3 for zone temperature setpoints.
d. The software shall prevent
   1) The heating setpoint from exceeding the cooling setpoint minus 2°F (i.e. the minimum difference between heating and cooling setpoints shall be 2°F)
   2) The unoccupied heating setpoint from exceeding the occupied heating setpoint; and
   3) The unoccupied cooling setpoint from being less than the occupied cooling setpoint.
e. Where the zone has a local setpoint adjustment knob/button

1) The setpoint adjustment offsets established by the occupant shall be software points that are persistent (e.g. not reset daily), but the actual offset used in control logic shall be adjusted based on limits and modes as described below.

2) The adjustment shall be capable of being limited in software.
   a) As a default, the active occupied cooling setpoint shall be limited between 72°F and 80°F.
   b) As a default, the active occupied heating setpoint shall be limited between 65°F and 72°F.

3) The active heating and cooling setpoints shall be independently adjustable, respecting the limits and anti-overlap logic described above. If zone thermostat provides only a single setpoint adjustment, then the adjustment shall move both the active heating and cooling setpoints upwards or downwards by the same amount, within the limits described above.

4) The adjustment shall only affect occupied setpoints in Occupied Mode, Warm-Up Mode, and Cool-Down Mode and shall have no impact on setpoints in all other modes.

5) Upon receiving a demand response signal, the local setpoint adjustment value shall be frozen. Further adjustment of the setpoint by local controls shall be suspended for the duration of the demand response event.

f. Demand Response Cooling Setpoint Adjustment: The active cooling setpoints for all zones shall be increased when demand response is imposed on the associated Zone Group. The operator shall have the ability to exempt individual zones from this adjustment through the normal BAS user interface. Changes due to demand response are not cumulative.

1) At Demand Response Level 1, increase setpoint by 1°F.
2) At Demand Response Level 2, increase setpoint by 2°F.
3) At Demand Response Level 3, increase setpoint by 4°F.

g. Demand Response Heating Setpoint Adjustment: The active heating setpoints for all zones shall be decreased when demand response is imposed on the associated Zone Group. The operator shall have the ability to exempt individual zones from this adjustment through the normal BAS user interface. Changes due to demand response are not cumulative.

1) At Demand Response Level 1, decrease setpoint by 1°F.
2) At Demand Response Level 2, decrease setpoint by 2°F.
3) At Demand Response Level 3, decrease setpoint by 4°F.

h. Occupancy sensors. For zones that have an occupancy sensor

1) When the sensor indicates the space has been unpopulated for 5 minutes continuously during the Occupied Mode, the active heating setpoint shall be decreased by 2°F and the cooling setpoint shall be increased by 2°F.

2) When the sensor indicates that the space has been populated for 1 minute continuously, the active heating and cooling setpoints shall be restored to their previous values.

i. Hierarchy of Setpoint Adjustments: The following adjustment restrictions shall prevail in order from highest to lowest priority:

1) Setpoint overlap restriction, see Paragraph 3.3B.6.d.1)
2) Absolute limits on local setpoint adjustment, see Paragraph 3.3B.6.e.1)
3) Demand limit
a) Occupancy sensors: Change of setpoint by occupancy sensor is added to change of setpoint by any demand limits in effect.

b) Local setpoint adjustment: Any changes to setpoint by local adjustment are frozen at the onset of the demand limiting event and remain fixed for the duration of the event. Additional local adjustments are ignored for the duration of the demand limiting event.

4) Scheduled setpoints based on Zone Group mode

7. Occupancy Override: When any occupancy override button (typically associated with a thermostat) is pressed, the call for Occupied Mode operation shall be sent up to the Zone Group control for 60 minutes.

8. Zone Temperature Control Loops

a. For each zone, two separate control loops shall operate to maintain space temperature at setpoint, the Cooling Loop and the Heating Loop.

1) The Heating Loop shall be enabled whenever the space temperature is below the current zone heating setpoint temperature, and disabled when space temperature is above the current zone heating setpoint temperature and the Loop output is zero for 30 seconds.

2) The Cooling Loop shall be enabled whenever the space temperature is above the current zone cooling setpoint temperature, and disabled when space temperature is below the current zone cooling setpoint temperature and the Loop output is zero for 30 seconds.

b. The Cooling Loop shall maintain the space temperature at the active cooling setpoint. The output of the loop shall be a virtual point ranging from 0% (no cooling) to 100% (full cooling).

c. The Heating Loop shall maintain the space temperature at the active heating setpoint. The output of the loop shall be a virtual point ranging from 0% (no heating) to 100% (full heating).

d. Loops shall use proportional + integral logic or other technology with similar performance. Proportional-only control is not acceptable, although the integral gain shall be small relative to the proportional gain. P and I gains shall be adjustable by the operator.

e. See other sections for how the outputs from these loops are used.

9. Zone State

a. Heating: when the output of the space heating control loop is nonzero and the output of the cooling loop is equal to zero.

b. Cooling: when the output of the space cooling control loop is nonzero and the output of the heating loop is equal to zero.

c. Deadband: when not in either Heating or Cooling.

10. Zone Alarms

a. Zone temperature alarms

1) High temperature alarm

a) If the zone is 3°F above cooling setpoint for 10 minutes, generate Level 3 alarm.

b) If the zone is 5°F above cooling setpoint for 10 minutes, generate Level 2 alarm.

2) Low temperature alarm

a) If the zone is 3°F below heating setpoint for 10 minutes, generate Level 3 alarm.
b) If the zone is 5°F below heating setpoint for 10 minutes, generate Level 2 alarm.

3) Suppress zone temperature alarms as follows:
   a) After zone setpoint is changed per Paragraph 3.3A.11.h.
   b) While Zone Group is in Warm-up or Cool-down Modes.
   c) For zones with an Importance Multiplier (see Paragraph 3.3A.14.c.1) of zero for its static pressure reset, SAT reset, or Hot Water reset Trim & Respond loops.

b. For zones with CO₂ sensors:
   1) CO₂ sensors: If the CO₂ concentration is less than 300 ppm, or the zone is in Unoccupied Mode for more than 2 hours and zone CO₂ concentration exceeds 600 ppm, generate a Level 3 alarm. The alarm text shall identify the sensor and indicate that it may be out of calibration.
   2) If the CO₂ concentration exceeds setpoint plus 10% for more than 10 minutes generate a Level 3 alarm.

C. Thermal Control Zone Groups

1. Each system shall be broken into separate Zone Groups composed of a collection of one or more Thermal Control Zone(s) served by a single air handler or other system. See Paragraph 3.1C for Zone Group assignments.

2. Each Zone Group shall be capable of having separate occupancy schedules and Operating Modes from other Zone Groups.

3. All zones in each Zone Group shall be in the same Zone Group Operating Mode at all times. If one zone in a Zone Group is placed in any mode other than Unoccupied Mode (due to override, sequence logic, or scheduled occupancy) all zones in that Zone Group shall enter that mode.

   a. Note that Occupied-Standby Mode (a condition that allows some zones to reduce ventilation when unpopulated during scheduled occupancy) is a subset of Occupied Mode and applies to zones individually rather than at the Zone Group level.

4. A Zone Group may be in only one mode at any given time.

5. For each Zone Group, provide a set of testing/commissioning software switches that override all zones served by the Zone Group. Provide a separate software switch for each of the zone-level override switches listed under “Testing and Commissioning Overrides” in terminal unit sequences. When the value of a Zone Group’s override switch is changed, the corresponding override switch for every zone in the Zone Group shall change to the same value. Subsequently, the zone-level override switch at may be changed to a different value. The value of the zone-level switch has no effect on the value of the Zone Group switch, and the value of the Zone Group switch only affects the zone-level switches when the Zone Group switch is changed.

6. Zone Group Operating Modes: Each Zone Group shall have the following modes:
   a. Occupied Mode: A Zone Group is in the Occupied Mode when any of the following is true:
      1) The time of day is between the Zone Group’s scheduled occupied start and stop times.
      2) Any zone occupancy override timer (initiated by local occupancy override button) is nonzero.
b. Warm-Up Mode: For each zone, the BAS shall calculate the required warm-up time based on the zone’s occupied heating setpoint, the current zone temperature, the outdoor air temperature, and a mass/capacity factor for each zone. The mass factor shall be manually adjusted or self-tuned by the BAS. If automatic, the tuning process shall be turned on or off by a software switch, to allow tuning to be stopped after the system has been trained. Warm-up Mode shall start based on the zone with the longest calculated warm-up time requirement, but no earlier than 3 hours before the start of the scheduled occupied period, and shall end at the scheduled Occupied start hour.

c. Cool-Down Mode: For each zone, the BAS shall calculate the required cool down time based on the zone’s occupied cooling setpoint, the current zone temperature, the outdoor air temperature, and a mass/capacity factor for each zone. The mass factor shall be manually adjusted or self-tuned by the BAS. If automatic, the tuning process shall be turned on or off by a software switch, to allow tuning to be stopped after the system has been trained. Cool-down Mode shall start based on the zone with the longest calculated cool-down time requirement, but no earlier than 3 hours before the start of the scheduled occupied period, and shall end at the scheduled Occupied start hour.

d. Setback Mode: During Unoccupied Mode, if any 5 zones (or all zones, if fewer than 5) or the average of all zones in the Zone Group fall below their unoccupied heating setpoints, the Zone Group shall enter Setback Mode until all spaces in the Zone Group are 2°F above their unoccupied setpoints.

e. Freeze Protection Setback Mode: During Unoccupied Mode, if any single zone falls below 40°F, the Zone Group shall enter Setback Mode until all zones are above 45°F, and a Level 3 alarm shall be set.

f. Setup Mode: During Unoccupied Mode, if any 5 zones (or all zones, if fewer than 5) or the average of all zones in the Zone Group rise above their unoccupied cooling setpoints, the Zone Group shall enter Setup Mode until all spaces in the Zone Group are 2°F below their unoccupied setpoints.

g. Unoccupied Mode: When the Zone Group is not in any other mode.

D. CH/HHW Plant (Air Source Heat Pump: ASHP-1,2,3 & Pumps)

1. After unit is installed and started up in standby mode, it is recommended to call manufacturer for assistance in setting up BMS / BACnet control.

2. The plant is designed to produce either heating hot water, chilled water, or both simultaneously.
   a. ASHP-1 is a 4-pipe heat pump that can produce both heating, cooling or both simultaneously. ASHP-1 is sized to handle the peak simultaneous load of the building.
   b. ASHP-2,3 are 2-pipe units that shall supplement the main heat pump with either heating or cooling depending on the building load.

3. Plant Enable/Disable
   a. The heat pump plant shall be enabled to run any time any zone is in Occupied Mode.
   b. The heat pumps produce hot and/or chilled water as commanded by the BMS. However, the compressors, fans and pumps shall run subject to internal controls only (no direct BMS control), in response to demand for chilled and/or hot water.
   c. When the heat pump is enabled but is not responding to a BMS request for chilled and/or hot water, it shall remain available in a minimum power standby condition.

4. Chilled Water Production
   a. ASHP-1
1) The BMS shall command heat pump ASHP-1 to produce chilled water when the secondary CHW supply temperature exceeds the CHWST setpoint + 5°F
2) When commanded to provide chilled water, ASHP-1 shall run pumps, fans, and compressors as required to provide chilled water to the primary CHW loop at the CHWST setpoint.
3) Simultaneous Heating and Cooling
   a) If any temperature sensor in the hot water buffer tank is below the HWST setpoint - 2°F, the heat pump ASHP-1 shall also produce hot water simultaneously.
   b) Simultaneous hot water production shall stop when chilled water production stops, or when the primary hot water return temperature (as measured by the heat pump internal sensor and reported by the heat pump internal controls) equals the HWST setpoint + 0°F, whichever happens first.

   (1) If chilled water production stops but there is a call to produce hot water (see logic below), the heat pump shall transition seamlessly to hot water production.

b. Staging on Additional 2-pipe Heat Pumps (ASHP-2,3)
   1) If the actual load of the heat pump indicates that all compressors of ASHP-1 are running, an additional heat pump (ASHP-2,3) shall be staged on. The BMS shall open the CHW isolation valves associated with that unit and then command it to run in cooling.
   2) The last heat pump (ASHP-2,3) shall be similarly staged on.
   3) The 2-pipe heat pumps shall be subject to equal wear rotation.

   c. Staging off Heat Pumps
      1) If the CHWST setpoint is met, and the actual load indicates that no compressors are running in one of the 2-pipe heat pumps (ASHP-2,3) for 5 minutes, that heat pump shall be staged off and its isolation valves closed.
      2) The other 2-pipe heat pump (ASHP-2,3) shall be similarly staged off.
      3) The BMS shall command ASHP-1 to stop producing chilled water when primary chilled water return (as measured by the heat pump internal sensor and reported by the heat pump internal controls) temperature equals the CHWST setpoint + 0°F

5. Heating Hot Water Production
   a. ASHP-1
      1) The BMS shall command heat pump ASHP-1 to produce heating hot water when the secondary HHW supply temperature exceeds the HHWST setpoint - 8°F
      2) When commanded to provide chilled water, ASHP-1 shall run pumps, fans, and compressors as required to provide heating hot water to the primary HHW loop at the HHWST setpoint.
      3) Simultaneous Heating and Cooling
         a) If any temperature sensor in the chilled water buffer tank is above the CHWST setpoint + 2°F, the heat pump ASHP-1 shall also produce chilled water simultaneously.
         b) Simultaneous chilled water production shall stop when hot water production stops, or when the primary chilled water return temperature (as measured by the heat pump internal sensor and reported by the heat pump internal controls) equals the CHWST setpoint + 0°F, whichever happens first.
(1) If hot water production stops but there is a call to produce chilled water (see logic below), the heat pump shall transition seamlessly to chilled water production.

b. Staging on Additional 2-pipe Heat Pumps (ASHP-2,3)
   1) If the actual load of the heat pump indicates that all compressors of ASHP-1 are running, an additional heat pump (ASHP-2,3) shall be staged on. The BMS shall open the HHW isolation valves associated with that unit and then command it to run in heating.
   2) The last heat pump (ASHP-2,3) shall be similarly staged on.
   3) The 2-pipe heat pumps shall be subject to equal wear rotation.

c. Staging off Heat Pumps
   1) If the HHWST setpoint is met, and the actual load indicates that no compressors are running in one of the 2-pipe heat pumps (ASHP-2,3) for 5 minutes, that heat pump shall be staged off and its isolation valves closed.
   2) The other 2-pipe heat pump (ASHP-2,3) shall be similarly staged off.
   3) The BMS shall command ASHP-1 to stop producing heating hot water when primary hot water return (as measured by the heat pump internal sensor and reported by the heat pump internal controls) temperature equals the HHWST setpoint + 0°F

6. Primary Pumps Control
   a. By internal unit controls, as required.

7. Condenser Fans Control
   a. By internal unit controls, as required.

8. Secondary Hydronic Pumps (CHWP-1,2, HHWP-1,2)
   a. Pumps are sized for 50% of design and shall be controlled on a lead/lag basis with lead pump determined by equal wear rotation logic.
      1) Stage up when lead pump is above 80% speed for 5 minutes.
      2) Stage down when both pumps are at minimum speed for 5 minutes.
   b. Pumps shall be controlled to meet a fixed differential pressure setpoint as measured by dP sensor located near the end of the loop.
      1) There shall be different static pressure setpoints for hot water and chilled water pumps.
      2) Coordinate with balance contractor to determine setpoints.
   c. Pumps shall be enabled if any downstream valve is open more than 10% for 1 minute. Pumps shall be disabled when all downstream valves are less than 5% open for 1 minute.

9. Alarms
   a. Chilled Water Temperature Alarm
      1) If Primary CHW supply temperature is more than 8°F above or below CHWST setpoint for 15 minutes, Level 3 alarm
      2) If Secondary CHW supply temperature is more than 15°F above or below CHWST setpoint for 30 minutes, Level 3 alarm
   b. Hot Water Temperature Alarm:
      1) If Primary HW supply temperature is more than 8°F above or below HWST setpoint for 15 minutes, Level 3 alarm
2) If Secondary HW supply temperature is more than 15°F above or below HWST setpoint for 30 minutes, Level 3 alarm

c. Heat Pump Alarms: Upon activation of the general alarm point by the heat pump’s internal controller
   1) The BMS front end shall display “Heat Pump Equipment Alarm”. This shall be a Level 2 alarm. This shall be displayed on every graphical page associated with heat pump monitoring or control.
   2) BMS front end shall also display the specific type of alarm as transmitted over the network and any additional information about the fault which is provided over the network
   3) These alarms shall NOT be resettable from the BMS front end, per manufacturer recommendation. These alarms require review on-site at the unit’s control interface before being reset.

E. Lab Supply Air Valve, 4-pipe Heating & Cooling Switchover
   1. Lab air valves shall have their own control system and controllers, separate from BAS. Lab controls to communicate to BMS via BACNET.
   2. Lab supply air valves maintain pressurization in the lab via airflow offset control and are also used for maintain temperature control.
   3. Active maximum and minimum setpoints shall vary depending on the time of day and whether the Lab is Occupied or Unoccupied:

<table>
<thead>
<tr>
<th>Setpoint</th>
<th>Occupied</th>
<th>Unoccupied</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cooling maximum</td>
<td>Vcool-max</td>
<td>Vcool-max</td>
</tr>
<tr>
<td>Minimum</td>
<td>Vent-min (6 ACH)</td>
<td>Vent-min (4 ACH)</td>
</tr>
<tr>
<td>Heating maximum</td>
<td>Vheat-max</td>
<td>Vheat-max</td>
</tr>
</tbody>
</table>

a. Lab shall only be considered “Unoccupied” if it is both scheduled unoccupied and has an occupancy sensor that is reading unpopulated (i.e. no occupants currently present in the zone)

4. Temperature Control
   a. When the Zone State is Cooling, the Cooling Loop shall maintain space temperature at the heating setpoint as follows:
      1) From 0% - 25%, the Cooling Loop output shall reset the discharge temperature from the current AHU SAT setpoint to a minimum of Min DAT.
      2) From 26% - 100%, if the discharge air temperature is less than room temperature, the Cooling Loop output shall reset the active airflow setpoint from the minimum airflow setpoint to the maximum cooling airflow setpoint.
   b. When the Zone State is Deadband, the active airflow setpoint shall be the minimum airflow setpoint. All hydronic valves are closed unless the discharge air temperature is below the minimum setpoint (see Paragraph 3.3H.5.e.1)).
   c. When the Zone State is Heating, the Heating Loop shall maintain space temperature at the heating setpoint as follows:
      1) From 0% - 50%, the Heating Loop output shall reset the discharge temperature from the current AHU SAT setpoint to a maximum of MaxΔT above space temperature setpoint.
2) From 51% - 100%, if the discharge air temperature is greater than room temperature plus 5°F, the Heating Loop output shall reset the active airflow setpoint from the minimum airflow setpoint to the maximum heating airflow setpoint.

d. The cooling coil shall be modulated to maintain the discharge temperature at setpoint. In cooling, the switchover isolation valve shall also be open.

1) The heating isolation and control valves shall be closed when the cooling valves are open.
2) In Occupied Mode, the cooling coil shall be modulated to maintain a discharge air temperature no higher than 80°F.
3) When the airflow setpoint is pulse width modulated for TAV operation per Paragraph 3.3B.5, the heating coil shall be locked out and the SAT control loop shall be disabled during the Closed Periods.

e. The heating coil shall be modulated to maintain the discharge temperature at setpoint. In heating, the switchover isolation valve shall also be open. (Directly controlling heating off the zone temperature control loop is not acceptable.)

1) The cooling isolation and control valves shall be closed when the heating valves are open.
2) In Occupied Mode, the heating coil shall be modulated to maintain a discharge air temperature no lower than 50°F.
3) When the airflow setpoint is pulse width modulated for TAV operation per Paragraph 3.3B.5, the heating coil shall be locked out and the SAT control loop shall be disabled during the Closed Periods.

5. Airflow Control

a. The Lab Air Valve damper shall be modulated by a control loop to maintain the measured airflow at the active setpoint Vspt_labsupply.

6. Alarms

a. Low airflow

1) If the measured airflow is less than 70% of setpoint while setpoint is greater than zero for 5 minutes, generate a Level 3 alarm.
2) If the measured airflow is less than 50% of setpoint while setpoint is greater than zero for 5 minutes, generate a Level 2 alarm.
3) If a zone has an Importance Multiplier of 0 (see Paragraph 3.3A.14.c.1) for its static pressure reset Trim & Respond control loop, low airflow alarms shall be suppressed for that zone.

b. High discharge air temperature

1) If CHW plant is proven on and the discharge air temperature is 15°F more than setpoint for 10 minutes, generate a Level 3 alarm.
2) If CHW plant is proven on and the discharge air temperature is 30°F more than setpoint for 10 minutes, generate a Level 2 alarm.

b. Low discharge air temperature

1) If HHW plant is proven on and the discharge air temperature is 15°F less than setpoint for 10 minutes, generate a Level 3 alarm.
2) If HHW plant is proven on and the discharge air temperature is 30°F less than setpoint for 10 minutes, generate a Level 2 alarm.

d. Leaking damper: If the damper position is 0% and airflow sensor reading is above 10% of Vcool-max for 10 minutes while the fan serving the zone is proven on, generate a Level 4 alarm.
e. Leaking valve: If the valve position is 0% for 15 minutes and discharge air temperature is above AHU SAT by 5°F while the fan serving the zone is proven on, generate a Level 4 alarm.

7. Testing/Commissioning Overrides: Provide software points that interlock to a system level point to
   a. Force zone airflow setpoint Vspt to zero
   b. Force zone airflow setpoint Vspt to Vcool-max
   c. Force zone airflow setpoint Vspt to Vmin
   d. Force zone airflow setpoint Vspt to Vheat-max
   e. Force damper full closed/open
   f. Force heating to off/closed
   g. Reset request-hours accumulator point to zero (provide one point for each reset type listed below)

8. System Requests
   a. Cooling SAT Reset Requests
      1) If the zone temperature exceeds the zone’s cooling setpoint by 5°F for 2 minutes after the suppression period per Paragraph 3.3A.11.h, send 3 Requests,
      2) Else if the zone temperature exceeds the zone’s cooling setpoint by 3°F for 2 minutes after the suppression period per Paragraph 3.3A.11.h, send 2 Requests,
      3) Else if the Cooling Loop is greater than 95%, send 1 Request until the Cooling Loop is less than 85%,
      4) Else if the Cooling Loop is less than 95%, send 0 Requests
   b. Static Pressure Reset Requests
      1) If the measured airflow is less than 50% of setpoint while setpoint is greater than zero and the damper position is greater than 95% for 1 minute, send 3 Requests,
      2) Else if the measured airflow is less than 70% of setpoint while setpoint is greater than zero and the damper position is greater than 95% for 1 minute, send 2 Requests,
      3) Else if the damper position is greater than 95%, send 1 Request until the damper position is less than 85%,
      4) Else if the damper position is less than 95%, send 0 Requests
   c. Send Cooling Plant Requests as follows:
      1) If the CHW valve position is greater than 95%, send 1 Request until the CHW valve position is less than 10%
      2) Else if the CHW valve position is less than 95%, send 0 Requests.
   d. Send Heating Plant Requests as follows:
      1) If the HW valve position is greater than 95%, send 1 Request until the HW valve position is less than 10%
      2) Else if the HW valve position is less than 95%, send 0 Requests.

F. Lab Exhaust Air Valve, General
   1. Lab air valves shall have their own control system and controllers, separate from BAS. Lab controls to communicate to BMS via BACNET.
   2. Lab exhaust air valves maintain pressurization in the lab via airflow offset control as required for positive, negative, or neutral control relative to adjacent spaces or outside. This sequence applies to all laboratory exhaust air valves except those serving a fume hood.
3. Lab exhaust air valves maintain face velocity at all times regardless of zone occupancy status.

4. Zones without fume hoods: Active airflow setpoint at the lab air valve shall vary depending on the setpoint at the local supply air valve as follows:
   a. \( V_{\text{spt,labexhaust}} = V_{\text{spt,labsupply}} + \text{offset} \)

5. Zones with fume hoods: Active airflow setpoint at the lab air valve shall vary depending on the setpoint at the local supply air valve and the current airflow setpoint of the fume hoods as follows:
   a. \( V_{\text{spt,labexhaust}} = V_{\text{spt,labsupply}} - V_{\text{spt,labfumehood}} + \text{offset} \)

6. Airflow Control
   a. The Lab Air Valve damper shall be modulated by a control loop to maintain the measured airflow at the active setpoint \( V_{\text{spt,labexhaust}} \).

7. Alarms
   a. Low airflow
      1) If the measured airflow is less than 70% of setpoint while setpoint is greater than zero for 5 minutes, generate a Level 3 alarm.
      2) If the measured airflow is less than 50% of setpoint while setpoint is greater than zero for 5 minutes, generate a Level 2 alarm.

8. Testing/Commissioning Overrides: Provide software points that interlock to a system level point to
   a. Force zone airflow setpoint \( V_{\text{spt}} \) to zero
   b. Force zone airflow setpoint \( V_{\text{spt}} \) to \( V_{\text{min}} \)
   c. Force damper full closed/open

G. Lab Exhaust Air Valve, Fume Hood
   1. Lab air valves shall have their own control system and controllers, separate from BAS. Lab controls to communicate to BMS via BACNET.
   2. Lab exhaust air valves for fume hoods control airflow to maintain face velocity at the fume hood.
   3. Lab exhaust air valves maintain face velocity at all times regardless of zone occupancy status.
   4. Sash Position Sensor
      a. A sash position sensor mounted on the fume hood shall provide a signal that is linearly proportional to the actual sash position.

5. Face Velocity Control
   a. The fume hood controller shall continually determine the total fume hood open area by monitoring the fume hood sash position via the sash sensor as well as taking account of any fume hood fixed open areas and/or bypass openings.
   b. The fume hood controller shall calculate the required fume hood exhaust airflow necessary to maintain the average face velocity setpoint over the total open area.

6. Airflow Control
   a. The Fume Hood Air Valve damper shall be modulated by a control loop to maintain the measured airflow at the active setpoint \( V_{\text{spt,fumehood}} \).
b. Fume hood controller shall ensure that the required fume hood exhaust to maintain the average face velocity setpoint is always maintained independently of any variations in exhaust system static pressure or any laboratory room conditions such as the ventilation airflow or room static pressure that could otherwise affect the fume hood exhaust airflow.

7. Operator Display Panel
   a. The fume hood controller shall also interface to an operator display panel (ODP) at the designated measurement location on the front of the fume hood.
   b. The ODP shall provide a continuous digital display of the average fume hood face velocity at all times. The fume hood face velocity display shall be the true average face velocity as calculated by the fume hood controller based upon the actual measured fume hood exhaust airflow and the total fume hood total open area.
   c. The ODP shall also include separate colored lights that shall illuminate to indicate fume hood operations status:
      1) Green- Proper face velocity
      2) Yellow- Marginal face velocity
      3) Red- Face Velocity Alarm Conditions
   d. The ODP shall also contain an audible alarm device that responds to face velocity alarm conditions and the ODP digital display shall change to "low face velocity" or "high face velocity" appropriate to the alarm condition.
   e. A silence push button at the ODP shall allow the user to silence the audible alarm which shall then remain silent until a subsequent face velocity alarm occurs.

8. Purge Mode
   a. The ODP shall also provide an emergency purge pushbutton which shall allow a user to increase fume hood exhaust airflow to the maximum amount for a designated period of time as required by lab safety standards.
   b. The initial setting for the emergency purge time shall be 1 minute.
   c. After the designated emergency purge time has expired, the fume hood exhaust shall automatically reset to a lower level to prevent excessive demand on the exhaust system.
   d. Emergency purge mode shall be cancellable at any time by depressing the emergency purge button a second time.
   e. The ODP shall sound its audible alarm device whenever the emergency purge mode of operation is activated.

9. Over-Opened Sash
   a. The ODP shall also provide an audible sash open alert feature that shall caution users whenever the fume hood sash exceeds a predetermined height.
   b. The audible alert shall consist of a series of quick "chirps" that continue until the sash is reduced to an acceptable height.

10. Alarms
    a. Low Face Velocity
        1) If the calculated face velocity is below its alarm threshold and generating an alarm at the ODP, a Level 2 alarm shall also be generated at the BMS.
    b. Low airflow
        1) If the measured airflow is less than 70% of setpoint while setpoint is greater than zero for 5 minutes, generate a Level 3 alarm.
        2) If the measured airflow is less than 50% of setpoint while setpoint is greater than zero for 5 minutes, generate a Level 2 alarm.
H. **VAV Supply Terminal Unit, 4-pipe Heating & Cooling Switchover**

1. This is a Thermal Control Zone device.
   a. See Generic Thermal Control Zones (Paragraph 3.3B) for setpoints, loops, control modes, alarms, etc.
   b. See Paragraph 3.3B.3 for calculation of zone minimum outdoor air requirements.
   c. See Paragraph 3.3B.4 for logic to reset active zone minimum airflow $V_{min^*}$.

2. See Paragraph 3.1H.1 for zone minimum airflow setpoint $V_{min}$, zone cooling maximum airflow setpoint $V_{cool-max}$, and zone heating maximum airflow setpoint $V_{heat-max}$.

3. See Paragraph 3.1H.2 for maximum heating DAT rise $Max\Delta T$.

4. Active maximum and minimum setpoints shall vary depending on the Mode of the Zone Group the zone is a part of, in accordance with the following table:

<table>
<thead>
<tr>
<th>Setpoint</th>
<th>Occupied</th>
<th>Cool-down</th>
<th>Setup</th>
<th>Warm-up</th>
<th>Setback</th>
<th>Unoccupied</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cooling maximum</td>
<td>$V_{cool-max}$</td>
<td>$V_{cool-max}$</td>
<td>$V_{cool-max}$</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Minimum</td>
<td>$V_{min^*}$</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>Heating maximum</td>
<td>$Max(V_{heat-max}, V_{min^*})$</td>
<td>$V_{heat-max}$</td>
<td>0</td>
<td>$V_{cool-max}$</td>
<td>$V_{cool-max}$</td>
<td>0</td>
</tr>
</tbody>
</table>

5. Control logic is depicted schematically in the figure below and described in the following sections. Relative levels of various setpoints are depicted for Occupied Mode operation.
a. When the Zone State is Cooling, the Cooling Loop shall maintain space temperature at the cooling setpoint as follows:
   1) From 0% - 25%, the Cooling Loop output shall reset the discharge temperature from the current AHU SAT setpoint to a minimum of Min DAT.
   2) From 26% - 100%, if the discharge air temperature is less than room temperature, the Cooling Loop output shall reset the active airflow setpoint from the minimum airflow setpoint to the maximum cooling airflow setpoint.

b. When the Zone State is Deadband, the active airflow setpoint shall be the minimum airflow setpoint. Hot water valve is closed unless the discharge air temperature is below the minimum setpoint (see Paragraph 3.3H.5.e.1)).

c. When the Zone State is Heating, the Heating Loop shall maintain space temperature at the heating setpoint as follows:
   1) From 0% - 50%, the Heating Loop output shall reset the discharge temperature from the current AHU SAT setpoint to a maximum of MaxΔT above space temperature setpoint.
   2) From 51% - 100%, if the discharge air temperature is greater than room temperature plus 5°F, the Heating Loop output shall reset the active airflow setpoint from the minimum airflow setpoint to the maximum heating airflow setpoint.

d. The cooling coil shall be modulated to maintain the discharge temperature at setpoint. In cooling, the switchover isolation valve shall also be open.
   1) The heating isolation and control valves shall be closed when the cooling valves are open.
   2) In Occupied Mode, the cooling coil shall be modulated to maintain a discharge air temperature no higher than 80°F.
   3) When the airflow setpoint is pulse width modulated for TAV operation per Paragraph 3.3B.5, the heating coil shall be locked out and the SAT control loop shall be disabled during the Closed Periods.

e. The heating coil shall be modulated to maintain the discharge temperature at setpoint. In heating, the switchover isolation valve shall also be open. (Directly controlling heating off the zone temperature control loop is not acceptable.)
   1) The cooling isolation and control valves shall be closed when the heating valves are open.
   2) In Occupied Mode, the heating coil shall be modulated to maintain a discharge air temperature no lower than 50°F.
   3) When the airflow setpoint is pulse width modulated for TAV operation per Paragraph 3.3B.5, the heating coil shall be locked out and the SAT control loop shall be disabled during the Closed Periods.

f. The VAV damper shall be modulated by a control loop to maintain the measured airflow at the active setpoint Vspt.

6. Alarms
   a. Low airflow
      1) If the measured airflow is less than 70% of setpoint while setpoint is greater than zero for 5 minutes, generate a Level 3 alarm.
      2) If the measured airflow is less than 50% of setpoint while setpoint is greater than zero for 5 minutes, generate a Level 2 alarm.
      3) If a zone has an Importance Multiplier of 0 (see Paragraph 3.3A.14.c.1) for its static pressure reset Trim & Respond control loop, low airflow alarms shall be suppressed for that zone.
b. High discharge air temperature
   1) If CHW plant is proven on and the discharge air temperature is 15°F more than setpoint for 10 minutes, generate a Level 3 alarm.
   2) If CHW plant is proven on and the discharge air temperature is 30°F more than setpoint for 10 minutes, generate a Level 2 alarm.

c. Low discharge air temperature
   1) If HHW plant is proven on and the discharge air temperature is 15°F less than setpoint for 10 minutes, generate a Level 3 alarm.
   2) If HHW plant is proven on and the discharge air temperature is 30°F less than setpoint for 10 minutes, generate a Level 2 alarm.

d. Airflow sensor calibration: If the fan serving the zone has been off for 10 minutes and airflow sensor reading is greater than 10% of Vcool-max, generate a Level 3 alarm.

e. Leaking damper: If the damper position is 0% and airflow sensor reading is above 10% of Vcool-max for 10 minutes while the fan serving the zone is proven on, generate a Level 4 alarm.

f. Leaking valve: If the valve position is 0% for 15 minutes and discharge air temperature is above AHU SAT by 5°F while the fan serving the zone is proven on, generate a Level 4 alarm.

7. Testing/Commissioning Overrides: Provide software points that interlock to a system level point to
   a. Force zone airflow setpoint Vspt to zero
   b. Force zone airflow setpoint Vspt to Vcool-max
   c. Force zone airflow setpoint Vspt to Vmin
   d. Force zone airflow setpoint Vspt to Vheat-max
   e. Force damper full closed/open
   f. Force heating to off/closed
   g. Reset request-hours accumulator point to zero (provide one point for each reset type listed below)

8. System Requests
   a. Cooling SAT Reset Requests
      1) If the zone temperature exceeds the zone’s cooling setpoint by 5°F for 2 minutes after the suppression period per Paragraph 3.3A.11.h, send 3 Requests,
      2) Else if the zone temperature exceeds the zone’s cooling setpoint by 3°F for 2 minutes after the suppression period per Paragraph 3.3A.11.h, send 2 Requests,
      3) Else if the Cooling Loop is greater than 95%, send 1 Request until the Cooling Loop is less than 85%,
      4) Else if the Cooling Loop is less than 95%, send 0 Requests

   b. Static Pressure Reset Requests
      1) If the measured airflow is less than 50% of setpoint while setpoint is greater than zero and the damper position is greater than 95% for 1 minute, send 3 Requests,
      2) Else if the measured airflow is less than 70% of setpoint while setpoint is greater than zero and the damper position is greater than 95% for 1 minute, send 2 Requests,
      3) Else if the damper position is greater than 95%, send 1 Request until the damper position is less than 85%,
      4) Else if the damper position is less than 95%, send 0 Requests
c. Send Cooling Plant Requests as follows:
   1) If the CHW valve position is greater than 95%, send 1 Request until the CHW valve position is less than 10%
   2) Else if the CHW valve position is less than 95%, send 0 Requests.

d. Send Heating Plant Requests as follows:
   1) If the HW valve position is greater than 95%, send 1 Request until the HW valve position is less than 10%
   2) Else if the HW valve position is less than 95%, send 0 Requests.

I. Typical Cooling-only FCU
   1. See Generic Thermal Control Zones (Paragraph 3.1B) for setpoints, loops, control modes, alarms, etc.
   2. Fan coil units shall have their own distinct occupancy schedule, initially 24/7. The fancoil unit and the Cooling Loop shall be enabled whenever its zone is in Occupied Mode. Otherwise, the unit shall be off, the control loop disabled and the coil valve closed.
   3. Discharge Air Temperature Setpoint and Control
      a. If the Cooling Loop signal is more than 5%, the unit shall operate in cooling
         1) A PI loop shall modulate the CHW control valve to maintain SA Temperature at setpoint. Mapping valve position directly to the Cooling Loop signal is not acceptable.
      b. There is no Heating Loop for these units.
      c. If the Cooling Loop signal is less than 5% (i.e. unit is in deadband), SA temperature control shall be suspended. CHW control valve shall be closed.
      d. The cooling SA temp setpoint and offset shall be independently adjustable for each unit.
   4. Fan Speed and Control
      a. The fan shall run whenever the unit is enabled and the cooling loop signal is greater than 0%.
      b. Maximum fan speed shall be that which provides the scheduled airflow.
      c. Minimum fan speed shall be 20% of maximum, or the minimum controllable fan speed.
      d. If cooling loop is equal to zero, fan shall be off. When the Cooling Loop is greater than zero, the fan speed shall be the minimum.
      e. The fan speed shall reset from minimum to maximum as the Cooling Loop goes from 0% to 100%.
   5. Alarms
      a. Maintenance interval alarm when fan has operated for more than 1500 hours: Level 5. Reset interval counter when alarm is acknowledged.
      b. Fan alarm is indicated by the status input being different from the output command after a period of 15 seconds after a change in output status.
         1) Commanded on, status off: Level 2
         2) Commanded off, status on: Level 4
      c. High supply air temperature (more than 5°F above setpoint) off cooling coils when coil control loop is active for longer than 5 minutes: Level 3.
      d. When CHW valve is commanded closed, supply air temperature more than 3°F below space temperature for longer than 5 minutes: Level 4, indicating a potential leaking control valve
e. Drip pan sensor: If the moisture sensor in the condensate pan detects moisture for longer than one minute, lock out the cooling valve and set a Level 3 alarm indicating that fancoil cooling is disabled for that zone. Release the cooling coil lockout when moisture is no longer detected at the sensor.

6. System Requests
   a. Send Cooling Plant Requests as follows:
      1) If the CHW valve position is greater than 95%, send 1 Request until the CHW valve position is less than 10%
      2) Else if the CHW valve position is less than 95%, send 0 Requests.

J. Air Handling Unit System Modes
   1. AHU system Modes are the same as the Mode of the Zone Group served by the system. When Zone Groups served by a single air handling system are in different modes, the following hierarchy applies (highest one sets AHU mode).
      a. Occupied Mode
      b. Cool-down Mode
      c. Setup Mode
      d. Warm-up Mode
      e. Setback Mode
      f. Freeze Protection Setback Mode
      g. Unoccupied Mode

K. Multiple Zone Recirculating VAV Air Handling Unit
   1. Supply Fan Control
      a. Supply Fan Start/Stop
         1) Supply fan shall run continuously as it serves Lab zones in addition to non-lab zones.
      b. Supply Airflow Measurement
         1) Totalize current airflow rate from VAV boxes and Lab supply air valves to a software point \( V_{ps} \) and display this sum-of-zones airflow near the discharge duct on AHU graphic.
         2) When economizer is disabled, display measured outdoor airflow rate near intake on AHU graphic. When economizer is enabled, hide this display as it will not be accurate.
         3) If the AHU has a total supply (not outdoor air) airflow measurement station, display the AFMS airflow rate adjacent to the sum-of-zone airflow rate.
            a) If the airflow measured by the AFMS exceeds the sum-of-zones airflow by more than 10% for more than five minutes, display the difference with the legend “Potential Leakage”. (If the difference is less than 10%, then this value shall not display.)
      c. Static Pressure Setpoint Reset
         1) See Paragraph 3.2E.1.a for Max_DSP, the maximum duct static pressure setpoint.
         2) Static pressure setpoint shall be reset using Trim & Respond logic (see Paragraph 3.3A.14) with the following parameters. Parameters should be adjusted if needed during commissioning to provide stable control (i.e. slow, smooth cycling of the setpoint).
d. Static Pressure Control

1) Supply fan speed is controlled to maintain duct static pressure at setpoint when the fan is proven on. If necessary for system stability, provide multiple sets of gains, with as a function of system load (e.g. as indicated by supply fan airflow rate, the area of the Zone Groups that are occupied, etc.) to provide consistent, smooth control response under a range of conditions.

2. Supply Air Temperature Control

a. The supply air temperature control loop sequences coils and dampers to maintain supply air temperature at setpoint. This control loop is enabled when the supply fan is proven on, and disabled with output set to Deadband (no heating, minimum economizer) otherwise.

b. Supply Air Temperature Setpoint

1) See Paragraph 3.1K for minimum and maximum cooling supply air temperature setpoints Min_ClgsAT and Max_ClgsAT, and for the outdoor air temperature range by which the SAT setpoint is reset (OAT_Min, OAT_Max).

2) During Occupied Mode and Setup Mode: Setpoint shall be reset from Min_ClgsAT when the outdoor air temperature is OAT_Max or higher, proportionally up to T-max when the outdoor air temperature is OAT_Min or lower.

a) T-max shall be reset between Min_ClgsAT and Max_ClgsAT using Trim & Respond logic (see Paragraph 3.3A.14) with the following parameters.

<table>

</table>
The net result of this SAT reset strategy is depicted in the chart below:

3) During Cool-Down Mode: Setpoint shall be Min_ClgSAT.
4) During Warm-Up and Setback Modes: Setpoint shall be 95°F.

c. Supply air temperature shall be controlled to setpoint using a control loop whose output is mapped to sequence the hot water/heat recovery valve, outdoor air damper, and return air damper as shown in the diagram below.

1) Economizer damper maximum (MaxOA-P) position is limited for economizer high limit lockout (see Paragraph 3.3K.5.d).
2) For units with a separate minimum outdoor air damper: MinOA-P is 0% and MaxRA-P is modulated to maintain minimum outdoor airflow (see Paragraph 3.3K.4.c).
3) The points of transition along the x-axis shown and described below are representative. Separate gains shall be provided for each section of the control map (hot water, economizer, chilled water), that are determined by DDC Contractor to provide stable control. DDC Contractor shall also adjust the precise value of the x-axis thresholds shown in the figure to provide stable control.
3. Minimum Outdoor Airflow Setpoint
   a. Minimum outdoor airflow setpoints, for California Title 24 ventilation:
      1) See Paragraph 3.1K.2 for system minimum outdoor air setpoints AbsMinOA and DesMinOA
      2) See Paragraph 3.3B.3.b for zone outdoor air rates Zone-Abs-OA-min and Zone-Des-OA-min.
      3) Effective outdoor air absolute minimum and design minimum setpoints are recalculated continuously based on the Mode of the zones being served.
         a) AbsMinOA* is the sum of Zone-Abs-OA-min for all non-lab zones in all Zone Groups that are in Occupied Mode plus the exhaust airflow rate as measured at the main exhaust fans, but shall be no larger than the scheduled absolute minimum outdoor airflow, AbsMinOA.
         b) DesMinOA* is the sum of Zone-Des-OA-min for all non-lab zones in all Zone Groups that are in Occupied Mode plus the exhaust airflow rate as measured at the main exhaust fans, but shall be no larger than the scheduled design minimum outdoor airflow, DesMinOA.
      4) Minimum outdoor air setpoint MinOAsp: Reset MinOAsp based on the highest zone CO₂ control loop signal, from AbsMinOA* at 50% signal to DesMinOA* at 100% signal.

4. Minimum Outdoor Air Control
   a. Minimum outdoor air control loop is enabled when the supply fan is proven on and the AHU is in Occupied Mode. It is disabled and output set to zero otherwise.
   b. The outdoor airflow rate shall be maintained at the minimum outdoor air setpoint MinOAsp by a reverse-acting control loop whose output is 0% - 100%.
      1) From 0% to 50% loop output, reset the minimum outdoor air damper position from 0% to 100%.
      2) Loop output greater than 50% is used when return air damper minimum outdoor air control logic (see below) is active.
c. Return Air Damper Control for Outdoor Air

1) Return air damper control for outdoor air is enabled and disabled based on supply fan speed and the positions of the economizer and minimum outdoor air dampers.
   a) Reset MinEcon from 5% at maximum supply fan speed proportionally to 80% at minimum supply fan speed.
   b) Return air damper control for outdoor air is enabled when the minimum outdoor air damper is 100% open and the economizer damper position is less than MinEcon for five minutes.
   c) Return air damper control for outdoor air is disabled when the minimum outdoor air damper is less than 100% open or the economizer damper position is 10% greater than MinEcon for five minutes.

2) When this logic is enabled, the maximum return damper position, MaxRA-P, is modulated from 100% to 0% as the minimum outdoor air control loop signal (Paragraph 3.3K.4.b) rises from 50% to 100%.

3) When this logic is disabled, the return air damper shall be controlled by the supply air temperature control logic (see Paragraph 3.3K.2.c).

5. Economizer High Limit Lockout
   a. When economizer is enabled, MaxOA-P = 100%.
   b. The normal sequencing of the economizer dampers (above) shall be disabled when outdoor conditions exceed the high limit lockout as specified in Paragraph 3.1K.3.
   c. Once the economizer is disabled, it shall not be re-enabled within 10 minutes, and vice versa.
   d. The economizer is disabled according to the following procedure:
      1) Return air damper shall be fully opened
      2) Wait 15 seconds, then set MaxOA-P equal to MinOA-P.
      3) Wait 3 minutes, then release return air damper for minimum outdoor air control.

6. Return Fan Control – Airflow Tracking
   a. Return fan operates whenever associated non-lab VAV boxes are in a mode other than Unoccupied. If all non-lab VAV zones are Unoccupied, indicating that there is no air available to recirculate, return fan shall be off.
   b. Return fan speed shall be controlled to maintain return airflow equal to supply airflow less the differential S-R-CFM-DIFF determined per Paragraph 3.2E.1.c.

7. Freeze Protection
   a. If the supply air temperature drops below 40°F for 5 minutes, send two (or more, as required to ensure that heating plant is active) Heating Plant Requests, override the outdoor air damper to the minimum position, and modulate the heating coil to maintain a supply air temperature of at least 42°F. Disable this function when supply air temperature rises above 45°F for 5 minutes.
   b. If the supply air temperature drops below 38°F for 5 minutes, fully close both the economizer damper and the minimum outdoor air damper for one hour, and set a Level 3 alarm noting that minimum ventilation was interrupted. After one hour, the unit shall resume minimum outdoor air ventilation and enter the previous stage of freeze protection (see Paragraph 3.3K.7.a).
c. If supply air temperature drops below 38°F for 15 minutes or below 34°F for 5 minutes, shut down supply and return/relief fan(s), close outdoor air damper. Also send two (or more, as required to ensure that heating plant is active) Heating Plant Requests, modulate the heating coil to maintain the higher of the supply air temperature or the mixed air temperature at 80°F, and set a Level 2 alarm indicating the unit is shut down by freeze protection.

1) If a freeze protection shutdown is triggered by a low air temperature sensor reading, it shall remain in effect until it is reset by the Operator.

8. Alarms
   a. Maintenance interval alarm when fan has operated for more than 1,500 hours: Level 5. Reset interval counter when alarm is acknowledged.
   b. Fan alarm is indicated by the status being different from the command for a period of 15 seconds.
      1) Commanded on, status off: Level 2
      2) Commanded off, status on: Level 4
   c. Filter pressure drop exceeds alarm limit: Level 5. The alarm limit shall vary with total airflow (if available; use fan speed if total airflow is not known) as follows:

\[ DP_x = DP_{100} (x)^{1.4} \]

where \( DP_{100} \) is the high limit pressure drop at design airflow (determine limit from filter manufacturer) and \( DP_x \) is the high limit at the current airflow rate (or speed signal) \( x \), where \( x \) is a percentage of design maximum. For instance, the setpoint at 50% of design airflow would be \((.5)^{1.4}\) or 38% of the design high limit pressure drop.

d. High building pressure (more than 0.10"): Level 3

e. Low building pressure (less than 0.0", i.e. negative): Level 4

9. Automatic Fault Detection and Diagnostics

a. AFDD conditions are evaluated continuously and separately for each operating air handling unit.

b. The Operating State (OS) of each AHU shall be defined by the commanded positions of the heating coil control valve, cooling coil control valve, and economizer damper in accordance with the following table and corresponding graphic.

<table>
<thead>
<tr>
<th>Operating State</th>
<th>Heat Recovery Valve Position (Heating)</th>
<th>Heat Recovery Valve Position (Cooling)</th>
<th>Outdoor Air Damper Position</th>
</tr>
</thead>
<tbody>
<tr>
<td>#1: Heating</td>
<td>&gt; 0</td>
<td>= 0</td>
<td>= MIN</td>
</tr>
<tr>
<td>#2: Free Cooling, Modulating OA</td>
<td>= 0</td>
<td>= 0</td>
<td>MIN &lt; X &lt; 100%</td>
</tr>
<tr>
<td>#3: Mechanical + Economizer</td>
<td>= 0</td>
<td>&gt; 0</td>
<td>= 100%</td>
</tr>
<tr>
<td>#4: Mechanical Cooling, Min OA</td>
<td>= 0</td>
<td>&gt; 0</td>
<td>= MIN</td>
</tr>
<tr>
<td>#5: Unknown</td>
<td>No other OS applies</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
c. The following points must be available to the AFDD routines for each AHU:

1) SAT = Supply air temperature
2) MAT = Mixed air temperature
3) RAT = Return air temperature
4) OAT = Outdoor air temperature
5) DSP = Duct static pressure
6) SATSP = supply air temperature setpoint
7) DSPSP = duct static pressure setpoint
8) HC = heating coil valve position command; 0% ≤ HC ≤ 100%
9) CC = cooling coil valve position command; 0% ≤ CC ≤ 100%
10) FS = fan speed command; 0% ≤ FS ≤ 100%
11) CCET = cooling coil entering temperature; depending on the AHU configuration this could be the MAT or a separate sensor for this specific purpose.
12) CCLT = cooling coil leaving temperature; depending on the AHU configuration this could be the SAT or a separate sensor for this specific purpose.
13) HCET = heating coil entering temperature; depending on the AHU configuration this could be the MAT or a separate sensor for this specific purpose.
14) HCLT = heating coil leaving temperature; depending on the AHU configuration this could be the SAT or a separate sensor for this specific purpose.

d. The following values must be continuously calculated by the AFDD routines for each AHU:

1) Five minute rolling averages with 1 minute sampling time of the following point values; operator shall have the ability to adjust the averaging window and sampling period for each point independently
   a) SAT\textsuperscript{AVG} = rolling average of supply air temperature
   b) MAT\textsuperscript{AVG} = rolling average of mixed air temperature
   c) RAT\textsuperscript{AVG} = rolling average of return air temperature
d) OAT\textsubscript{AVG} = rolling average of outdoor air temperature

e) DSP\textsubscript{AVG} = rolling average of duct static pressure

f) CCET\textsubscript{AVG} = rolling average of cooling coil entering temperature
g) CCLT\textsubscript{AVG} = rolling average of cooling coil leaving temperature

h) HCET\textsubscript{AVG} = rolling average of heating coil entering temperature

i) HCLT\textsubscript{AVG} = rolling average of heating coil leaving temperature

2) \%OA = actual outdoor air fraction as a percentage = \frac{MAT - RAT}{OAT - RAT} or per airflow measurement station if available.

3) \%OA\textsubscript{MIN} = Active minimum OA setpoint (MinOAsp) divided by actual total airflow (from sum of VAV box flows, or by airflow measurement station) as a percentage.

4) \Delta OS = number of changes in Operating State during the previous 60 minutes (moving window)

e. The following internal variables shall be defined for each AHU. All parameters are adjustable by the operator, with initial values as given below:

<table>
<thead>
<tr>
<th>Variable Name</th>
<th>Description</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>\Delta T\textsubscript{SF}</td>
<td>Temperature rise across supply fan</td>
<td>2° F</td>
</tr>
<tr>
<td>\Delta T\textsubscript{MIN}</td>
<td>Minimum difference between OAT and RAT to evaluate economizer error conditions (FC#6)</td>
<td>10° F</td>
</tr>
<tr>
<td>\varepsilon\textsubscript{SAT}</td>
<td>Temperature error threshold for SAT sensor</td>
<td>2° F</td>
</tr>
<tr>
<td>\varepsilon\textsubscript{RAT}</td>
<td>Temperature error threshold for RAT sensor</td>
<td>2° F</td>
</tr>
<tr>
<td>\varepsilon\textsubscript{MAT}</td>
<td>Temperature error threshold for MAT sensor</td>
<td>5° F</td>
</tr>
<tr>
<td>\varepsilon\textsubscript{OAT}</td>

<tr>
<td>\varepsilon\textsubscript{HCLT}</td>
<td>Heating coil leaving temperature sensor error. Equal to \varepsilon\textsubscript{SAT} or dedicated sensor error</td>
<td></td>
</tr>
<tr>
<td>\Delta OS\textsubscript{MAX}</td>
<td>Maximum number of changes in Operating State during the previous 60 minutes</td>
<td>7</td>
</tr>
<tr>
<td>Variable Name</td>
<td>Description</td>
<td>Default Value</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------------</td>
</tr>
<tr>
<td>ModeDelay</td>
<td>Time in minutes to suspend Fault Condition evaluation after a change in Mode</td>
<td>30</td>
</tr>
<tr>
<td>AlarmDelay</td>
<td>Time in minutes to that a Fault Condition must persist before triggering an alarm</td>
<td>15</td>
</tr>
<tr>
<td>TestModeDelay</td>
<td>Time in minutes that Test Mode is enabled</td>
<td>120</td>
</tr>
</tbody>
</table>

The following are potential Fault Conditions that can be evaluated by the AFDD routines. If the equation statement is true, then the specified fault condition exists. The Fault Conditions to be evaluated at any given time will depend on the Operating State of the AHU.

10. A subset of all potential fault conditions is evaluated by the AFDD routines. The set of applicable fault conditions depends on the Operating State of the AHU:

1) In OS #1 (Heating), the following Fault Conditions shall be evaluated:
   - a) FC#1: Duct static pressure is too low with fan at full speed
   - b) FC#2: MAT too low; should be between RAT and OAT
   - c) FC#3: MAT too high; should be between RAT and OAT
   - d) FC#4: Too many changes in Operating State
   - e) FC#5: SAT too low; should be higher than MAT
   - f) FC#6: OA fraction is too low or too high; should equal %OAMIN
   - g) FC#7: SAT too low in full heating
   - h) FC#14: Temperature drop across inactive cooling coil

2) In OS#2 (Modulating Economizer), the following Fault Conditions shall be evaluated:
   - a) FC#1: Duct static pressure is too low with fan at full speed
   - b) FC#2: MAT too low; should be between RAT and OAT
   - c) FC#3: MAT too high; should be between RAT and OAT
   - d) FC#4: Too many changes in Operating State
   - e) FC#8: SAT and MAT should be approximately equal
   - f) FC#9: OAT is too high for free cooling without mechanical cooling
   - g) FC#14: Temperature drop across inactive cooling coil
   - h) FC#15: Temperature rise across inactive heating coil

3) In OS#3 (Mechanical + 100% Economizer Cooling), the following Fault Conditions shall be evaluated:
   - a) FC#1: Duct static pressure is too low with fan at full speed
   - b) FC#2: MAT too low; should be between RAT and OAT
   - c) FC#3: MAT too high; should be between RAT and OAT
   - d) FC#4: Too many changes in Operating State
   - e) FC#10: MAT and OAT should be approximately equal
   - f) FC#11: OAT too low for 100% OA
   - g) FC#12: SAT too high; should be less than MAT
4) In OS#4 (Mechanical Cooling, Min OA), the following Fault Conditions shall be evaluated:

a) FC#1: Duct static pressure is too low with fan at full speed
b) FC#2: MAT too low; should be between RAT and OAT
c) FC#3: MAT too high; should be between RAT and OAT
d) FC#4: Too many changes in Operating State
e) FC#6: OA fraction is too low or too high; should equal %OAMIN
f) FC#12: SAT too high; should be less than MAT
g) FC#13: SAT too high in full cooling
h) FC#15: Temperature rise across inactive heating coil

5) In OS#5 (Other), the following Fault Conditions shall be evaluated:

a) FC#1: Duct static pressure is too low with fan at full speed
b) FC#2: MAT too low; should be between RAT and OAT
c) FC#3: MAT too high; should be between RAT and OAT
d) FC#4: Too many changes in Operating State

b. For each air handler, the operator shall be able to suppress the alarm for any Fault Condition.

c. Evaluation of Fault Conditions shall be suspended under the following conditions:
   1) When AHU is not operating.
   2) For a period of ModeDelay minutes following a change in Mode (e.g. from Warm-up to Occupied) of any Zone Group served by the AHU.

d. Fault Conditions that are not applicable to the current Operating State shall not be evaluated.

e. A Fault Condition that evaluates as true must do so continuously for AlarmDelay minutes before it is reported to the operator.
   1) Test Mode shall temporarily set ModeDelay and AlarmDelay to 0 minutes for a period of TestModeDelay minutes to allow instant testing of the AFDD system, while ensuring that normal fault detection occurs after testing is complete.

e. When a Fault Condition is reported to the operator, it shall be a Level 3 alarm and shall include the description of the fault and the list of possible diagnoses from the table in Paragraph 3.3K.9.f.

11. Testing/Commissioning Overrides: Provide software switches that interlock to a chilled water and hot water plant level to

   a. If there is a hot water coil, force hot water valve full open
   b. If there is a hot water coil, force hot water valve full closed
   c. Force chilled water valve full open
   d. Force chilled water valve full closed

12. Plant Requests

   a. Send Heating Plant Requests as follows:
      1) If the HW valve position is greater than 95%, send 1 Request until the HW valve position is less than 10%
      2) Else if the HW valve position is less than 95%, send 0 Requests.

L. Lab Exhaust Fans

1. Three manifolded fans exhaust the laboratory and maintain pressurization in the labs.
2. Exhaust Fan Start/Stop
1) Each set of general exhaust fans will be enabled 24/7 to maintain minimum air change rate in the labs.

2) Each fan has a corresponding set of isolation dampers. The isolation air dampers shall be fully open when the exhaust fan is proven on (see below for startup fan/damper startup sequence). Otherwise they shall be closed.

3) When starting a fan: Command the new fan to minimum speed and command the isolation damper to open. After damper feedback indicates that dampers are fully open, fan shall receive the same speed command as other operating fans.
   a) If proof of fan operation is not obtained within 30 seconds after start command, or if isolation damper feedback does not indicate fully open dampers after 120 seconds, disable fan, close associated dampers and set a Level 3 alarm.

4) When stopping a fan: Command the fan being stopped to minimum speed and command the isolation dampers to close. After 60 seconds, command the fan to stop.

3. Exhaust Fan Speed Control & Staging
   1) Fan speed is controlled to maintain duct static pressure and/or exhaust manifold static pressure at setpoint when the fan is proven on. As multiple static pressure sensors are associated with a single set of fans, modulate fan speed to maintain all measured static pressure sensors at or above setpoint.
   2) Exhaust fans serving a common plenum shall be controlled together and receive the same speed signal.
   3) If fans are operating at minimum speed determined by stack velocity criteria and all duct static pressure sensors are more than 10% above their duct static pressure setpoint for five minutes, fans shall stage down.
      a) Stop one fan per stage-down event.
   4) If a fan is operating at greater than 90% speed for five minutes, fans shall stage up.
      a) Start second fan per stage-up event.

4. Bypass Damper
   a. The bypass damper shall be modulated to maintain minimum exhaust velocity in the stacks.
   b. If the exhaust fans are meeting static pressure setpoints, but the velocity is too low, the bypass damper shall be opened until minimum velocity in the stack(s) is met.

5. Minimum Velocity in Stack
   a. The fans and bypass damper shall maintain the nominal velocity in the exhaust stack(s). Refer to 3.1L.1 for minimum stack exhaust velocity.
   b. If door contacts indicate that someone has either entered or left the Observation Deck, the minimum exhaust velocity shall be reset for the next 12 hours to the value defined by 3.1L.2.

6. Exhaust Airflow Measurement
   1) Sum-of-Zones: Totalize current airflow rate from Exhaust boxes to a software point \( EV_{\text{ps}} \) and display this sum-of-zones airflow near the intake duct on general exhaust graphic.
   2) Total Exhaust Airflow: Display AFMS measured airflow rate (from fan-inlet AFMS) adjacent to the sum-of-zone exhaust airflow rate.
7. Alarms
   a. Maintenance interval alarm when fan has operated for more than 1,500 hours: Level 4. Reset interval counter when alarm is acknowledged.
   b. Fan alarm is indicated by the status being different from the command for a period of 15 seconds.
      1) Commanded on, status off: Level 2
      2) Commanded off, status on: Level 4
   c. Fan alarm is indicated when exhaust air setpoint cannot be maintained at any sensor for more than 5 minutes: Level 4.

M. Lab Exhaust Heat Recovery
   1. Lab heat recovery is used to pre-heat or pre-cool air in the main air handler by rejecting or absorbing heat from the lab exhaust air.
   2. Exhaust heat recovery system is enabled when there is available heat or “coolth” to pull from the exhaust air stream as follows:
      a. Cooling
         1) If the outside air temperature is 3°F or more above the supply air temperature setpoint and the outside air temperature is 3°F or higher than the exhaust air temperature, the loop shall operate in cooling mode.
      b. Heating
         1) When the outside air temperature is 3°F or more below the supply air temperature setpoint and the outside air temperature is 3°F or more below the exhaust air temperature, the loop shall operate in heating mode.
   3. When exhaust heat recovery is enabled:
      a. Close HHW isolation valves, wait until feedback indicates valves are closed, then open heat recovery coil isolation valves.
      b. Open HHW Coil Control valve(s) 100%. Valve(s) shall remain fully open the entire time.
      c. Open all heat recovery isolation valves associated with a running exhaust fan. If a lab fan stages off, close its associated heat recovery isolation valve. If a new lab exhaust fan stages on, open that associated isolation valve.
      d. Heat recovery loop pump speed is modulated by the supply air temperature control loop. Heat recovery pumps shall be staged lead-standby for equal wear rotation. If one pump fails, the other pump shall continue to operate.
   4. When an exhaust heat recovery system is disabled:
      a. Close heat recovery coil isolation valves.
      b. Close all lab exhaust heat recovery isolation valves.
      c. Heat recovery loop pump is locked out.
   5. Alarms
      a. Generate a Level 5 maintenance alarm when either pump has operated for more than 3000 hours. Reset interval counter when alarm is acknowledged.
      b. Pump alarm is indicated by the status input being different from the output command after a period of 15 seconds after a change in output status.
         1) Commanded on, status off: Level 2
         2) Commanded off, status on: Level 4
N. BAS Fire Alarm Mode

1. In the event the BAS receives a signal from the fire alarm panel that the building is in fire alarm mode, the following sequence shall be initiated to ensure safe conditions for evacuating the building. See 3.2F.1 for TAB procedure to determine setpoints.

2. Immediately upon receipt of fire alarm signal:
   a. Air handler supply and return fans shall be commanded off.
   b. Lab supply air valves shall close.
   c. Lab general exhaust air valves shall close.
   d. Lab fume hood exhaust air valves shall fail in place.
   e. The bypass damper shall be commanded to position BD_P1.
   f. Lab exhaust fans shall be commanded to a minimum speed determined in conjunction with TAB to maintain duct static pressure setpoint DSP_FA.

3. Over time interval \( T \):
   a. Gradually close bypass damper from initial position to BD_P1 to BD_P2. The intent is that the damper closes over the same time interval as the fan slowing down.

O. Exhaust Fan, Temperature Controlled

1. See Generic Thermal Control Zones (Paragraph 3.3B) for setpoints, loops, control modes, alarms, etc.

2. See Paragraph 3.2D.1.a for exhaust fan maximum speed setpoint MaxSpeed.

3. Exhaust fan shall be continuously enabled (i.e. available to run, not necessarily running).

4. Space shall be maintained at the cooling setpoint by a P-only loop which resets exhaust fan speed from minimum speed to MaxSpeed. Fan shall be stopped if zone temperature is below cooling setpoint.

5. Alarms
   a. Generate a Level 5 maintenance alarm when fan has operated for more than 3000 hours. Reset interval counter when alarm is acknowledged.
   b. Fan alarm is indicated by the status input being different from the output command after a period of 15 seconds after a change in output status.
      1) Commanded on, status off: Level 2
      2) Commanded off, status on: Level 4
   c. High space temperature alarm
      1) 5°F above setpoint for 15 minutes: Level 3
      2) 10°F above setpoint for 5 minutes: Level 2

P. Domestic Hot Water Plant

1. Heat pump water heater shall be controlled by manufacturer internal controls to maintain domestic hot water tanks at setpoint.

2. Heat pump water heater shall be connected to BAS for monitoring.

Q. Resource Meters

1. Connect BAS to outputs for each meter (electric, gas, and/or water) shown on Contract Drawing control schematics.
   a. For pulse output meters, determine and verify conversion between pulse count and resource consumption. Document the value and source of the conversion factor as a comment in code.
For meters using analog outputs, determine and verify conversion between analog signal and rate of resource consumption. Document the value and source of the conversion factor as a comment in code.

For networked meters, map meter points to BAS using BACnet point autodiscovery.

Networked meters which are not native BACnet devices or require the use of a gateway or protocol translator are not acceptable. See “BACnet Gateways and Network Devices” in Part 2 of Section 25 50 00.

After installation, verify that information reported by DDC System matches actual consumption. Submit verification with Functional Test Report as required by Section 25 50 00. **DDC Contractor is responsible for ensuring accuracy of meter information reported by DDC System.**

Report cumulative electricity and water use at the operator’s front end for:

a. Current day
b. Previous day
c. Current month to date
d. Previous month to date
e. Total since last reset

Trend meter outputs in accordance with the requirements of this Section and Section 25 50 00.

END OF SECTION
SECTION 260413 - COMMON SUBMITTAL REQUIREMENTS FOR ELECTRICAL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Supplementary administrative and procedural requirements for submitting Shop Drawings, Product Data, Samples, and other submittals specific to the work of this Division.

B. Related Requirements:
   1. Division 01 submittal requirements.

1.3 DEFINITIONS

A. Contractor: Refers to an entity in direct Contract with the Owner to furnish and/or perform any portion of the Work of the Contract.
   1. Contractor shall review and approve Product Submittals prior to forwarding them to the Architect.

B. Product Submittals: In general, Product Submittals show characteristics of the proposed construction in one of the following forms:
   1. Shop Drawings.
   2. Product Data.
   3. Samples.

C. Action Submittals: Written and graphic information and physical samples that require Architect/Engineer's responsive action. Action submittals are those submittals indicated in individual Specification Sections as "action submittals."

D. Sustainable Design Submittals: Submittals required by Section 01813 "Sustainable Design Requirements." Submit documentation for products and materials contributing to achievement of LEED rating indicated. Sustainable Design Submittals are in addition to other submittal requirements.

E. Informational Submittals: Written and graphic information and physical samples that do not require Architect/Engineer's responsive action. Submittals may be rejected for not complying with requirements. Informational submittals are those submittals indicated in individual Specification Sections as "informational submittals."

F. Submittal Review Sheet: Specific form required to accompany each submittal. Obtain Submittal Review Sheet from the SmithGroup Project Manager.
1.4 SUBMITTAL ADMINISTRATIVE REQUIREMENTS

A. Requirements specified for submittals are intended to provide efficient handling, while permitting review responsibilities to be carried out.

B. Avoidable Resubmittals: The first two reviews of each specified submittal will be processed without cost to the Contractor. After the second review, the Owner may charge the Contractor for the cost of such additional processing, unless the processing results from approved Change Orders causing revisions to previously approved submittals.

C. Coordination: Coordinate preparation and processing of submittals with performance of construction activities.
   1. Coordinate each submittal with fabrication, purchasing, testing, delivery, other submittals, and related activities that require sequential activity.
   2. Submit all submittal items required for each Specification Section concurrently unless partial submittals for portions of the Work are indicated on approved submittal schedule.
   3. Submit action submittals and informational submittals required by the same Specification Section as separate packages under separate transmittals.
   4. Coordinate transmittal of different types of submittals for related parts of the Work so processing will not be delayed because of need to review submittals concurrently for coordination.
      a. Architect and Engineer reserve the right to withhold action on a submittal requiring coordination with other submittals until related submittals are received.

D. Processing Time: Allow time for submittal review, including time for resubmittals, as follows. Time for review shall commence on Architect's receipt of submittal. No extension of the Contract Time will be authorized because of failure to transmit submittals enough in advance of the Work to permit processing, including resubmittals.
   1. Refer to Section 01330 for quantity of days allowed for review.
   2. When a large volume of submittal materials is scheduled, additional review time may be required. Similarly, a particular submittal may require review completion in less than the agreed normal time. Due to variations in submittal volume and processing needs, agreed review time is not intended to apply to extreme conditions.

E. Maintain at the Project Site ready access to the latest reviewed Shop Drawings and Product Data, and one set of samples.

PART 2 - PRODUCTS

2.1 SUSTAINABLE DESIGN REQUIREMENTS

A. The District requires the Contractor to implement practices and procedures to meet the project's environmental performance goals. The Contractor shall ensure that the minimum requirements related to these goals, as defined in Section 01813 "Sustainable Design Requirements" are implemented to the fullest extent possible. Specific materials and systems have been selected to this end. Substitutions, or other changes to the work proposed by the Contractor or their Subcontractors, shall not be allowed if such changes compromise the aforementioned environmental goals and LEED certification.
B. Specific material goals, beyond inherently designed facility service systems, that may impact this area of work include: use of products with third-party verified Environmental Product Declaration, use of products with Health Product Declarations, use of products from manufacturers with publicly disclosed Corporate Sustainability Reports, use of products with recycled-content materials; use of locally-purchased, manufactured and extracted materials; use of FSC certified wood; use of low-emitting materials; construction waste recycling; and the implementation of a construction indoor air quality management plan.

PART 3 - EXECUTION

3.1 CONTRACTOR'S REVIEW

A. Project Closeout and Maintenance Material Submittals: See requirements in Division 01.

B. Be responsible for quantities, weights, and dimensions to be confirmed and correlated at the site; for information that pertains solely to the fabrication processes and to the means, methods, techniques, sequences, and procedures of construction; and for coordination of the work of every trade, supplier, and subcontractor.

C. Be responsible for each submittal to be in conformance with information given and the design intent expressed in the Contract Documents.

D. Provide with each submittal specific written notice of any variation from the requirements of the Contract Documents by causing a specific notation to be made on the Submittal Review Sheet and Submittal Transmittal. Changes to the approved construction documents are subject to DSA review and approval, submitted by the Architect as a CCD per DSA IR A-6.

3.2 ARCHITECT/ENGINEER'S AND GENERAL CONTRACTOR'S ACTION

A. General: Architect will not review submittals that do not include the Submittal Review Sheet.

B. Action Submittals: Architect's staff and consultants will review the submittal, and mark the Submittal Review Sheet with an action code. The code meanings are described below.

C. Additional codes may be provided within comments or as an electronic submittal review stamp and shall be used in help indicating return of partial submittals.

E. Review Code meanings are as follows:
   1. Action Codes Permitting Use:
      a. When an action code permitting use is assigned to a submittal, it does not authorize work that does not comply with the requirements of the Contract Documents. Acceptance of the Work will depend on compliance.
      b. Code AP - Approved: The Work covered by the submittal item may proceed, provided it complies with Contract Document requirements.
      c. Code AN - Approved as Noted: The Work covered by the submittal item may proceed, provided it complies with the Architect's notations and Contract Document requirements.
d. Code AN-R - Approved as Noted - Resubmit: Do not deliver or install the related work until the resubmittal has received Code AP or AN. However, fabrication and other off-site work covered by the submittal item may proceed, at the Contractor's risk, provided it complies with the Architect's notations and Contract Document requirements.

2. Action Code Prohibiting Use:
   a. Action Code REJ - Not Approved: The Work covered by the submittal item, including purchasing, fabrication, delivery, and other activity, shall not proceed. Revise the submittal item or prepare a new item in accordance with the Architect's notations. Resubmit the corrected or new item without delay; do not permit submittal items marked "Not Approved" to be used. Work incorporating such items will be rejected.

3. Action Code for Items Not Required:
   a. Action Code X - Not Requested by Contract Documents: The submittal item is not called for by the Contract Documents and is being returned unreviewed by the Architect except to the extent necessary to determine its status.

F. Informational Submittals: For Architect's information only. Architect will review each submittal and will not return it, or will return it if it does not comply with requirements. Architect will forward each submittal to appropriate party.

   1. Action Code for Information Only:
      a. Action Code INF - Information Only - Received: The submittal item is not called for a return with a reviewed action code by the Contract Documents and is being returned un-reviewed by the Architect except to the extent necessary to determine its status.

G. Partial submittals prepared for a portion of the Work will be reviewed when use of partial submittals has received prior approval from Architect.

H. Incomplete submittals are not acceptable, will be considered non-responsive, and will be returned without review.

I. Architect will return without review or discard submittals received from sources other than the Contractor.

J. Submittals not required by the Contract Documents may be returned by the Architect without action.

   1. Do not submit Material Safety Data Sheets. They will be returned without review or discarded.

3.3 SUBMITTAL TRANSMITTAL REQUIREMENTS

A. Submittal Transmittal shall be a PDF file in electronic format. It is recommended, to expedite the submittal review, the electronic form be emailed for review to the Architect as early as possible.

   1. Submittal Numbering: See below.
   2. Contact Information: Full Name, Phone Number and Email Address.

B. Submittal Definition

   1. Each submittal consists of items from only ONE Specifications section.
2. **Complete Submittal:** If ALL the items required by the Specifications section are listed on one Submittal Form (including continuation sheet), it is a complete submittal.

3. **Partial Submittals:** If it is necessary to divide the required items of a given Specifications section into two or more submittals to meet schedule or handling requirements, the separate submittals are partial submittals. All partial submittals have the same submittal number, and are differentiated by sequential P-numbers (see below).

4. All items in each submittal, whether complete or partial, will be processed together: Individual items will not be 'broken out' for special handling. Arrange submittals accordingly.

C. **Submittal Numbering**

1. Number submittals as described below to assist tracking.

2. Number each submittal in the format nnnnnn-nn.
   a. The 6-digit number is the number of the section that requires the submittal. For example, 044200.
   b. The 2-digit number is based on the numerical sequence of submittals from that section. In other words, for each section, the first submittal is 01, the second is 02, and so on. The 2-digit number does not change for partial or re-submittals, so that the submittal can be tracked.
   c. P-Number for Partial Submittals: Number each partial submittal in the pee space, beginning with P1, and increasing by one for each partial submittal of that submittal. If the submittal is a complete submittal, leave the P space blank.
   d. R-Number for Re-submittals: Number each re-submittal in the arr space, beginning with R1, and increasing by one for each re-submittal of that submittal. Do not include an R-Number for the initial submittal.
   e. Examples:

3.4 **SUBMITTAL REVIEW SHEET REQUIREMENTS**

A. Provide Submittal Review Sheet in PDF format. Submit as the page after the Submittal Transmittal.

B. When attached, the Submittal Review Sheet shall not obscure information contained in the submittal.

C. Do not edit any of the information contained within the Submittal Review Sheet except as follows:
   1. Submittal Number: See Submittal Numbering in Submittal Transmittal Requirements paragraph.

D. The Contractor shall submit the PDF file in a manner that will allow editing of the Submittal Review Sheet fields by SmithGroup and its consultants.

END OF SECTION
SECTION 260513 - MEDIUM-VOLTAGE CABLES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes cables and related cable splices, terminations, and accessories for medium-voltage (2001 to 35,000 V) electrical distribution systems.

1.3 DEFINITIONS

A. Jacket: A continuous nonmetallic outer covering for conductors or cables.

C. Sheath: A continuous metallic covering for conductors or cables.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of cable. Include splices and terminations for cables and cable accessories.

B. Samples: 16-inch lengths for each type of cable specified.

1.5 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Indicate location of each cable, splice, and termination.

B. Qualification Data: For Installer.

C. Material Certificates: For each type of cable and accessory.

D. Design Data: Cable pulling calculations, including conduit size and fill percentage, pulling tensions, cable sidewall pressure, jam probability, voltage drop, and ground wire sizing for each cable.

E. Source quality-control reports.

F. Field quality-control reports.
1.6 QUALITY ASSURANCE
   A. Installer: Engage a cable splicer, trained and certified by splice material manufacturer, to install, splice, and terminate medium-voltage cable.
   B. Testing Agency Qualifications: Member Company of NETA or an NRTL.
      1. Testing Agency's Field Supervisor: Certified by NETA to supervise on-site testing.

1.7 FIELD CONDITIONS
   A. Interruption of Existing Electric Service: Do not interrupt electric service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary electric service according to requirements indicated:
      1. Notify Construction Manager no fewer than five days in advance of proposed interruption of electric service.
      2. Do not proceed with interruption of electric service without Owner's written permission.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION
   A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
   B. Comply with IEEE C2 and NFPA 70.
   C. Source Limitations: Obtain cables and accessories from single source from single manufacturer.

2.2 CABLES
   A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      1. Aetna Insulated Wire, Inc.
      2. Kerite Co. (The).
      3. Okonite Company (The).
   B. Cable Type: Type MV 105.
   C. Conductor Insulation: Ethylene-propylene rubber.
      1. Voltage Rating: 15 kV.
      2. Insulation Thickness: 133 percent insulation level.
   D. Conductor: Copper.
   E. Comply with UL 1072, AEIC CS8, ICEA S-93-639/NEMA WC 74, and ICEA S-97-682.
   F. Conductor Stranding: Compact round, concentric lay, Class B.
G. Shielding: Copper tape, helically applied over semiconducting insulation shield. Minimum of 25% overlap.

H. Cable Jacket: Sunlight-resistant PVC.

2.3 CONNECTORS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. 3M.

B. Comply with ANSI C119.4 for connectors between aluminum conductors or for connections between aluminum to copper conductors.

2.4 SEPARABLE INSULATED CONNECTORS

A. Description: Modular system, complying with IEEE 386, with disconnecting, single-pole, cable terminators and with matching, stationary, plug-in, dead-front terminals designed for cable voltage and for sealing against moisture.

B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. 3M.
   3. Raychem; TE Connectivity.

C. Terminations at Distribution Points: Modular type, consisting of terminators installed on cables and modular, dead-front, terminal junctions for interconnecting cables.

D. Dead-Break Cable Terminators: Elbow-type unit with 600-A continuous-current rating; designed for de-energized disconnecting and connecting; coordinated with insulation diameter, conductor size, and material of cable being terminated. Include test point on terminator body that is capacitance coupled.

E. Dead-Front Terminal Junctions: Modular bracket-mounted groups of dead-front stationary terminals that mate and match with above cable terminators. Two-, three-, or four-terminal units as indicated, with fully rated, insulated, watertight conductor connection between terminals and complete with grounding lug, manufacturer's standard accessory stands, stainless-steel mounting brackets, and attaching hardware.
   1. Protective Cap: Insulating, electrostatic-shielding, water-sealing cap with drain wire.
   2. Portable Feed-Through Accessory: Two-terminal, dead-front junction arranged for removable mounting on accessory stand of stationary terminal junction.
   3. Grounding Kit: Jumpered elbows, portable feed-through accessory units, protective caps, test rods suitable for concurrently grounding three phases of feeders and carrying case.
2.5 MEDIUM-VOLTAGE TAPES

A. Description: Electrical grade, insulating tape rated for medium voltage application.

B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. 3M.
   3. Raychem; TE Connectivity.

C. Ethylene/propylene rubber-based, 30-mil splicing tape, rated for 130 deg C operation. Minimum 3/4 inch wide.

D. Silicone rubber-based, 12-mil self-fusing tape, rated for 130 deg C operation. Minimum 1-1/2 inches (38 mm) wide.

2.6 ARC-PROOFING MATERIALS

A. Description: Fire retardant, providing arc flash protection.

B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. 3M.
   3. Raychem; TE Connectivity.

C. Tape for First Course on Metal Objects: 10-mil-thick, corrosion-protective, moisture-resistant, PVC pipe-wrapping tape.

D. Arc-Proofing Tape: Fireproof tape, flexible, conformable, intumescent to 0.3 inch thick, and compatible with cable jacket.

E. Glass-Cloth Tape: Pressure-sensitive adhesive type, 1 inch wide.

2.7 FAULT INDICATORS

A. Indicators: Manually reset fault indicator with inrush restraint feature, arranged to clamp to cable sheath and provide a display after a fault has occurred in cable. Instrument shall not be affected by heat, moisture, and corrosive conditions and shall be recommended by manufacturer for installation conditions.
2.8 SOURCE QUALITY CONTROL

A. Test and inspect cables according to ICEA S-97-682 before shipping.

B. Test strand-filled cables for water-penetration resistance according to ICEA T-31-610, using a test pressure of 5 psig.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install cables according to IEEE 576.

B. Proof conduits prior to conductor installation by passing a wire brush mandrel and then a rubber duct swab through the conduit. Separate the wire brush and the rubber swab by 48 to 72 inches on the pull rope.
   1. Wire Brush Mandrel: Consists of a length of brush approximately the size of the conduit inner diameter with stiff steel bristles and an eye on each end for attaching the pull ropes. If an obstruction is felt, pull the brush back and forth repeatedly to break up the obstruction.
   2. Rubber Duct Swab: Consists of a series of rubber discs approximately the size of the conduit inner diameter on a length of steel cable with an eye on each end for attaching the pull ropes. Pull the rubber duct swab through the duct to extract loose debris from the duct.

C. Pull Conductors: Do not exceed manufacturer’s recommended maximum pulling tensions and sidewall pressure values.
   1. Where necessary, use manufacturer-approved pulling compound or lubricant that does not deteriorate conductor or insulation.
   2. Use pulling means, including fish tape, cable, rope, and basket-weave cable grips, that do not damage cables and raceways. Do not use rope hitches for pulling attachment to cable.
   3. Use pull-in guides, cable feeders, and draw-in protectors as required to protect cables during installation.
   4. Do not pull cables with ends unsealed. Seal cable ends with rubber tape.

D. Support cables according to Section 26-05-29 "Hangers and Supports for Electrical Systems."

E. Install "buried-cable" warning tape 12 inches above cables.

F. In manholes, handholes, pull boxes, junction boxes, and cable vaults, train cables around walls by the longest route from entry to exit; support cables at intervals adequate to prevent sag.

G. Install sufficient cable length to remove cable ends under pulling grips. Remove length of conductor damaged during pulling.

H. Install cable splices at pull points and elsewhere as indicated; use standard kits.

I. Install separable insulated-connector components as follows:
   1. Protective Cap: At each terminal junction, with one on each terminal to which no feeder is indicated to be connected.
2. Portable Feed-Through Accessory: At each terminal junction, with one on each terminal.
3. Standoff Insulator: At each terminal junction, with one on each terminal.

J. Arc Proofing: Unless otherwise indicated, arc proof medium-voltage cable at locations not protected by conduit, cable tray, direct burial, or termination materials. In addition to arc-proofing tape manufacturer's written instructions, apply arc proofing as follows:
1. Clean cable sheath.
2. Wrap metallic cable components with 10-mil pipe-wrapping tape.
3. Smooth surface contours with electrical insulation putty.
4. Apply arc-proofing tape in one half-lapped layer with coated side toward cable.
5. Band arc-proofing tape with two layers of 1-inch-wide half-lapped, adhesive, glass-cloth tape at each end of the arc-proof tape.

K. Seal around cables passing through fire-rated elements according to Section 07 84 13 "Penetration Firestopping."

L. Install fault indicators on each phase where indicated.

M. Ground shields of shielded cable at terminations, splices, and separable insulated connectors. Ground metal bodies of terminators, splices, cable and separable insulated-connector fittings, and hardware.

N. Identify cables according to Section 26 05 53 "Identification for Electrical Systems." Identify phase and circuit number of each conductor at each splice, termination, pull point, and junction box. Arrange identification so that it is unnecessary to move the cable or conductor to read the identification.

3.2 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Perform the following tests and inspections with the assistance of a factory-authorized service representative:
1. Perform each visual and mechanical inspection and electrical test stated in NETA ATS. Certify compliance with test parameters.
2. After installing medium-voltage cables and before electrical circuitry has been energized, test for compliance with requirements.
3. Perform direct-current High Potential test of each new conductor according to NETA ATS, Ch. 7.3.3. Do not exceed cable manufacturer's recommended maximum test voltage.
4. Perform Partial Discharge test of each new conductor according to NETA ATS, Ch. 7.3.3 and to test equipment manufacturer's recommendations.
5. Perform Dissipation Factor test of each new conductor according to NETA ATS, Ch. 7.3.3 and to test equipment manufacturer's recommendations.

C. Medium-voltage cables will be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports.

END OF SECTION
 SECTION 260519 - LOW-VOLTAGE ELECTRICAL POWER CONDUCTORS AND CABLES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Copper building wire rated 600 V or less.
   2. Metal-clad cable, Type MC, rated 600 V or less.
   3. Armored cable, Type AC, rated 600 V or less.
   4. Tray cable, Type TC, rated 600 V or less.
   5. Connectors, splices, and terminations rated 600 V and less.

B. Related Requirements:
   1. Section 26 05 13 "Medium-Voltage Cables" for single-conductor and multiconductor cables, cable splices, and terminations for electrical distribution systems with 601 to 35,000 V.
   2. Section 27 13 13 "Communications Copper Backbone Cabling" for twisted pair cabling used for data circuits.
   3. Section 27 15 13 "Communications Copper Horizontal Cabling" for twisted pair cabling used for data circuits.

1.3 DEFINITIONS

A. RoHS: Restriction of Hazardous Substances.

B. VFC: Variable-frequency controller.

1.4 ACTION SUBMITTALS

A. Product Schedule: Indicate type, use, location, and termination locations.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For testing agency.

B. Field quality-control reports.

1.6 QUALITY ASSURANCE

A. Testing Agency Qualifications: Member Company of NETA.
   1. Testing Agency's Field Supervisor: Certified by NETA to supervise on-site testing.
PART 2 - PRODUCTS

2.1 COPPER BUILDING WIRE

A. Description: Flexible, insulated and uninsulated, drawn copper current-carrying conductor with an overall insulation layer or jacket, or both, rated 600 V or less.

B. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
   1. Alpha Wire Company.
   2. American Bare Conductor.
   3. Belden Inc.
   4. Cerro Wire LLC.
   5. Encore Wire Corporation.
   6. General Cable Technologies Corporation.
   7. Okonite Company (The).
   8. Service Wire Co.
   10. WESCO.

C. Standards:
   1. Listed and labeled as defined in CEC 70, by a qualified testing agency, and marked for intended location and use.
   2. RoHS compliant.
   3. Conductor and Cable Marking: Comply with wire and cable marking according to UL's "Wire and Cable Marking and Application Guide."

D. Conductors: Copper, complying with ASTM B 3 for bare annealed copper and with ASTM B 8 for stranded conductors.

E. Conductor Insulation:
   1. Type THHN and Type THWN-2: Comply with UL 83.
   2. Type THW and Type THW-2: Comply with NEMA WC-70/ICEA S-95-658 and UL 83.
   3. Type XHHW-2: Comply with UL 44.

2.2 ARMORED CABLE, TYPE AC

A. Description: A factory assembly of insulated current-carrying conductors with or without an equipment grounding conductor in an overall metallic sheath.

B. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
   1. Alpha Wire Company.
   2. American Bare Conductor.
   3. Belden Inc.
   4. Cerro Wire LLC.
   5. Encore Wire Corporation.
   6. General Cable Technologies Corporation.
   7. Okonite Company (The).
   8. Service Wire Co.
   10. WESCO.
C. Standards:
1. Listed and labeled as defined in CEC 70, by a qualified testing agency, and marked for intended location and use.
2. RoHS compliant.
4. Conductor and Cable Marking: Comply with wire and cable marking according to UL's "Wire and Cable Marking and Application Guide."

D. Circuits:

E. Conductors: Copper, complying with ASTM B 3 for bare annealed copper and with ASTM B 8 for stranded conductors.

F. Ground Conductor: Insulated.

G. Conductor Insulation: Type THHN/THWN-2. Comply with UL 83. Temperature rating of conductors’ size #8 and lower 70 Degree C and size #6 and larger 90 Degree C.

H. Armor: Steel, interlocked.

2.3 CONNECTORS AND SPLICES

A. Description: Factory-fabricated connectors, splices, and lugs of size, ampacity rating, material, type, and class for application and service indicated; listed and labeled as defined in CEC 70, by a qualified testing agency, and marked for intended location and use.

B. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
1. 3M Electrical Products.
2. AFC Cable Systems; a part of Atkore International.
5. Ideal Industries, Inc.
6. ILSCO.
7. NSI Industries LLC.
8. O-Z/Gedney; a brand of Emerson Industrial Automation.
10. TE Connectivity Ltd.
11. Thomas & Betts Corporation; A Member of the ABB Group.

C. Jacketed Cable Connectors: For steel and aluminum jacketed cables, zinc die-cast with set screws, designed to connect conductors specified in this Section.

D. Lugs: One piece, seamless, designed to terminate conductors specified in this Section.
1. Material: Copper.
2. Type: Two hole with long barrels.
3. Termination: Crimp.
PART 3 - EXECUTION

3.1 CONDUCTOR MATERIAL APPLICATIONS

A. Feeders: Copper; solid for No. 10 AWG and smaller; stranded for No. 8 AWG and larger.

B. Feeders: Copper for feeders smaller than No. 4 AWG; copper for feeders No. 4 AWG and larger. Conductors shall be solid for No. 10 AWG and smaller; stranded for No. 8 AWG and larger.

C. Branch Circuits: Copper. Solid for No. 12 AWG and smaller; stranded for No. 10 AWG and larger.

D. VFC Output Circuits Cable: Extra-flexible stranded for all sizes.

3.2 CONDUCTOR INSULATION AND MULTICONDUCTOR CABLE APPLICATIONS AND WIRING METHODS

A. Service Entrance: Type THHN/THWN-2, single conductors in raceway.

B. Exposed Feeders: Type THHN/THWN-2, single conductors in raceway.

C. Feeders Concealed in Ceilings, Walls, Partitions, and Crawlspace: Type THHN/THWN-2, single conductors in raceway.

D. Feeders Concealed in Concrete, below Slabs-on-Grade, and Underground: Type THHN/THWN-2, single conductors in raceway.

E. Feeders Installed below Raised Flooring: Type THHN/THWN-2, single conductors in raceway.

F. Exposed Branch Circuits, Including in Crawlspace: Type THHN/THWN-2, single conductors in raceway.

G. Branch Circuits Concealed in Ceilings, Walls, and Partitions: Type THHN/THWN-2, single conductors in raceway.

H. Branch Circuits Concealed in Concrete, below Slabs-on-Grade, and Underground: Type THHN/THWN-2, single conductors in raceway.

I. Cord Drops and Portable Appliance Connections: Type SO, hard service cord with stainless-steel, wire-mesh, strain relief device at terminations to suit application.

J. VFC Output Circuits: Type XHHW-2 in metal conduit Type TC-ER cable with braided shield.

3.3 INSTALLATION OF CONDUCTORS AND CABLES

A. Conceal cables in finished walls, ceilings, and floors unless otherwise indicated.
B. Complete raceway installation between conductor and cable termination points according to Section 26 05 33 "Raceways and Boxes for Electrical Systems" prior to pulling conductors and cables.

C. Use manufacturer-approved pulling compound or lubricant where necessary; compound used must not deteriorate conductor or insulation. Do not exceed manufacturer's recommended maximum pulling tensions and sidewall pressure values.

D. Use pulling means, including fish tape, cable, rope, and basket-weave wire/cable grips, that will not damage cables or raceway.

E. Install exposed cables parallel and perpendicular to surfaces of exposed structural members, and follow surface contours where possible.

F. Support cables according to Section 26 05 29 "Hangers and Supports for Electrical Systems."

G. Complete cable tray systems installation according to Section 26 05 36 "Cable Trays for Electrical Systems" prior to installing conductors and cables.

3.4 CONNECTIONS

A. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B.

B. Make splices, terminations, and taps that are compatible with conductor material and that possess equivalent or better mechanical strength and insulation ratings than unsheathed conductors.
   1. Use oxide inhibitor in each splice, termination, and tap for aluminum conductors.

C. Wiring at Outlets: Install conductor at each outlet, with at least 12 inches of slack.

3.5 IDENTIFICATION

A. Identify and color-code conductors and cables according to Section 26 05 53 "Identification for Electrical Systems."

B. Identify each spare conductor at each end with identity number and location of other end of conductor and identify as spare conductor.

3.6 SLEEVE AND SLEEVE-SEAL INSTALLATION FOR ELECTRICAL PENETRATIONS

A. Install sleeves and sleeve seals at penetrations of exterior floor and wall assemblies. Comply with requirements in Section 26 05 44 "Sleeves and Sleeve Seals for Electrical Raceways and Cabling."

3.7 FIRESTOPPING

A. Apply firestopping to electrical penetrations of fire-rated floor and wall assemblies to restore original fire-resistance rating of assembly according to Section 07 84 13 "Penetration Firestopping."
3.8 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Perform tests and inspections.
   1. After installing conductors and cables and before electrical circuitry has been energized, test service entrance and feeder conductors for compliance with requirements.
   2. Perform each of the following visual and electrical tests:
      a. Inspect exposed sections of conductor and cable for physical damage and correct connection according to the single-line diagram.
      b. Test bolted connections for high resistance using one of the following:
         1) A low-resistance ohmmeter.
         2) Calibrated torque wrench.
         3) Thermographic survey.
      c. Inspect compression-applied connectors for correct cable match and indentation.
      d. Inspect for correct identification.
      e. Inspect cable jacket and condition.
      f. Insulation-resistance test on each conductor for ground and adjacent conductors. Apply a potential of 500-V dc for 300-V rated cable and 1000-V dc for 600-V rated cable for a one-minute duration.
      g. Continuity test on each conductor and cable.
      h. Uniform resistance of parallel conductors.

   3. Initial Infrared Scanning: After Substantial Completion, but before Final Acceptance, perform an infrared scan of each splice in conductors No. 3 AWG and larger. Remove box and equipment covers so splices are accessible to portable scanner. Correct deficiencies determined during the scan.
      a. Instrument: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
      b. Record of Infrared Scanning: Prepare a certified report that identifies switches checked and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

   4. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each switch 11 months after date of Substantial Completion.

C. Cables will be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports to record the following:
   1. Procedures used.
   2. Results that comply with requirements.
   3. Results that do not comply with requirements, and corrective action taken to achieve compliance with requirements.

END OF SECTION
SECTION 260526 GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes grounding and bonding systems and equipment, plus the following special applications:
   1. Underground distribution grounding.
   2. Ground bonding common with lightning protection system.
   3. Foundation steel electrodes.

1.3 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Plans showing dimensioned locations of grounding features specified in "Field Quality Control" Article, including the following:
   1. Test wells.
   2. Ground rods.
   3. Ground rings.
   4. Grounding arrangements and connections for separately derived systems.

B. Qualification Data: For testing agency and testing agency's field supervisor.

C. Field quality-control reports.

1.4 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For grounding to include in emergency, operation, and maintenance manuals.
   1. In addition to items specified in Section 01785 "Operation and Maintenance Data," include the following:
      a. Plans showing as-built, dimensioned locations of grounding features specified in "Field Quality Control" Article, including the following:
         1) Test wells.
         2) Ground rods.
         3) Ground rings.
         4) Grounding arrangements and connections for separately derived systems.
      b. Instructions for periodic testing and inspection of grounding features at test wells and grounding connections for separately derived systems based on NETA MTS and NFPA 70B.
         1) Tests shall determine if ground-resistance or impedance values remain within specified maximums, and instructions shall recommend corrective action if values do not.
         2) Include recommended testing intervals.
PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in CEC 70, by a qualified testing agency, and marked for intended location and application.

B. Comply with UL 467 for grounding and bonding materials and equipment.

2.2 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
   1. Burndy; Part of Hubbell Electrical Systems.
   2. ERICO International Corporation.
   3. ILSCO.
   4. O-Z/Gedney; a brand of Emerson Industrial Automation.
   5. SIEMENS Industry, Inc.; Energy Management Division.
   6. Thomas & Betts Corporation; A Member of the ABB Group.

2.3 CONDUCTORS

A. Insulated Conductors: Copper wire or cable insulated for 600 V unless otherwise required by applicable Code or authorities having jurisdiction.

B. Bare Copper Conductors:
   4. Bonding Conductor: No. 4 or No. 6 AWG, stranded conductor.
   5. Bonding Jumper: Copper tape, braided conductors terminated with copper ferrules; 1-5/8 inches wide and 1/16 inch thick.
   6. Tinned Bonding Jumper: Tinned-copper tape, braided conductors terminated with copper ferrules; 1-5/8 inches wide and 1/16 inch thick.

C. Grounding Bus: Predrilled rectangular bars of annealed copper, 1/4 by 4 inches in cross section, with 9/32-inch holes spaced 1-1/8 inches apart. Stand-off insulators for mounting shall comply with UL 891 for use in switchboards, 600 V and shall be Lexan or PVC, impulse tested at 5000 V.

2.4 CONNECTORS

A. Listed and labeled by an NRTL acceptable to authorities having jurisdiction for applications in which used and for specific types, sizes, and combinations of conductors and other items connected.

B. Welded Connectors: Exothermic-welding kits of types recommended by kit manufacturer for materials being joined and installation conditions.

C. Bus-Bar Connectors: Mechanical type, cast silicon bronze, solderless compression-type wire terminals, and long-barrel, two-bolt connection to ground bus bar.
D. Beam Clamps: Mechanical type, terminal, ground wire access from four directions, with dual, tin-plated or silicon bronze bolts.

E. Cable-to-Cable Connectors: Compression type, copper or copper alloy.

F. Cable Tray Ground Clamp: Mechanical type, zinc-plated malleable iron.

G. Conduit Hubs: Mechanical type, terminal with threaded hub.

H. Ground Rod Clamps: Mechanical type, copper or copper alloy, terminal with hex head bolt.

I. Ground Rod Clamps: Mechanical type, copper or copper alloy, terminal with hex head bolt.

J. Lay-in Lug Connector: Mechanical type, copper rated for direct burial terminal with set screw.

K. Signal Reference Grid Clamp: Mechanical type, stamped-steel terminal with hex head screw.

L. Straps: Solid copper, cast-bronze clamp. Rated for 600 A.

M. Tower Ground Clamps: Mechanical type, copper or copper alloy, terminal two-piece clamp.

N. U-Bolt Clamps: Mechanical type, copper or copper alloy, terminal listed for direct burial.

O. Water Pipe Clamps:
   1. Mechanical type, two pieces with zinc-plated bolts.
      b. Listed for direct burial.
   2. U-bolt type with malleable-iron clamp and copper ground connector rated for direct burial.

2.5 GROUNDING ELECTRODES

A. Ground Rods: Copper-clad steel; 3/4 inch by 10 feet.

B. Ground Plates: 1/4 inch thick, hot-dip galvanized.

PART 3 - EXECUTION

3.1 APPLICATIONS

A. Conductors: Install solid conductor for No. 8 AWG and smaller, and stranded conductors for No. 6 AWG and larger unless otherwise indicated.

B. Underground Grounding Conductors: Install barecopper conductor, No. 2/0 AWG minimum.
   1. Bury at least 24 inches below grade.
   2. Duct-Bank Grounding Conductor: Bury 12 inches above duct bank when indicated as part of duct-bank installation.

C. Isolated Grounding Conductors: Green-colored insulation with continuous yellow stripe. On feeders with isolated ground, identify grounding conductor where visible to normal inspection, with alternating bands of green and yellow tape, with at least three bands of green and two bands of yellow.
D. Grounding Bus: Install in electrical equipment rooms, in rooms housing service equipment, and elsewhere as indicated.
   1. Install bus horizontally, on insulated spacers 2 inches minimum from wall, 6 inches above finished floor unless otherwise indicated.
   2. Where indicated on both sides of doorways, route bus up to top of door frame, across top of doorway, and down; connect to horizontal bus.

E. Conductor Terminations and Connections:
   1. Pipe and Equipment Grounding Conductor Terminations: Bolted connectors.
   2. Underground Connections: Welded connectors except at test wells and as otherwise indicated.
   3. Connections to Ground Rods at Test Wells: Bolted connectors.

3.2 GROUNDING AT THE SERVICE

A. Equipment grounding conductors and grounding electrode conductors shall be connected to the ground bus. Install a main bonding jumper between the neutral and ground buses.

3.3 GROUNDING SEPARATELY DERIVED SYSTEMS

A. Generator: Install grounding electrode(s) at the generator location. The electrode shall be connected to the equipment grounding conductor and to the frame of the generator.

3.4 GROUNDING UNDERGROUND DISTRIBUTION SYSTEM COMPONENTS

A. Comply with IEEE C2 grounding requirements.

B. Grounding Manholes and Handholes: Install a driven ground rod through manhole or handhole floor, close to wall, and set rod depth so 4 inches will extend above finished floor. If necessary, install ground rod before manhole is placed and provide No. 1/0 AWG bare, tinned-copper conductor from ground rod into manhole through a waterproof sleeve in manhole wall. Protect ground rods passing through concrete floor with a double wrapping of pressure-sensitive insulating tape or heat-shrunk insulating sleeve from 2 inches above to 6 inches below concrete. Seal floor opening with waterproof, nonshrink grout.

C. Grounding Connections to Manhole Components: Bond exposed-metal parts such as inserts, cable racks, pulling irons, ladders, and cable shields within each manhole or handhole, to ground rod or grounding conductor. Make connections with No. 4 AWG minimum, stranded, hard-drawn copper bonding conductor. Train conductors level or plumb around corners and fasten to manhole walls. Connect to cable armor and cable shields according to written instructions by manufacturer of splicing and termination kits.
