D. Pad-Mounted Transformers and Switches: Install two ground rods and ground ring around the pad. Ground pad-mounted equipment and noncurrent-carrying metal items associated with substations by connecting them to underground cable and grounding electrodes. Install tinned-copper conductor not less than No. 2 AWG for ground ring and for taps to equipment grounding terminals. Bury ground ring not less than 6 inches from the foundation.
3.5   EQUIPMENT GROUNDING

A. Install insulated equipment grounding conductors with all feeders and branch circuits.

B. Air-Duct Equipment Circuits: Install insulated equipment grounding conductor to duct-mounted electrical devices operating at 120 V and more, including air cleaners, heaters, dampers, humidifiers, and other duct electrical equipment. Bond conductor to each unit and to air duct and connected metallic piping.

C. Water Heater: Install a separate insulated equipment grounding conductor to each electric water heater and heat-tracing cable. Bond conductor to heater units, piping, connected equipment, and components.

D. Isolated Grounding Receptacle Circuits: Install an insulated equipment grounding conductor connected to the receptacle grounding terminal. Isolate conductor from raceway and from panelboard grounding terminals. Terminate at equipment grounding conductor terminal of the applicable derived system or service unless otherwise indicated.

E. Isolated Equipment Enclosure Circuits: For designated equipment supplied by a branch circuit or feeder, isolate equipment enclosure from supply circuit raceway with a nonmetallic raceway fitting listed for the purpose. Install fitting where raceway enters enclosure, and install a separate insulated equipment grounding conductor. Isolate conductor from raceway and from panelboard grounding terminals. Terminate at equipment grounding conductor terminal of the applicable derived system or service unless otherwise indicated.

F. Poles Supporting Outdoor Lighting Fixtures: Install grounding electrode and a separate insulated equipment grounding conductor in addition to grounding conductor installed with branch-circuit conductors.

G. Metallic Fences: Comply with requirements of IEEE C2.
   1. Grounding Conductor: Bare copper, not less than No. 8 AWG.
   2. Gates: Shall be bonded to the grounding conductor with a flexible bonding jumper.
   3. Barbed Wire: Strands shall be bonded to the grounding conductor.

3.6   INSTALLATION

A. Grounding Conductors: Route along shortest and straightest paths possible unless otherwise indicated or required by Code. Avoid obstructing access or placing conductors where they may be subjected to strain, impact, or damage.

B. Ground Bonding Common with Lightning Protection System: Comply with NFPA 780 and UL 96 when interconnecting with lightning protection system. Bond electrical power system ground directly to lightning protection system grounding conductor at closest point to electrical service grounding electrode. Use bonding conductor sized same as system grounding electrode conductor and install in conduit.

C. Ground Rods: Drive rods until tops are 2 inches below finished floor or final grade unless otherwise indicated.
   1. Interconnect ground rods with grounding electrode conductor below grade and as otherwise indicated. Make connections without exposing steel or damaging coating if any.
   2. Use exothermic welds for all below-grade connections.
   3. For grounding electrode system, install at least three rods spaced at least two -rod lengths from each other and located at least the same distance from other grounding electrodes, and connect to the service grounding electrode conductor.
D. Test Wells: Ground rod driven through drilled hole in bottom of handhole. Handholes are specified in Section 26 05 43 "Underground Ducts and Raceways for Electrical Systems," and shall be at least 12 inches deep, with cover.
   1. Install at least one test well for each service unless otherwise indicated. Install at the ground rod electrically closest to service entrance. Set top of test well flush with finished grade or floor.

E. Bonding Straps and Jumpers: Install in locations accessible for inspection and maintenance except where routed through short lengths of conduit.
   1. Bonding to Structure: Bond straps directly to basic structure, taking care not to penetrate any adjacent parts.
   2. Bonding to Equipment Mounted on Vibration Isolation Hangers and Supports: Install bonding so vibration is not transmitted to rigidly mounted equipment.
   3. Use exothermic-welded connectors for outdoor locations; if a disconnect-type connection is required, use a bolted clamp.

F. Grounding and Bonding for Piping:
   1. Metal Water Service Pipe: Install insulated copper grounding conductors, in conduit, from building's main service equipment, or grounding bus, to main metal water service entrances to building. Connect grounding conductors to main metal water service pipes; use a bolted clamp connector or bolt a lug-type connector to a pipe flange by using one of the lug bolts of the flange. Where a dielectric main water fitting is installed, connect grounding conductor on street side of fitting. Bond metal grounding conductor conduit or sleeve to conductor at each end.
   2. Water Meter Piping: Use braided-type bonding jumpers to electrically bypass water meters. Connect to pipe with a bolted connector.
   3. Bond each aboveground portion of gas piping system downstream from equipment shutoff valve.

G. Bonding Interior Metal Ducts: Bond metal air ducts to equipment grounding conductors of associated fans, blowers, electric heaters, and air cleaners. Install bonding jumper to bond across flexible duct connections to achieve continuity.

H. Grounding for Steel Building Structure: Install a driven ground rod at base of each corner column and at intermediate exterior columns at distances not more than 60 feet apart.

I. Ground Ring: Install a grounding conductor, electrically connected to each building structure ground rod and to each indicated item, extending around the perimeter of area or item indicated.
   1. Install tinned-copper conductor not less than No. 2/0 AWG for ground ring and for taps to building steel.
   2. Bury ground ring not less than 24 inches from building's foundation.

J. Concrete-Encased Grounding Electrode (UFER Ground): Fabricate according to CEC 70; use a minimum of 20 feet of bare copper conductor not smaller than No. 4 AWG.
   1. If concrete foundation is less than 20 feet long, coil excess conductor within base of foundation.
   2. Bond grounding conductor to reinforcing steel in at least four locations and to anchor bolts. Extend grounding conductor below grade and connect to building's grounding grid or to grounding electrode external to concrete.

K. Connections: Make connections so possibility of galvanic action or electrolysis is minimized. Select connectors, connection hardware, conductors, and connection methods so metals in direct contact are galvanically compatible.
   1. Use electroplated or hot-tin-coated materials to ensure high conductivity and to make contact points closer in order of galvanic series.
2. Make connections with clean, bare metal at points of contact.
5. Coat and seal connections having dissimilar metals with inert material to prevent future penetration of moisture to contact surfaces.

3.7 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Tests and Inspections:
1. After installing grounding system but before permanent electrical circuits have been energized, test for compliance with requirements.
2. Inspect physical and mechanical condition. Verify tightness of accessible, bolted, electrical connections with a calibrated torque wrench according to manufacturer's written instructions.
3. Test completed grounding system at each location where a maximum ground-resistance level is specified, at service disconnect enclosure grounding terminal, at ground test wells, and at individual ground rods. Make tests at ground rods before any conductors are connected.
   a. Measure ground resistance no fewer than two full days after last trace of precipitation and without soil being moistened by any means other than natural drainage or seepage and without chemical treatment or other artificial means of reducing natural ground resistance.
   b. Perform tests by fall-of-potential method according to IEEE 81.
4. Prepare dimensioned Drawings locating each test well, ground rod and ground-rod assembly, and other grounding electrodes. Identify each by letter in alphabetical order, and key to the record of tests and observations. Include the number of rods driven and their depth at each location and include observations of weather and other phenomena that may affect test results. Describe measures taken to improve test results.

C. Grounding system will be considered defective if it does not pass tests and inspections.

D. Prepare test and inspection reports.

E. Report measured ground resistances that exceed the following values:
1. Power and Lighting Equipment or System with Capacity of 500 kVA and Less: 10 ohms.
2. Power and Lighting Equipment or System with Capacity of 500 to 1000 kVA: 5 ohms.
3. Power and Lighting Equipment or System with Capacity More Than 1000 kVA: 3 ohms.
4. Power Distribution Units or Panelboards Serving Electronic Equipment: 3 ohm(s).

F. Excessive Ground Resistance: If resistance to ground exceeds specified values, notify Architect promptly and include recommendations to reduce ground resistance.

END OF SECTION
SECTION 260529 - HANGERS AND SUPPORTS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Steel slotted support systems.
   2. Aluminum slotted support systems.
   3. Nonmetallic slotted support systems.
   4. Conduit and cable support devices.
   5. Support for conductors in vertical conduit.
   6. Structural steel for fabricated supports and restraints.
   7. Mounting, anchoring, and attachment components, including powder-actuated fasteners, mechanical expansion anchors, concrete inserts, clamps, through bolts, toggle bolts, and hanger rods.
   8. Fabricated metal equipment support assemblies.

B. Related Requirements:
   1. Section 26 05 48.16 "Seismic Controls for Electrical Systems" for products and installation requirements necessary for compliance with seismic criteria.

1.3 ACTION SUBMITTALS

A. Hangers and supports are not deferred submittal nor a delegated design item. A complete design shall be provided on construction drawings.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Reflected ceiling plan(s) and other details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
   1. Suspended ceiling components.
   2. Ductwork, piping, fittings, and supports.
   3. Structural members to which hangers and supports will be attached.
   4. Items penetrating finished ceiling, including the following:
      a. Luminaires.
      b. Air outlets and inlets.
      c. Speakers.
      d. Sprinklers.
      e. Access panels.
      f. Projectors.

B. Seismic Qualification Data: Certificates, for hangers and supports for electrical equipment and systems, accessories, and components, from manufacturer.
1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Hangers and supports shall withstand the effects of earthquake motions determined according to ASCE/SEI 7. Hangers and supports are not deferred submittal nor delegated design items. Refer to details on drawings for requirements.
   1. The term "withstand" means "the supported equipment and systems will remain in place without separation of any parts when subjected to the seismic forces specified and the supported equipment and systems will be fully operational after the seismic event."
   2. Component Importance Factor: 1.5.

2.2 SUPPORT, ANCHORAGE, AND ATTACHMENT COMPONENTS

A. Steel Slotted Support Systems: Preformed steel channels and angles with minimum 13/32-inch-diameter holes at a maximum of 8 inches o.c. in at least one surface.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. Allied Tube & Conduit; a part of Atkore International.
      b. B-line, an Eaton business.
      c. Thomas & Betts Corporation; A Member of the ABB Group.
      d. Unistrut; Part of Atkore International.
   2. Standard: Comply with MFMA-4 factory-fabricated components for field assembly.
   4. Channel Width: Selected for applicable load criteria.
   5. Metallic Coatings: Hot-dip galvanized after fabrication and applied according to MFMA-4.

B. Conduit and Cable Support Devices: Steel and malleable-iron hangers, clamps, and associated fittings, designed for types and sizes of raceway or cable to be supported.

C. Support for Conductors in Vertical Conduit: Factory-fabricated assembly consisting of threaded body and insulating wedging plug or plugs for nonarmored electrical conductors or cables in riser conduits. Plugs shall have number, size, and shape of conductor gripping pieces as required to suit individual conductors or cables supported. Body shall be made of malleable iron.

D. Structural Steel for Fabricated Supports and Restraints: ASTM A 36/A 36M steel plates, shapes, and bars; black and galvanized.

E. Mounting, Anchoring, and Attachment Components: Items for fastening electrical items or their supports to building surfaces include the following:
   1. Mechanical-Expansion Anchors: Insert-wedge-type, stainless steel, for use in hardened portland cement concrete, with tension, shear, and pullout capacities appropriate for supported loads and building materials where used.
a. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
   1) Kwik Bolt TZ, by Hilti, Inc. per ICC-ES ESR-1917.
   2) Cooper B-Line Power-Stud + SD1 ICC-ES ESR-2818.

2. Concrete Inserts: Kwik HUS-EZ screw anchor and HUS-EZ1 rod hanger, by Hilti Inc. per ICC-ES ESR 3027.
3. Clamps for Attachment to Steel Structural Elements: MSS SP-58 units are suitable for attached structural element.
4. Through Bolts: Structural type, hex head, and high strength. Comply with ASTM A 325.
5. Toggle Bolts: All-steel springhead type.

2.3 FABRICATED METAL EQUIPMENT SUPPORT ASSEMBLIES

A. Description: Welded or bolted structural-steel shapes, shop or field fabricated to fit dimensions of supported equipment.

B. Materials: Comply with requirements in Section 05 50 00 "Metal Fabrications" for steel shapes and plates.

PART 3 - EXECUTION

3.1 APPLICATION

A. Comply with the following standards for application and installation requirements of hangers and supports, except where requirements on Drawings or in this Section are stricter:
   1. NECA 1.
   2. NECA 101
   3. NECA 102.
   4. NECA 105.

B. Comply with requirements in Section 07 84 13 "Penetration Firestopping" for firestopping materials and installation for penetrations through fire-rated walls, ceilings, and assemblies.

C. Comply with requirements for raceways and boxes specified in Section 26 05 33 "Raceways and Boxes for Electrical Systems."

D. Maximum Support Spacing and Minimum Hanger Rod Size for Raceways: Space supports for EMT and RMC as scheduled in NECA 1, where its Table 1 lists maximum spacings that are less than those stated in CEC 70. Minimum rod size shall be 1/4 inch in diameter.

E. Multiple Raceways or Cables: Install trapeze-type supports fabricated with steel slotted support system, sized so capacity can be increased by at least 50 percent in future without exceeding specified design load limits.
   1. Secure raceways and cables to these supports with single-bolt conduit clamps using spring friction action for retention in support channel.

F. Spring-steel clamps designed for supporting single conduits without bolts may be used for 1-1/2-inch and smaller raceways serving branch circuits and communication systems above suspended ceilings, and for fastening raceways to trapeze supports.
3.2 SUPPORT INSTALLATION

A. Comply with NECA 1 and NECA 101 for installation requirements except as specified in this article.

B. Strength of Support Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry present and future static loads within specified loading limits. Minimum static design load used for strength determination shall be weight of supported components plus 200 lb.

C. Mounting and Anchorage of Surface-Mounted Equipment and Components: Anchor and fasten electrical items and their supports to building structural elements by the following methods unless otherwise indicated by code:
   1. To Wood: Fasten with lag screws or through bolts.
   2. To New Concrete: Bolt to concrete inserts.
   3. To Existing Concrete: Expansion anchor fasteners.
   4. To Steel: Beam clamps (MSS SP-58, Type 19, 21, 23, 25, or 27), complying with MSS SP-69.
   5. To Light Steel: Sheet metal screws.
   6. Items Mounted on Hollow Walls and Nonstructural Building Surfaces: Mount cabinets, panelboards, disconnect switches, control enclosures, pull and junction boxes, transformers, and other devices on slotted-channel racks attached to substrate by means that comply with seismic-restraint strength and anchorage requirements.

D. Drill holes for expansion anchors in concrete at locations and to depths that avoid the need for reinforcing bars.

3.3 INSTALLATION OF FABRICATED METAL SUPPORTS

A. Comply with installation requirements in Section 05 50 00 "Metal Fabrications" for site-fabricated metal supports.

B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor electrical materials and equipment.

C. Field Welding: Comply with AWS D1.1/D1.1M.

3.4 CONCRETE BASES

A. Construct concrete bases of dimensions indicated, but not less than 4 inches larger in both directions than supported unit, and so anchors will be a minimum of 10 bolt diameters from edge of the base.

B. Use 3000-psi, 28-day compressive-strength concrete. Concrete materials, reinforcement, and placement requirements are specified in Section 03 30 00 "Cast-in-Place Concrete."

C. Anchor equipment to concrete base as follows:
   1. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
   2. Install anchor bolts to elevations required for proper attachment to supported equipment.
   3. Install anchor bolts according to anchor-bolt manufacturer's written instructions.
3.5 PAINTING

A. Touchup: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.
   1. Apply paint by brush or spray to provide minimum dry film thickness of 2.0 mils.

B. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A 780.

END OF SECTION
SECTION 260533 - RACEWAYS AND BOXES FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Metal conduits and fittings.
   2. Nonmetallic conduits and fittings.
   3. Metal wireways and auxiliary gutters.
   4. Surface raceways.
   5. Boxes, enclosures, and cabinets.
   6. Handholes and boxes for exterior underground cabling.

B. Related Requirements:
   1. Section 078413 "Penetration Firestopping" for firestopping at conduit and box entrances.
   2. Section 260543 "Underground Ducts and Raceways for Electrical Systems" for exterior ductbanks, manholes, and underground utility construction.
   3. Section 270528 "Pathways for Communications Systems" for conduits, wireways, surface pathways, innerduct, boxes, faceplate adapters, enclosures, cabinets, and handholes serving communications systems.

1.3 DEFINITIONS

A. GRC: Galvanized rigid steel conduit.

B. EMT: Electrical metallic tubing conduit.

C. PVC: Polyvinyl chloride conduit.

1.4 ACTION SUBMITTALS

A. Samples: For wireways and surface raceways and for each color and texture specified, 12 inches long.

1.5 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Conduit routing plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of items involved:
   1. Structural members in paths of conduit groups with common supports.
   2. HVAC and plumbing items and architectural features in paths of conduit groups with common supports.
3. Where raceways are crossing exposed ceiling spaces visible to the building occupants and where indicated on plans.

B. Qualification Data: For professional engineer.

C. Source quality-control reports.

PART 2 - PRODUCTS

2.1 METAL CONDUITS AND FITTINGS

A. Metal Conduit:
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
   a. AFC Cable Systems; a part of Atkore International.
   b. Allied Tube & Conduit; a part of Atkore International.
   c. Cal conduit.
   d. Electri-Flex Company.
   e. FSR Inc.
   f. O-Z/Gedney; a brand of Emerson Industrial Automation.
   g. Thomas & Betts Corporation; A Member of the ABB Group.
   h. Western Tube and Conduit Corporation.
   i. Wheatland Tube Company.
2. Listing and Labeling: Listed and labeled as defined in CEC 70, by a qualified testing agency, and marked for intended location and application.
3. GRC: Comply with ANSI C80.1 and UL 6.
4. PVC-Coated Steel Conduit: PVC-coated rigid steel conduit.
   a. Comply with NEMA RN 1.
   b. Coating Thickness: 0.040 inch, minimum.
5. EMT: Comply with ANSI C80.3 and UL 797.
6. FMC: Comply with UL 1; zinc-coated steel.
7. LFMC: Flexible steel conduit with PVC jacket and complying with UL 360.

B. Metal Fittings:
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
   a. AFC Cable Systems; a part of Atkore International.
   b. Allied Tube & Conduit; a part of Atkore International.
   c. Anamet Electrical, Inc.
   d. FSR Inc.
   e. O-Z/Gedney; a brand of Emerson Industrial Automation.
   f. Thomas & Betts Corporation; A Member of the ABB Group.
   g. Western Tube and Conduit Corporation.
   h. Wheatland Tube Company.
2. Comply with NEMA FB 1 and UL 514B.
3. Listing and Labeling: Listed and labeled as defined in CEC 70, by a qualified testing agency, and marked for intended location and application.
4. Fittings, General: Listed and labeled for type of conduit, location, and use.
5. Conduit Fittings for Hazardous (Classified) Locations: Comply with UL 1203 and CEC 70.
6. Fittings for EMT:
a. Material: Steel.
   b. Type: Setscrew or compression.

7. Expansion Fittings: PVC or steel to match conduit type, complying with UL 651, rated for environmental conditions where installed, and including flexible external bonding jumper.

8. Coating for Fittings for PVC-Coated Conduit: Minimum thickness of 0.040 inch, with overlapping sleeves protecting threaded joints.

C. Joint Compound for GRC, or ARC: Approved, as defined in NFPA 70, by authorities having jurisdiction for use in conduit assemblies, and compounded for use to lubricate and protect threaded conduit joints from corrosion and to enhance their conductivity.

2.2 NONMETALLIC CONDUITS AND FITTINGS

A. Nonmetallic Conduit:
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. AFC Cable Systems; a part of Atkore International.
      b. Arnco Corporation.
      c. CANTEX INC.
      d. Electri-Flex Company.
      e. RACO; Hubbell.
      f. Thomas & Betts Corporation; A Member of the ABB Group.
   2. Listing and Labeling: Nonmetallic conduit shall be listed and labeled as defined in CEC 70, by a qualified testing agency, and marked for intended location and application.
   3. ENT: Comply with NEMA TC 13 and UL 1653.
   4. RNC: Type EPC-40-PVC, complying with NEMA TC 2 and UL 651 unless otherwise indicated.
   5. LFNC: Comply with UL 1660.
   6. Rigid HDPE: Comply with UL 651A.
   7. Continuous HDPE: Comply with UL 651A.
   8. Coilable HDPE: Preassembled with conductors or cables and complying with ASTM D 3485.

B. Nonmetallic Fittings:
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. AFC Cable Systems; a part of Atkore International.
      b. Arnco Corporation.
      c. CANTEX INC.
      d. FRE Composites.
      e. RACO; Hubbell.
      f. Thomas & Betts Corporation; A Member of the ABB Group.

   2. Fittings, General: Listed and labeled for type of conduit, location, and use.
   3. Fittings for ENT and RNC: Comply with NEMA TC 3; match to conduit or tubing type and material.
      a. Fittings for LFNC: Comply with UL 514B.
   4. Solvents and Adhesives: As recommended by conduit manufacturer.
2.3 METAL WIREWAYS AND AUXILIARY GUTTERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. B-line, an Eaton business.
2. Hoffman; a brand of Pentair Equipment Protection.
3. MonoSystems, Inc.
4. Square D.

B. Description: Sheet metal, complying with UL 870 and NEMA 250, Type 3R unless otherwise indicated, and sized according to CEC 70.
1. Metal wireways installed outdoors shall be listed and labeled as defined in CEC 70, by a qualified testing agency, and marked for intended location and application.

C. Fittings and Accessories: Include covers, couplings, offsets, elbows, expansion joints, adapters, hold-down straps, end caps, and other fittings to match and mate with wireways as required for complete system.

D. Wireway Covers: Hinged type unless otherwise indicated.

E. Finish: Manufacturer's standard enamel finish.

2.4 SURFACE RACEWAYS

A. Listing and Labeling: Surface raceways and tele-power poles shall be listed and labeled as defined in CEC 70, by a qualified testing agency, and marked for intended location and application.

B. Surface Aluminum Raceways: Alloy 6063-T5 extruded aluminum, minimum thickness 0.050 inches. Satin, No. 204 clear anodized, 0.004-inch-thick, Class R1 Mil-Spec finish. Device cover plates suitable to mount commercially available duplex devices, single 1.40 inch and 1.59-inch diameter receptacles, GFCI, surge receptacles and other rectangular faced devices, and voice and data jacks. Devices shall be mounted to cover plates held in place by extruded protrusions. Cover plates shall be removable using standard screwdriver without marring the finish.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Thomas & Betts Corporation.
   c. Wiremold Company (The); Electrical Sales Division

2.5 BOXES, ENCLOSURES, AND CABINETS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
1. Adalet.
3. EGS/Appleton Electric.
5. FSR Inc.
6. Hoffman; a brand of Pentair Equipment Protection.
8. Hubbell Incorporated; Wiring Device-Kellems.
10. MonoSystems, Inc.
11. Oldcastle Enclosure Solutions.
13. RACO; Hubbell.
14. Spring City Electrical Manufacturing Company.
15. Thomas & Betts Corporation; A Member of the ABB Group.
16. Wiremold / Legrand.

B. General Requirements for Boxes, Enclosures, and Cabinets: Boxes, enclosures, and cabinets installed in wet locations shall be listed for use in wet locations.

C. Sheet Metal pressed Outlet and Device Boxes with not welded edges: Comply with NEMA OS 1 and UL 514A.

D. Cast-Metal Outlet and Device Boxes: Comply with NEMA FB 1, ferrous alloy, Type FD, with gasketed cover.

E. Nonmetallic Outlet and Device Boxes: Comply with NEMA OS 2 and UL 514C.

F. Metal Floor Boxes:
   1. Type FL-500P/600P Floor box and cover, Multi-service flush mounted floor box with UL scrub water approved.
      a. Material: Cast metal.
      b. Type: Fully adjustable.
      c. Shape: Rectangular.
      d. Listing and Labeling: Metal floor boxes shall be listed and labeled as defined in CEC 70, by a qualified testing agency, and marked for intended location and application.
   2. Type FL-500P/600P Floor box and cover, Recessed multi-service flush mounted box with hinged cover and cord access flap with UL scrub water approved label.
      a. Material: Cast metal.
      b. Type: Fully adjustable.
      c. Shape: Rectangular.
      d. Size: 10”x12”x6” Deep
      e. Knock-out fittings: (8) ¾”, (12) concentric 1”/1¼”/1½”
      f. Cover: Cover with brass carpet flange, life off door and UL scube water rated for tile and carpet installation, coordinate brass flange height with architect Cover with aluminum carpet flange, life off door and UL scube water rated for tile and carpet installation, coordinate aluminum flange height with architect. Solid cover with cable exit, no trim, color as selected by Architect

G. Luminaire Outlet Boxes: Nonadjustable, designed for attachment of luminaire weighing 50 lb. Outlet boxes designed for attachment of luminaires weighing more than 50 lb shall be listed and marked for the maximum allowable weight.

H. Small Sheet Metal Pull and Junction Boxes: NEMA OS 1.

I. Cast-Metal Access, Pull, and Junction Boxes: Comply with NEMA FB 1 and UL 1773, galvanized, cast iron with gasketed cover.

J. Box extensions used to accommodate new building finishes shall be of same material as recessed box.

K. Device Box Dimensions: 4 inches square by 2-1/8 inches deep.
L. Gangable boxes are prohibited.

M. Hinged-Cover Enclosures: Comply with UL 50 and NEMA 250, Type 1 and Type 3R with continuous-hinge cover with flush latch unless otherwise indicated.
   1. Metal Enclosures: Steel, finished inside and out with manufacturer's standard enamel.
   2. Interior Panels: Steel; all sides finished with manufacturer's standard enamel.

N. Cabinets:
   1. NEMA 250, Type 1 and Type 3R galvanized-steel box with removable interior panel and removable front, finished inside and out with manufacturer's standard enamel.
   2. Hinged door in front cover with flush latch and concealed hinge.
   3. Key latch to match panelboards.
   4. Metal barriers to separate wiring of different systems and voltage.
   5. Accessory feet where required for freestanding equipment.

O. Monuments:
   1. WaterSaver pedestal electrical box with ¾” hub, single-gang catalog number E300SAA, two-gang catalog number E400SA and E500SA, and four-gang catalog number E600SA;
      a. Hubbell.
      b. LeGrand.
      c. Or Approved Equal.
      d. If alternate product is submitted, all material and functional requirements of the specified product must demonstrated and documented to be equal.
   2. Pedestals shall have single-piece aluminum base and housing, integral raised threaded hub, and shall contain devices as shown on drawings. Housing shall be brushed.

2.6 HANDBHOLES AND BOXES FOR EXTERIOR UNDERGROUND WIRING

A. General Requirements for Handholes and Boxes:
   1. Boxes and handholes for use in underground systems shall be designed and identified as defined in CEC 70, for intended location and application.
   2. Boxes installed in wet areas shall be listed and labeled as defined in CEC 70, by a qualified testing agency, and marked for intended location and application.

B. Polymer-Concrete Handholes and Boxes with Polymer-Concrete Cover: Molded of sand and aggregate, bound together with polymer resin, and reinforced with steel, fiberglass, or a combination of the two.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. Armorcast Products Company.
      b. NewBasis.
      c. Oldcastle Enclosure Solutions.
      d. Oldcastle Precast, Inc.
      e. Quazite: Hubbell Power Systems, Inc.
   2. Standard: Comply with SCTE 77.
   3. Configuration: Designed for flush burial with open bottom unless otherwise indicated.
   4. Cover: Weatherproof, secured by tamper-resistant locking devices and having structural load rating consistent with enclosure and handhole location.
   5. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.
   6. Cover Legend: Molded lettering, "ELECTRIC."
   7. Conduit Entrance Provisions: Conduit-terminating fittings shall mate with entering ducts for secure, fixed installation in enclosure wall.

2.7 SOURCE QUALITY CONTROL FOR UNDERGROUND ENCLOSURES

A. Handhole and Pull-Box Prototype Test: Test prototypes of handholes and boxes for compliance with SCTE 77. Strength tests shall be for specified tier ratings of products supplied.
   1. Strength tests of complete boxes and covers shall be by either an independent testing agency or manufacturer. A qualified registered professional engineer shall certify tests by manufacturer.
   2. Testing machine pressure gages shall have current calibration certification complying with ISO 9000 and ISO 10012 and traceable to NIST standards.

PART 3 - EXECUTION

3.1 RACEWAY APPLICATION

A. Outdoors: Apply raceway products as specified below unless otherwise indicated:
   1. Exposed Conduit: GRC.
   2. Concealed Conduit, Aboveground: GRC IMC EMT.
   3. Underground Branch Conduit: RNC, Type EPC-40-PVC Type and Rigid HDPE, direct buried.
   4. Underground Feeder Conduit: Type EPC-40-PVC and Type Rigid HDPE concrete encased.
   5. Connection to Vibrating Equipment (Including Transformers and Hydraulic, Pneumatic, Electric Solenoid, or Motor-Driven Equipment): LFMC.
   6. Boxes and Enclosures, Aboveground: NEMA 250, Type 3R.

B. Indoors: Apply raceway products as specified below unless otherwise indicated:
   1. Exposed, Not Subject to Physical Damage: EMT.
   2. Exposed, Not Subject to Severe Physical Damage: EMT.
   3. Exposed and Subject to Severe Physical Damage: GRC. Raceway locations include the following:
      a. Loading dock.
      b. Corridors used for traffic of mechanized carts, forklifts, and pallet-handling units.
      c. Mechanical rooms.
   4. Concealed in Ceilings and Interior Walls and Partitions: EMT.
   5. Connection to Vibrating Equipment (Including Transformers and Hydraulic, Pneumatic, Electric Solenoid, or Motor-Driven Equipment): FMC, except use LFMC in damp or wet locations.
   6. Damp or Wet Locations: GRS.
   7. Boxes and Enclosures: NEMA 250, Type 1, except use NEMA 250, Type 4 stainless steel in institutional and commercial kitchens and damp or wet locations.

C. Minimum Interior Raceway Size: 3/4-inch trade size.

D. Minimum Exterior Raceway Size: 1-1/4" inch

E. Raceway Fittings: Compatible with raceways and suitable for use and location.
   1. Rigid and Intermediate Steel Conduit: Use threaded rigid steel conduit fittings unless otherwise indicated. Comply with NEMA FB 2.10.
2. PVC Externally Coated, Rigid Steel Conduits: Use only fittings listed for use with this type of conduit. Patch and seal all joints, nicks, and scrapes in PVC coating after installing conduits and fittings. Use sealant recommended by fitting manufacturer and apply in thickness and number of coats recommended by manufacturer.

3. EMT: Use setscrew or compression, steel fittings. Comply with NEMA FB 2.10.

4. Flexible Conduit: Use only fittings listed for use with flexible conduit. Comply with NEMA FB 2.20.

F. Install nonferrous conduit or tubing for circuits operating above 60 Hz. Where aluminum raceways are installed for such circuits and pass through concrete, install in nonmetallic sleeve.

G. Do not install aluminum conduits, boxes, or fittings in contact with concrete or earth.

H. Install surface raceways only where indicated on Drawings.

I. Do not install nonmetallic conduit where ambient temperature exceeds 120 deg F.

3.2 RACEWAY SEPARATION OF SYSTEM WIRING

A. Provide minimum separations between power and wiring and signal system wiring as indicated in table below. Where minimum separation can not be maintained due to existing conditions obtain written permission for closer spacing.

Legend: EMT Electrical metallic tubing 1. Building finishes must provide a barrier with a 15-minute fire rating. ENT Electrical nonmetallic conduit 2. For buildings not more than three stories above grade. FS/FD Cast-metal conduit 3. Corrosion protection is required. HDPE High-density polyethylene conduit 4. With fittings for purpose. LFMC Liquidtight flexible metal conduit 5. Enclosed gasketed. LFNC Liquidtight flexible nonmetallic conduit 6. Dust-tight wireway only. N/A Not applicable 8. Nonincendive and intrinsically safe wiring are allowed in any classification. NEMA Refers to NEMA 250, type wiring method permitted for unclassified locations. NM Nonmetallic box 9. Aluminum materials are permitted only with approved supplementary corrosion protection. PVC Rigid polyvinyl chloride conduit 10. Schedule 80. RMC Rigid metal conduit 11. Only as specifically permitted under the environmental condition. RTRC Reinforced thermosetting resin conduit 12. Subject to temperature limitations where exposed to sunlight. SM Sheet-metal box 7. Raintight wireway only. WW Wireway 6. Dust-tight wireway only. *“Subject to damage” denotes environments where exposed raceways may be impacted by traffic, by cleaning or maintenance operations, or by similar influences.
3.4 INSTALLATION

A. Comply with requirements in Section 260529 "Hangers and Supports for Electrical Systems" for hangers and supports.

B. Comply with NECA 1 and NECA 101 for installation requirements except where requirements on Drawings or in this article are stricter. Comply with NECA 102 for aluminum conduits. Comply with CEC 70 limitations for types of raceways allowed in specific occupancies and number of floors.

C. Do not install raceways or electrical items on any "explosion-relief" walls or rotating equipment.

D. Do not fasten conduits onto the bottom side of a metal deck roof.

E. Keep raceways at least 6 inches away from parallel runs of flues and steam or hot-water pipes. Install horizontal raceway runs above water and steam piping.

F. Complete raceway installation before starting conductor installation.

G. Arrange stub-ups so curved portions of bends are not visible above finished slab.

H. Install, for 70 volt and above, no more than the equivalent of three 90-degree bends in any conduit run except for control wiring conduits, for which fewer bends are allowed. Support within 12 inches of changes in direction.

I. Install, for below 70 volt raceways, no more than the equivalent of two 90-degree bends in any conduit run. Support within 12 inches of changes in direction.

J. Make bends in raceway using large-radius preformed ells. Field bending shall be according to CEC 70 minimum radii requirements. Use only equipment specifically designed for material and size involved.

K. Conceal conduit within finished walls, ceilings, and floors unless otherwise indicated. Install conduits parallel or perpendicular to building lines.

L. Support conduit within 12 inches of enclosures to which attached.

M. Stub-ups to Above Recessed Ceilings:
   1. Use EMT or RMC for raceways.
   2. Use a conduit bushing or insulated fitting to terminate stub-ups not terminated in hubs or in an enclosure.

N. Threaded Conduit Joints, Exposed to Wet, Damp, Corrosive, or Outdoor Conditions: Apply listed compound to threads of raceway and fittings before making up joints. Follow compound manufacturer's written instructions.

O. Coat field-cut threads on PVC-coated raceway with a corrosion-preventing conductive compound prior to assembly.

P. Terminate threaded conduits into threaded hubs or with locknuts on inside and outside of boxes or cabinets. Install bushings on conduits up to 1-1/4-inch trade size and insulated throat metal bushings on 1-1/2-inch trade size and larger conduits terminated with locknuts. Install insulated throat metal grounding bushings on service conduits.
Q. Install raceways square to the enclosure and terminate at enclosures with locknuts. Install locknuts hand tight plus 1/4 turn more.

R. Do not rely on locknuts to penetrate nonconductive coatings on enclosures. Remove coatings in the locknut area prior to assembling conduit to enclosure to assure a continuous ground path.

S. Cut conduit perpendicular to the length. For conduits 2-inch trade size and larger, use roll cutter or a guide to make cut straight and perpendicular to the length.

T. Install pull wires in empty raceways. Use polypropylene or monofilament plastic line with not less than 200-lb tensile strength. Leave at least 12 inches of slack at each end of pull wire. Cap underground raceways designated as spare above grade alongside raceways in use.

U. Surface Raceways:
1. Install surface raceway with a minimum 2-inch radius control at bend points.
2. Secure surface raceway with screws or other anchor-type devices at intervals not exceeding 48 inches and with no less than two supports per straight raceway section. Support surface raceway according to manufacturer's written instructions. Tape and glue are not acceptable support methods.

V. Install raceway sealing fittings at accessible locations according to NFPA 70 and fill them with listed sealing compound. For concealed raceways, install each fitting in a flush steel box with a blank cover plate having a finish similar to that of adjacent plates or surfaces. Install raceway sealing fittings according to CEC 70.

W. Install devices to seal raceway interiors at accessible locations. Locate seals so no fittings or boxes are between the seal and the following changes of environments. Seal the interior of all raceways at the following points:
1. Where conduits pass from warm to cold locations, such as boundaries of refrigerated spaces.
2. Where an underground service raceway enters a building or structure.
3. Conduit extending from interior to exterior of building.
4. Conduit extending into pressurized duct and equipment.
5. Conduit extending into pressurized zones that are automatically controlled to maintain different pressure set points.
6. Where otherwise required by CEC 70.

X. Comply with manufacturer's written instructions for solvent welding RNC and fittings.

Y. Expansion-Joint Fittings:
1. Install in each run of aboveground RNC that is located where environmental temperature change may exceed 30 deg F and that has straight-run length that exceeds 25 feet. Install in each run of aboveground RMC and EMT conduit that is located where environmental temperature change may exceed 100 deg F and that has straight-run length that exceeds 100 feet.
2. Install type and quantity of fittings that accommodate temperature change listed for each of the following locations:
   a. Outdoor Locations Exposed to Direct Sunlight: 155 deg F temperature change.
   b. Indoor Spaces Connected with Outdoors without Physical Separation: 125 deg F temperature change.
   c. Attics: 135 deg F temperature change.
3. Install fitting(s) that provide expansion and contraction for at least 0.00041 inch per foot of length of straight run per deg F of temperature change for PVC conduits. Install...
fitting(s) that provide expansion and contraction for at least 0.000078 inch per foot of length of straight run per deg F of temperature change for metal conduits.

4. Install expansion fittings at all locations where conduits cross building or structure expansion joints.

5. Install each expansion-joint fitting with position, mounting, and piston setting selected according to manufacturer's written instructions for conditions at specific location at time of installation. Install conduit supports to allow for expansion movement.

Z. Flexible Conduit Connections: Comply with NEMA RV 3. Use a maximum of 72 inches of flexible conduit for recessed and semirecessed luminaires, equipment subject to vibration, noise transmission, or movement; and for transformers and motors.
1. Use LFMC in damp or wet locations subject to severe physical damage.
2. Use LFMC in damp or wet locations not subject to severe physical damage.

AA. Mount boxes at heights indicated on Drawings. If mounting heights of boxes are not individually indicated, give priority to ADA requirements. Install boxes with height measured to center of box unless otherwise indicated.

BB. Horizontally separate boxes mounted on opposite sides of walls, so they are not in the same vertical channel.

CC. Locate boxes so that cover or plate will not span different building finishes.

DD. Support boxes of three gangs or more from more than one side by spanning two framing members or mounting on brackets specifically designed for the purpose.

EE. Fasten junction and pull boxes to or support from building structure. Do not support boxes by conduits.

FF. Set metal floor boxes level and flush with finished floor surface.

GG. Set non-metallic floor boxes level. Trim after installation to fit flush with finished floor surface.

3.5 INSTALLATION OF UNDERGROUND CONDUIT

A. Direct-Buried Branch Circuit Conduit (600 V and below):
1. Excavate trench bottom to provide firm and uniform support for conduit. Prepare trench bottom as specified in Section 312333 "Utility Trenching and Backfilling" for pipe less than 6 inches in nominal diameter.
2. Install backfill as specified in Section 312333 "Utility Trenching and Backfilling."
3. After installing conduit, backfill and compact. Start at tie-in point, and work toward end of conduit run, leaving conduit at end of run free to move with expansion and contraction as temperature changes during this process. Firmly hand tamp backfill around conduit to provide maximum supporting strength. After placing controlled backfill to within 12 inches of finished grade, make final conduit connection at end of run and complete backfilling with normal compaction as specified in Section 312333 “Utility Trenching and Backfilling.”
4. Install manufactured rigid steel conduit elbows for stub-ups at poles and equipment and at building entrances through floor.
   a. Couple steel conduits to ducts with adapters designed for this purpose and encase coupling with 3 inches of concrete for a minimum of 12 inches on each side of the coupling.
   b. For stub-ups at equipment mounted on outdoor concrete bases and where conduits penetrate building foundations, extend steel conduit horizontally a
3.6 INSTALLATION OF UNDERGROUND HANDOLES AND BOXES

A. Install handholes and boxes level and plumb and with orientation and depth coordinated with connecting conduits to minimize bends and deflections required for proper entrances.

B. Unless otherwise indicated, support units on a level bed of crushed stone or gravel, graded from 1/2-inch sieve to No. 4 sieve and compacted to same density as adjacent undisturbed earth.

C. Elevation: In paved areas, set so cover surface will be flush with finished grade. Set covers of other enclosures 1 inch above finished grade.

D. Install removable hardware, including pulling eyes, cable stanchions, cable arms, and insulators, as required for installation and support of cables and conductors and as indicated. Select arm lengths to be long enough to provide spare space for future cables but short enough to preserve adequate working clearances in enclosure.

E. Field-cut openings for conduits according to enclosure manufacturer's written instructions. Cut wall of enclosure with a tool designed for material to be cut. Size holes for terminating fittings to be used, and seal around penetrations after fittings are installed.

3.7 SLEEVE AND SLEEVE-SEAL INSTALLATION FOR ELECTRICAL PENETRATIONS

A. Install sleeves and sleeve seals at penetrations of exterior floor and wall assemblies. Comply with requirements in Section 260544 "Sleeves and Sleeve Seals for Electrical Raceways and Cabling."

3.8 FIRESTOPPING

A. Install firestopping at penetrations of fire-rated floor and wall assemblies. Comply with requirements in Section 078413 "Penetration Firestopping."

3.9 PROTECTION

A. Protect coatings, finishes, and cabinets from damage and deterioration.
   1. Repair damage to galvanized finishes with zinc-rich paint recommended by manufacturer.
   2. Repair damage to PVC coatings or paint finishes with matching touchup coating recommended by manufacturer.

END OF SECTION
NOT USED
SECTION 260543 - UNDERGROUND DUCTS AND RACEWAYS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

   A. Section Includes:
      1. Metal conduits and fittings, including GRC and PVC-coated steel conduit.
      2. Rigid nonmetallic duct.
      3. Flexible nonmetallic duct.
      4. Duct accessories.
      5. Precast concrete handholes.
      6. Polymer concrete handholes and boxes with polymer concrete cover.
      7. Fiberglass handholes and boxes with polymer concrete cover.
      8. Fiberglass handholes and boxes.
      9. High-density plastic boxes.

1.3 DEFINITIONS

   A. Direct Buried: Duct or a duct bank that is buried in the ground, without any additional casing materials such as concrete.

   B. Duct: A single duct or multiple ducts. Duct may be either installed singly or as component of a duct bank.

   C. Duct Bank:
      1. Two or more ducts installed in parallel, with or without additional casing materials.
      2. Multiple duct banks.

   D. GRC: Galvanized rigid (steel) conduit.

   E. Trafficways: Locations where vehicular or pedestrian traffic is a normal course of events.

1.4 ACTION SUBMITTALS

   A. Sustainable Design Submittals:

1.5 INFORMATIONAL SUBMITTALS

   A. Coordination Drawings: For duct and duct bank. Show duct profiles and coordination with other utilities and underground structures.
1. Include plans and sections, drawn to scale, and show bends and locations of expansion fittings.
2. Drawings shall be signed and sealed by a qualified professional engineer.

B. Field quality-control reports.

1.6 FIELD CONDITIONS

A. Interruption of Existing Electrical Service: Do not interrupt electrical service to facilities occupied by Owner or others unless permitted under the following conditions, and then only after arranging to provide temporary electrical service according to requirements indicated:
1. Notify Construction Manager no fewer than two days in advance of proposed interruption of electrical service.
2. Do not proceed with interruption of electrical service without Owner's written permission.

B. Ground Water: Assume ground-water level is 36 inches below ground surface unless a higher water table is noted on Drawings.

PART 2 - PRODUCTS

2.1 METAL CONDUIT AND FITTINGS

A. GRC: Comply with ANSI C80.1 and UL 6.

B. Coated Steel Conduit: PVC-coated GRC.
1. Comply with NEMA RN 1.
2. Coating Thickness: 0.040 inch, minimum.

C. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
1. AFC Cable Systems; a part of Atkore International.
2. Allied Tube & Conduit; a part of Atkore International.
3. Anamet Electrical, Inc.
5. O-Z/Gedney; a brand of Emerson Industrial Automation.
6. Republic Conduit.

D. Listed and labeled as defined in NFPA 70, by a nationally recognized testing laboratory, and marked for intended location and application.

2.2 RIGID NONMETALLIC DUCT

A. Underground Plastic Utilities Duct: Type EPC-40-PVC RNC, complying with NEMA TC 2 and UL 651, with matching fittings complying with NEMA TC 3 by same manufacturer as duct.

B. Underground Plastic Utilities Duct: Type EPEC-40 HDPE, complying with NEMA TC 7 and UL 651A.

C. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
1. ARNCO Corp.
2. CANTEX INC.
5. Electri-Flex Company.

D. Listed and labeled as defined in CEC 70, by a nationally recognized testing laboratory, and marked for intended location and application.

E. Solvents and Adhesives: As recommended by conduit manufacturer.

2.3 FLEXIBLE NONMETALLIC DUCTS

A. HDPE Duct: Type EPEC-80 HDPE, complying with NEMA TC 7 and UL 651A.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. ARNCO Corp.
      b. Carlon; a brand of Thomas & Betts Corporation.
      d. Opti-Com Manufacturing Network, Inc (OMNI).
      e. Premier Conduit.
   2. Listed and labeled as defined in CEC 70, by a nationally recognized testing laboratory, and marked for intended location and application.

2.4 DUCT ACCESSORIES

A. Duct Spacers: Factory-fabricated, rigid, PVC interlocking spacers; sized for type and size of duct with which used and selected to provide minimum duct spacing indicated while supporting duct during concreting or backfilling.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. Allied Tube & Conduit; a part of Atkore International.
      b. CANTEX INC.
      c. Carlon; a brand of Thomas & Betts Corporation.
      d. IPEX USA LLC.
      e. PenCell Plastics.
      f. Underground Devices, Inc.
   B. Underground-Line Warning Tape: Comply with requirements for underground-line warning tape specified in Section 26 05 53 "Identification for Electrical Systems."

2.5 PRECAST CONCRETE HANHOLES AND BOXES

A. Description: Factory-fabricated, reinforced-concrete, monolithically poured walls and bottom unless open-bottom enclosures are indicated. Frame and cover shall form top of enclosure and shall have load rating consistent with that of handhole or box.
   B. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
1. Christy Concrete Products.
2. Oldcastle Precast, Inc.
3. Utility Concrete Products, LLC.

C. Comply with ASTM C 858 for design and manufacturing processes.

D. Frame and Cover: Weatherproof cast-iron frame, with cast-iron cover with recessed cover hook eyes and tamper-resistant, captive, cover-securing bolts.

E. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.

F. Cover Legend: Molded lettering, as indicated for each service.

G. Configuration: Units shall be designed for flush burial and have open bottom unless otherwise indicated.

H. Extensions and Slabs: Designed to mate with bottom of enclosure. Same material as enclosure.
   1. Extension shall provide increased depth of 12 inches.
   2. Slab: Same dimensions as bottom of enclosure and arranged to provide closure.

I. Joint Sealant: Asphaltic-butyl material with adhesion, cohesion, flexibility, and durability properties necessary to withstand maximum hydrostatic pressures at the installation location with the ground-water level at grade.

J. Knockout Panels: Precast openings in walls, arranged to match dimensions and elevations of approaching duct, plus an additional 12 inches vertically and horizontally to accommodate alignment variations.
   1. Knockout panels shall be located no less than 6 inches from interior surfaces of walls, floors, or frames and covers of handholes, but close enough to corners to facilitate racking of cables on walls.
   2. Knockout panel opening shall have cast-in-place, welded-wire fabric reinforcement for field cutting and bending to tie in to concrete envelopes of duct.
   3. Knockout panels shall be framed with at least two additional No. 3 steel reinforcing bars in concrete around each opening.
   4. Knockout panels shall be 1-1/2 to 2 inches thick.

K. Handholes 12 inches wide by 24 inches long and larger shall have inserts for cable racks and pulling-in irons installed before concrete is poured.

2.6 POLYMER CONCRETE HANDHOLES AND BOXES WITH POLYMER CONCRETE COVER

A. Description: Molded of sand and aggregate, bound together with a polymer resin, and reinforced with steel or fiberglass or a combination of the two.

B. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
   1. Armorcast Products Company.
   2. NewBasis.
   3. Oldcastle Enclosure Solutions.

D. Color: Gray.

E. Configuration: Units shall be designed for flush burial and have open bottom unless otherwise indicated.

F. Cover: Weatherproof, secured by tamper-resistant locking devices and having structural load rating consistent with enclosure.

G. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.

H. Cover Legend: Molded lettering, as indicated for each service.

I. Direct-Buried Wiring Entrance Provisions: Knockouts equipped with insulated bushings or end-bell fittings, selected to suit box material, sized for wiring indicated, and arranged for secure, fixed installation in enclosure wall.

J. Handholes 12 inches wide by 24 inches long and larger shall have factory-installed inserts for cable racks and pulling-in irons.

2.7 PRECAST MANHOLES

A. Description: One-piece units and units with interlocking mating sections, complete with accessories, hardware, and features.

B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Carder Concrete Products.
   2. Christy Concrete Products.
   3. Oldcastle Precast, Inc.
   4. Utility Concrete Products, LLC.
   5. Utility Vault Co.

C. Comply with ASTM C 858.

D. Structural Design Loading: Comply with requirements in "Underground Enclosure Application" Article.

E. Knockout Panels: Precast openings in walls, arranged to match dimensions and elevations of approaching duct, plus an additional 12 inches vertically and horizontally to accommodate alignment variations.
   1. Center window location.
   2. Knockout panels shall be located no less than 6 inches from interior surfaces of walls, floors, or roofs of manholes, but close enough to corners to facilitate racking of cables on walls.
   3. Knockout panel opening shall have cast-in-place, welded-wire fabric reinforcement for field cutting and bending to tie in to concrete envelopes of duct.
   4. Knockout panel shall be framed with at least two additional No. 3 steel reinforcing bars in concrete around each opening.
   5. Knockout panels shall be 1-1/2 to 2 inches thick.

F. Duct Entrances in Manhole Walls: Cast end-bell or duct-terminating fitting in wall for each entering duct.
   1. Type and size shall match fittings to duct to be terminated.
2. Fittings shall align with elevations of approaching duct and be located near interior corners of manholes to facilitate racking of cable.

G. Ground Rod Sleeve: Provide a 3-inch PVC sleeve in manhole floors 2 inches from the wall adjacent to, but not underneath, the duct entering the structure.

H. Joint Sealant: Asphaltic-butyl material with adhesion, cohesion, flexibility, and durability properties necessary to withstand maximum hydrostatic pressures at the installation location with the ground-water level at grade.

2.8 UTILITY STRUCTURE ACCESSORIES

A. Accessories for Utility Structures: Utility equipment and accessory items used for utility structure access and utility support, listed and labeled for intended use and application.

B. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
   1. Campbell Foundry Company.
   2. Christy Concrete Products.
   3. Oldcastle Precast, Inc.
   4. Utility Concrete Products, LLC.
   5. Utility Vault Co.

C. Manhole Frames, Covers, and Chimney Components: Comply with structural design loading specified for manhole.
   1. Frame and Cover: Weatherproof, gray cast iron complying with ASTM A 48/A 48M, Class 30B with milled cover-to-frame bearing surfaces; diameter, 29 inches.
      a. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.
      b. Special Covers: Recess in face of cover designed to accept finish material in paved areas.
   2. Cover Legend: Cast in. Selected to suit system.
      a. Legend: "ELECTRIC-LV" for duct systems with power wires and cables for systems operating at 600 V and less.
      b. Legend: "ELECTRIC-MV" for duct systems with medium-voltage cables.
   3. Manhole Chimney Components: Precast concrete rings with dimensions matched to those of roof opening.
      a. Seal joints watertight using preformed plastic or rubber complying with ASTM C 990. Install sealing material according to sealant manufacturers' written instructions.

E. Pulling Eyes in Concrete Walls: Eyebolt with reinforcing-bar fastening insert, 2-inch-diameter eye, and 1-by-4-inch bolt.
   1. Working Load Embedded in 6-Inch, 4000-psi Concrete: 13,000-lbf minimum tension.

F. Pulling-in and Lifting Irons in Concrete Floors: 7/8-inch-diameter, hot-dip galvanized, bent steel rod; stress relieved after forming; and fastened to reinforcing rod. Exposed triangular opening.
   1. Ultimate Yield Strength: 40,000-lbf shear and 60,000-lbf tension.

G. Bolting Inserts for Concrete Utility Structure Cable Racks and Other Attachments: Flared, threaded inserts of noncorrosive, chemical-resistant, nonconductive thermoplastic material; 1/2-inch ID by 2-3/4 inches deep, flared to 1-1/4 inches minimum at base.
   1. Tested Ultimate Pullout Strength: 12,000 lbf minimum.
H. Ground Rod Sleeve: 3-inch PVC sleeve in manhole floors 2 inches from the wall adjacent to, but not underneath, the ducts routed from the facility.

I. Expansion Anchors for Installation after Concrete Is Cast: Zinc-plated, carbon-steel-wedge type with stainless-steel expander clip with 1/2-inch bolt, 5300-lbf rated pullout strength, and minimum 6800-lbf rated shear strength.

J. Cable Rack Assembly: Steel, hot-dip galvanized, except insulators.
   1. Stanchions: T-section or channel with provisions to connect to other sections or channels to form a continuous unit; 1-1/2 inches in width by nominal 24 inches long; punched with 14 hook holes on 1-1/2-inch centers for cable-arm attachment.
   2. Arms: 1-1/2 inches wide, lengths ranging from 3 inches with 450-lb minimum capacity to 18 inches with 250-lb minimum capacity. Arms shall have slots along full length for cable ties and be arranged for secure mounting in horizontal position at any vertical location on stanchions.

K. Duct-Sealing Compound: Nonhardening, safe for contact with human skin, not deleterious to cable insulation, and workable at temperatures as low as 35 deg F. Capable of withstanding temperature of 300 deg F without slump and adhering to clean surfaces of plastic ducts, metallic conduit, conduit and duct coatings, concrete, masonry, lead, cable sheaths, cable jackets, insulation materials, and common metals.

L. Fixed Manhole Ladders: Arranged for attachment to roof or wall and floor of manhole. Ladder and mounting brackets and braces shall be fabricated from nonconductive, structural-grade, fiberglass-reinforced resin.

M. Cover Hooks: Heavy duty, designed for lifts 60 lbf and greater. Two required.

2.9 SOURCE QUALITY CONTROL

A. Test and inspect precast concrete utility structures according to ASTM C 1037.

PART 3 - EXECUTION

3.1 PREPARATION

A. Coordinate layout and installation of duct, duct bank, manholes, handholes, and boxes with final arrangement of other utilities, site grading, and surface features as determined in the field. Notify Architect if there is a conflict between areas of excavation and existing structures or archaeological sites to remain.

B. Coordinate elevations of duct and duct-bank entrances into manholes, handholes, and boxes with final locations and profiles of duct and duct banks, as determined by coordination with other utilities, underground obstructions, and surface features. Revise locations and elevations as required to suit field conditions and to ensure that duct and duct bank will drain to manholes and handholes, and as approved by Architect.

C. Clear and grub vegetation to be removed according to Section 311100 "Clearing and Grubbing," and protect vegetation to remain according to Section 31 10 01 "Plant Protection." Remove and stockpile topsoil for reapplication according to Section 31 23 00 "Excavation and Fill."
3.2 UNDERGROUND DUCT APPLICATION

A. Duct for Electrical Cables More Than 600 V: RNC, concrete-encased unless otherwise indicated.

B. Duct for Electrical Feeders 600 V and Less: EPEC-40 HDPE and Type EPC-40-PVC RNC, concrete-encased unless otherwise indicated.

C. Duct for Electrical Feeders 600 V and Less: Type EPEC-40 HDPE and Type EPC-40-PVC RNC, direct-buried unless otherwise indicated.

D. Duct for Electrical Branch Circuits: Type EPEC-40 HDPE and Type EPC-40-PVC RNC, direct-buried unless otherwise indicated.

E. Bored Underground Duct: Type EPEC-40 HDPE unless otherwise indicated.

F. Stub-ups: Concrete-encased GRC.

3.3 UNDERGROUND ENCLOSURE APPLICATION

A. Handholes and Boxes for 600 V and Less:
   1. Units in Roadways and Other Deliberate Traffic Paths: Precast concrete, AASHTO HB 17, H-20 structural load rating.
   2. Units in Driveway, Parking Lot, and Off-Roadway Locations, Subject to Occasional, Nondeliberate Loading by Heavy Vehicles: Precast concrete, AASHTO HB 17, H-20 structural load rating.
   4. Units Subject to Light-Duty Pedestrian Traffic Only: Fiberglass-reinforced polyester resin, structurally tested according to SCTE 77 with 3000-lbf vertical loading.
   5. Cover design load shall not exceed the design load of the handhole or box.

B. Manholes: Precast or cast-in-place concrete.
   1. Units Located in Roadways and Other Deliberate Traffic Paths by Heavy or Medium Vehicles: H-20 structural load rating according to AASHTO HB 17.
   2. Units Not Located in Deliberate Traffic Paths by Heavy or Medium Vehicles: H-10 load rating according to AASHTO HB 17.

3.4 EARTHWORK

A. Excavation and Backfill: Comply with Section 31 20 00 "Earth Moving," but do not use heavy-duty, hydraulic-operated, compaction equipment.

B. Restoration: Replace area immediately after backfilling is completed or after construction vehicle traffic in immediate area is complete.

C. Restore surface features at areas disturbed by excavation and re-establish original grades unless otherwise indicated. Replace removed sod immediately after backfilling is completed.

D. Restore areas disturbed by trenching, storing of dirt, cable laying, and other work. Restore vegetation and include necessary topsoiling, fertilizing, liming, seeding, sodding, sprigging, and mulching. Comply with Section 32 92 00 "Turf and Grasses" and Section 32 93 00 "Plants."
E. Cut and patch existing pavement in the path of underground duct, duct bank, and underground structures according to "Cutting and Patching" Article in Section 01 73 00 "Execution."

3.5 DUCT AND DUCT-BANK INSTALLATION

A. Where indicated on Drawings, install duct, spacers, and accessories into the duct-bank configuration shown. Duct installation requirements in this Section also apply to duct bank.

B. Install duct according to NEMA TCB 2.

C. Slope: Pitch duct a minimum slope of 1:300 down toward manholes and handholes and away from buildings and equipment. Slope duct from a high point between two manholes, to drain in both directions.

D. Curves and Bends: Use 5-degree angle couplings for small changes in direction. Use manufactured long sweep bends with a minimum radius of 12.5 feet, both horizontally and vertically, at other locations unless otherwise indicated.

E. Joints: Use solvent-cemented joints in duct and fittings and make watertight according to manufacturer's written instructions. Stagger couplings so those of adjacent duct do not lie in same plane.

F. Installation Adjacent to High-Temperature Steam Lines: Where duct is installed parallel to underground steam lines, perform calculations showing the duct will not be subject to environmental temperatures above 40 deg C. Where environmental temperatures are calculated to rise above 40 deg C, and anywhere the duct crosses above an underground steam line, install insulation blankets listed for direct burial to isolate the duct bank from the steam line.

G. End Bell Entrances to Manholes and Concrete and Polymer Concrete Handholes: Use end bells, spaced approximately 10 inches o.c. for 5-inch duct, and vary proportionately for other duct sizes.
   1. Begin change from regular spacing to end-bell spacing 10 feet from the end bell, without reducing duct slope and without forming a trap in the line.
   2. Expansion and Deflection Fittings: Install an expansion and deflection fitting in each duct in the area of disturbed earth adjacent to manhole or handhole. Install an expansion fitting near the center of all straight line direct-buried duct with calculated expansion of more than 3/4 inch.

H. Terminator Entrances to Manholes and Concrete and Polymer Concrete Handholes: Use manufactured, cast-in-place duct terminators, with entrances into structure spaced approximately 6 inches o.c. for 4-inch duct, and vary proportionately for other duct sizes.
   1. Begin change from regular spacing to terminator spacing 10 feet from the terminator, without reducing duct line slope and without forming a trap in the line.
   2. Expansion and Deflection Fittings: Install an expansion and deflection fitting in each duct in the area of disturbed earth adjacent to manhole or handhole. Install an expansion fitting near the center of all straight-line duct with calculated expansion of more than 3/4 inch.

I. Building Wall Penetrations: Make a transition from underground duct to GRC at least 10 feet outside the building wall, without reducing duct line slope away from the building and without forming a trap in the line. Use fittings manufactured for RNC-to-GRC transition. Install GRC penetrations of building walls as specified in Section 26 05 44 "Sleeves and Sleeve Seals for Electrical Raceways and Cabling."
J. Sealing: Provide temporary closure at terminations of duct with pulled cables. Seal spare duct at terminations. Use sealing compound and plugs to withstand at least 15-psig hydrostatic pressure.

L. Concrete-Encased Ducts and Duct Bank:
   1. Excavate trench bottom to provide firm and uniform support for duct. Prepare trench bottoms as specified in Section 31 20 00 “Earth Moving” for pipes less than 6 inches in nominal diameter.
   2. Width: Excavate trench 3 inches wider than duct on each side.
   3. Depth: Install so top of duct envelope is at least 24 inches below finished grade in areas not subject to deliberate traffic, and at least 30 inches below finished grade in deliberate traffic paths for vehicles unless otherwise indicated.
   4. Support duct on duct spacers coordinated with duct size, duct spacing, and outdoor temperature.
   5. Spacer Installation: Place spacers close enough to prevent sagging and deforming of duct, with not less than five spacers per 20 feet of duct. Place spacers within 24 inches of duct ends. Stagger spacers approximately 6 inches between tiers. Secure spacers to earth and to duct to prevent floating during concreting. Tie entire assembly together using fabric straps; do not use tie wires or reinforcing steel that may form conductive or magnetic loops around ducts or duct groups.
   6. Minimum Space between Duct: 3 inches between edge of duct and exterior envelope wall, 2 inches between ducts for like services, and 4 inches between power and communications ducts.
   7. Elbows: Use manufactured duct elbows for stub-ups, at building entrances, and at changes of direction in duct unless otherwise indicated. Extend encasement throughout length of elbow.
   8. Elbows: Use manufactured GRC elbows for stub-ups, at building entrances, and at changes of direction in duct run.
      a. Couple RNC duct to GRC with adapters designed for this purpose and encase coupling with 3 inches of concrete.
      b. Stub-ups to Outdoor Equipment: Extend concrete-encased GRC horizontally a minimum of 60 inches from edge of base. Install insulated grounding bushings on terminations at equipment.
         1) Stub-ups shall be minimum 4 inches above finished floor and minimum 3 inches from conduit side to edge of slab.
      c. Stub-ups to Indoor Equipment: Extend concrete-encased GRC horizontally a minimum of 60 inches from edge of wall. Install insulated grounding bushings on terminations at equipment.
         1) Stub-ups shall be minimum 4 inches above finished floor and no less than 3 inches from conduit side to edge of slab.
   9. Reinforcement: Reinforce concrete-encased duct where crossing disturbed earth and where indicated. Arrange reinforcing rods and ties without forming conductive or magnetic loops around ducts or duct groups.
   10. Forms: Use walls of trench to form side walls of duct bank where soil is self-supporting and concrete envelope can be poured without soil inclusions; otherwise, use forms.
   11. Concrete Cover: Install a minimum of 3 inches of concrete cover between edge of duct to exterior envelope wall, 2 inches between duct of like services, and 4 inches between power and communications ducts.
   12. Concreting Sequence: Pour each run of envelope between manholes or other terminations in one continuous operation.
      a. Start at one end and finish at the other, allowing for expansion and contraction of duct as its temperature changes during and after the pour. Use expansion fittings
installed according to manufacturer's written instructions or use other specific measures to prevent expansion-contraction damage.

b. If more than one pour is necessary, terminate each pour in a vertical plane and install 3/4-inch reinforcing-rod dowels extending a minimum of 18 inches into concrete on both sides of joint near corners of envelope.

13. Pouring Concrete: Comply with requirements in "Concrete Placement" Article in Section 03 30 00 "Cast-in-Place Concrete." Place concrete carefully during pours to prevent voids under and between duct and at exterior surface of envelope. Do not allow a heavy mass of concrete to fall directly onto ducts. Allow concrete to flow around duct and rise up in middle, uniformly filling all open spaces. Do not use power-driven agitating equipment unless specifically designed for duct-installation application.

M. Direct-Buried Duct and Duct Bank:

1. Excavate trench bottom to provide firm and uniform support for duct. Comply with requirements in Section 31 20 00 "Earth Moving" for preparation of trench bottoms for pipes less than 6 inches in nominal diameter.

2. Width: Excavate trench 12 inches wider than duct on each side.

3. Depth: Install top of duct at least 36 inches below finished grade unless otherwise indicated.

4. Set elevation of bottom of duct bank below frost line.

5. Support ducts on duct spacers coordinated with duct size, duct spacing, and outdoor temperature.

6. Spacer Installation: Place spacers close enough to prevent sagging and deforming of duct, with not less than five spacers per 20 feet of duct. Place spacers within 24 inches of duct ends. Stagger spacers approximately 6 inches between tiers. Secure spacers to earth and to ducts to prevent floating during concreting. Tie entire assembly together using fabric straps; do not use tie wires or reinforcing steel that may form conductive or magnetic loops around ducts or duct groups.

7. Install duct with a minimum of 3 inches between ducts for like services and 6 inches between power and communications duct.

8. Elbows: Install manufactured duct elbows for stub-ups, at building entrances, and at changes of direction in duct direction unless otherwise indicated. Encase elbows for stub-up ducts throughout length of elbow.

9. Install manufactured GRC elbows for stub-ups, at building entrances, and at changes of direction in duct.

a. Couple RNC duct to GRC with adapters designed for this purpose and encase coupling with 3 inches of concrete.

b. Stub-ups to Outdoor Equipment: Extend concrete-encased GRC horizontally a minimum of 60 inches from edge of base. Install insulated grounding bushings on terminations at equipment.

1) Stub-ups shall be minimum 4 inches above finished floor and minimum 3 inches from conduit side to edge of slab.

c. Stub-ups to Indoor Equipment: Extend concrete-encased GRC horizontally a minimum of 60 inches from edge of wall. Install insulated grounding bushings on terminations at equipment.

1) Stub-ups shall be minimum 4 inches above finished floor and no less than 3 inches from conduit side to edge of slab.

10. After installing first tier of duct, backfill and compact. Start at tie-in point and work toward end of duct run, leaving ducts at end of run free to move with expansion and contraction as temperature changes during this process. Repeat procedure after placing each tier. After placing last tier, hand place backfills to 4 inches over duct and hand tamp. Firmly tamp backfill around ducts to provide maximum supporting strength. Use hand tamper only. After placing controlled backfill over final tier, make final duct connections at end of run and complete backfilling with normal compaction. Comply with requirements in Section 31 20 00 "Earth Moving" for installation of backfill materials.
a. Place minimum 6 inches of engineered fill above concrete encasement of duct.

N. Underground-Line Warning Tape: Bury conducting underground line specified in Section 26 05 53 "Identification for Electrical Systems" no less than 12 inches above all concrete-encased duct and duct banks and approximately 12 inches below grade. Align tape parallel to and within 3 inches of centerline of duct bank. Provide an additional warning tape for each 12-inch increment of duct-bank width over a nominal 18 inches. Space additional tapes 12 inches apart, horizontally.

3.6 INSTALLATION OF CONCRETE MANHOLES, HANDHOLES, AND BOXES

A. Cast-in-Place Manhole Installation:
1. Finish interior surfaces with a smooth-troweled finish.
2. Knockouts for Future Duct Connections: Form and pour concrete knockout panels 1-1/2 to 2 inches thick, arranged as indicated.
3. Comply with requirements in Section 03 30 00 "Cast-in-Place Concrete" for cast-in-place concrete, formwork, and reinforcement.

B. Precast Concrete Handhole and Manhole Installation:
1. Comply with ASTM C 891 unless otherwise indicated.
2. Install units level and plumb and with orientation and depth coordinated with connecting duct, to minimize bends and deflections required for proper entrances.
3. Unless otherwise indicated, support units on a level bed of crushed stone or gravel, graded from 1-inch sieve to No. 4 sieve and compacted to same density as adjacent undisturbed earth.

C. Elevations:
1. Manhole Roof: Install with rooftop at least 15 inches below finished grade.
2. Manhole Frame: In paved areas and trafficways, set frames flush with finished grade. Set other manhole frames 1 inch above finished grade.
3. Handhole Covers: In paved areas and trafficways, set surface flush with finished grade. Set covers of other handholes 1 inch above finished grade.
4. Where indicated, cast handhole cover frame integrally with handhole structure.

D. Drainage: Install drains in bottom of manholes where indicated. Coordinate with drainage provisions indicated.

E. Manhole Access: Circular opening in manhole roof; sized to match cover size.
1. Manholes with Fixed Ladders: Offset access opening from manhole centerlines to align with ladder.
2. Install chimney, constructed of precast concrete collars and rings, to support cast-iron frame to connect cover with manhole roof opening. Provide moisture-tight masonry joints and waterproof grouting for frame to chimney.

F. Manhole Coatings:
1. Manhole interiors shall be coated with waterproofing coating. Waterproofing shall be of the cementitious crystalline type that chemically controls and permanently fixes non-soluble crystalline growth throughout the capillary voids of concrete. Coating shall be XYPEX Concentrate, Thoroseal or approved equal.

G. Waterproofing: Apply waterproofing to exterior surfaces of manholes after concrete has cured at least three days. Waterproofing materials and installation are specified in [Section 07 13 53 "Elastomeric Sheet Waterproofing."] [Section 07 13 54 "Thermoplastic Sheet Waterproofing."] After duct has been connected and grouted, and before backfilling,
waterproof joints and connections, and touch up abrasions and scars. Waterproof exterior of manhole chimneys after mortar has cured at least three days.

H. Dampproofing: Apply dampproofing to exterior surfaces of manholes after concrete has cured at least three days. Dampproofing materials and installation are specified in Section 07 11 13 "Bituminous Dampproofing." After ducts are connected and grouted, and before backfilling, dampproof joints and connections, and touch up abrasions and scars. Dampproof exterior of manhole chimneys after mortar has cured at least three days.

I. Hardware: Install removable hardware, including pulling eyes, cable stanchions, and cable arms, and insulators, as required for installation and support of cables and conductors and as indicated.

J. Fixed Manhole Ladders: Arrange to provide for safe entry with maximum clearance from cables and other items in manholes.

K. Field-Installed Bolting Anchors in Manholes and Concrete Handholes: Do not drill deeper than 3-7/8 inches for manholes and 2 inches for handholes, for anchor bolts installed in the field. Use a minimum of two anchors for each cable stanchion.

3.7 INSTALLATION OF HANDHOLES AND BOXES OTHER THAN PRECAST CONCRETE

A. Install handholes and boxes level and plumb and with orientation and depth coordinated with connecting duct, to minimize bends and deflections required for proper entrances. Use box extension if required to match depths of duct, and seal joint between box and extension as recommended by manufacturer.

B. Unless otherwise indicated, support units on a level bed of crushed stone or gravel, graded from 1/2-inch sieve to No. 4 sieve and compacted to same density as adjacent undisturbed earth.

C. Elevation: In paved areas and trafficways, set cover flush with finished grade. Set covers of other handholes 1 inch above finished grade.

D. Install removable hardware, including pulling eyes, cable stanchions, cable arms, and insulators, as required for installation and support of cables and conductors and as indicated. Select arm lengths to be long enough to provide spare space for future cables, but short enough to preserve adequate working clearances in enclosure.

E. Field cut openings for duct according to enclosure manufacturer's written instructions. Cut wall of enclosure with a tool designed for material to be cut. Size holes for terminating fittings to be used, and seal around penetrations after fittings are installed.

F. For enclosures installed in asphalt paving and subject to occasional, nondeliberate, heavy-vehicle loading, form and pour a concrete ring encircling, and in contact with, enclosure and with top surface screened to top of box cover frame. Bottom of ring shall rest on compacted earth.
   1. Concrete: 3000 psi, 28-day strength, complying with Section 03 30 00 "Cast-in-Place Concrete," with a troweled finish.
   2. Dimensions: 10 inches wide by 12 inches deep.
3.8 GROUNDING

A. Ground underground ducts and utility structures according to Section 26 05 26 "Grounding and Bonding for Electrical Systems."

3.9 FIELD QUALITY CONTROL

A. Perform the following tests and inspections:
   1. Demonstrate capability and compliance with requirements on completion of installation of underground duct, duct bank, and utility structures.
   2. Pull solid aluminum or wood test mandrel through duct to prove joint integrity and adequate bend radii, and test for out-of-round duct. Provide a minimum 12-inch-long mandrel equal to duct size minus 1/4 inch. If obstructions are indicated, remove obstructions and retest.
   3. Test manhole grounding to ensure electrical continuity of grounding and bonding connections. Measure and report ground resistance as specified in Section 26 05 26 "Grounding and Bonding for Electrical Systems."

B. Correct deficiencies and retest as specified above to demonstrate compliance.

C. Prepare test and inspection reports.

3.10 CLEANING

A. Pull leather-washer-type duct cleaner, with graduated washer sizes, through full length of duct until duct cleaner indicates that duct is clear of dirt and debris. Follow with rubber duct swab for final cleaning and to assist in spreading lubricant throughout ducts.

B. Clean internal surfaces of manholes, including sump.
   1. Sweep floor, removing dirt and debris.
   2. Remove foreign material.

END OF SECTION
SECTION 260544 - SLEEVES AND SLEEVE SEALS FOR ELECTRICAL RACEWAYS AND CABLING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Sleeves for raceway and cable penetration of non-fire-rated construction walls and floors.
   2. Sleeve-seal systems.
   5. Silicone sealants.

B. Related Requirements:
   1. Section 07 84 13 "Penetration Firestopping" for penetration firestopping installed in fire-resistance-rated walls, horizontal assemblies, and smoke barriers, with and without penetrating items.

1.3 ACTION SUBMITTALS

A. Sustainable Design Submittals:

PART 2 - PRODUCTS

2.1 SLEEVES

A. Wall Sleeves:
   1. Cast-Iron Pipe Sleeves: Cast or fabricated "wall pipe," equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop unless otherwise indicated.

B. Sleeves for Conduits Penetrating Non-Fire-Rated Gypsum Board Assemblies: Galvanized-steel sheet; 0.0239-inch minimum thickness; round tube closed with welded longitudinal joint, with tabs for screw-fastening the sleeve to the board.

C. Sleeves for Rectangular Openings:
   2. Minimum Metal Thickness:
      a. For sleeve cross-section rectangle perimeter less than 50 inches and with no side larger than 16 inches, thickness shall be 0.052 inch.
      b. For sleeve cross-section rectangle perimeter 50 inches or more and one or more sides larger than 16 inches, thickness shall be 0.138 inch.
2.2 SLEEVE-SEAL SYSTEMS

A. Description: Modular sealing device, designed for field assembly, to fill annular space between sleeve and raceway or cable.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. Advance Products & Systems, Inc.
      b. Holdrite (Engineered Sleeve Solutions).
      c. Pipeline Seal and Insulator, Inc.
   2. Sealing Elements: EPDM rubber interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
   3. Pressure Plates: Carbon steel.
   4. Connecting Bolts and Nuts: Carbon steel, with corrosion-resistant coating, of length required to secure pressure plates to sealing elements.

2.3 SLEEVE-SEAL FITTINGS

A. Description: Manufactured plastic, sleeve-type, waterstop assembly made for embedding in concrete slab or wall. Unit shall have plastic or rubber waterstop collar with center opening to match piping OD.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. HOLDRITE.

2.4 SILICONE SEALANTS

A. Silicone Sealants: Single-component, silicone-based, neutral-curing elastomeric sealants of grade indicated below.
   1. Grade: Pourable (self-leveling) formulation for openings in floors and other horizontal surfaces that are not fire rated.

B. Silicone Foams: Multicomponent, silicone-based liquid elastomers that, when mixed, expand and cure in place to produce a flexible, nonshrinking foam.

PART 3 - EXECUTION

3.1 SLEEVE INSTALLATION FOR NON-FIRE-RATED ELECTRICAL PENETRATIONS

A. Comply with NECA 1.

B. Comply with NEMA VE 2 for cable tray and cable penetrations.

C. Sleeves for Conduits Penetrating Above-Grade Non-Fire-Rated Concrete and Masonry-Unit Floors and Walls:
   1. Interior Penetrations of Non-Fire-Rated Walls and Floors:
      a. Seal annular space between sleeve and raceway or cable, using joint sealant appropriate for size, depth, and location of joint. Comply with requirements in Section 07 92 00 "Joint Sealants."
b. Seal space outside of sleeves with mortar or grout. Pack sealing material solidly between sleeve and wall so no voids remain. Tool exposed surfaces smooth; protect material while curing.

2. Use pipe sleeves unless penetration arrangement requires rectangular sleeved opening.

3. Size pipe sleeves to provide 1/4-inch annular clear space between sleeve and raceway or cable unless sleeve seal is to be installed or unless seismic criteria require different clearance.

4. Install sleeves for wall penetrations unless core-drilled holes or formed openings are used. Install sleeves during erection of walls. Cut sleeves to length for mounting flush with both surfaces of walls. Deburr after cutting.

5. Install sleeves for floor penetrations. Extend sleeves installed in floors 2 inches above finished floor level. Install sleeves during erection of floors.

D. Sleeves for Conduits Penetrating Non-Fire-Rated Gypsum Board Assemblies:
   1. Use circular metal sleeves unless penetration arrangement requires rectangular sleeved opening.
   2. Seal space outside of sleeves with approved joint compound for gypsum board assemblies.

E. Roof-Penetration Sleeves: Seal penetration of individual raceways and cables with flexible boot-type flashing units applied in coordination with roofing work.

F. Aboveground, Exterior-Wall Penetrations: Seal penetrations using steel pipe sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.

G. Underground, Exterior-Wall and Floor Penetrations: Install cast-iron pipe sleeves. Size sleeves to allow for 1-inch annular clear space between raceway or cable and sleeve for installing sleeve-seal system.

3.2 SLEEVE-SEAL-SYSTEM INSTALLATION

A. Install sleeve-seal systems in sleeves in exterior concrete walls and slabs-on-grade at raceway entries into building.

B. Install type and number of sealing elements recommended by manufacturer for raceway or cable material and size. Position raceway or cable in center of sleeve. Assemble mechanical sleeve seals and install in annular space between raceway or cable and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

3.3 SLEEVE-SEAL-FITTING INSTALLATION

A. Install sleeve-seal fittings in new walls and slabs as they are constructed.

B. Assemble fitting components of length to be flush with both surfaces of concrete slabs and walls. Position waterstop flange to be centered in concrete slab or wall.

C. Secure nailing flanges to concrete forms.

D. Using grout, seal the space around outside of sleeve-seal fittings.

END OF SECTION
SECTION 260548.16 - SEISMIC CONTROLS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Restraint channel bracings.
   2. Restraint cables.
   4. Mechanical anchor bolts.
   5. Adhesive anchor bolts.

B. Related Requirements:
   1. Section 260529 "Hangers and Supports for Electrical Systems" for commonly used electrical supports and installation requirements.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.
   1. Illustrate and indicate style, material, strength, fastening provision, and finish for each type and size of seismic-restraint component used.
      a. Tabulate types and sizes of seismic restraints, complete with report numbers and rated strength in tension and shear as evaluated by an agency acceptable to authorities having jurisdiction.
      b. Annotate to indicate application of each product submitted and compliance with requirements.

1.4 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Show coordination of seismic bracing for electrical components with other systems and equipment in the vicinity, including other supports and seismic restraints. Electrical components include:
   1. Control and monitoring panels.
   2. Generators.
   3. Luminaires. Luminaires with pole.
   4. Panelboards.
   5. Substations.
   6. Transformers.

B. Qualification Data: For professional engineer and testing agency.

C. Field quality-control reports.
1.5 QUALITY ASSURANCE

A. Testing Agency Qualifications: An independent agency, with the experience and capability to conduct the testing indicated and that is acceptable to authorities having jurisdiction.

B. Comply with seismic-restraint requirements in the IBC unless requirements in this Section are more stringent.

C. Seismic-restraint devices shall have horizontal and vertical load testing and analysis. They shall bear anchorage preapproval from OSHPD in addition to preapproval, showing maximum seismic-restraint ratings, by ICC-ES or another agency acceptable to authorities having jurisdiction. Ratings based on independent testing are preferred to ratings based on calculations. If preapproved ratings are not available, submittals based on independent testing are preferred. Calculations (including combining shear and tensile loads) that support seismic-restraint designs must be signed and sealed by a qualified professional engineer.

D. Comply with CEC 70.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Wind-Restraint Loading:
   1. Basic Wind Speed: 115 mph
   2. Building “Risk” Classification Category: III.
   3. Minimum 10 lb/sq. ft. multiplied by maximum area of component projected on vertical plane normal to wind direction and 45 degrees either side of normal.

B. Seismic-Restraint Loading:
   1. Site Class as Defined in the IBC: D.
   2. Building “Risk” Category as Defined in the IBC: III.
   3. Design Spectral Response Acceleration at Short Periods (0.2 Second). Refer to Sheet S0.02.
   4. Design Spectral Response Acceleration at 1.0-Second Period. Refer to Sheet S0.02.

2.2 RESTRAINT CHANNEL BRACINGS

A. Coordinate with system specified on Drawings: Mason West. Inc per OSHPD OPM-0043-13.

2.3 RESTRAINT CABLES

A. Coordinate with system specified on Drawings: Mason West. Inc per OSHPD OPM-0043-13.

2.4 SEISMIC-RESTRAINT ACCESSORIES

A. Coordinate with system specified on Drawings: Mason West. Inc per OSHPD OPM-0043-13.
2.3  RESTRAINT CABLES

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
   1. Kinetics Noise Control, Inc.
   2. Vibration & Seismic Technologies, LLC.
   3. Vibration Mountings & Controls, Inc.

B. Restraint Cables: ASTM A 492 stainless-steel cables. End connections made of steel assemblies with thimbles, brackets, swivel, and bolts designed for restraining cable service; with a minimum of two clamping bolts for cable engagement.

2.4  SEISMIC-RESTRAINT ACCESSORIES

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
   1. B-line, an Eaton business.
   2. Kinetics Noise Control, Inc.
   3. Mason Industries, Inc.

B. Hanger-Rod Stiffener: Steel tube or steel slotted-support-system sleeve with internally bolted connections to hanger rod.

C. Hinged and Swivel Brace Attachments: Multifunctional steel connectors for attaching hangers to rigid channel bracings and restraint cables.

D. Bushings for Floor-Mounted Equipment Anchor Bolts: Neoprene bushings designed for rigid equipment mountings and matched to type and size of anchor bolts and studs.

E. Bushing Assemblies for Wall-Mounted Equipment Anchorage: Assemblies of neoprene elements and steel sleeves designed for rigid equipment mountings and matched to type and size of attachment devices used.

F. Resilient Isolation Washers and Bushings: One-piece, molded, oil- and water-resistant neoprene, with a flat washer face.

2.5  MECHANICAL ANCHOR BOLTS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
   1. B-line, an Eaton business.
   2. Hilti, Inc.
   4. Mason Industries, Inc.

B. Mechanical Anchor Bolts: Drilled-in and stud-wedge or female-wedge type in zinc-coated steel for interior applications and stainless steel for exterior applications. Select anchor bolts with strength required for anchor and as tested according to ASTM E 488.
C. Install cables so they do not bend across edges of adjacent equipment or building structure.

D. Install bushing assemblies for mounting bolts for wall-mounted equipment, arranged to provide resilient media where equipment or equipment-mounting channels are attached to wall.

E. Attachment to Structure: If specific attachment is not indicated, anchor bracing to structure at flanges of beams, at upper truss chords of bar joists, or at concrete members.

F. Drilled-in Anchors:
   1. Identify position of reinforcing steel and other embedded items prior to drilling holes for anchors. Do not damage existing reinforcing or embedded items during coring or drilling. Notify the structural engineer if reinforcing steel or other embedded items are encountered during drilling. Locate and avoid prestressed tendons, electrical and telecommunications conduit, and gas lines.
   2. Do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength.
   3. Wedge Anchors: Protect threads from damage during anchor installation. Heavy-duty sleeve anchors shall be installed with sleeve fully engaged in the structural element to which anchor is to be fastened.
   4. Adhesive Anchors: Clean holes to remove loose material and drilling dust prior to installation of adhesive. Place adhesive in holes proceeding from the bottom of the hole and progressing toward the surface in such a manner as to avoid introduction of air pockets in the adhesive.
   5. Set anchors to manufacturer's recommended torque using a torque wrench.
   6. Install zinc-coated steel anchors for interior and stainless-steel anchors for exterior applications.

3.4 ACCOMMODATION OF DIFFERENTIAL SEISMIC MOTION

A. Install flexible connections in runs of raceways, wireways, cable trays, and busways where they cross seismic joints, where adjacent sections or branches are supported by different structural elements, and where connection is terminated to equipment that is anchored to a different structural element from the one supporting them as they approach equipment.

3.5 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Perform the following tests and inspections:
   1. Provide evidence of recent calibration of test equipment by a testing agency acceptable to authorities having jurisdiction.
   2. Schedule test with Owner, through Architect, before connecting anchorage device to restrained component (unless post connection testing has been approved), and with at least seven days' advance notice.
   4. Test at least four of each type and size of installed anchors and fasteners selected by Architect.
   5. Test to 90 percent of rated proof load of device.

C. Seismic controls will be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports.
3.6 ADJUSTING

A. Adjust restraints to permit free movement of equipment within normal mode of operation.

END OF SECTION
2. Schedule test with Owner, through Architect, before connecting anchorage device to restrained component (unless postconnection testing has been approved), and with at least seven days' advance notice.

4. Test at least four of each type and size of installed anchors and fasteners selected by Architect.

5. Test to 90 percent of rated proof load of device.

C. Seismic controls will be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports.

3.6 ADJUSTING

A. Adjust restraints to permit free movement of equipment within normal mode of operation.

END OF SECTION

NOT USED
SECTION 260553 - IDENTIFICATION FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
   A. Section Includes:
      1. Color and legend requirements for raceways, conductors, and warning labels and signs.
      2. Labels.
      4. Tapes and stencils.
      5. Tags.
      7. Cable ties.
      9. Fasteners for labels and signs.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS
   A. Comply with NFPA 70.
   C. Comply with ANSI Z535.4 for safety signs and labels.
   D. Comply with NFPA 70E and Section 260574 "Overcurrent Protective Device Arc-Flash Study" requirements for arc-flash warning labels.
   E. Adhesive-attached labeling materials, including label stocks, laminating adhesives, and inks used by label printers, shall comply with UL 969.
   F. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes.
      1. Temperature Change: 120 deg F, ambient; 180 deg F, material surfaces.

2.2 COLOR AND LEGEND REQUIREMENTS
   A. Raceways and Cables Carrying Circuits at 600 V or Less:
      1. Black letters on an orange field.
      2. Legend: Indicate voltage and system or service type.
B. Color-Coding for Phase- and Voltage-Level Identification, 600 V or Less: Use colors listed below for ungrounded service feeder and branch-circuit conductors.
   1. Color shall be factory applied.
   2. Colors for 208/120-V Circuits:
      a. Phase A: Black.
      b. Phase B: Red.
      c. Phase C: Blue.
   3. Colors for 480/277-V Circuits:
      b. Phase B: Orange.
      c. Phase C: Yellow.
   6. Colors for Isolated Grounds: Green with white stripe.

C. Raceways and Cables Carrying Circuits at More Than 600 V:
   1. Black letters on an orange field.
   2. Legend: "DANGER - CONCEALED HIGH VOLTAGE WIRING."

D. Warning Label Colors:
   1. Identify system voltage with black letters on an orange background.

E. Warning labels and signs shall include, but are not limited to, the following legends:
   1. Multiple Power Source Warning: "DANGER - ELECTRICAL SHOCK HAZARD - EQUIPMENT HAS MULTIPLE POWER SOURCES."
   2. Workspace Clearance Warning: "WARNING - OSHA REGULATION - AREA IN FRONT OF ELECTRICAL EQUIPMENT MUST BE KEPT CLEAR FOR 36 INCHES."

F. Equipment Identification Labels:
   1. Black letters on a white field.

2.3 LABELS

A. Vinyl Wraparound Labels: Preprinted, flexible labels laminated with a clear, weather- and chemical-resistant coating and matching wraparound clear adhesive tape for securing label ends.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. Brady Corporation.
      b. Panduit Corp.
      c. Seton Identification Products.

B. Snap-around Labels: Slit, pretensioned, flexible, preprinted, color-coded acrylic sleeves, with diameters sized to suit diameters and that stay in place by gripping action.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. Brady Corporation.
      b. Panduit Corp.
      c. Seton Identification Products.

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
   a. Brady Corporation.
   b. Brother International Corporation.
   c. Ideal Industries, Inc.
   d. Panduit Corp.
   e. Seton Identification Products.

2. Self-Lamination: Clear; UV-, weather- and chemical-resistant; self-laminating, protective shield over the legend. Labels sized such that the clear shield overlaps the entire printed legend.

3. Marker for Labels: Machine-printed, permanent, waterproof, black ink recommended by printer manufacturer.

D. Self-Adhesive Labels: Polyester, thermal, transfer-printed, 3-mil-thick, multicolor, weather- and UV-resistant, pressure-sensitive adhesive labels, configured for intended use and location.
   1. Minimum Nominal Size:
      a. 1-1/2 by 6 inches for raceway and conductors.
      b. 3-1/2 by 5 inches for equipment.
      c. As required by authorities having jurisdiction.

2.4 BANDS AND TUBES

A. Snap-around, Color-Coding Bands: Slit, pretensioned, flexible, solid-colored acrylic sleeves, 2 inches long, with diameters sized to suit diameters and that stay in place by gripping action.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. Brady Corporation.
      b. Marking Services, Inc.
      c. Panduit Corp.

B. Heat-Shrink Preprinted Tubes: Flame-retardant polyolefin tubes with machine-printed identification labels, sized to suit diameter and shrunk to fit firmly. Full shrink recovery occurs at a maximum of 200 deg F. Comply with UL 224.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. Brady Corporation.
      b. Panduit Corp.

2.5 TAPES AND STENCILS

A. Self-Adhesive Vinyl Tape: Colored, heavy duty, waterproof, fade resistant; not less than 3 mils thick by 1 to 2 inches wide; compounded for outdoor use.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. Brady Corporation.
      b. Carlton Industries, LP.
      c. Marking Services, Inc.
B. Tape and Stencil: 4-inch-wide black stripes on 10-inch centers placed diagonally over orange background and is 12 inches wide. Stop stripes at legends.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. LEM Products Inc.
      b. Marking Services, Inc.
      c. Seton Identification Products.

C. Floor Marking Tape: 2-inch-wide, 5-mil pressure-sensitive vinyl tape, with yellow and black stripes and clear vinyl overlay.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. Carlton Industries, LP.
      b. Seton Identification Products.

D. Underground-Line Warning Tape:
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. Brady Corporation.
      b. Ideal Industries, Inc.
      c. Marking Services, Inc.
      d. Seton Identification Products.
   2. Tape:
      a. Recommended by manufacturer for the method of installation and suitable to identify and locate underground electrical and communications utility lines.
      b. Printing on tape shall be permanent and shall not be damaged by burial operations.
      c. Tape material and ink shall be chemically inert and not subject to degradation when exposed to acids, alkalis, and other destructive substances commonly found in soils.
   3. Color and Printing:
      b. Inscriptions for Red-Colored Tapes: "ELECTRIC LINE, HIGH VOLTAGE".
      c. Inscriptions for Orange-Colored Tapes: "TELEPHONE CABLE, CATV CABLE, COMMUNICATIONS CABLE, OPTICAL FIBER CABLE".
   4. Tag:
      a. Reinforced, detectable three-layer laminate, consisting of a printed pigmented woven scrim, a solid aluminum-foil core, and a clear protective film that allows inspection of the continuity of the conductive core; bright-colored, continuous-printed on one side with the inscription of the utility, compounded for direct-burial service.
      b. Width: 3 inches.
      c. Overall Thickness: 8 mils.
      d. Foil Core Thickness: 0.35 mil.
      e. Weight: 34 lb/1000 sq. ft.
      f. Tensile according to ASTM D 882: 300 lbf and 12,500 psi.

E. Stenciled Legend: In nonfading, waterproof, black ink or paint. Minimum letter height shall be 1 inch.
2.6 TAGS

A. Metal Tags: Brass or aluminum, 2 by 2 by 0.05 inch, with stamped legend, punched for use with self-locking cable tie fastener.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. Brady Corporation.
      b. Carlton Industries, LP.
      c. Marking Services, Inc.
      d. Seton Identification Products.

B. Nonmetallic Preprinted Tags: Polyethylene tags, 0.023 inch thick, color-coded for phase and voltage level, with factory printed permanent designations; punched for use with self-locking cable tie fastener.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. Brady Corporation.
      b. Marking Services, Inc.
      c. Panduit Corp.
      d. Seton Identification Products.

C. Write-on Tags:
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. Carlton Industries, LP.
      b. Seton Identification Products.
   2. Polyester Tags: 0.015 inch thick, with corrosion-resistant grommet and cable tie for attachment.
   3. Marker for Tags: Permanent, waterproof, black ink marker recommended by tag manufacturer.
   4. Marker for Tags: Machine-printed, permanent, waterproof, black ink marker recommended by printer manufacturer.

2.7 SIGNS

A. Baked-Enamel Signs:
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. Carlton Industries, LP.
      b. Marking Services, Inc.
   2. Preprinted aluminum signs, high-intensity reflective, punched or drilled for fasteners, with colors, legend, and size required for application.
   3. 1/4-inch grommets in corners for mounting.

B. Laminated Acrylic or Melamine Plastic Signs:
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
      a. Brady Corporation.
b. Carlton Industries, LP.
c. Marking Services, Inc.

2. Engraved legend.

3. Thickness:
   a. For signs up to 20 sq. in., minimum 1/16 inch thick.
   b. For signs larger than 20 sq. in., 1/8 inch thick.
   c. Engraved legend with black letters on white face.
   d. Punched or drilled for mechanical fasteners with 1/4-inch grommets in corners for mounting.
   e. Framed with mitered acrylic molding and arranged for attachment at applicable equipment.

2.8 CABLE TIES

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
   1. Ideal Industries, Inc.
   2. Marking Services, Inc.
   3. Panduit Corp.

B. Plenum-Rated Cable Ties: Self-extinguishing, UV stabilized, one piece, and self-locking.
   2. Tensile Strength at 73 Deg F according to ASTM D 638: 7000 psi.
   3. UL 94 Flame Rating: 94V-0.
   4. Temperature Range: Minus 50 to plus 284 deg F.
   5. Color: Black.

2.9 MISCELLANEOUS IDENTIFICATION PRODUCTS

A. Paint: Comply with requirements in painting Sections for paint materials and application requirements. Retain paint system applicable for surface material and location (exterior or interior).

B. Fasteners for Labels and Signs: Self-tapping, stainless-steel screws or stainless-steel machine screws with nuts and flat and lock washers.

PART 3 - EXECUTION

3.1 PREPARATION

A. Self-Adhesive Identification Products: Before applying electrical identification products, clean substrates of substances that could impair bond, using materials and methods recommended by manufacturer of identification product.

3.2 INSTALLATION

A. Verify and coordinate identification names, abbreviations, colors, and other features with requirements in other Sections requiring identification applications, Drawings, Shop Drawings, manufacturer's wiring diagrams, and operation and maintenance manual. Use consistent designations throughout Project.
B. Install identifying devices before installing acoustical ceilings and similar concealment.

C. Verify identity of each item before installing identification products.

D. Coordinate identification with Project Drawings, manufacturer’s wiring diagrams, and operation and maintenance manual.

E. Apply identification devices to surfaces that require finish after completing finish work.

F. Install signs with approved legend to facilitate proper identification, operation, and maintenance of electrical systems and connected items.

G. System Identification for Raceways and Cables under 600 V: Identification shall completely encircle cable or conduit. Place identification of two-color markings in contact, side by side.
   1. Secure tight to surface of conductor, cable, or raceway.

H. System Identification for Raceways and Cables over 600 V: Identification shall completely encircle cable or conduit. Place adjacent identification of two-color markings in contact, side by side.
   1. Secure tight to surface of conductor, cable, or raceway.

J. Emergency Operating Instruction Signs: Install instruction signs with white legend on a red background with minimum 3/8-inch-high letters for emergency instructions at equipment used for power transfer.

K. Elevated Components: Increase sizes of labels, signs, and letters to those appropriate for viewing from the floor.

L. Accessible Fittings for Raceways: Identify the covers of each junction and pull box of the following systems with the wiring system legend and system voltage. System legends shall be as follows:
   1. "EMERGENCY POWER."
   2. "POWER."

M. Snap-around Labels: Secure tight to surface at a location with high visibility and accessibility.

N. Self-Adhesive Wraparound Labels: Secure tight to surface at a location with high visibility and accessibility.

O. Self-Adhesive Labels:
   1. On each item, install unique designation label that is consistent with wiring diagrams, schedules, and operation and maintenance manual.
   2. Unless otherwise indicated, provide a single line of text with 1/2-inch-high letters on 1-1/2-inch-high label; where two lines of text are required, use labels 2 inches high.

P. Snap-around Color-Coding Bands: Secure tight to surface at a location with high visibility and accessibility.

Q. Heat-Shrink, Preprinted Tubes: Secure tight to surface at a location with high visibility and accessibility.

R. Marker Tapes: Secure tight to surface at a location with high visibility and accessibility.
S. Self-Adhesive Vinyl Tape: Secure tight to surface at a location with high visibility and accessibility.

T. Tape and Stencil: Comply with requirements in painting Sections for surface preparation and paint application.

U. Floor Marking Tape: Apply stripes to finished surfaces following manufacturer’s written instructions.

V. Underground Line Warning Tape:
   1. During backfilling of trenches, install continuous underground-line warning tape directly above cable or raceway at 6 to 8 inches below finished grade. Use multiple tapes where width of multiple lines installed in a common trench or concrete envelope exceeds 16 inches overall.
   2. Install underground-line warning tape for direct-buried cables and cables in raceways.

W. Metal Tags:
   1. Place in a location with high visibility and accessibility.

X. Nonmetallic Preprinted Tags:
   1. Place in a location with high visibility and accessibility.

Y. Write-on Tags:
   1. Place in a location with high visibility and accessibility.

Z. Baked-Enamel Signs:
   1. Attach signs that are not self-adhesive type with mechanical fasteners appropriate to the location and substrate.
   2. Unless otherwise indicated, provide a single line of text with 1/2-inch-high letters on minimum 1-1/2-inch-high sign; where two lines of text are required, use signs minimum 2 inches high.

AA. Laminated Acrylic or Melamine Plastic Signs:
   1. Attach signs that are not self-adhesive type with mechanical fasteners appropriate to the location and substrate.
   2. Unless otherwise indicated, provide a single line of text with 1/2-inch-high letters on 1-1/2-inch-high sign; where two lines of text are required, use labels 2 inches high.

BB. Cable Ties: General purpose, for attaching tags, except as listed below:
   1. Outdoors: UV-stabilized nylon.
   2. In Spaces Handling Environmental Air: Plenum rated.

3.3 IDENTIFICATION SCHEDULE

A. Install identification materials and devices at locations for most convenient viewing without interference with operation and maintenance of equipment. Install access doors or panels to provide view of identifying devices.

B. Identify conductors, cables, and terminals in enclosures and at junctions, terminals, pull points, and locations of high visibility. Identify by system and circuit designation.
   1. Locate identification at changes in direction, at penetrations of walls and floors, and at 10-foot maximum intervals.

D. Accessible Raceways and Cables, 600 V or Less, for Service, Feeder, and Branch Circuits, More Than 30 A and 120 V to Ground: Identify with self-adhesive raceway labels.
   1. Locate identification at changes in direction, at penetrations of walls and floors, at 50-foot maximum intervals in straight runs, and at 25-foot maximum intervals in congested areas.

E. Accessible Fittings for Raceways and Cables within Buildings: Identify the covers of each junction and pull box of the following systems with self-adhesive labels containing the wiring system legend and system voltage. System legends shall be as follows:
   1. "EMERGENCY POWER."
   2. "POWER."
   3. "FIRE ALARM"

F. Power-Circuit Conductor Identification, 600 V or Less: For conductors in vaults, pull and junction boxes, manholes, and handholes, use snap-around color-coding bands to identify the phase.
   1. Locate identification at changes in direction, at penetrations of walls and floors, at 50-foot maximum intervals in straight runs, and at 25-foot maximum intervals in congested areas.

G. Power-Circuit Conductor Identification, More Than 600 V: For conductors in vaults, pull and junction boxes, manholes, and handholes, use nonmetallic preprinted tags colored and marked to indicate phase, and a separate tag with the circuit designation.

H. Control-Circuit Conductor Identification: For conductors and cables in pull and junction boxes, manholes, and handholes, use self-adhesive labels with the conductor or cable designation, origin, and destination.

I. Control-Circuit Conductor Termination Identification: For identification at terminations, provide heat-shrink preprinted tubes with the conductor designation.

J. Conductors to Be Extended in the Future: Attach write-on tags to conductors and list source.

K. Auxiliary Electrical Systems Conductor Identification: Marker tape that is uniform and consistent with system used by manufacturer for factory-installed connections.
   1. Identify conductors, cables, and terminals in enclosures and at junctions, terminals, and pull points. Identify by system and circuit designation.

L. Locations of Underground Lines: Underground-line warning tape for power, lighting, communication, and control wiring and optical-fiber cable.

M. Concealed Raceways and Duct Banks, More Than 600 V, within Buildings: Apply floor marking tape to the following finished surfaces:
   1. Floor surface directly above conduits running beneath and within 12 inches of a floor that is in contact with earth or is framed above unexcavated space.
   2. Wall surfaces directly external to raceways concealed within wall.
   3. Accessible surfaces of concrete envelope around raceways in vertical shafts, exposed in the building, or concealed above suspended ceilings.

N. Workspace Indication: Apply floor marking tape to finished surfaces. Show working clearances in the direction of access to live parts. Workspace shall comply with NFPA 70 and
29 CFR 1926.403 unless otherwise indicated. Do not install at flush-mounted panelboards and similar equipment in finished spaces.

O. Instructional Signs: Self-adhesive labels, including the color code for grounded and ungrounded conductors.

P. Warning Labels for Indoor Cabinets, Boxes, and Enclosures for Power and Lighting: Baked-enamel warning signs.
   1. Apply to exterior of door, cover, or other access.
   2. For equipment with multiple power or control sources, apply to door or cover of equipment, including, but not limited to, the following:
      a. Power-transfer switches.
      b. Controls with external control power connections.

R. Main Electrical Room: Framed with glass protective cover a full size drawing of project electrical single line diagram including all Project Record changes wall. Where multiple drawings are included in construction documents provide one for each sheet.

S. Operating Instruction Signs: Self-adhesive labels.

T. Emergency Operating Instruction Signs: Baked-enamel warning signs with white legend on a red background with minimum 3/8-inch-high letters for emergency instructions at equipment used for power transfer.

U. Equipment Identification Labels:
   1. Indoor Equipment: Laminated acrylic or melamine plastic sign.
   2. Outdoor Equipment: Stenciled legend 4 inches high.
   3. Equipment to Be Labeled:
      a. Panelboards: Typewritten directory of circuits in the location provided by panelboard manufacturer. Panelboard identification shall be in the form of an engraved, laminated acrylic or melamine label.
      b. Enclosures and electrical cabinets.
      c. Access doors and panels for concealed electrical items.
      d. Switchboards.
      e. Transformers: Label that includes tag designation indicated on Drawings for the transformer, feeder, and panelboards or equipment supplied by the secondary.
      f. Substations.
      g. Emergency system boxes and enclosures.
      h. Enclosed switches.
      i. Enclosed circuit breakers.
      j. Enclosed controllers.
      k. Variable-speed controllers.
      l. Push-button stations.
      m. Power-transfer equipment.
      n. Contactors.
      o. Remote-controlled switches, dimmer modules, and control devices.
      p. Power-generating units.
      q. Monitoring and control equipment.

END OF SECTION
SECTION 260572 - OVERCURRENT PROTECTIVE DEVICE SHORT-CIRCUIT STUDY

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
   A. Section includes a computer-based, fault-current study to determine the minimum interrupting capacity of circuit protective devices.

1.3 DEFINITIONS
   A. Existing to Remain: Existing items of construction that are not to be removed and that are not otherwise indicated to be removed, removed and salvaged, or removed and reinstalled.
   B. One-Line Diagram: A diagram which shows, by means of single lines and graphic symbols, the course of an electric circuit or system of circuits and the component devices or parts used therein.
   C. Protective Device: A device that senses when an abnormal current flow exists and then removes the affected portion from the system.
   D. SCCR: Short-circuit current rating.
   E. Service: The conductors and equipment for delivering electric energy from the serving utility to the wiring system of the premises served.

1.4 ACTION SUBMITTALS
   A. Product Data: For computer software program to be used for studies.
   B. Other Action Submittals: Submit the following after the approval of system protective devices submittals. Submittals shall be in digital form.
      1. Short-circuit study input data, including completed computer program input data sheets.
      2. Short-circuit study and equipment evaluation report; signed, dated, and sealed by a qualified professional engineer.
         a. Submit study report for action prior to receiving final approval of the distribution equipment submittals. If formal completion of studies will cause delay in equipment manufacturing, obtain approval from Architect for preliminary submittal of sufficient study data to ensure that the selection of devices and associated characteristics is satisfactory.
         b. Revised single-line diagram, reflecting field investigation results and results of short-circuit study.
1.5 INFORMATIONAL SUBMITTALS
A. Qualification Data: For Short-Circuit Study Specialist.
B. Product Certificates: For short-circuit study software, certifying compliance with IEEE 399.

1.6 QUALITY ASSURANCE
A. Studies shall use computer programs that are distributed nationally and are in wide use. Software algorithms shall comply with requirements of standards and guides specified in this Section. Manual calculations are unacceptable.
B. Short-Circuit Study Specialist Qualifications: Professional engineer in charge of performing the study and documenting recommendations, licensed in the state where Project is located. All elements of the study shall be performed under the direct supervision and control of this professional engineer.
C. Field Adjusting Agency Qualifications: An independent agency, with the experience and capability to adjust overcurrent devices and to conduct the testing indicated, that is a member company of the InterNational Electrical Testing Association or is a nationally recognized testing laboratory (NRTL) as defined by OSHA in 29 CFR 1910.7, and that is acceptable to authorities having jurisdiction.

PART 2 - PRODUCTS

2.1 COMPUTER SOFTWARE
A. Manufacturers: Subject to compliance with requirements, provide products by the following:
1. SKM Systems Analysis, Inc.
B. Comply with IEEE 399 and IEEE 551.
C. Analytical features of fault-current-study computer software program shall have the capability to calculate "mandatory," "very desirable," and "desirable" features as listed in IEEE 399.
D. Computer software program shall be capable of plotting and diagramming time-current-characteristic curves as part of its output.

2.2 SHORT-CIRCUIT STUDY REPORT CONTENTS
A. Executive summary.
B. Study descriptions, purpose, basis, and scope. Include case descriptions, definition of terms, and guide for interpretation of the computer printout.
C. One-line diagram, showing the following:
1. Protective device designations and ampere ratings.
2. Cable size and lengths.
3. Transformer kilovolt ampere (kVA) and voltage ratings.
4. Motor and generator designations and kVA ratings.
5. Switchgear, switchboard, motor-control center, and panelboard designations.

D. Comments and recommendations for system improvements, where needed.

E. Protective Device Evaluation:
   1. Evaluate equipment and protective devices and compare to short-circuit ratings.
   2. Tabulations of circuit breaker, fuse, and other protective device ratings versus calculated short-circuit duties.
   3. For 600-V overcurrent protective devices, ensure that interrupting ratings are equal to or higher than calculated 1/2-cycle symmetrical fault current.
   4. For devices and equipment rated for asymmetrical fault current, apply multiplication factors listed in the standards to 1/2-cycle symmetrical fault current.
   5. Verify adequacy of phase conductors at maximum three-phase bolted fault currents; verify adequacy of equipment grounding conductors and grounding electrode conductors at maximum ground-fault currents. Ensure that short-circuit withstand ratings are equal to or higher than calculated 1/2-cycle symmetrical fault current.

G. Short-Circuit Study Output:
   1. Low-Voltage Fault Report: Three-phase and unbalanced fault calculations, showing the following for each overcurrent device location:
      a. Voltage.
      b. Calculated fault-current magnitude and angle.
      c. Fault-point X/R ratio.
      d. Equivalent impedance.
   2. Momentary Duty Report: Three-phase and unbalanced fault calculations, showing the following for each overcurrent device location:
      a. Voltage.
      b. Calculated symmetrical fault-current magnitude and angle.
      c. Fault-point X/R ratio.
      d. Calculated asymmetrical fault currents:
         1) Based on fault-point X/R ratio.
         2) Based on calculated symmetrical value multiplied by 1.6.
         3) Based on calculated symmetrical value multiplied by 2.7.
   3. Interrupting Duty Report: Three-phase and unbalanced fault calculations, showing the following for each overcurrent device location:
      a. Voltage.
      b. Calculated symmetrical fault-current magnitude and angle.
      c. Fault-point X/R ratio.
      d. No AC Decrement (NACD) ratio.
      e. Equivalent impedance.
      f. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on a symmetrical basis.
      g. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on a total basis.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Obtain all data necessary for the conduct of the study.
   1. Verify completeness of data supplied on the one-line diagram. Call any discrepancies to the attention of Architect.
2. For equipment provided that is Work of this Project, use characteristics submitted under the provisions of action submittals and information submittals for this Project.

3. For relocated equipment and that which is existing to remain, obtain required electrical distribution system data by field investigation and surveys, conducted by qualified technicians and engineers. The qualifications of technicians and engineers shall be qualified as defined by NFPA 70E.

B. Gather and tabulate the following input data to support the short-circuit study. Comply with recommendations in IEEE 551 as to the amount of detail that is required to be acquired in the field. Field data gathering shall be under the direct supervision and control of the engineer in charge of performing the study, and shall be by the engineer or its representative who holds NETA ETT Level III certification or NICET Electrical Power Testing Level III certification.

1. Product Data for Project's overcurrent protective devices involved in overcurrent protective device coordination studies. Use equipment designation tags that are consistent with electrical distribution system diagrams, overcurrent protective device submittals, input and output data, and recommended device settings.

2. Obtain electrical power utility impedance at the service.

3. Power sources and ties.

4. For transformers, include kVA, primary and secondary voltages, connection type, impedance, X/R ratio, taps measured in percent, and phase shift.

5. For reactors, provide manufacturer and model designation, voltage rating, and impedance.

6. For circuit breakers and fuses, provide manufacturer and model designation. List type of breaker, type of trip, SCCR, current rating, and breaker settings.

7. Generator short-circuit current contribution data, including short-circuit reactance, rated kVA, rated voltage, and X/R ratio.

8. Busway manufacturer and model designation, current rating, impedance, lengths, and conductor material.

9. Motor horsepower and NEMA MG 1 code letter designation.

10. Cable sizes, lengths, number, conductor material and conduit material (magnetic or nonmagnetic).

3.2 SHORT-CIRCUIT STUDY

A. Perform study following the general study procedures contained in IEEE 399.

B. Calculate short-circuit currents according to IEEE 551.

C. Base study on the device characteristics supplied by device manufacturer.

D. Begin short-circuit current analysis at the service, extending down to the system overcurrent protective devices as follows:

1. To normal system low-voltage load buses where fault current is 10 kA or less.

2. Exclude equipment rated 240-V ac or less when supplied by a single transformer rated less than 125 kVA.

E. Study electrical distribution system from normal and alternate power sources throughout electrical distribution system for Project. Study all cases of system-switching configurations and alternate operations that could result in maximum fault conditions.

F. The calculations shall include the ac fault-current decay from induction motors, synchronous motors, and asynchronous generators and shall apply to low- and medium-voltage, three-phase ac systems. The calculations shall also account for the fault-current dc decrement, to address the asymmetrical requirements of the interrupting equipment.
1. For grounded systems, provide a bolted line-to-ground fault-current study for areas as defined for the three-phase bolted fault short-circuit study.

G. Calculate short-circuit momentary and interrupting duties for a three-phase bolted fault at each of the following:
   1. Pad mounted transformer.
   2. Incoming switchboard.
   3. Distribution panelboards.
   4. Panelboards
   5. Control panels.
   8. Disconnect switches.

3.3 ADJUSTING

   A. Make minor modifications to equipment as required to accomplish compliance with short-circuit study.

3.4 DEMONSTRATION

   A. Train Owner's operating and maintenance personnel in the use of study results.

END OF SECTION
SECTION 260573 - OVERCURRENT PROTECTIVE DEVICE COORDINATION STUDY

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
A. Section includes computer-based, overcurrent protective device coordination studies to determine overcurrent protective devices and to determine overcurrent protective device settings for selective tripping.

1.3 DEFINITIONS
A. Existing to Remain: Existing items of construction that are not to be removed and that are not otherwise indicated to be removed, removed and salvaged, or removed and reinstalled.
B. One-Line Diagram: A diagram which shows, by means of single lines and graphic symbols, the course of an electric circuit or system of circuits and the component devices or parts used therein.
C. Protective Device: A device that senses when an abnormal current flow exists and then removes the affected portion from the system.
D. SCCR: Short-circuit current rating.
E. Service: The conductors and equipment for delivering electric energy from the serving utility to the wiring system of the premises served.

1.4 ACTION SUBMITTALS
A. Product Data: For computer software program to be used for studies.
B. Other Action Submittals: Submit the following after the approval of system protective devices submittals. Submittals shall be in digital form.
   1. Coordination-study input data, including completed computer program input data sheets.
   2. Study and equipment evaluation reports.
   3. Overcurrent protective device coordination study report; signed, dated, and sealed by a qualified professional engineer.
      a. Submit study report for action prior to receiving final approval of the distribution equipment submittals. If formal completion of studies will cause delay in equipment manufacturing, obtain approval from Architect for preliminary submittal of sufficient study data to ensure that the selection of devices and associated characteristics is satisfactory.
1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Coordination Study Specialist Field Adjusting Agency.

B. Product Certificates: For overcurrent protective device coordination study software, certifying compliance with IEEE 399.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For the overcurrent protective devices to include in emergency, operation, and maintenance manuals.

1. In addition to items specified in Section 01785 "Operation and Maintenance Data," include the following:
   a. The following parts from the Protective Device Coordination Study Report:
      1) One-line diagram.
      2) Protective device coordination study.
      3) Time-current coordination curves.
   b. Power system data.

1.7 QUALITY ASSURANCE

A. Studies shall use computer programs that are distributed nationally and are in wide use. Software algorithms shall comply with requirements of standards and guides specified in this Section. Manual calculations are unacceptable.

B. Coordination Study Software Developer Qualifications: An entity that owns and markets computer software used for studies, having performed successful studies of similar magnitude on electrical distribution systems using similar devices.

1. The computer program shall be developed under the charge of a licensed professional engineer who holds IEEE Computer Society's Certified Software Development Professional certification.

C. Coordination Study Specialist Qualifications: Professional engineer in charge of performing the study and documenting recommendations, licensed in the state where Project is located. All elements of the study shall be performed under the direct supervision and control of this professional engineer.

D. Field Adjusting Agency Qualifications: An independent agency, with the experience and capability to adjust overcurrent devices and to conduct the testing indicated, that is a member company of the InterNational Electrical Testing Association or is a nationally recognized testing laboratory (NRTL) as defined by OSHA in 29 CFR 1910.7, and that is acceptable to authorities having jurisdiction.

PART 2 - PRODUCTS

2.1 COMPUTER SOFTWARE DEVELOPERS

A. Software Developers:

1. Manufacturers: Subject to compliance with requirements, provide products by the following:
   a. SKM Systems Analysis, Inc.
B. Comply with IEEE 242 and IEEE 399.

C. Analytical features of device coordination study computer software program shall have the capability to calculate "mandatory," "very desirable," and "desirable" features as listed in IEEE 399.

D. Computer software program shall be capable of plotting and diagramming time-current-characteristic curves as part of its output. Computer software program shall report device settings and ratings of all overcurrent protective devices and shall demonstrate selective coordination by computer-generated, time-current coordination plots.

1. Optional Features:
   a. Arcing faults.
   b. Simultaneous faults.
   c. Explicit negative sequence.
   d. Mutual coupling in zero sequence.

2.2 PROTECTIVE DEVICE COORDINATION STUDY REPORT CONTENTS

A. Executive summary.

B. Study descriptions, purpose, basis and scope. Include case descriptions, definition of terms and guide for interpretation of the computer printout.

C. One-line diagram, showing the following:
   1. Protective device designations and ampere ratings.
   2. Cable size and lengths.
   3. Transformer kilovolt ampere (kVA) and voltage ratings.
   4. Motor and generator designations and kVA ratings.
   5. Switchgear, switchboard, motor-control center, and panelboard designations.

D. Study Input Data: As described in "Power System Data" Article.

E. Short-Circuit Study Output: As specified in "Short-Circuit Study Output" Paragraph in "Short-Circuit Study Report Contents" Article in Section 260572 "Overcurrent Protective Device Short-Circuit Study."

F. Protective Device Coordination Study:
   1. Report recommended settings of protective devices, ready to be applied in the field. Use manufacturer's data sheets for recording the recommended setting of overcurrent protective devices when available.
      a. Phase and Ground Relays:
         1) Device tag.
         2) Relay current transformer ratio and tap, time dial, and instantaneous pickup value.
         3) Recommendations on improved relaying systems, if applicable.
      b. Circuit Breakers:
         1) Adjustable pickups and time delays (long time, short time, ground).
         2) Adjustable time-current characteristic.
         3) Adjustable instantaneous pickup.
         4) Recommendations on improved trip systems, if applicable.
      c. Fuses: Show current rating, voltage, and class.

G. Time-Current Coordination Curves: Determine settings of overcurrent protective devices to achieve selective coordination. Graphically illustrate that adequate time separation exists
between devices installed in series, including power utility company's upstream devices. Prepare separate sets of curves for the switching schemes and for emergency periods where the power source is local generation. Show the following information:

1. Device tag and title, one-line diagram with legend identifying the portion of the system covered.
2. Terminate device characteristic curves at a point reflecting maximum symmetrical or asymmetrical fault current to which the device is exposed.
3. Identify the device associated with each curve by manufacturer type, function, and, if applicable, tap, time delay, and instantaneous settings recommended.
4. Plot the following listed characteristic curves, as applicable:
   a. Medium-voltage equipment overcurrent relays.
   b. Medium- and low-voltage fuses including manufacturer's minimum melt, total clearing, tolerance, and damage bands.
   c. Low-voltage equipment circuit-breaker trip devices, including manufacturer's tolerance bands.
   d. Transformer full-load current, magnetizing inrush current, and ANSI through-fault protection curves.
   e. Cables and conductors damage curves.
   f. Ground-fault protective devices.
   g. Motor-starting characteristics and motor damage points.
   h. Generator short-circuit decrement curve and generator damage point.
   i. The largest feeder circuit breaker in each motor-control center and panelboard.
5. Series rating on equipment is not allowed.
6. Provide adequate time margins between device characteristics such that selective operation is achieved.
7. Comments and recommendations for system improvements.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine Project overcurrent protective device submittals for compliance with electrical distribution system coordination requirements and other conditions affecting performance. Devices to be coordinated are indicated on Drawings.
   1. Proceed with coordination study only after relevant equipment submittals have been assembled. Overcurrent protective devices that have not been submitted and approved prior to coordination study may not be used in study.

3.2 PROTECTIVE DEVICE COORDINATION STUDY

A. Comply with IEEE 242 for calculating short-circuit currents and determining coordination time intervals.
B. Comply with IEEE 399 for general study procedures.
C. The study shall be based on the device characteristics supplied by device manufacturer.
D. Begin analysis at the service, extending down to the system overcurrent protective devices as follows:
   1. To normal system low-voltage load buses where fault current is 10 kA or less.
2. Exclude equipment rated 240-V ac or less when supplied by a single transformer rated less than 125 kVA.

E. Study electrical distribution system from normal and alternate power sources throughout electrical distribution system for Project. Study all cases of system-switching configurations and alternate operations that could result in maximum fault conditions.

F. Transformer Primary Overcurrent Protective Devices:
   1. Device shall not operate in response to the following:
      a. Inrush current when first energized.
      b. Self-cooled, full-load current or forced-air-cooled, full-load current, whichever is specified for that transformer.
      c. Permissible transformer overloads according to IEEE C57.96 if required by unusual loading or emergency conditions.
   2. Device settings shall protect transformers according to IEEE C57.12.00, for fault currents.

G. Motor Protection:
   1. Select protection for low-voltage motors according to IEEE 242 and CEC 70.
   2. Select protection for motors served at voltages more than 600 V according to IEEE 620.

H. Conductor Protection: Protect cables against damage from fault currents according to ICEA P-32-382, ICEA P-45-482, and protection recommendations in IEEE 242. Demonstrate that equipment withstands the maximum short-circuit current for a time equivalent to the tripping time of the primary relay protection or total clearing time of the fuse. To determine temperatures that damage insulation, use curves from cable manufacturers or from listed standards indicating conductor size and short-circuit current.

I. Generator Protection: Select protection according to manufacturer's written recommendations and to IEEE 242.

J. The calculations shall include the ac fault-current decay from induction motors, synchronous motors, and asynchronous generators and shall apply to low- and medium-voltage, three-phase ac systems. The calculations shall also account for the fault-current dc decrement, to address the asymmetrical requirements of the interrupting equipment.
   1. For grounded systems, provide a bolted line-to-ground fault-current study for areas as defined for the three-phase bolted fault short-circuit study.

K. Calculate short-circuit momentary and interrupting duties for a three-phase bolted fault and single line-to-ground fault at each of the following:
   1. Collage utility's supply termination point.
   2. Medium Voltage switch.
   3. Pad mount transformer.
   4. Low-voltage switchboard.
   5. Distribution panelboard.

L. Protective Device Evaluation:
   1. Evaluate equipment and protective devices and compare to short-circuit ratings.
   2. Adequacy of switchgear, motor-control centers, and panelboard bus bars to withstand short-circuit stresses.
   3. Any application of series-rated devices shall be allowed.
3.3 LOAD-FLOW AND VOLTAGE-DROP STUDY

A. Perform a load-flow and voltage-drop study to determine the steady-state loading profile of the system. Analyze power system performance two times as follows:
   1. Determine load-flow and voltage drop based on full-load currents obtained in "Power System Data" Article.
   2. Determine load-flow and voltage drop based on 80 percent of the design capacity of the load buses.
   3. Prepare the load-flow and voltage-drop analysis and report to show power system components that are overloaded or might become overloaded; show bus voltages that are less than as prescribed by CEC 70.

3.4 MOTOR-STARTING STUDY

A. Perform a motor-starting study to analyze the transient effect of the system's voltage profile during motor starting. Calculate significant motor-starting voltage profiles and analyze the effects of the motor starting on the power system stability.

B. Prepare the motor-starting study report, noting light flicker for limits proposed by IEEE 141, and voltage sags so as not to affect the operation of other utilization equipment on the system supplying the motor.

3.5 POWER SYSTEM DATA

A. Obtain all data necessary for the conduct of the overcurrent protective device study.
   1. Verify completeness of data supplied in the one-line diagram on Drawings. Call discrepancies to the attention of Architect.
   2. For new equipment, use characteristics submitted under the provisions of action submittals and information submittals for this Project.
   3. For existing equipment, whether or not relocated obtain required electrical distribution system data by field investigation and surveys, conducted by qualified technicians and engineers. The qualifications of technicians and engineers shall be qualified as defined by NFPA 70E.

B. Gather and tabulate the following input data to support coordination study. The list below is a guide. Comply with recommendations in IEEE 551 for the amount of detail required to be acquired in the field. Field data gathering shall be under the direct supervision and control of the engineer in charge of performing the study, and shall be by the engineer or its representative who holds NETA ETT Level III certification or NICET Electrical Power Testing Level III certification.
   1. Product Data for overcurrent protective devices specified in other Sections and involved in overcurrent protective device coordination studies. Use equipment designation tags that are consistent with electrical distribution system diagrams, overcurrent protective device submittals, input and output data, and recommended device settings.
   2. Electrical power utility impedance at the service.
   3. Power sources and ties.
   4. Short-circuit current at each system bus, three phase and line-to-ground.
   5. Full-load current of all loads.
   6. Voltage level at each bus.
   7. For transformers, include kVA, primary and secondary voltages, connection type, impedance, X/R ratio, taps measured in percent, and phase shift.
8. For reactors, provide manufacturer and model designation, voltage rating, and impedance.
9. For circuit breakers and fuses, provide manufacturer and model designation. List type of breaker, type of trip and available range of settings, SCCR, current rating, and breaker settings.
10. Generator short-circuit current contribution data, including short-circuit reactance, rated kVA, rated voltage, and X/R ratio.
11. For relays, provide manufacturer and model designation, current transformer ratios, potential transformer ratios, and relay settings.
12. Maximum demands from service meters.
13. Busway manufacturer and model designation, current rating, impedance, lengths, and conductor material.
14. Motor horsepower and NEMA MG 1 code letter designation.
15. Low-voltage cable sizes, lengths, number, conductor material, and conduit material (magnetic or nonmagnetic).
16. Medium-voltage cable sizes, lengths, conductor material, and cable construction and metallic shield performance parameters.
17. Data sheets to supplement electrical distribution system diagram, cross-referenced with tag numbers on diagram, showing the following:
   a. Special load considerations, including starting inrush currents and frequent starting and stopping.
   b. Transformer characteristics, including primary protective device, magnetic inrush current, and overload capability.
   c. Motor full-load current, locked rotor current, service factor, starting time, type of start, and thermal-damage curve.
   d. Generator thermal-damage curve.
   e. Ratings, types, and settings of utility company's overcurrent protective devices.
   f. Special overcurrent protective device settings or types stipulated by utility company.
   g. Time-current-characteristic curves of devices indicated to be coordinated.
   h. Manufacturer, frame size, interrupting rating in amperes rms symmetrical, ampere or current sensor rating, long-time adjustment range, short-time adjustment range, and instantaneous adjustment range for circuit breakers.
   i. Manufacturer and type, ampere-tap adjustment range, time-delay adjustment range, instantaneous attachment adjustment range, and current transformer ratio for overcurrent relays.
   j. Panelboards, switchboards, motor-control center ampacity, and SCCR in amperes rms symmetrical.
   k. Identify series-rated interrupting devices for a condition where the available fault current is greater than the interrupting rating of the downstream equipment. Obtain device data details to allow verification that series application of these devices complies with NFPA 70 and UL 489 requirements.

3.6 FIELD ADJUSTING

A. Adjust relay and protective device settings according to the recommended settings provided by the coordination study. Field adjustments shall be completed by the engineering service division of the equipment manufacturer under the Startup and Acceptance Testing contract portion.
B. Testing and adjusting shall be by a full-time employee of the Field Adjusting Agency, who holds NETA ETT Level III certification or NICET Electrical Power Testing Level III certification.
   1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters. Perform NETA tests and inspections for all adjustable overcurrent protective devices.

3.7 DEMONSTRATION

A. Engage the Coordination Study Specialist to train Owner's maintenance personnel in the following:
   1. Acquaint personnel in the fundamentals of operating the power system in normal and emergency modes.
   2. Hand-out and explain the objectives of the coordination study, study descriptions, purpose, basis, and scope. Include case descriptions, definition of terms, and guide for interpreting the time-current coordination curves.
   3. Adjust, operate, and maintain overcurrent protective device settings.

END OF SECTION
SECTION 260574 - OVERCURRENT PROTECTIVE DEVICE ARC-FLASH STUDY

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes a computer-based, arc-flash study to determine the arc-flash hazard distance and the incident energy to which personnel could be exposed during work on or near electrical equipment.

1.3 DEFINITIONS

A. Existing to Remain: Existing items of construction that are not to be removed and that are not otherwise indicated to be removed, removed and salvaged, or removed and reinstalled.

B. One-Line Diagram: A diagram which shows, by means of single lines and graphic symbols, the course of an electric circuit or system of circuits and the component devices or parts used therein.

C. Protective Device: A device that senses when an abnormal current flow exists and then removes the affected portion from the system.

D. SCCR: Short-circuit current rating.

E. Service: The conductors and equipment for delivering electric energy from the serving utility to the wiring system of the premises served.

1.4 ACTION SUBMITTALS

A. Product Data: For computer software program to be used for studies.

B. Study Submittals: Submit the following submittals after the approval of system protective devices submittals. Submittals shall be in digital form.
   1. Arc-flash study input data, including completed computer program input data sheets.
   2. Arc-flash study report; signed, dated, and sealed by a qualified professional engineer.
      a. Submit study report for action prior to receiving final approval of the distribution equipment submittals. If formal completion of studies will cause delay in equipment manufacturing, obtain approval from Architect for preliminary submittal of sufficient study data to ensure that the selection of devices and associated characteristics is satisfactory.
1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Arc-Flash Study Specialist.

B. Product Certificates: For arc-flash hazard analysis software, certifying compliance with IEEE 1584 and NFPA 70E.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data:
   1. Maintenance procedures according to requirements in NFPA 70E shall be provided in the equipment manuals.
   2. Operation and Maintenance Procedures: In addition to items specified in Section 017823 "Operation and Maintenance Data," provide maintenance procedures for use by Owner's personnel that comply with requirements in NFPA 70E.

1.7 QUALITY ASSURANCE

A. Studies shall use computer programs that are distributed nationally and are in wide use. Software algorithms shall comply with requirements of standards and guides specified in this Section. Manual calculations are unacceptable.

B. Arc-Flash Study Software Developer Qualifications: An entity that owns and markets computer software used for studies, having performed successful studies of similar magnitude on electrical distribution systems using similar devices.
   1. The computer program shall be developed under the charge of a licensed professional engineer who holds IEEE Computer Society's Certified Software Development Professional certification.

C. Arc-Flash Study Specialist Qualifications: Professional engineer in charge of performing the study, analyzing the arc flash, and documenting recommendations, licensed in the state where Project is located. All elements of the study shall be performed under the direct supervision and control of this professional engineer.

PART 2 - PRODUCTS

2.1 COMPUTER SOFTWARE DEVELOPERS

A. Manufacturers: Subject to compliance with requirements, provide products by the following:
   1. SKM Systems Analysis, Inc.

B. Comply with IEEE 1584 and NFPA 70E.

C. Analytical features of device coordination study computer software program shall have the capability to calculate "mandatory," "very desirable," and "desirable" features as listed in IEEE 399.
2.2 ARC-FLASH STUDY REPORT CONTENT

A. Executive summary.

B. Study descriptions, purpose, basis and scope.

C. One-line diagram, showing the following:
   1. Protective device designations and ampere ratings.
   2. Cable size and lengths.
   3. Transformer kilovolt ampere (kVA) and voltage ratings.
   4. Motor and generator designations and kVA ratings.
   5. Switchgear, switchboard, motor-control center and panelboard designations.

D. Study Input Data: As described in "Power System Data" Article.

E. Protective Device Coordination Study Report Contents: As specified in "Protective Device Coordination Study Report Contents" Article in Section 260573 "Overcurrent Protective Device Coordination Study."

F. Arc-Flash Study Output:
   1. Interrupting Duty Report: Three-phase and unbalanced fault calculations, showing the following for each overcurrent device location:
      a. Voltage.
      b. Calculated symmetrical fault-current magnitude and angle.
      c. Fault-point X/R ratio.
      d. No AC Decrement (NACD) ratio.
      e. Equivalent impedance.
      f. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on a symmetrical basis.
      g. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on a total basis.

G. Incident Energy and Flash Protection Boundary Calculations:
   1. Arcing fault magnitude.
   2. Protective device clearing time.
   3. Duration of arc.
   5. Working distance.
   6. Incident energy.

H. Fault study input data, case descriptions, and fault-current calculations including a definition of terms and guide for interpretation of the computer printout.

2.3 ARC-FLASH WARNING LABELS

A. Comply with requirements in Section 260553 "Identification for Electrical Systems" for self-adhesive equipment labels. Produce a 3.5-by-5-inch self-adhesive equipment label for each work location included in the analysis.

B. The label shall have an orange header with the wording, "WARNING, ARC-FLASH HAZARD," and shall include the following information taken directly from the arc-flash hazard analysis:
   1. Location designation.
   2. Nominal voltage.
3. Flash protection boundary.
5. Incident energy.
7. Engineering report number, revision number, and issue date.

C. Labels shall be machine printed, with no field-applied markings.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine Project overcurrent protective device submittals. Proceed with arc-flash study only after relevant equipment submittals have been assembled. Overcurrent protective devices that have not been submitted and approved prior to arc-flash study may not be used in study.

3.2 ARC-FLASH HAZARD ANALYSIS

A. Comply with NFPA 70E and its Annex D for hazard analysis study.

B. Preparatory Studies:
   1. Protective Device Coordination Study Report Contents: As specified in "Protective Device Coordination Study Report Contents" Article in Section 260573 "Overcurrent Protective Device Coordination Study."

C. Calculate maximum and minimum contributions of fault-current size.
   1. The minimum calculation shall assume that the utility contribution is at a minimum and shall assume no motor load.
   2. The maximum calculation shall assume a maximum contribution from the utility and shall assume motors to be operating under full-load conditions.

D. Calculate the arc-flash protection boundary and incident energy at locations in the electrical distribution system where personnel could perform work on energized parts.

E. Include medium- and low-voltage equipment locations, except equipment rated 240-V ac or less fed from transformers less than 125 kVA.

F. Safe working distances shall be specified for calculated fault locations based on the calculated arc-flash boundary, considering incident energy of 1.2 cal/sq.cm.

G. Incident energy calculations shall consider the accumulation of energy over time when performing arc-flash calculations on buses with multiple sources. Iterative calculations shall take into account the changing current contributions, as the sources are interrupted or decremented with time. Fault contribution from motors and generators shall be decremented as follows:
   1. Fault contribution from induction motors should not be considered beyond three to five cycles.
   2. Fault contribution from synchronous motors and generators should be decayed to match the actual decrement of each as closely as possible (e.g., contributions from permanent magnet generators will typically decay from 10 per unit to three per unit after 10 cycles).

H. Arc-flash computation shall include both line and load side of a circuit breaker as follows:
1. When the circuit breaker is in a separate enclosure.
2. When the line terminals of the circuit breaker are separate from the work location.

I. Base arc-flash calculations on actual overcurrent protective device clearing time. Cap maximum clearing time at two seconds based on IEEE 1584, Section B.1.2.

3.3 POWER SYSTEM DATA

A. Obtain all data necessary for the conduct of the arc-flash hazard analysis.
   2. For new equipment, use characteristics submitted under the provisions of action submittals and information submittals for this Project.
   3. For existing equipment, whether or not relocated, obtain required electrical distribution system data by field investigation and surveys, conducted by qualified technicians and engineers.

B. Electrical Survey Data: Gather and tabulate the following input data to support study. Comply with recommendations in IEEE 1584 and NFPA 70E as to the amount of detail that is required to be acquired in the field. Field data gathering shall be under the direct supervision and control of the engineer in charge of performing the study, and shall be by the engineer or its representative who holds NETA ETT Level III certification or NICET Electrical Power Testing Level III certification.
   1. Product Data for overcurrent protective devices specified in other Sections and involved in overcurrent protective device coordination studies. Use equipment designation tags that are consistent with electrical distribution system diagrams, overcurrent protective device submittals, input and output data, and recommended device settings.
   2. Obtain electrical power utility impedance at the service.
   3. Power sources and ties.
   4. Short-circuit current at each system bus, three phase and line-to-ground.
   5. Full-load current of all loads.
   6. Voltage level at each bus.
   7. For transformers, include kVA, primary and secondary voltages, connection type, impedance, X/R ratio, taps measured in per cent, and phase shift.
   8. For reactors, provide manufacturer and model designation, voltage rating and impedance.
   9. For circuit breakers and fuses, provide manufacturer and model designation. List type of breaker, type of trip and available range of settings, SCCR, current rating, and breaker settings.
  10. Generator short-circuit current contribution data, including short-circuit reactance, rated kVA, rated voltage, and X/R ratio.
  11. For relays, provide manufacturer and model designation, current transformer ratios, potential transformer ratios, and relay settings.
  12. Busway manufacturer and model designation, current rating, impedance, lengths, and conductor material.
  13. Motor horsepower and NEMA MG 1 code letter designation.
  14. Low-voltage cable sizes, lengths, number, conductor material and conduit material (magnetic or nonmagnetic).
  15. Medium-voltage cable sizes, lengths, conductor material, and cable construction and metallic shield performance parameters.
3.4 LABELING

A. Apply one arc-flash label for 600-V ac, 480-V ac, and applicable 208-V ac panelboards and disconnects and for each of the following locations:
   1. Pad mount transformer
   2. Low-voltage switchboard.
   3. Distribution panelboards.
   4. Medium-voltage switch.
   5. Control panel.
   6. Standby generator and ATS.
   7. Panelboards.

3.5 APPLICATION OF WARNING LABELS

A. Install the arc-fault warning labels under the direct supervision and control of the Arc-Flash Study Specialist.

3.6 DEMONSTRATION

A. Engage the Arc-Flash Study Specialist to train Owner’s maintenance personnel in the potential arc-flash hazards associated with working on energized equipment and the significance of the arc-flash warning labels.

END OF SECTION
SECTION 26 08 00 – COMMISSIONING OF ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes:

1. Section includes requirements for furnishing all labor, materials, and technical supervision to perform training for equipment and special systems described herein.
2. Electrical Systems Commissioning consists of static checks of component and system installations and actual testing of equipment conditions and functions.
3. Section specifies that Contractor shall engage the services of a recognized independent testing company for performing final inspections and tests as specified.
4. The testing company shall provide all material, test instruments, equipment, labor, and technical supervision to perform such tests and inspections.
5. It is the intent of these tests to verify that electrical equipment is operational within industry and manufacturer’s tolerances, and is installed in accordance with these specifications.
6. Perform tests, calibration, adjustment of relays and inspections before energizing any equipment.
7. Upon completion of the tests and inspections specified, a label shall be provided in accordance with NETA labeling.
8. Relay settings shall be made using approved relay setting reports, arc-flash, short circuit and coordination studies.
9. Commissioning Authority will review and approve, prior to use, all test procedures and forms used and will witness a varying fraction of the initial checks and testing performed by the Subcontractor. The Commissioning Authority will review the completed check and test documentation of the Subcontractor of all checks and tests.
10. The test requirements listed in this section do not release the Subcontractor from the obligation to perform all other appropriate, industry standard, manufacturer-recommended or code-required checks and tests.

B. Related Requirements:

1. Division 260553 Section “Overcurrent Protective Device Short Circuit Study” for Minimum fault current levels at equipment.
2. Division 260573 Section “Overcurrent Protective Device Coordination Study” for Device coordination settings.
3. Division 260574 Section “Overcurrent Protective Device Arc-Flash Study” for PPE signage and requirement labeling.
4. Division 26 Section “Lighting Controls” for lighting control sequence of operation requirements.
5. Division 262713.05 Section “Electricity Metering – M&V”.
6. Division 263213 Section “Diesel Emergency Engine Generators”

1.3 DEFINITIONS

A. Commissioning Authority (CA)

B. Certified Testing Agency (CTA)

1.4 QUALITY ASSURANCE

A. Referenced Standards:

1. OSHA Part 1910; Subpart S. 1910.308.
2. American National Standards Institute: ANSI
4. Association of Edison Illuminating Companies: AEIC
5. Institute of Electrical and Electronics Engineers: IEEE
6. Insulated Cable Engineers Association: ICEA
7. National Electrical Manufacturers Association: NEMA
9. National Fire Protection Association (NFPA)

B. All inspections and tests shall use the following references.

2. Drawings.
3. Manufacturer’s instruction manuals and approved shop drawings for applicable equipment.

C. Certified Testing Agency Qualifications: Member Company of NETA or an NRTL.

1.5 COMMON RESPONSIBILITY

A. The following are responsibilities applicable to all electrical systems being commissioned.

B. The general commissioning requirements and coordination in Division 01 apply to electrical systems. The Subcontractor shall be familiar with all parts of Division 01 commissioning requirements and the commissioning plan issued by the Commissioning Authority and shall execute all commissioning responsibilities assigned to them in the Contract Documents.

C. The work of this section shall be performed by a Certified Testing Agency, Electrical, by the contractor, or the manufacturer’s service representative. The Commissioning Authority has some testing responsibilities for some equipment. The specified checks and static tests are conducted by any of the above listed parties, but the tests requiring measurements or special tools or skills are generally conducted only by the CTA. The Check and Testing Responsibility Table, included as a supplement to Division 01 Section “General Commissioning Requirements” provides specific allocation of checklist oversight and testing responsibilities. The Certified Testing Agency, Electrical Contractor, and Manufacturers Service Representative shall
document all checks and testing on check and test procedure forms submitted to and approved by the Commissioning Authority prior to testing.

D. Contractor shall notify the Construction Manager, Owner and Architect when equipment becomes available for acceptance tests. Work shall be coordinated to expedite project scheduling.

E. The Contractor or Commissioning Authority shall notify the Construction Manager, Architect and Owner ahead of time when commissioning activities not yet performed or not yet scheduled will delay construction. The Contractor and Commissioning Authority shall be proactive in seeing that commissioning processes are executed and that the Contractor or Commissioning Authority has the scheduling information needed to efficiently execute the commissioning process.

F. Certified Testing Agency shall notify the Construction Manager a minimum of two weeks before commencement of testing.

G. Certified Testing Agency and Contractor shall be responsible for implementing final settings and adjustments on protective devices with contractor’s assistance.

H. The Contractor shall respond to notices of issues identified during the commissioning process, making require corrections or clarifications and returning prompt notification to the Commissioning Authority.

I. When completion of a task or other issue has been identified as holding up any commissioning process, particularly functional testing, the contractor shall, within two (2) days of notification of the issue, notify the Commissioning Authority in writing providing an expected date of completion. The contractor shall notify the Commissioning Authority in writing within one day of completion. It is not the responsibility of the Commissioning Authority to obtain this status information through meeting attendance, asking questions or field observation.

J. Construction Checklists. The Commissioning Authority or Contractor shall develop checklists. At a minimum, for a given piece of equipment, checks from the inspection checklists in NETA Acceptance Testing Specifications for Electric Power Distribution Equipment and Systems shall be included in the electrical checklists. The contractor shall execute and document all checks.

K. Check and testing procedure and startup plan development and execution responsibilities are described in the Check and Testing Responsibility Table.

L. The contractor shall review design documents, shop drawings and Operation and Maintenance manuals and manufacturer recommended installation and testing procedures of each system installation.

M. The contractor shall monitor installation to ensure the equipment, configuration and quality of construction meets the design requirements, approved submittals and shop drawings.

N. Certified Testing Agency and Contractor shall maintain a written record of tests and upon completion of the work, assemble and certify a final test report. A final test report shall be submitted to the Construction Manager for review and comment before the final report is submitted.

1.6 CHECK AND TESTING RESPONSIBILITY TABLE.
A. Column heading Key

1. Submittal Review: Review submittals of commissioned equipment for either information to assist in test writing and field verification (designated by an (i) in the table), or for a more thorough review to make comments parallel with the A/E reviews (r).
2. Field Observation: General observation of installation to become familiar with equipment and secondarily to identify problems.
3. Perform and Document Checklists: The first indicated party is responsible to execute the check-lists and document each line item. The Commissioning Authority spot-witnesses check listing and startup and reviews the completed versions (reports). Any Construction Checklists or Startup Plans developed by the Commissioning Authority are reviewed by the Trade Subcontractors and visa-versa prior to execution.
4. Prepare Test Procedures: Develop the written step-by-step test procedures and documentation forms for mechanical systems. For electrical component tests these procedures may be more checklist in nature and not include all specific procedural details, though all measurements will be recorded.
   a. Ensure that tests are scheduled and coordinated with the interfaces to other systems and requirements of the authorities having jurisdiction.
   b. Develop a logical test plan that flows from the component level on the various systems to the integrated testing of the systems as they interact with each other.
   c. Direct the order that test procedures are conducted. Coordinate and manage the parties participating in the testing.
   d. Verify that all necessary documentation requirements are met for all parties including but not limited to authorities having jurisdiction, the Owner, the Commissioning Authority and the insurance underwriter.
   e. Facilitate effective communication and coordination across trades and disciplines as required for successful integrated testing of systems and assemblies.
   f. Witness entire test and fully document on approved forms the methods, procedures and results of each test procedure of all tests.
6. Perform Test: Manipulate equipment or systems or set up and initiate actions on assemblies that demonstrates function and performance.
7. Witness: (See also applicable footnotes.)
   a. Spot: (s) in the table. Spot witnessing of testing shall include a large enough sample to provide reasonable confidence that the tests were conducted properly. Sampling may be random or focused as determined by the Commissioning Authority. For selected systems such as Overcurrent devices coordination and arc-flash labeling, spot witnessing may only require reviewing means and methods at the beginning of the test and a review of the test report.
   b. All: (a) in the table. Witness the duration of all test procedures performed. Note that for some systems where there is a sampling strategy, not all systems will be tested, but all that are tested, will be witnessed. Refer to the testing requirements in the referenced Sections for details.
   c. Witnessing does not necessarily include documenting of individual test or observation results, but does include recording attendance and general results.
8. Prepare Test Report: Assembly and review the testing documentation. Report information could be gathered and incorporated into final report by Commission Agent or in some cases documented by commissioning agent.
B. The contractor shall develop test procedures and forms and execute and document testing according to the requirements of this Section, Division 01, and other specification sections containing testing requirements.

C. Tests of energized equipment shall be conducted when the equipment is operating at its normal capacity. This may require some tests to be conducted after occupancy.

D. Training and Orientation. The Subcontractor shall follow the facility staff orientation and training requirements as described in Division 01 Section “Demonstration and Training” and other applicable technical sections.

E. Operation And Maintenance (O&M) Manuals. Refer to Division 01 Section “General Commissioning Requirements” and Division 01 Section “General Requirements” for requirements for O&M manuals. Contractor shall perform routine insulation resistance, continuity and rotation tests for distribution and utilization equipment before tests performed by the testing company specified.

### TEST INSTRUMENT SERVICE AND CALIBRATION

#### A. Calibration Program and Accuracy:

1. Certified Testing Agency shall have a calibration program that maintains applicable test instrumentation within rated accuracy in accordance with manufacturer’s recommendations and standard industry practice.
2. The accuracy shall be traceable to the National Bureau of Standards (NBS) in an unbroken chain.
3. Instruments shall be calibrated in accordance with the following frequency schedule:
   
   a. Field instruments: 6 months, maximum.
   b. Laboratory instruments: 12 months.
   c. Leased specialty equipment: 12 months (where accuracy is guaranteed by the lessor)

---

**Abbreviations:**

- A/E: Designer
- CA: Commissioning Authority
- TC: Trade Subcontractor providing equipment
- CC: Controls Contractor
- EC: Electrical Contractor
- CTA: Certified Testing Agency
- MC: Mechanical Contractor
- MSR: Manufacturer Service Representative
- TAB: Testing, Adjusting and Balancing contractor.
4. Dated calibration labels shall be visible on test equipment.

B. Safety and Precautions:

1. Safety practices shall include, but are not limited to, the following requirements.
   a. OSHA
   c. Applicable State and local safety operating procedures.

2. Acceptance tests shall be performed with apparatus de-energized, unless otherwise specified.

3. Certified Testing Agency shall have a designated safety representative who shall be present on the Project and supervise operations with respect to safety.

4. Circuits operating in excess of 600-volts between conductors shall have conductors shorted to ground by a hot-line grounded device UL approved for the purpose.

5. Work shall not proceed until the safety representative has determined that it is safe to do so.

6. Certified Testing Agency shall have available sufficient protective barriers and warning signs. The testing agency shall place the protective barriers and warning signs in close proximity to the area where testing is being performed.

C. DEFINITION OF TESTS

2. Electrical Startup Tests: Those inspections and tests required to show that the workmanship, methods, inspections, and materials used in erection and installation of the electrical equipment conforms to accepted engineering practices, IEEE Standards, the National Electrical Code, manufacturers instructions, and Electrical Work of this Contract, and to determine that the equipment involved may be energized for operational tests.

3. Operating Tests: Those tests performed on all electrical equipment installed as part of the Electrical Work of the Contract and under other sections of the Specifications, to show that the electrical equipment will perform the functions for which it was designed.

1.8 AUTHORIZED WITNESSES

A. Perform all acceptance, startup and operating tests in the presence of the Construction Manager, Architect and Owner or designated authorized witness.

B. Notify vendors and manufacturers of electrical equipment of the time of tests. Coordinate with them or their representatives to permit them to witness tests should they so request.

1.9 DATA TO BE RECORDED

A. Maintain reproducible test data sheets showing results of tests described in the accepted test procedures. Provide reproducible data sheets, listing acceptable or specified test limits and
values actually measured. Retain one copy of test data sheets at the site. Furnish four copies to the Construction Manager.

B. Provide data sheets showing test set-up, equipment used, names of persons performing test, names of witnesses, date, location, and serial number of equipment under test. Test data sheets will be reviewed by the Construction Manager and accepted as submitted, or additional tests may be required. If additional tests are required because initial test results do not comply with Specifications, document the re-testing and submit as before at no additional cost to BSDA.

1.10 ACTION SUBMITTALS

A. Submit proposed testing program and test procedures for review and approval by the Construction Manager before beginning any testing. Each procedure shall include the following as a minimum:

1. Statement of procedure objective and scope.
2. List of equipment required to set up and perform the procedure.
3. List of equipment or services required from areas outside Contractor’s control.
4. List of prerequisite tests that need to be completed before the procedure can be performed.
5. Description of the required procedure setup, including diagrams illustrating test equipment connections and identifying test points, where applicable.
6. Step-by-step instructions for performing the procedure identifying the points where data is to be recorded and the limits for acceptable data, in accordance with referenced standards.
7. Provisions for recording pertinent test conditions and environment at time of test.
8. Instructions for recording data on data sheets and verifying that procedure steps have been completed.

B. Test Report (Draft and Final)

1. The draft and final test reports, shall include, but not be limited to, the following:

   a. Summary of Project.
   b. Description of equipment tested.
   c. Description of test.
   d. List of test equipment used in calibration and calibration date.
   e. Test results, including plots/graphs and actual readings/measurements taken including corrected values.
   f. Conclusions and recommendations.
   g. Appendix, including appropriate test forms.
   h. All test reports shall be signed by the Construction Manager’s authorized witness present at the test.

2. The final test report shall be bound and its contents certified.
3. Furnish ten copies of the completed final test report to the Construction Manager no later than 15 days after completion of the inspection and testing.

C. Instruments: Submit list of instruments and certification indicating that instruments that will be used for testing have been calibrated and their accuracy certified within a previous period of not more than one month. List types of instruments to be used, manufacturer, model, serial number, latest date of calibration, and calibration organization.
1.11 INFORMATIONAL SUBMITTALS

A. Qualification Data: For testing agency and the resumes of the personnel proposed to be assigned to this Project.

B. Data gathering check lists and forms.

C. Product Test Reports: For each, for tests performed by manufacturer and witnessed by a qualified testing agency.

D. Evaluation Reports: For equipment identified on the check and testing responsibility table, from ICC-ES.

E. Pretesting observation Reports: For equipment identified on the check and testing responsibility table.

F. Source quality-control reports.

G. Field quality-control reports.

1.12 CLOSEOUT SUBMITTALS

A. Final Commissioning Data: For equipment identified on the check and testing responsibility table to include in maintenance manuals.

B. Final Commissioning Report Data: For equipment identified on the check and testing responsibility table to include in emergency, operation, operation and maintenance manuals.

PART 2 - PRODUCTS – NOT USED

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine, with Installer present, for compliance with requirements for installation tolerances and construction documents and other conditions affecting performance of the Work.

B. Examine equipment identified on the check and testing responsibility table before installation. Reject that are damaged, incomplete installation, or incorrect application or installation.

C. Proceed with testing and commissioning only after unsatisfactory conditions have been corrected.

3.2 TESTING REQUIREMENTS

A. Do not perform more than one high potential test on any conductor unless specifically authorized by the CM.
B. Megger Tests

1. Megger readings specified are the minimum readings desired at an ambient temperature of 60-degrees F and at a relative humidity of less than 60-percent. When megger readings are taken at other than 60-degrees F, convert readings to equivalent values at 60-degrees F.

2. When megger readings fall below the specified minimum values at 60-degrees F, devise some means of applying heat for drying out the equipment subject to the approval of the Construction Manager. If drying is to be done by applying an electric potential to a piece of equipment, do not exceed the continuous voltage or current ratings of the equipment being dried, directly or by induction.

C. Continuity Tests: Perform continuity tests with a dc type device using a bell, buzzer, or multimeter. Do not use telephones for continuity tests; use telephones only for communication.

D. Restore all connections and equipment to operating conditions after testing has been completed.

3.3 TESTS ON CONDUCTORS RATED 600 VOLT AND BELOW

A. General: Provide and record all power feeder and branch circuit except feeders to individual HVAC equipment or motors conductor a continuity test and a megger test. Verify phase identification on each power feeder and branch circuit.

B. Verify identification of all lighting circuits and branch circuits on panel directories and make operational checks on all lighting circuits and branch circuits to prove that the circuits perform all functions for which they are designed.

C. Check all feeder and subfeeder cable connections for workmanship and conformance with standard practice by visual inspection.

D. Visual and mechanical inspection

1. Conductors shall be inspected for physical damage and proper connection in accordance with single line diagram.

2. Conductors connections shall be torque tested to manufacturer’s recommended values.

E. Connections: Isolate power conductor to be megger tested by opening switches or breakers at each end of cable before testing where such disconnecting means exists. Where cables are direct connected without a disconnecting means, do not disconnect cables: Test as connected.

F. Megger Tests

1. Use a 1,000-volt megger for each megger test. Insulation resistance tests shall be performed at 1,000-volts dc for 30 seconds.

2. Apply megger tests between each conductor and ground with the other two conductors in the conduit or cable grounded to the same ground. Test each conductor in the same manner.

3. Minimum acceptable readings: For disconnected cables, 100-megohm.

4. When insulation resistance is to be determined with all switchboards, panelboards, fuse holders, switches, and overcurrent devices in place, the insulation resistance when tested at 500-volts dc shall be no less than indicated in Table "Minimum Insulation Resistance".
G. Acceptance: Cable that do not pass all inspections and tests shall be considered defective and must be replaced and retested.

H. Records: Include the following information in test report on each power feeder and branch circuit cable rated below 600-volts:

2. Megger readings, including converted values.
3. Approximate average cable temperature.

3.4 TESTS ON CONTROL WIRING

A. General: Give each single conductor and multi-conductor control wire or cable a continuity tests and an insulation strength test. Verify identification of conductors.

B. Connections: Disconnect and fan out conductors to be tested.

C. Insulation Strength Tests

1. Subject each control wire to a 500-volt, 60-Hertz test.
2. Apply test between each conductor in a wire group and ground with all other conductors in the wire group grounded to the same ground. Use a test set having an accurate means of insuring 500-volt test voltage and provide a series resistance to limit fault when a ground is found. Hold test voltage only long enough to read instruments. Test each conductor in the same manner.
3. Instead of the above insulation strength test, megger each control wire as specified for 600-volt and below power conductors.
4. Acceptance: Control wiring conductors that do not pass all inspections and tests shall be considered defective and must be replaced and retested.

D. Records: Include the following information in test report on each wire group.

1. Wire and group identification.
2. Type of test, insulation strength or megger.
3. When megger testing is selected, include information as specified for conductors rated 600 volt and below.

3.5 TESTS ON TRANSFORMERS RATED 600 VOLTS AND BELOW

A. General: Check continuity and correctness of connections of windings and give each winding a megger test.

1. Visual and mechanical inspection

   a. Inspect for physical damage.
   b. Compare equipment nameplate information with latest single line diagram and report discrepancies to the Construction Manager.
c. Verify proper auxiliary device operation for components including, but not limited to, fans, indicators, and tap changer.
d. Check tightness of accessible bolted electrical joints in accordance with Table 3.7.1. Check hardware, bushings, and vibration mats.
e. Perform specific inspections and mechanical tests in accordance with the manufacturer’s instructions.

B. Connections: Isolate transformer by opening the line side circuit breaker and disconnect secondary conductors at panels. Tie conductors together on each winding.

C. Megger Tests

1. Use a 1,000-volt megger for megger tests on 480-volt windings and a 500-volt megger for megger tests on lesser voltage windings. Appropriate guard circuit shall be used under bushings.
2. Apply a megger test between each transformer winding tied together and ground. Ground all windings not included in the test to the same ground. Winding resistance tests shall be made for each winding at nominal tap position. Perform a megger test of the secondary windings.
3. Minimum acceptable readings: 480-volt winding to ground, 45-megohms; lesser voltage winding to ground, 30-megohms.
4. Hold all megger tests for at least one minute or until the reading maintains a constant value for 15 seconds.

D. Electrical tests

1. A dielectric absorption test shall be made winding to winding and winding to ground for ten minutes. The polarization index shall be computed.
2. A turn ratio test shall be performed between windings for all tap positions. The final tap setting shall be determined and set by the testing company upon completion of the ratio testing acceptable values.
3. AC over-potential test shall be made on all high and low voltage winding to ground.
4. Individual exciting current tests shall be performed on each phase in accordance with established procedure.
5. Perform special test and adjustments in accordance with the manufacturer’s instructions for tap changer, fan and controls, and alarm functions.
6. Perform a double power factor excitation test with a 10-kV tester.
7. Perform a core ground test.
8. Test temperature control panel and verify alarm stages and interlock for shutdown.

E. Test values

1. Insulation resistance and absorption test voltage shall be in accordance with Table "Insulation Resistance Test Voltage". Results shall be temperature corrected.
2. The absorption test polarization index shall be above 2.0 unless an extremely high value is obtained at the end of 1 minute, that when doubled will not yield a meaningful value with the available test equipment.
3. AC high potential test voltage shall not exceed 75-percent of factory test voltage or Table "Insulation Resistance Test Voltage" for a one-minute duration. Evaluation shall be on go, no-go, basis; NEMA ST-20.
4. Power factor test values more than 3-percent shall be investigated.
5. Winding resistance test results shall compare within 1-percent of adjacent windings.
6. Turns ratio test results shall not deviate more than 0.50 percent from calculated ratio.
F. Acceptance: Transformers that do not pass all inspections and tests shall be considered deficient and shall be replaced and retested.

G. Records: Make complete and accurate records of each test. Include the following in each test report:

2. Megger readings, including converted values and ambient temperature at time of test.

</tr>
</tbody>
</table>

3. Values of insulation resistance (IR) less than manufacturer’s minimum or kV plus 1 in megohms shall be investigated. Over-potential tests shall not proceed until IR levels are raised to specified minimum.

4. Over-potential test voltages shall be applied in accordance with ANSI C37.20c, Table “Overpotential Test Voltages”.

<table>

3.6 TESTS ON CIRCUIT BREAKERS, LOW VOLTAGE (MOLDED CASE)

A. Visual and mechanical inspection

1. Circuit breakers shall be checked for proper mounting, conductor size, and feeder designation.
2. Operate circuit breakers to insure smooth operation.
3. Inspect case for cracks and other defects.
4. Check tightness of connection with torque wrench in accordance with manufacturer’s instructions.
B. Electrical tests

1. Contact resistance shall be measured.
2. Time-current characteristic tests shall be performed by passing 300 percent rated current through each pole separately. Trip time shall be determined.
3. Instantaneous pickup current shall be determined by run-up or pulse method. Clearing times shall be within 4-cycles or less.
4. Insulation resistance shall be determined pole to pole, across pole and pole to ground. Test voltage shall be 1,000-volts DC.

C. Test Values

1. Contact resistance shall be compared to adjacent poles and similar breaker. Deviations of more than 50-percent shall be investigated.
2. Insulation resistance shall not be less than 50 megohms.
3. All trip times shall fall within Table 3.17.1. Circuit breakers exceeding maximum 300-percent time (Column 5) shall be replaced.
4. Instantaneous pickup current levels shall be within 20-percent of manufacturer’s published values.

a. * These values are based on heat tests conducted by circuit breaker manufacturers on conductors in conduit.

3.7 TESTS ON INSTRUMENT TRANSFORMERS

A. Visual and mechanical inspection

1. Inspect for physical damage and compliance with the Drawings.
2. Check mechanical clearances and proper operations of all disconnecting and grounding devices associated with potential transformers.
3. Verify proper operation of grounding or shorting devices.
B. Electrical tests

1. Current transformers (CT) shall have secondary saturation tests done at a minimum of three points below and one point above knee of saturation curve.
2. Confirm transformer polarity electrically.
3. Burden tests shall be performed at the secondary leads of the CT to assure accurate translation of primary current.
4. Verify connection at secondary CT leads by driving a low current through the leads and checking for this current at applicable devices.
5. Confirm transformer ratio.
6. Measure insulation resistance of transformer secondary and leads with 500 volt Megohm meter.
7. Measure transformer primary insulation with applicable over-potential tests.
8. Verify connection of secondary potential transformer (PT) leads by applying a low voltage to the leads and checking for this voltage at applicable devices.
9. Check for PT secondary load with secondary voltage and current measurements. Load shall less than voltage ampere capacity of the PT.

3.8 TESTS ON METERING AND INSTRUMENTATION

A. Visual and mechanical inspection

1. Examine devices for broken parts, indication of shipping damage and wire connection tightness.
2. Verify meter connections in accordance with single line meter and relay diagram.

B. Electrical tests

1. Calibrate all meters at mid-scale. Calibration instrument precision shall be 50-percent or less than the precision of the instrument being tested. (If the instrument being tested has a precision of plus or minus 10-percent, the precision of the calibration instrument shall be plus or minus 5-percent or better.)
2. Calibrate watt-hour meters to 0.50-percent.
3. Verify instrument multipliers.

C. Acceptance: Grounding materials and connections must pass all inspections and must meet all specified maximum and minimum values.

D. Records: Make complete records of all tests. Include resistance values obtained, calculations of same, and methods of test and calculation.

3.9 TESTS ON GROUNDING SYSTEMS

A. General: Inspect ground conductors, ground buses, and connections for conformance with design specifications and for satisfactory workmanship. Test resistance to earth of each ground rod. Test ground paths for equipment and structural steel or reinforcing bar grounding.

1. Visual and mechanical inspection: Inspect ground system for compliance with the Drawings and specifications.

B. Connections
1. Maintain each ground rod isolated from the associated ground rods for tests on individual rods for resistance to earth.
2. Include associated ground rods and interconnecting wiring in test for resistance to earth.
3. Include ground bus on equipment, room and pullbox connections, and associated intermediate copper ground conductors in tests on ground paths for electrical equipment.
4. Include structural steel or reinforcing bar connection, rod connection and intermediate conductor in tests on ground paths for structural steel or reinforcing bars.

C. Electrical tests

1. Perform fall of potential test in accordance with IEEE 81, Section 9.04, on the main grounding electrode or system.
2. Perform the two-point method test in accordance with IEEE 81, to determine the ground resistance between the main grounding system and major electrical equipment frames, system neutral, and/or derived neutral points.
   a. Alternate method: Perform ground continuity test between main ground system and equipment frame, system neutral and/or derived neutral point. This test shall be made by passing a minimum of 10 amperes DC current between ground reference system and the ground point to be tested. Voltage drop shall be measured and resistance calculated by voltage drop method.

3. Tests on Individual Ground Rods
   a. Test each ground rod for resistance to earth by a standard method. Use a Biddle Ground Tester (AVO International) or the method of using two auxiliary ground rods as described in IEEE. The IEEE method requires the use of ac test current. Place auxiliary test rods sufficiently far away from the rod under test so that the regions in which their resistance is localized do not overlap. Calculate ground resistance from the readings taken. Maximum acceptable resistance to earth: 2-ohms.
   b. If the resistance is found to be higher than 2-ohms, drive additional rods with a minimum separation of 20-feet and connect in parallel with the rod under test until 2-ohms or less is obtained, or increase the length of the rod under test until 2-ohms maximum is obtained.

D. Tests of same, and methods of test and calculation.

3.10 TESTS ON SURGE ARRESTORS

A. Visual and mechanical inspection
   1. Inspect for physical damage.
   2. Verify location and nameplate rating with the Drawings and the specifications.
   3. Inspect ground and discharge counter connections for integrity.

B. Electrical tests
   1. Perform a 60-Hertz sparkover test.
   2. Perform a radio influence voltage (RIV) test.
   3. Perform an insulation power factor test.
   4. Perform ground continuity test to ground grid system.
C. Test values

1. Sparkover voltage shall:
   a. Exceed 1.5 times rating.
   b. Not exceed 2.0 times rating.

2. Radio influence voltage (RIV) shall not be detected within voltage rating of arrestor.
3. Power factor tests shall show similar dielectric loss between similar arrests.
4. Ground grid connections shall not exceed 0.5-ohms, maximum.

3.11 TESTS ON LIGHTING SYSTEMS – STATION AND BUILDINGS

A. Perform operation tests for complete lighting system including switches, emergency lighting, and receptacles.

3.12 SYSTEM FUNCTION TESTS

A. General

1. Each system specified shall be function tested to confirm total system operation.
2. Upon completion of equipment tests, the system functional tests shall be performed. System functional tests shall show the proper interaction of sensing, processing, and action devices to effect the design end-product or results.
3. Implementation
   a. The testing company shall develop a test matrix that includes, but is not limited to, the following:
      1) Input signal or stimuli. Example: Current transformers; potential transformers.
      2) Decision process. Example: Pilot Wire Relay System
      3) Action device. Example: Circuit Breaker – ACB
      4) End product or result. Example: Zone Fault Protection
   b. All interlocks safety devices and fail-safe functions shall be tested in addition to design function.
   c. The testing company shall propose methods to initiate the sensing device by physical stimuli and quantitatively monitor the result or output by measurement.

B. Engage a factory-authorized service representative to train Owner’s maintenance personnel to adjust, operate, and maintain units.

END OF SECTION
SECTION 260913.01 - ELECTRICAL POWER MONITORING AND CONTROL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. The products specified herein are intended to provide a complete sub-metering solution. This solution shall be utilized to measure and monitor owner provided utilities including, but not limited to, electricity, gas, water, and Standby power. System will also allow for compliance with national and local energy codes and provide equipment needed to meet specific LEED M&V credits.

B. Electrical sub-metering equipment, data collection systems, and data management software systems including:
   1. Standard single point kWh electrical sub-meters
   2. Advanced single point kWh electrical sub-meters
   3. Multi-point electrical sub-meters
   4. Data collection hubs
   5. High density pulse modules
   6. Open protocol data communication network
   7. Wireless communication devices

C. Related Requirements:
   1. Section 255000 "Building Automation Hardware and Networking.

1.3 DEFINITIONS

A. Active Power: The average power consumed by a unit. Also known as "real power."

B. Analog: A continuously varying signal value, such as current, flow, pressure, or temperature.

C. Apparent (Phasor) Power: "S = VI" where "S" is the apparent power, "V" is the rms value of the voltage, and "I" is the rms value of the current.

D. Firmware: Software (programs or data) that has been written onto read-only memory (ROM). Firmware is a combination of software and hardware. Storage media with ROMs that have data or programs recorded on them are firmware.

E. KY Pulse: A method of measuring consumption of electricity that is based on a relay operating like a SPST switch.

F. KYZ Pulse: A method of measuring consumption of electricity based on a relay operating like a SPDT switch.

G. LAN: Local area network.
H. L-G: Line to ground.
I. L-L: Line to line.
J. L-N: Line to neutral.
K. Low Voltage: As defined in NFPA 70 for circuits and equipment operating at less than 50 V or remote-control, signaling and power-limited circuits.
L. Modbus TCP/IP: An open protocol for exchange of process data.
M. Monitoring: Acquisition, processing, communication, and display of equipment status data, metered electrical parameter values, power quality evaluation data, event and alarm signals, tabulated reports, and event logs.
N. N-G: Neutral to ground.
O. Power Factor: The ratio of active power to apparent power, sometimes expressed in percentage.
P. rms: Root-mean-square value of alternating voltage, which is the square root of the mean value of the square of the voltage values during a complete cycle.
Q. TCP/IP: Transport control protocol/Internet.
R. UPS: Uninterruptible power supply; used both in singular and plural context.

1.4 ACTION SUBMITTALS
A. Product Data: For each type of product.
   1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for power monitoring and control.
   2. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
B. Sustainable Design Submittals:
   1. Product Data: Indicating that computers used by the system are certified by ENERGY STAR.
C. Shop Drawings: For power monitoring and control equipment.
   1. Include plans, elevations, sections, and attachment details.
   2. Include details of equipment assemblies. Indicate dimensions, method of field assembly, components, and location and size of each field connection.
      a. Attach copies of approved Product Data submittals for products (such as switchboards, switchgear, and motor-control centers) that describe the following:
         1) Location of the meters and gateways, and routing of the connecting wiring.
         2) Details of power monitoring and control features to illustrate coordination among related equipment and power monitoring and control.
   3. Block Diagram: Show interconnections between components specified in this Section and devices furnished with power distribution system components. Indicate data communication paths and identify networks, data buses, data gateways, concentrators, and other devices to be used. Describe characteristics of network and other data communication lines.
   4. Network naming and numbering scheme.
5. Include diagrams for power, signal, and control wiring. Coordinate nomenclature and presentation with a block diagram.
7. Surge Suppressors: Data for each device used and where applied.

1.5 INFORMATIONAL SUBMITTALS

A. Field quality-control reports.

B. Design Data:
   1. Manufacturer’s system installation and setup guides, with data forms to plan and record options and setup decisions.
      a. Project Record Drawings of as-built versions of submittal Shop Drawings provided in electronic PDF format on compact disk or portable storage device with a USB interface.
      b. Testing and commissioning reports and checklists of completed final versions of reports, checklists, and trend logs.
      c. As-built versions of submittal Product Data.
      d. Names, addresses, e-mail addresses, and 24-hour telephone numbers of Installer and service representatives for the system and products.
      e. Operator’s manual with procedures for operating control systems including logging on and off, handling alarms, producing point reports, trending data, overriding computer control, and changing set points and variables.
      f. Programming manuals with description of programming language and syntax, of statements for algorithms and calculations used, of point database creation and modification, of program creation and modification, and of editor use.
      g. Engineering, installation, and maintenance manuals that explain how to do the following:
         1) Design and install new points, panels, and other hardware.
         2) Perform preventive maintenance and calibration.
         3) Debug hardware problems.
         4) Repair or replace hardware.
      h. Documentation of all programs created using custom programming language including set points, tuning parameters, and object database.
      i. Backup copy of graphic files, programs, and database on compact disk or portable storage device with a USB interface.
      j. Complete original-issue documentation, installation, and maintenance information for furnished third-party hardware including computer equipment and sensors.
      k. Complete original-issue copies of furnished software, including operating systems, custom programming language, workstation software, and graphics software on compact disk or portable storage device with a USB interface.
      l. Recommended preventive maintenance procedures for system components, including schedule of tasks such as inspection, cleaning, and calibration; time between tasks; and task descriptions.
      m. Owner training materials.

1.6 CLOSEOUT SUBMITTALS

A. Section 01785 “Operation and Maintenance Data”: For power monitoring and control units to include in operation and maintenance manuals.

B. Software and Firmware Operational Documentation:
   1. Software operating and upgrade manuals.
2. Software licenses.
3. Software service agreement.
4. PC installation and operating documentation, manuals, and software for the PC and all installed peripherals. Provide separately for each PC.
5. Hard copies of manufacturer's specification sheets, operating specifications, design guides, user's guides for software and hardware, and PDF files on compact disk or portable storage device with a USB interface of the hard-copy submittal.
6. Program Software Backup: On compact disk or portable storage device with a USB interface, complete with data files.
7. Device address list.
8. Printout of software application and graphic screens.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Addressable Relays: One for every 10 installed. Furnish at least one of each type.
   2. Data Line Surge Suppressors: One for every 10 of each type installed. Furnish at least one of each type.

1.8 QUALITY ASSURANCE

A. Installer Qualifications: An authorized representative who is trained and approved by manufacturer.

1.9 COORDINATION

A. Coordinate features of distribution equipment and power monitoring and control components to form an integrated interconnection of compatible components.

B. Coordinate Work of this Section with those in Sections specifying distribution components that are monitored or controlled by power monitoring and control equipment.

PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Basis-of-Design Product: Subject to compliance with requirements, provide Leviton Verifeye Metering System or comparable product by one of the following:
   1. Eaton.
   2. General Electric Company.
   3. Schneider Electric USA, Inc.

B. Microprocessor-based monitoring and control of electrical power distribution system(s) that includes the following:
   1. Electrical meters that monitor, control, and connect to the data transmission network.
   2. LAN: High-speed, multi-access, open, nonproprietary, industry-standard communication protocols.
3. Include multiple PC-based workstations, with its operating system and application software, connected to data transmission network.
4. Monitoring and Verification of the following load types:
   a. Lighting interior and exterior loads.
   b. Receptacle plug loads.
   c. HVAC and Mechanical loads

C. The electrical power monitoring and control system shall be Internet based.
   1. System software shall be based on server thin-client architecture, designed around open standards of internet technology.
   2. Intent of thin-client architecture is to provide operators complete access to power monitoring and control system via an Internet browser. No special software other than an Internet browser shall be required to access graphics, point displays, and trends; to configure trends, points, and controllers; and to edit programming.
   3. Internet access shall be password protected.

D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in CEC 70, by a qualified testing agency, and marked for intended location and application.

E. UL Compliance: Listed and labeled as complying with UL 61010-1.

2.2 PERFORMANCE REQUIREMENTS

A. Surge Protection: For external wiring of each conductor entry connection to components to protect components from voltage surges originating external to equipment housing and entering through power, communication, signal, control, or sensing leads.
   1. Minimum Protection for Power Lines 120 V and More: SPDs complying with UL 1449, listed and labeled for intended use by an NRTL acceptable to authorities having jurisdiction.
   2. Minimum Protection for Communication, Signal, Control, and Low-Voltage Power Lines: Comply with requirements as recommended by manufacturer for type of line being protected.

B. Addressable Devices: All transmitters and receivers shall communicate unique device identification and status reports to monitoring and control clients.

C. Interface with DDC System for HVAC: Provide factory-installed hardware and software to enable the DDC system for HVAC to monitor, display, and record data for use in processing reports.
   1. ASHRAE 135 (BACnet), LonTalk, Modbus and Industry-accepted, open-protocol communication interface with the DDC system for HVAC shall enable the DDC system for HVAC operator to remotely monitor meter information from a DDC system for HVAC workstation. Control features and monitoring points displayed locally at metering panel shall be available through the DDC system for HVAC.

D. Backup Power Source:
   1. Electrical power distribution equipment served by a backup power source for controls shall have associated power monitoring and control system products that monitor and control such systems and equipment also served from a backup power source.
2.3 METERS AND CURRENT TRANSFORMERS

A. Description: Separately mounted, modular, permanently installed, solid-state, digital I/O instrument for power monitoring and control; complying with UL 61010-1.
   1. Capable of metering 4-wire Y, 3-wire Y, 3-wire delta, and single-phase power systems.
   2. Equipped with security lock to protect revenue related metering from unauthorized and accidental changes.

B. Environment: System components shall be capable of withstanding the following environmental conditions without mechanical or electrical damage or degradation of operating capability:
   1. Indoor installation in nontemperature-controlled spaces that have environmental controls to maintain ambient conditions of minus 13 to 158 deg F dry bulb and 20 to 90 percent relative humidity, noncondensing.
   2. Comply with IEC 60529 degree of protection code of IP51 for the front of the meter, and code of IP30 for the body.

C. Overvoltage: Comply with UL 61010-1 overvoltage withstand rating for CAT III.

D. Accuracy:
   1. Comply with ANSI C12.20, Class 0.5.
   2. Neutral Current Measurement: Not more than 0.65 percent.
   3. Power: 0.6 percent.
   4. Power Factor: 0.5 percent.
   5. Active Energy: 0.6 percent.
   6. Reactive Energy: 2.5 percent.
   7. Frequency: 0.05 percent.
   8. THD: 1.0 percent.

E. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to the following:
   2. Advanced single point metering devices: Leviton Energy Monitoring HUB + (EMH+), 3500, 4000 and 4100 Series
   4. Leviton solid or split core current transformers with full scale output of 0.1A or 0.333v
   5. Leviton Rogowski coil current transformers.
   6. Solid Core current transformers available for 100-400A and split core current transformers available from 100-5,000A.
   7. Current transformer secondary conductors can be extended:
      a. 500’ for 0.1A CT’s
      b. 300’ for 0.333V CT’s
      c. 20’ for Rogowski Coil CT’s

2.4 SYSTEM DESCRIPTION – SINGLE POINT METERING DEVICES

A. Provide single point metering devices capable of metering 1PH/2W, 2PH/3W, 3PH/3W, and/or 3PH/4W loads.

B. Meters must be capable of directly metering North American 120/208,277/480V.

C. Metering units must be capable of metering loads between 100A and 5000A. Provide meters as indicated on construction drawings.
D. Must meet all ISO 9001 standards for quality control where all meters test to a minimum of +/- 0.5% accuracy.

E. The system shall be as described below:
1. To consist of electronic meters with embedded communications capability, and solid or split-core current transformer technology. The current transformers shall have a full scale output of 0.1A or .333v and secondary voltage clamps for safety purposes.
2. Meters to be used for Energy Monitoring applications.
3. The meters will be capable of remote communication from each metering device.
4. Standard meters shall have isolated pulse output with output ranges from 10Wh to 1kWh.

E. Advanced meters shall transmit data via one of the following communication protocols:
   a. Isolated Pulse Output
   b. Modbus TCP/IP
   c. BACNet IP
   d. Modbus RTU
   e. BACNet MS/TP
5. Backup power provided by on-board battery maintains the real time clock through power loss (Advanced Meters Only). Energy data is stored in non-volatile memory to maintain value through power loss. Device is capable of holding 65 days of historical data in default settings (Advanced Meters Only).
6. Failure of the building electrical normal power system shall not result in loss of data and will not require manual restarting of the metering system.

F. The electronic energy monitoring system shall be fully automated microprocessor-based electrical energy measurement system for Measurement and Verification. The system shall incorporate complete metering, communications, reporting functions; energy monitoring and threshold limit capabilities.

2.5 SYSTEM MEASUREMENTS – SINGLE POINT METERING DEVICES

A. Meters to be complete with a Liquid Crystal Display (LCD) to access all energy measurements and phase diagnostics when needed.

B. Standard Meter Energy Parameters:
   1. kWh real consumption
   2. kW peak resettable kW peak

C. Advanced Meter Energy Parameters:
   1. Bi-directional Energy Measurements
   2. kWh real consumption
   3. kW peak resettable kW peak
   4. kW instantaneous consumption
   5. kVAh apparent energy consumption
   6. kVA total apparent power
   7. kVARh reactive consumption
   8. kVAR total reactive power
   9. PF power Factor Total
   10. Maximum kW peak demand with time and date stamp
11. **Line Frequency Hz**

D. **Advanced Meter Phase Diagnostics:** Parameters to be displayed for each individual phase of each metered load:

1. **Voltage** Phase to neutral or phase to phase
2. **Amps** Instantaneous amperage for each phase
3. **kW** Instantaneous real energy
4. **PF** Power factor
5. **kVA** Instantaneous apparent energy
6. **KVAR** Instantaneous reactive energy

2.6 **SYSTEM DESCRIPTION – MULTIPoint METERING DEVICES**

A. The system shall be as described below:

1. To consist of electronic multiple point meters with embedded communications capability, and solid or split-core current transformer technology. The current transformers shall have a full scale output of 0.1A outputs and secondary voltage clamps for safety purposes.
2. Meters to be used for Energy Monitoring and Tenant Billing applications
3. The meters will be capable of remote communication from each metering device. Each device shall have IP sockets and RS-485 terminals to accommodate data transmission via Modbus TCP/IP, BACNet IP, Modbus RTU and standard Ethernet. Data shall be transmitted by one or a combination of the following:
   a. Standard Ethernet interface
   b. Ethernet connection to PC or laptop via crossover cable.
   c. RS-485 Network-Modbus RTU
4. Systems to have backup storage power to key components so no data is lost during power outages. Device must be capable of holding 2 years of interval data for a 20 year period. The system shall continue to function after resumption of power.
5. Failure of the building electrical normal power system shall not result in loss of data and will not require manual restarting of the metering system

B. The electronic energy monitoring system shall be fully automated microprocessor-based electrical energy measurement system for Measurement and Verification and Tenant Billing purposes. The system shall incorporate the following:

1. Complete metering
2. Communications
3. Reporting functions
4. Energy monitoring
5. Threshold limits capabilities.

C. Meters must be capable of directly metering on board, North American 120/208 and 277/480V.

D. Meters must be capable of metering 480v Delta and 347/600v using PT’s.

E. Metering Units must have the capability of a Wiring Harness, single incoming cable containing 25 pairs of 22 AWG wire with associated current transformers (CT’s) or optional Terminal Strips, screw terminal connections for CT’s.

F. Must meet all ISO 9001 standards for quality control where all meters test to a minimum of +/- 0.5% accuracy.

G. Metering unit(s) must be configurable to meter 24 single-pole circuits, 12 two-pole circuits, or 8 three-pole circuits
2.7 SYSTEM MEASUREMENTS – MULTIPoint METERING DEVICES

A. Meters to be complete with a Liquid Crystal Display (LCD) to access energy measurements and phase diagnostics when needed

B. Energy Parameters:
   1. kWh  real consumption
   2. kW  instantaneous consumption
   3. kVAh  apparent consumption
   4. kVA  apparent power
   5. kVARh  reactive consumption
   6. kVAR  reactive power

C. Phase Diagnostics: Parameters to be displayed for each individual phase of each metered load:
   1. Voltage  Phase to neutral or phase to phase
   2. Amps  Instantaneous amperage for each phase
   3. kW  Instantaneous real energy
   4. PF  Power factor
   5. PA  Phase angle
   6. kVA  Instantaneous apparent energy
   7. KVAR  Instantaneous reactive energy

2.8 METER DATA COLLECTION AND COMMUNICATION

A. Data acquisition server: Leviton Energy Monitoring Hub and Hub Lite

B. Pulse data collection: Leviton High Density Pulse Module

C. Wireless data transmission: Leviton Modhopper

2.9 SYSTEM DESCRIPTION METER COMMUNICATIONS AND DATA COLLECTION

A. The system shall be as described below:
   1. To consist of energy management hubs, pulse modules, wireless communication devices, and software used to transmit, collect, and display data provided by sub-metering equipment used to capture measurements from utilities that include, but are not limited to, electrical, gas, water, and steam.
   2. System to allow all data collected to be connected to IP based applications including Third Party Billing Companies/Software, Enterprise Energy Management Software, Demand Response, and Smart Grid Collection for use in power Measurement and tenant billing.
   3. Data collection system shall be all non-proprietary and compatible with industry standard M&V software applications. Open protocols such as Modbus, pulse outputs, analog, resistive inputs, etc. shall be utilized. No proprietary or manufacturer specific protocols between meter and data collectors shall be accepted.

2.10 PRODUCT REQUIREMENTS - DATA ACQUISITION SERVER

A. Provide data acquisition servers that measure and verify data from electrical meters and environmental sensors.
B. Server shall comply with the following codes and standards:
1. FCC CFR 47 Part 15, Class A
2. EN 610000
3. EN 61326
4. CE

C. Server shall be equipped with an ARMg embedded CPU, an ARM7 I/O co-processor, 32MB of onboard RAM, 16MB of NOR flash memory, and a USB expansion port.

D. Server shall operate under the following conditions:
1. 32°F to 122°F (0°C to 50°C), 0-90% RH, non-condensing
2. 41°F to 104°F (5°C to 40°C), 0-90% RH, non-condensing

E. Server shall have the capability to collect and log information at intervals from one (1) to sixty (60) minutes.

F. Server shall timestamp all acquired data and store it in a non-volatile memory.

G. Server shall use modem and/or Ethernet connections for internet access allowing either static IP (internet protocol) or DHCP (Dynamic Host Control Protocol) addressing.

H. Server shall communicate with metering data points via wired or wireless connections over the following protocols:
   1. Wired communications:
      a. Pulse
      b. Ethernet-Modbus TCP/IP
      c. RS-485-Modbus RTU
         1) Modbus devices to be connected via Belden 1120A or equivalent 18g twisted shielded pair.
   2. Wireless Communications:
      a. Wireless Modbus

I. Server shall communicate with external devices via -wired or wireless connections over the following protocols:
   1. Wired communications:
      a. Ethernet LAN (Local Area Network) or WAN (Wide Area Network)
         1) TCP/IP
         2) PPP
         3) HTTP/HTML
         4) FTP
         5) NTP
         6) XML
         7) SNMP
         8) BACnet-Optional Downloaded Module
   2. Wireless Communications:
      a. GSM (Global System for Mobile Communications)
      b. GPRS (General Packet Radio Service)
      c. PSTN (Public Switched Telephone Network)

J. Server shall upload data at user selectable scheduled intervals via HTTP or FTP and download data in XML or custom formats.

K. Server shall generate alarms for data points including SNMP (Simple Network Management Protocol) traps.
L. Server shall have the following input and output connections:

1. Input:
   a. RS485 Modbus serial input capable of supporting 32 external devices. Input to be expandable at owner's option.
   b. Eight (8) Flex I/O inputs configurable for the following modes:
      1) 0-10VDC
      2) 4-20mA
      3) Resistive
      4) Standard KYZ pulse modes for A or C dry contact relay outputs
      5) Status

2. Output:
   a. Two (2) opto-FET dry contact relays rated at 30VDC and 150mA maximum

2.11 PRODUCT REQUIREMENTS – HIGH DENSITY PULSE MODULES

A. Provide high density pulse module for collection and distribution of pulse output data generated by electric.

B. Module shall have on-board, adjustable Modbus addressing via dip switches with addresses from 1-128.

C. Module shall comply with the following codes and standards:

D. Module shall be equipped with an ARM7 I/O processor with field-upgradable firmware.

E. Module shall communicate over a Modbus / RTU RS-485, two wire network with the following network speeds
   1. 19200 Baud
   2. 9600 Baud

F. Module shall operate under the following conditions
   1. -22°F to 158°F (-30°C to 70°C), 0-90% RH, non-condensing

G. Module shall have a 32-bit pulse counter which rolls over at 4.295 billion pulses per channel and store pulse data in a non-volatile memory. Pulse rate shall be user selectable.

H. Module shall have the following input and output connections
   1. Input
      a. Non isolated pulse and power inputs
      b. Modbus RS485 connection
      c. Twenty-three (23) independent pulse count inputs designed for use with dry contact outputs. The pulse rate shall be user selectable between the following:
         1) 10Hz: Minimum pulse width to be 50ms
         2) 50Hz: Minimum pulse width to be 10ms
         3) 100Hz
2.12 PRODUCT REQUIREMENTS – WIRELESS TRANSCEIVER

A. Provide OPTIONAL wireless transceiver for collection and distribution of pulse outputs generated by electrical meters, other energy and water meters and environmental sensors.

B. Transceiver shall comply with the following codes and standards:
   2. FCC ID to be OUR-9XTREAM

C. Transceiver shall be equipped with a 60 MHz ARM7 embedded CPU.

D. Transceiver firmware to be field upgradable.

E. Transceiver shall communicate over a self-healing, self-optimizing wireless mesh network. Network shall utilize frequency hopping, spread-spectrum radio transmission and reception over 900MHz band.

F. Transceiver shall have a range of 3000 feet indoors and 14 miles outdoor line of sight.

G. Transceiver broadcast power shall be 1 watt.

H. Transceiver shall operate under the following conditions
   1. 32°F to 122°F (0°C to 50°C), 0-90% RH, non-condensing
   2. 1.24 miles (2000m) maximum altitude, degree 2 pollution

I. Transceiver shall have a pulse counter with pulse data stored in a non-volatile memory.

J. Transceiver shall have the following input and output connections. Modbus addresses to be adjustable via DIP switches with addresses between 1 and 247.
   1. Input
      a. Two (2) Pulse inputs with user selectable pulse rates of 10, 50, 100, or 250 Hz.
      b. Modbus RS485 input
         1) Connect a maximum of 32 Modbus devices to transceiver input
   2. Output
      a. Modbus RS485 output
         1) Outputs to be user selectable between 100 Ohms and 2.5 kOhms.
      b. Two (2) opto-FET dry contact relays rated at 30VDC, 150mA max.

2.13 CLOUD BASED ENERGY INFORMATION SOFTWARE

A. Software package shall consist of one or more of the following modules:
   1. Basic Building Management Software BMO 3.0-Base Module

2.14 PRODUCT REQUIREMENTS-BASIC SOFTWARE-BMO 3.0 BASE MODULE

A. BMO 3.0 Base Module is a basic energy information platform that allows for basic reporting of limited graphing of energy information collected from energy and water meters and environmental sensors.

B. Provide a web hosted software platform which is fully functional without software other than standard web browsers including, but not limited to, Microsoft Internet Explorer, Google Chrome and Firefox Mozilla.
1. Software shall support multiple Leviton Energy Monitoring HUBs.

C. Software shall be used for the collection, analysis, and reporting of energy data from sub-metering equipment used to capture energy usage measurements that include, but are not limited to, electrical.

D. Software shall collect and report data in intervals 15 minute intervals by default.

E. Software shall produce configurable reports and display data for all engineering units available from the meters incorporated in to the system; kWh, kW.

F. Software will allow for graphical representation of up to 4 different metering points compared to each other on the graphical output.

G. Software shall allow for exportable tabular data in all report options; excel, .csv, etc.

H. Software shall allow for graphical representations of data in 15 minute intervals or other intervals as determined by the end user.

I. Software will allow for basic energy consumption and cost reporting.

J. Software shall allow for a Date Picking capability to allow for reports to be selected from the following time options:
   1. Last Hour, 8Hrs, Today, Yesterday, 7 days, Week, 30 days, Month, Last Month, Last 12 Months, This Year, Last Year
   2. User Defined Custom Period including date and time range as narrow as a single 15 minute interval

K. Report Header will display the range of total available data for the meter assigned to the report

L. Software will allow for the creation of user defined alarms for low and high readings for energy metrics reported on meters within the system.

2.15 PRODUCT REQUIREMENTS – EEM SOFTWARE-BMO 3.0 EXECUTIVE REPORTING MODULE

A. Description: BMO 3.0 Executive Reporting Module is an Enterprise Energy Management software platform designed to assist energy and facility managers in the conduct of daily energy management reporting and analysis functions. It is designed for portfolio level use incorporating a wide range of graphical interfaces and an executive dashboard for high level energy information.

B. Provide a web hosted software platform which is fully functional without software other than standard web browsers including, but not limited to, Microsoft Internet Explorer, Google Chrome and Firefox Mozilla

C. Software shall support a minimum of 10 separate facilities with 50 meters per facility; additional facilities/meters added as user requires

D. Software shall allow for unique facility information to be entered on Building Set Up Page to include:
   1. Facility Address Information
   2. Facility Square Footage
   3. Utility Cost Information
E. Software shall be used for the collection, analysis, and reporting of energy data from sub-metering equipment used to capture energy usage measurements that include, but are not limited to, electrical, gas, water, steam & BTU values.

F. Software shall collect and report data in intervals 15 minute intervals by default; other user defined intervals available.

G. Software shall produce configurable reports and display data for all engineering units available from the meters incorporated into the system; kWh, kW, gallons, BTU.hr, etc.

H. Software shall allow for exportable tabular data in all report options; excel, .csv, etc.

I. Software shall allow for a wide variety of graphical representations of data in the following options:
   1. 2 Dimensional Charts
      a. Area Charts
      b. Vertical Bar Charts
      c. Horizontal Bar Charts
      d. Pie Charts
      e. Donut Charts
      f. Smooth Area Charts
      g. Smooth Line Charts
      h. Scatter Charts
   2. 3 Dimensional Charts
      a. Vertical Bar Charts
      b. Horizontal Bar Charts
      c. Pie Charts
      d. Donut Charts

J. Software shall allow for graphical data to be displayed in the following time interval options:
   1. 15 minute
   2. One day
   3. One week
   4. One month
   5. One year

K. Software shall allow for a Date Picking capability to allow for reports to be selected from the following time options:
   1. Last Hour, 8Hrs, Today, Yesterday, 7 days, Week, 30 days, Month, Last Month, Last 12 Months, This Year, Last Year
   2. User Defined Custom Period including date and time range as narrow as a single 15 minute interval

L. Report Header will display the range of total available date for the meter or virtual meter assigned to the report

M. Software shall organize all user defined and pre-configured reports to be cataloged on a building specific dashboard including the following basic information:
   1. Street Map pinpointing the buildings geographic location
   2. Local current weather conditions displayed
   3. Building Performance Goal Odometers if configured

N. Software shall allow for the construction of Virtual Meters with the following parameters:
   1. Any number of like kind data points (kWh + kWh, etc)
   2. Combinations of data points from any HUB found in the software license
3. Combinations of virtual meters to create an additional virtual meter.
4. Virtual meter point data begins on the date and time the VM is created.

O. Software shall allow the creation of energy information alerts with the following parameters:
1. Alerts shall be either consumption or demand based
2. Alerts shall be configured to trip based on a fixed base point value with the following conditions:
   a. Less Than (<)
   b. Less Than or Equal to (<, =)
   c. Equal to (=)
   d. Greater Than or Equal to (> ,=)
   e. Greater Than (>)
3. Alerts will be configured to allow communications via the following methods:
   a. Text
   b. Email
   c. Mobile APP (Must have downloaded and activated BMO 3.0 Mobile APP)
   d. Option for continuous notification or single notification
4. Software shall allow for the creation of a Base Case Analysis for energy demand, consumption or cost
5. Base Case can be configured from any physical meter or virtual meter
6. Base Case date range/period is user selectable
7. Base Case Type can be selected from the following types:
   a. Cost
   b. Cost/SqFt
   c. Demand (Average)
   d. Demand(Peak)
   e. Usage-Consumption
   f. Usage-Consumption/Sqft
8. Base Case can be compared to any other period for the same meter or virtual meter
9. Base Case Comparison to be an option for display on the Executive Dashboard
10. Base Case Comparison data to be incorporated into Building Goal calculations

P. Software will allow for creation of specific Building Goals:
1. Building Goals must be specifically targeted against Base Case Analysis
2. Goal creation must allow for a buffer zone around the goal to be determined by user +/- 5%, etc
3. Building Goals must be displayed on specific building dashboard using an odometer type display.
4. Building Goals will be created for any values found in the Base Case Analysis
   a. Energy Cost
   b. Energy Cost/SqFt
   c. Energy Demand-Average
   d. Energy Demand-Peak
   e. Energy Consumption
   f. Energy Consumption/SqFt
5. Building Goal information will be capable of being displayed on the higher level executive dashboard

Q. Software will allow the creation of a configurable Executive Dashboard. Dashboard will be configurable by end user.
1. Dashboard will offer multiple layout schemes to offer the end user maximum impact of the displayed data
2. Dashboard will regularly refresh data every 15 minutes or as directed by the end user
3. Dashboard will allow for the following items to be displayed:
   a. Reports-Building or Portfolio Level-Graphical or Badge type
b. Carbon Footprint
c. Comparison Report
d. Building Goals
e. Base Case Comparisons
f. Street Map
g. Current/Future Weather data
h. Photo/Picture
i. Time Clock (Time Zone adjustable)

4. Dashboard will be shareable with other users via email.
5. Dashboard will be adjustable for use with multiple screen sizes and types.
6. BMO 3.0 Base module functionality will be enabled in conjunction with this module.

2.16 PRODUCT REQUIREMENTS – CODE COMPLIANCE MODULE - BMO 3.0

A. Description-BMO 3.0 Code Compliance Module is a cloud based software platform that is
designed to allow commercial building/facility operators to meet minimum requirements found
in existing and emerging State and Municipal energy codes related to energy metering, data
acquisition & storage and reporting.

B. Provide a web hosted software platform which is fully functional without software other than
standard web browsers including, but not limited to, Microsoft Internet Explorer, Google
Chrome and Firefox Mozilla

C. Software shall be used for the collection, analysis, and reporting of energy data from sub-
metering equipment used to capture energy usage measurements that include, but are not
limited to, electrical, gas, water, steam & BTU values for whole Building Energy Sources and
End User Energy categories

D. Software shall collect and report data in intervals 15 minute intervals by default; other user
defined intervals available.

E. Software shall produce configurable reports and display data for all engineering units available
from the meters incorporated in to the system; kWh, kW, gallons, BTU.hr, etc.

F. Software shall allow for a Date Picking capability to allow for reports to be selected from the
following time options:
   1. Last Hour, 8Hrs, Today, Yesterday, 7 days, Week, 30 days, Month, Last Month, Last 12
      Months, This Year, Last Year
   2. Defined Custom Period including date and time range as narrow as a single 15 minute
      interval
   3. Report Header will display the range of total available date for the meter or virtual meter
      assigned to the report
   4. Software will allow for the creation of alarms for low and high readings for energy metrics
      reported on incorporated meters.

G. Software shall allow for the construction of Virtual Meters with the following parameters:
   1. Any number of like kind data points (kWh + kWh, etc)
   2. Combinations of data points from any HUB found in the software license
   3. Combinations of virtual meters to create an additional virtual meter.
   4. Virtual meter point data begins on the date and time the VM is created.

H. Software shall allow for exportable tabular data in all report options; excel, .csv, etc.
I. Software shall allow for graphical representations of data in 15 minute intervals or other intervals as determined by the end user.

J. Software will allow for basic energy consumption, demand and cost reporting.

K. Report Header will display the range of total available date for the meter or virtual meter assigned to the report.

L. Software will allow for the creation of alarms for low and high readings for energy metrics reported on incorporated meters.

M. BMO 3.0 Base Module functionality will be enabled with this software module.

2.17 RACEWAYS AND BOXES

A. Comply with requirements in Section 260533 "Raceways and Boxes for Electrical Systems" for electrical power wiring and CEC 70 Class 1 remote-control and signaling circuits.

B. Comply with requirements in Section 270528 "Pathways for Communications Systems" for control wiring, RS-232 cable, and CEC 70 Class 2 remote-control and signaling circuits.

2.18 WIRES AND CABLES

A. Electrical Power Wiring: Comply with requirements in Section 260519 "Low-Voltage Electrical Power Conductors and Cables."
   1. Copper conductors are Type THHN/THWN-2.

B. RS-232 Cable:
   1. PVC-Jacketed, RS-232 Cable: Paired, two pairs, No. 22 AWG, stranded (7x30) tinned copper conductors, polypropylene insulation, and individual aluminum foil-polyester tape shielded pairs with 100 percent shield coverage; PVC jacket. Pairs are cabled on common axis with No. 24 AWG, stranded (7x32) tinned copper drain wire.
      a. Type CM.
      b. Flame Resistance: UL 1581, vertical tray.
   2. Plenum-Type, RS-232 Cable: Paired, two pairs, No. 22 AWG, stranded (7x30) tinned copper conductors, plastic insulation, and individual aluminum foil-polyester tape shielded pairs with 100 percent shield coverage; plastic jacket. Pairs are cabled on common axis with No. 24 AWG, stranded (7x32) tinned copper drain wire.
      a. Type CMP.

2.19 SURGE PROTECTION DEVICES

A. Basis-of-Design Product: Subject to compliance with requirements, provide Leviton Manufacturing Co., Inc. or comparable product by one of the following:
   1. Eaton.
   2. GE Zenith Controls.
   3. Schneider Electric USA, Inc.

B. SPDs: Comply with UL 1449, Type 1 and Type 2.
1. Include LED indicator lights for power and protection status.
2. Internal thermal protection that disconnects the SPD before damaging internal suppressor components.
3. Include Form-C contacts rated at 5 A and 250-V ac, one normally open and one normally closed, for remote monitoring of protection status. Contacts shall reverse on failure of any surge diversion module or on opening of any current-limiting device. Coordinate with building power monitoring and control system.

C. Peak Surge Current Rating: The minimum single-pulse surge current withstand rating per phase shall not be less than 100 kA. The peak surge current rating shall be the arithmetic sum of the ratings of the individual metal-oxide varistors in a given mode.

D. Comply with UL 1283.

E. Protection modes and UL 1449 SPD for grounded wye circuits with 480Y/277 V and 208Y/120 V, three-phase, four-wire circuits shall not exceed the following:
   1. L-N: 1200 V for 480Y/277 V 700 V for 208Y/120 V.
   2. L-G: 1200 V for 480Y/277 V 700 V for 208Y/120 V.
   3. N-G: 1200 V for 480Y/277 V 700 V for 208Y/120 V.
   4. L-L: 2000 V for 480Y/277 V 1200 V for 208Y/120 V.

F. Protection modes and UL 1449 SPD for 240/120-V, single-phase, three-wire circuits shall not exceed the following:
   1. L-N: 700 V.
   2. L-G: 700 V.
   3. N-G: 700 V.
   4. L-L: 1200 V.

G. SCCR: Equal or exceed 100 kA.

H. Nominal Rating: 20 and 10 kA.

I. Indoor Enclosures: NEMA 250, Type 1.

J. Outdoor Enclosures: NEMA 250, Type 3R.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine pathway elements intended for cables. Check raceways, cable trays, and other elements for compliance with space allocations, installation tolerances, hazards to cable installation, and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 POWER MONITORING AND CONTROL SYSTEM INSTALLATION

A. Comply with NECA 1.

C. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Install lacing bars and distribution spools.

D. Wiring and Cabling Installation:
   1. Comply with Section 260519 "Low-Voltage Electrical Power Conductors and Cables" for electrical power wiring.

E. Raceways Installation:
   1. Comply with Section 260533 "Raceways and Boxes for Electrical Systems" for electrical power wiring and CEC 70 Class 1 remote-control and signaling circuits.
   2. Comply with Section 270528 "Communications Building Pathways" for control wiring, RS-232 cable, and CEC 70 Class 2 remote-control and signaling circuits.

F. Identification Installation:
   1. Comply with Section 260519 "Low-Voltage Electrical Power Conductors and Cables" for electrical power wiring.
   2. Comply with Section 271513 "Communications Horizontal Twisted Pair Cabling" for identification products and cable management system requirements for twisted pair cable, RS-485 cable, low-voltage control cable, and RS-232 cable.
   3. Comply with Section 271323 "Communications Backbone ISP Optical Fiber Cabling" and Section 271324 "Communications Backbone OSP Optical Fiber Cabling" for identification products and cable management system requirements for optical-fiber cable.

3.3 WORKSTATION INSTALLATION

A. Desktop Workstations Installation:
   1. Install workstation(s) at location(s) directed by Owner.
   2. Install multiple-receptacle power strip with cord for use in connecting multiple workstation components to a single, duplex electrical power receptacle.
   3. Install software on workstation(s) and verify that software functions properly.
   4. Develop Project-specific graphics, trends, reports, logs, and historical database.
   5. Power workstation through a UPS unit. Locate UPS adjacent to workstation.

B. Portable Workstations Installation:
   1. Turn over portable workstations to Owner at Substantial Completion.
   2. Install software on workstation(s) and verify that software functions properly.

C. Graphics Application:
   1. Use system schematics indicated as starting point to create graphics.
   2. Develop Project-specific library of symbols for representing system equipment and products.
   3. Incorporate digital images of Project-completed installation into graphics where beneficial to enhance effect.
   4. Submit sketch of graphic layout with description of all text for each graphic for Owner's and Architect's review before creating graphic using graphics software.
   5. Seek Owner input in graphics development once using graphics software.
   6. Final editing shall be done on-site with Owner's review and feedback.
   7. Refine graphics as necessary for Owner acceptance.
8. On receiving Owner acceptance, print a hard copy to include in operation and maintenance manual. Prepare a scanned copy PDF file of each graphic and include with softcopy of the system operation and maintenance manual.

3.4 NETWORK NAMING AND NUMBERING

A. Coordinate with Owner and provide unique naming and addressing for networks and devices.

3.5 GROUNDING

A. For data communication wiring, comply with NECA/BICSI 568.

B. For low-voltage control wiring and cabling, comply with requirements in Section 260526 "Grounding and Bonding for Electrical Systems."

3.6 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

C. Perform the following tests and inspections with the assistance of a factory-authorized service representative:
   1. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.
   2. Visually inspect balanced twisted pair cabling and optical-fiber cable jacket materials for UL or third-party certification markings. Inspect cabling terminations to confirm color-coding for pin assignments and inspect cabling connections to confirm compliance with TIA-568-C.1.
   3. Visually inspect cable placement, cable termination, grounding and bonding, equipment and patch cords, and labeling of all components.
   4. Test balanced twisted pair cabling for direct-current loop resistance, shorts, opens, intermittent faults, and polarity between conductors. Test operation of shorting bars in connection blocks. Test cables after termination, but not after cross-connection.
      a. Test instruments shall meet or exceed applicable requirements in TIA-568-C.2. Perform tests with a tester that complies with performance requirements in its "Test Instruments (Normative)" Annex, complying with measurement accuracy specified in its "Measurement Accuracy (Informative)" Annex. Use only test cords and adapters that are qualified by test equipment manufacturer for channel or link test configuration.
      b. Document data for each measurement. Print data for submittals in a summary report that is formatted using Table 10.1 in BICSI TDMM as a guide or transfer the data from the instrument to the computer, save as text files, print, and submit.
   5. Optical-Fiber Cable Tests:
      a. Test instruments shall meet or exceed applicable requirements in TIA-568-C.0. Use only test cords and adapters that are qualified by test equipment manufacturer for channel or link test configuration.
      b. Link End-to-End Attenuation Tests:
         1) Multimode Link Measurements: Test at 850 or 1300 nm in one direction according to IEC 61280-4-1.
         2) Attenuation test results for links shall be less than 2.0 dB.
   
a. Test Analog Signals:
   1) Check analog voltage signals using a precision voltage meter at zero, 50, and 100 percent.
   2) Check analog current signals using a precision current meter at zero, 50, and 100 percent.
   3) Check resistance signals for temperature sensors at zero, 50, and 100 percent of operating span using a precision-resistant source.

b. Test Digital Signals:
   1) Check digital signals using a jumper wire.
   2) Check digital signals using an ohmmeter to test for contact making or breaking.

c. I/O Control Loop Tests:
   1) Test every I/O point to verify that safety and operating control set points are as indicated and as required to operate controlled system safely and at optimum performance.
   2) Test every I/O point throughout its full operating range.
   3) Test every control loop to verify that operation is stable and accurate.
   4) Adjust control loop proportional, integral, and derivative settings to achieve optimum performance while complying with performance requirements indicated. Document testing of each control loop’s precision and stability via trend logs.
   5) Test and adjust every control loop for proper operation according to sequence of operation.
   6) Test software and hardware interlocks for proper operation.
   7) Operate each analog point at the following:
      a) Upper quarter of range.
      b) Lower quarter of range.
      c) At midpoint of range.
   8) Exercise each binary point.
   9) For every I/O point in the system, read and record each value at workstation, at controller, and at field instrument simultaneously. Value displayed at workstation and at field instrument shall match.
   10) Prepare and submit a report documenting results for each I/O point in the system and include in each I/O point a description of corrective measures and adjustments made to achieve desire results.

D. Wiring and cabling will be considered defective if they do not pass tests and inspections.

E. Prepare test and inspection reports.

3.7 FINAL REVIEW

A. Submit written request to Construction Manager when the power monitoring and control system is ready for final review. Written request shall state the following:
   1. The system has been thoroughly inspected for compliance with Contract Documents and found to be in full compliance.
   2. The system has been calibrated, adjusted, and tested and found to comply with requirements of operational stability, accuracy, speed, and other performance requirements indicated.
3. The system monitoring and control of electrical distribution systems results in operation according to sequences of operation indicated.
4. The system is complete and ready for final review.

B. Review by Architect will be made after receipt of written request. A field report shall be issued to document observations and deficiencies.

C. Take prompt action to remedy deficiencies indicated in field report and submit a second written request when all deficiencies have been corrected. Repeat process until no deficiencies are reported.

D. Final review shall include a demonstration to parties participating in final review.

3.8 MAINTENANCE SERVICE

A. Beginning at Substantial Completion, maintenance service shall include 12 months' full maintenance by manufacturer's authorized service representative. Include quarterly preventive maintenance, repair or replacement of defective components, cleaning, and adjusting as required for proper system operation. Parts and supplies shall be manufacturer's authorized replacement parts and supplies.

3.9 SOFTWARE SERVICE AGREEMENT

A. Technical Support: Beginning at Substantial Completion, service agreement shall include software support for two years.

B. Upgrade Service: At Substantial Completion, update software to latest version. Install and program software upgrades that become available within two years from date of Substantial Completion. Upgrading software shall include operating system and new or revised licenses for using software.
   1. Upgrade Notice: At least 30 days to allow Owner to schedule and access the system and to upgrade computer equipment if necessary.

3.10 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain the power monitoring and control system.

B. Extent of Training:
   1. Base extent of training on scope and complexity of power monitoring and control system indicated and training requirements indicated. Provide extent of training required to satisfy requirements indicated even if more than minimum training requirements are indicated.
   2. Inform Owner of anticipated training requirements if more than minimum training requirements are indicated.
   3. Minimum Training Requirements:
      a. Provide no fewer than two days of training total.
      b. Stagger training over multiple training classes to accommodate Owner's requirements. All training shall occur before end of warranty period.
      c. Total days of training shall be broken into not more than two separate training classes.
      d. Each training class shall be no fewer than one consecutive day(s).
C. Attendee Training Manuals:
   1. Provide each attendee with a color hard copy of all training materials and visual presentations.
   2. Hard-copy materials shall be organized in a three-ring binder with table of contents and individual divider tabs marked for each logical grouping of subject matter. Organize material to provide space for attendees to take handwritten notes within training manuals.
   3. In addition to hard-copy materials included in training manual, provide each binder with a sleeve or pocket that includes a DVD or flash drive with PDF copy of all hard-copy materials.

D. Instructor Requirements:
   1. One or multiple qualified instructors, as required, to provide training.
   2. Instructors shall have no fewer than five years of providing instructional training on no fewer than five past projects with similar electrical monitoring and control system scope and complexity.

E. Training Outline: Submit training outline for Owner review at least 10 business days before scheduling training. Outline shall include a detailed agenda for each training day that is broken down into each training session that day, training objectives for each training session, and synopses for each lesson planned.

F. On-Site Training:
   1. Owner will provide conditioned classroom or workspace with ample desks or tables, chairs, power, and data connectivity for instructor and each attendee.
   2. Instructor shall provide training materials, projector, and other audiovisual equipment used in training.
   3. Provide as much of training located on-site as deemed feasible and practical by Owner.
   4. On-site training shall include regular walk-through tours, as required, to observe each unique product type installed with hands-on review of operation, calibration, and service requirements.
   5. The workstation provided with the system shall be used in training. If workstation is not indicated, provide a temporary workstation to convey training content.

G. Off-Site Training:
   1. Provide conditioned training rooms and workspace with ample tables, chairs, power, and data connectivity for each attendee.
   2. Provide capability to remotely access to Project monitoring and control system for use in training.
   3. Provide a workstation for use by each attendee.

3.11 AT COMPLETION OF TRAINING:

A. Staff familiar with the system installed are capable of demonstrating operation of the system during final review.

B. Demonstration shall include, but not be limited to, the following:
   1. Accuracy and calibration of 10 I/O points randomly selected by reviewers. If review finds that some I/O points are not properly calibrated and not satisfying performance requirements indicated, additional I/O points may be selected by reviewers until total I/O points being reviewed that satisfy requirements equals quantity indicated.
   2. Reporting of alarm conditions for randomly selected alarms, including different classes of alarms, to ensure that alarms are properly received by operators and workstations.
   3. Trends, summaries, logs, and reports set-up for Project.
4. Software’s ability to communicate with controllers, workstations, and uploading and downloading of control programs.
5. Software’s ability to edit control programs off-line.
6. Data entry to show Project-specific customizing capability including parameter changes.
7. Step through penetration tree, display all graphics, demonstrate dynamic update, and direct access to graphics.
8. Execution of digital and analog commands in graphic mode.
10. Online user guide and help functions.
11. For Each Meter:
   a. Memory: Programmed data, parameters, trend, and alarm history collected during normal operation is not lost during power failure.
   b. Operator Interface: Ability to connect directly to each meter with a portable workstation.
   c. Wiring Labels: Match control drawings.
   d. Network Communication: Ability to locate a meter on the network. Communication architecture matches Shop Drawings.
   e. Nameplates and Tags: Accurate and permanently attached to control panel doors, instrument, actuators, and devices.
12. For Each Workstation:
   a. I/O point lists agree with naming conventions.
   b. Graphics are complete.

END OF SECTION
SECTION 26 09 23.02 - LIGHTING CONTROLS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Digital Lighting Controls
   2. Relay Panels
   3. Emergency Lighting Control (if applicable)

B. Related Sections:
   1. Section 26 27 26 "Wiring Devices* for wall-box dimmers, non-networkable wall-switch occupancy sensors, and manual light switches.
   2. Section 26 51 19 "LED Interior Lighting".
   3. Section 26 56 19 "LED Exterior Lighting".
   4. Section 26 63 15 "Planetarium Lighting Technology (PLTS)".

C. Control Intent – Control Intent includes, but is not limited to:
   1. Defaults and initial calibration settings for such items as time delay, sensitivity, fade rates, etc.
   2. Initial sensor and switching zones
   3. Initial time switch settings
   4. Task lighting and receptacle controls
   5. Emergency Lighting control (if applicable)

1.3 QUALITY ASSURANCE

A. Manufacturer: Minimum 10 years’ experience in manufacture of lighting controls.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings:
   1. Show installation details for the following:
      a. Occupancy sensors.
      b. Vacancy sensors.
      c. Daylighting sensors.
      d. Inwall controls.
   2. Interconnection diagrams showing field-installed wiring.
3. Include diagrams for power, signal, and control wiring.

1.5 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Reflected ceiling plan(s) and elevations, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
   1. Suspended ceiling components.
   2. Structural members to which equipment will be attached.
   3. Items penetrating finished ceiling, including the following:
      a. Luminaires.
      b. Air outlets and inlets.
      c. Speakers.
      d. Sprinklers.
      e. Access panels.
      f. Control modules.

B. Field quality-control reports.

C. Sample Warranty: For manufacturer's warranties.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For each type of lighting control device to include in operation and maintenance manuals.

B. Software and Firmware Operational Documentation:
   1. Software operating and upgrade manuals.
   2. Program Software Backup: On USB media and On manufacturer's website. Provide names, versions, and website addresses for locations of installed software.
   3. Device address list.
   4. Printout of software application and graphic screens.

1.7 WARRANTY

A. Manufacturer's Warranty: Manufacturer and Installer agree to repair or replace lighting control devices that fail(s) in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Faulty operation of lighting control software.
      b. Faulty operation of lighting control devices.
2.1 SYSTEM DESCRIPTION AND OPERATION

A. The Lighting Control and Automation system as defined under this section covers the following equipment:

1. Digital Occupancy Sensors – Self-configuring, digitally addressable and calibrated occupancy sensors with LCD display and two-way active infrared (IR) communications.
2. Digital Switches – Self-configuring, digitally addressable pushbutton on/off, dimming, and scene switches with two-way active infrared (IR) communications.
3. Handheld remotes for personal control – One-button dimming, two-button on/off, or five-button scene remotes provide control using infrared communications. Remote may be configured in the field to control selected loads or scenes without special tools.
4. Digital Daylighting Sensors – Single-zone closed loop, multi-zone open loop and single-zone dual-loop daylighting sensors with two-way active infrared (IR) communications can provide switching, bi-level, tri-level or dimming control for daylight harvesting.
5. Digital Room Controllers – Self-configuring, digitally addressable one, two or three relay plenum-rated controllers for on/off control. Selected models include 0-10 volt or line voltage forward phase control dimming outputs and integral current monitoring capabilities.
7. Configuration Tools – Handheld remote for room configuration and relay panel programming provides two way infrared (IR) communications to digital devices and allows complete configuration and reconfiguration of the device / room from up to 30 feet away. Unit to have Organic LED display, simple pushbutton interface, and allow bi-directional communication of room variables and occupancy sensor settings. Computer software also customizes room settings.
8. Digital Lighting Management (DLM) local network – Free topology, plug-in wiring system (Cat 5e) for power and data to room devices.
9. Digital Lighting Management (DLM) segment network – Linear topology, BACnet MS/TP network (1.5 twisted pair, shielded,) to connect multiple DLM local networks for centralized control.
10. Network Bridge – provides BACnet MS/TP-compliant digital networked communication between rooms, panels and the Segment Manager or building automation system (BAS) and automatically creates BACnet objects representative of connected devices.
11. Segment Manager – provides web browser-based user interface for system control, scheduling, power monitoring, room device parameter administration and reporting.
12. Programming and Configuration software – Optional PC-native application capable of accessing DLM control parameters within a room, for the local network, via a USB adapter, or globally, for many segment networks simultaneously, via BACnet/IP communication.
13. LMCP Digital Lighting Management Relay Panel – provides up to 8, 24, or 48 mechanically latching relays. Relays include a manual override and a single push-on connector for easy installation or removal from the panel. Panel accepts program changes from handheld configuration tool for date and time, location, holidays, event scheduling, button binding and group programming. Provides
BACnet MS/TP-compliant digital networked communication between other lighting controls and/or building automation system (BAS).

14. Emergency Lighting Control Unit (ELCU) – allows a standard lighting control device to control emergency lighting in conjunction with normal lighting in any area within a building

2.2 LIGHTING CONTROL APPLICATIONS

A. Unless relevant provisions of the applicable local Energy Codes are more stringent, provide a minimum application of lighting controls as follows:

1. Space Control Requirements – Provide occupancy/vacancy sensors with Manual- or Partial-ON functionality in all spaces except toilet rooms, storerooms, library stacks, or other applications where hands-free operation is desirable and Automatic-ON occupancy sensors are more appropriate. Provide Manual-ON occupancy/vacancy sensors for any enclosed office, conference room, meeting room, open plan system and training room. For spaces with multiple occupants, or where line-of-sight may be obscured, provide ceiling- or corner-mounted sensors and Manual-ON switches.

2. Bi-Level Lighting – Provide multi-level controls in all spaces except toilet rooms, storerooms, library stacks, or applications where variable dimming is used.

3. Task Lighting / Plug Loads – Provide automatic shut off of non-essential plug loads and task lighting in all spaces except toilet rooms and storerooms. Provide Automatic-ON of plug loads whenever spaces are occupied. For spaces with multiple occupants a single shut off consistent with the overhead lighting may be used for the area.

4. Daylit Areas – Provide daylight-responsive automatic control in all spaces (conditioned or unconditioned) where daylight contribution is available as defined by relevant local building energy code:
   a. All luminaires within code-defined daylight zones shall be controlled separately from luminaires outside of daylit zones.
   b. Daytime setpoints for total ambient illumination (combined daylight and electric light) levels that initiate dimming shall be programmed in compliance with relevant local building energy codes.
   c. Multiple-leveled switched daylight harvesting controls may be utilized for areas marked on drawings.
   d. Provide smooth and continuous daylight dimming for areas marked on drawings. Daylighting control system may be designed to turn off electric lighting when daylight is at or above required lighting levels, only if system functions to turn lamps back on at dimmed level, rather than turning full-on prior to dimming.

5. Conference, meeting, training, auditoriums, and multipurpose rooms shall have controls that allow for independent control of each local control zone. Rooms larger than 300 square feet shall instead have at least four (4) pre-set lighting scenes unless otherwise specified. Occupancy / vacancy sensors shall be provided to extinguish all lighting in the space. Spaces with up to four moveable walls shall include controls that can be reconfigured when the room is partitioned.

2.3 MANUFACTURERS

A. Basis-of-Design Product: Subject to compliance with requirements, provide Watt Stopper; or a comparable product by one of the following:
1. Cooper Industries, Inc.
2. Lithonia Lighting; Acuity Brands Lighting, Inc.

2.4 DIGITAL LIGHTING CONTROLS

A. Furnish the Company’s system which accommodates the square-footage coverage requirements for each area controlled, utilizing room controllers, digital occupancy sensors, switches, daylighting sensors and accessories which suit the lighting and electrical system parameters.

2.5 DIGITAL WALL SWITCH OCCUPANCY SENSORS

A. Wallbox mounted passive infrared PIR or dual technology (passive infrared and ultrasonic) digital occupancy sensor with 1 or 2 switch buttons.

B. Digital Occupancy Sensors shall provide scrolling LCD display for digital calibration and electronic documentation. Features include the following:

1. Digital calibration and pushbutton configuration for the following variables:
   a. Sensitivity – 0-100% in 10% increments
   b. Time delay – 1-30 minutes in 1 minute increments
   c. Test mode – Five second time delay
   d. Detection technology – PIR, Dual Technology activation and/or re-activation.
   e. Walk-through mode
   f. Load parameters including Auto/Manual-ON, blink warning, and daylight enable/disable when photosensors are included in the DLM local network.

2. Programmable control functionality including:
   a. Each sensor may be programmed to control specific loads within a local network.
   b. Sensor shall be capable of activating one of 16 user-definable lighting scenes.
   c. Adjustable retrigger time period for manual-on loads. Load will retrigger (turn on) automatically during the configurable period of time (default 10 seconds) after turning off.
   d. On dual technology sensors, independently configurable trigger modes are available for both Normal (NH) and After Hours (AH) time periods. The retrigger mode can be programmed to use the following technologies:
      1) Ultrasonic and Passive Infrared
      2) Ultrasonic or Passive Infrared
      3) Ultrasonic only
      4) Passive Infrared only
   3. Independently configurable sensitivity settings for passive infrared and ultrasonic technologies (on dual technology sensors) for both Normal (NH) and After Hour (AH) time periods.
   4. Two RJ-45 ports for connection to DLM local network.
   5. Two-way infrared (IR) transceiver to allow remote programming through handheld configuration tool and control by remote personal controls.
   6. Device Status LEDs including:
      a. PIR detection
      b. Ultrasonic detection
c. Configuration mode  
d. Load binding  
7. Assignment of occupancy sensor to a specific load within the room without wiring or special tools.  
8. Assignment of local buttons to specific loads within the room without wiring or special tools.  
10. All digital parameter data programmed into an individual wall switch sensor shall be retained in non-volatile FLASH memory within the wall switch sensor itself. Memory shall have an expected life of no less than 10 years.  

C. BACnet object information shall be available for the following objects:  
1. Detection state  
2. Occupancy sensor time delay  
3. Occupancy sensor sensitivity, PIR and Ultrasonic  
4. Button state  
5. Switch lock control  
6. Switch lock status  

D. Units shall not have any dip switches or potentiometers for field settings.  

E. Multiple occupancy sensors may be installed in a room by simply connecting them to the free topology DLM local network. No additional configuration will be required.  

F. Two-button wall switch occupancy sensors, when connected to a single relay dimming room controller, shall operate in the following sequence as a factory default:  
1. Left button  
   a. Press and release - Turn load on  
   b. Press and hold - Raise dimming load  
2. Right button  
   a. Press and release - Turn load off  
   b. Press and hold - Lower dimming load  

G. Low voltage momentary pushbuttons shall include the following features:  
1. Load/Scene Status LED on each switch button with the following characteristics:  
   a. Bi-level LED  
   b. Dim locator level indicates power to switch  
   c. Bright status level indicates that load or scene is active  
2. The following button attributes may be changed or selected using a wireless configuration tool:  
   a. Load and Scene button function may be reconfigured for individual buttons (from Load to Scene, and vice versa).  
   b. Individual button function may be configured to Toggle, On only or Off only.  
   c. Individual scenes may be locked to prevent unauthorized change.  
   d. Fade Up and Fade Down times for individual scenes may be adjusted from 0 seconds to 18 hours.  
   e. Ramp rate may be adjusted for each dimmer switch.  
   f. Switch buttons may be bound to any load on a room controller and are not load type dependent; each button may be bound to multiple loads.
H. WattStopper part numbers: LMPW, LMDW. Available in white, light almond, ivory, grey, red and black; compatible with wall plates with decorator opening.

2.6 DIGITAL WALL OR CEILING MOUNTED OCCUPANCY SENSOR

A. Wall or ceiling mounted (to suit installation) passive infrared (PIR), ultrasonic or dual technology digital (passive infrared and ultrasonic) occupancy sensor.

B. Digital Occupancy Sensors shall provide graphic LCD display for digital calibration and electronic documentation. Features include the following:

1. Digital calibration and pushbutton configuration for the following variables:
   a. Sensitivity – 0-100% in 10% increments
   b. Time delay – 1-30 minutes in 1 minute increments
   c. Test mode – Five second time delay
   d. Detection technology – PIR, Ultrasonic or Dual Technology activation and/or re-activation.
   e. Walk-through mode
   f. Load parameters including Auto/Manual-ON, blink warning, and daylight enable/disable when photosensors are included in the DLM local network.

2. Programmable control functionality including:
   a. Each sensor may be programmed to control specific loads within a local network.
   b. Sensor shall be capable of activating one of 16 user-definable lighting scenes.
   c. Adjustable retrigger time period for manual-on loads. Load will retrigger (turn on) automatically within a configurable period of time (default 10 seconds) after turning off.
   d. On dual technology sensors, independently configurable trigger modes are available for both Normal (NH) and After Hours (AH) time periods. The retrigger mode can be programmed to use the following technologies:
      1) Ultrasonic and Passive Infrared
      2) Ultrasonic or Passive Infrared
      3) Ultrasonic only
      4) Passive Infrared only
   e. One or two RJ-45 port(s) for connection to DLM local network.
   f. Two-way infrared (IR) transceiver to allow remote programming through handheld commissioning tool and control by remote personal controls.
   g. Device Status LEDs, which may be disabled for selected applications, including:
      a. PIR detection
      b. Ultrasonic detection
      c. Configuration mode
      d. Load binding

3. Independently configurable sensitivity settings for passive infrared and ultrasonic technologies (on dual technology sensors) for both Normal (NH) and After Hour (AH) time periods.

4. One or two RJ-45 port(s) for connection to DLM local network.

5. Two-way infrared (IR) transceiver to allow remote programming through handheld commissioning tool and control by remote personal controls.

6. Device Status LEDs, which may be disabled for selected applications, including:
   a. PIR detection
   b. Ultrasonic detection
   c. Configuration mode
   d. Load binding

7. Assignment of occupancy sensor to a specific load within the room without wiring or special tools.

9. All digital parameter data programmed into an individual occupancy sensor shall be retained in non-volatile FLASH memory within the sensor itself. Memory shall have an expected life of no less than 10 years.

C. BACnet object information shall be available for the following objects:
   1. Detection state
   2. Occupancy sensor time delay
   3. Occupancy sensor sensitivity, PIR and Ultrasonic

D. Units shall not have any dip switches or potentiometers for field settings.

E. Multiple occupancy sensors may be installed in a room by simply connecting them to the free topology DLM local network. No additional configuration will be required.

F. WattStopper product numbers: LMPX, LMDX, LMPC, LMUC, LMDC

2.7 DIGITAL WALL SWITCHES

A. Low voltage momentary pushbutton switches in 1, 2, 3, 4, 5 and 8 button configuration. Wall switches shall include the following features:
   1. Two-way infrared (IR) transceiver for use with personal and configuration remote controls.
   2. Removable buttons for field replacement with engraved buttons and/or alternate color buttons. Button replacement may be completed without removing the switch from the wall.
   3. Configuration LED on each switch that blinks to indicate data transmission.
   4. Load/Scene Status LED on each switch button with the following characteristics:
      a. Bi-level LED
      b. Dim locator level indicates power to switch
      c. Bright status level indicates that load or scene is active
   5. Dimming switches shall include seven bi-level LEDs to indicate load levels using 14 steps.
   6. Programmable control functionality including:
      a. Button priority may be configured to any BACnet priority level, from 1-16, corresponding to networked operation allowing local actions to utilize life safety priority
      b. Scene patterns may be saved to any button other than dimming rockers. Once set, buttons may be digitally locked to prevent overwriting of the preset levels.
   7. All digital parameter data programmed into an individual wall switch shall be retained in non-volatile FLASH memory within the wall switch itself. Memory shall have an expected life of no less than 10 years.

B. BACnet object information shall be available for the following objects:
   1. Button state
   2. Switch lock control
   3. Switch lock status

C. Two RJ-45 ports for connection to DLM local network.
D. Multiple digital wall switches may be installed in a room by simply connecting them to the free topology DLM local network. No additional configuration shall be required to achieve multi-way switching.

E. The following switch attributes may be changed or selected using a wireless configuration tool:
1. Load and Scene button function may be reconfigured for individual buttons (from Load to Scene, and vice versa).
2. Individual button function may be configured to Toggle, On only or Off only.
3. Individual scenes may be locked to prevent unauthorized change.
4. Fade Up and Fade Down times for individual scenes may be adjusted from 0 seconds to 18 hours.
5. Ramp rate may be adjusted for each dimmer switch.
6. Switch buttons may be bound to any load on a room controller and are not load type dependant; each button may be bound to multiple loads.

2.8 HANDHELD REMOTE CONTROLS

A. Battery-operated handheld devices in 1, 2 and 5 button configurations for remote switching or dimming control. Remote controls shall include the following features:
1. Two-way infrared (IR) transceiver for line of sight communication with DLM local network within up to 30 feet.
2. LED on each button confirms button press.
3. Load buttons may be bound to any load on a room controller and are not load type dependant; each button may be bound to multiple loads.
4. Inactivity timeout to save battery life.

B. A wall mount holster and mounting hardware shall be included with each remote control

C. WattStopper part numbers: LMRH-101, LMRH-102, LMRH-105.

2.9 DIGITAL PARTITION CONTROLS

A. Partition controls shall enable manual or automatic coordination of lighting controls in flexible spaces with up to four moveable walls by reconfiguring the connected digital switches and occupancy sensors.

B. Four-button low voltage pushbutton switch for manual control.
1. Two-way infrared (IR) transceiver for use with configuration remote control.
2. Removable buttons for field replacement with engraved buttons and/or alternate color buttons. Button replacement may be completed without removing the switch from the wall.
3. Configuration LED on each switch that blinks to indicate data transmission.
4. Each button represents one wall; Green button LED indicates status.
5. Two RJ-45 ports for connection to DLM local network.
C. Contact closure interface for automatic control via input from limit switches on movable walls (by others).
   1. Operates on Class 2 power supplied by DLM local network.
   2. Includes 24VDC output and four input terminals for maintained third party contract closure inputs.
      a. Input max. sink/source current: 1-5mA
      b. Logic input signal voltage High: >18VDC
      c. Logic input signal voltage Low: <2VDC
   3. Four status LEDs under hinged cover indicate if walls are open or closed; supports LMPS-104 as remote status indicator.
   4. Two RJ-45 ports for connection to DLM local network.
   5. WattStopper part number: LMIO-102

2.10 DIGITAL DAYLIGHTING SENSORS

A. Digital daylighting sensors shall work with room controllers to provide automatic switching, bi-level, or tri-level or dimming daylight harvesting capabilities for any load type connected to a room controller. Daylighting sensors shall be interchangeable without the need for rewiring.
   1. Closed loop sensors measure the ambient light in the space and control a single lighting zone.
   2. Open loop sensors measure incoming daylight in the space and are capable of controlling up to three lighting zones.
   3. Dual loop sensors measure both ambient and incoming daylight in the space to ensure that proper light levels are maintained as changes to reflective materials are made in a single zone.

B. Digital daylighting sensors shall include the following features:
   1. The sensor’s internal photodiode shall only measure lightwaves within the visible spectrum. The photodiode’s spectral response curve shall closely match the entire photopic curve. The photodiode shall not measure energy in either the ultraviolet or infrared spectrums. The photocell shall have a sensitivity of less than 5% for any wavelengths less than 400 nanometers or greater than 700 nanometers.
   2. Sensor light level range shall be from 1-6,553 footcandles (fc).
   3. The capability of ON/OFF, bi-level or tri-level switching, or dimming, for each controlled zone, depending on the selection of room controller(s) and load binding to room controller(s).
   4. For switching daylight harvesting, the photosensor shall provide a field-selectable deadband, or a separation, between the “ON Setpoint” and the “OFF Setpoint” that will prevent the lights from cycling excessively after they turn off.
   5. For dimming daylight harvesting, the photosensor shall provide the option, when the daylight contribution is sufficient, of turning lights off or dimming lights to a field-selectable minimum level.
   6. Photosensors shall have a digital, independently configurable fade rate for both increasing and decreasing light level in units of percent per second.
   7. Photosensors shall provide adjustable cut-off time. Cut-off time is defined by the number of selected minutes the load is at the minimum output before the load turns off. Selectable range between 0-240 minutes including option to never cut-off.
   8. Optional wall switch override shall allow occupants to reduce lighting level to increase energy savings or, if permitted by system administrator, raise lighting levels for a selectable period of time or cycle of occupancy.
9. Integral infrared (IR) transceiver for configuration and/or commissioning with a handheld configuration tool, to transmit detected light level to wireless configuration tool, and for communication with personal remote controls.

10. Configuration LED status light on device that blinks to indicate data transmission.

11. Status LED indicates test mode, override mode and load binding.

12. Recessed switch on device to turn controlled load(s) ON and OFF.

13. BACnet object information shall be available for the following daylighting sensor objects, based on the specific photocell’s settings:
   a. Light level
   b. Day and night setpoints
   c. Off time delay
   d. On and off setpoints
   e. Up to three zone setpoints
   f. Operating mode – on/off, bi-level, tri-level or dimming

14. One RJ-45 port for connection to DLM local network.

15. A choice of accessories to accommodate multiple mounting methods and building materials. The photosensors may be mounted on a ceiling tile, skylight light well, suspended lighting fixture or backbox. Standard tube photosensors accommodate mounting materials from 0-0.62” thickness (LMLS-400, LMLS-500). Extended tube photosensors accommodate mounting materials from 0.62”-1.25” thickness (LMLS-400-L, LMLS-500-L). Mounting brackets are compatible with J boxes (LMLS-MB1) and wall mounting (LMLS-MB2). LMLS-600 photosensor to be mounted on included bracket below skylight well.

16. Any load or group of loads in the room can be assigned to a daylighting zone

17. Each load within a daylighting zone can be individually enabled or disabled for discrete control (load independence).

18. All digital parameter data programmed into a photosensor shall be retained in non-volatile FLASH memory within the photosensor itself. Memory shall have an expected life of no less than 10 years.

C. Closed loop digital photosensors shall include the following additional features:
   1. An internal photodiode that measures light in a 100-degree angle, cutting off the unwanted light from bright sources outside of this cone.
   2. Automatic self-calibration, initiated from the photosensor, a wireless configuration tool or a PC with appropriate software.
   3. Automatically establishes application-specific setpoints following self-calibration. For switching operation, an adequate deadband between the ON and OFF setpoints shall prevent the lights from cycling; for dimming operation a sliding setpoint control algorithm with separate Day and Night setpoints shall prevent abrupt ramping of loads.
   4. WattStopper Product Number: LMLS-400, LMLS-400-L.

D. Open loop digital photosensors shall include the following additional features:
   1. An internal photodiode that measures light in a 60-degree angle cutting off the unwanted light from the interior of the room.
   2. Automatically establishes application-specific setpoints following manual calibration using a wireless configuration tool or a PC with appropriate software. For switching operation, an adequate deadband between the ON and OFF setpoints for each zone shall prevent the lights from cycling; for dimming operation, a proportional control algorithm shall maintain the design lighting level in each zone.
   3. Each of the three discrete daylight zones can include any non overlapping group of loads in the room.
4. WattStopper Product Number: LMLS-500, LMLS-500-L.

E. Dual loop digital photosensors shall include the following additional features:

1. Close loop portion of dual loop device must have an internal photodiode that measures light in a 100 degree angle, cutting off the unwanted light from sources outside of this con
2. Open loop portion of dual loop device must have an internal photodiode that can measure light in a 60 degree angle, cutting off the unwanted light from the interior of the room.
3. Automatically establishes application-specific set-points following self-calibration. For switching operation, an adequate deadband between the ON and OFF setpoints shall prevent the lights from cycling; for dimming operation a sliding setpoint control algorithm with separate Day and Night setpoints shall prevent abrupt ramping of load.
4. Device must reference closed loop photosensor information as a base line reference. The device must be able to analyze the open loop photosensor information to determine if an adjustment in light levels is required.
5. Device must be able to automatically commission setpoints each night to provide adjustments to electrical lighting based on changes in overall lighting in the space due to changes in reflectance within the space or changes to daylight contribution based on seasonal changes.
6. Device must include extendable mounting arm to properly position sensor within a skylight well.
7. WattStopper product number LMLS-600

2.11 DIGITAL ROOM CONTROLLERS AND PLUG-LOAD CONTROLLERS

A. Digital controllers for lighting and plug loads automatically bind the room loads to the connected devices in the space without commissioning or the use of any tools. Room and plug load controllers shall be provided to match the room lighting and plug load control requirements. The controllers will be simple to install, and will not have dip switches or potentiometers, or require special configuration for standard Plug n’ Go applications. The control units will include the following features:

1. Automatic room configuration to the most energy-efficient sequence of operation based upon the devices in the room.
2. Simple replacement – Using the default automatic configuration capabilities, a room controller may be replaced with an off-the-shelf.
3. Multiple room controllers connected together in a local network must automatically prioritize each room controller, without requiring any configuration or setup, so that loads are sequentially assigned using room controller device ID’s from highest to lowest.
4. Device Status LEDs to indicate:
   a. Data transmission
   b. Device has power
   c. Status for each load
   d. Configuration status
5. Quick installation features including:
   a. Standard junction box mounting
   b. Quick low voltage connections using standard RJ-45 patch cable
6. Based on individual configuration, each load shall be capable of the following behavior on power up following the loss of normal power:
a. Turn on to 100%
b. Remain off
c. Turn on to last level

7. Each load shall be configurable to operate in the following sequences based on occupancy:
   a. Auto-on/Auto-off (Follow on and off)
   b. Manual-on/Auto-off (Follow off only)

8. The polarity of each load output shall be reversible, via digital configuration, so that on is off and off is on.

9. BACnet object information shall be available for the following objects:
   a. Load status
   b. Electrical current
   c. Total watts per controller
   d. Schedule state – normal or after-hours
   e. Demand response control and cap level
   f. Room occupancy status
   g. Total room lighting and plug loads watts
   h. Total room watts/sq ft
   i. Force on/off all loads

10. UL 2043 plenum rated
11. Manual override and LED indication for each load
12. Dual voltage (120/277 VAC, 60 Hz), or 347 VAC, 60 Hz (selected models only).
    120/277 volt models rated for 20A total load, derating to 16A required for some dimmed loads (forward phase dimming); 347 volt models rated for 15A total load; plug load controllers carry application-specific UL 20 rating for receptacle control.
13. Zero cross circuitry for each load
14. All digital parameter data programmed into an individual room controller or plug load controller shall be retained in non-volatile FLASH memory within the controller itself. Memory shall have an expected life of no less than 10 years.

B. On/Off Room Controllers shall include:
   1. One or two relay configuration
   2. Efficient 150 mA switching power supply
   3. Three RJ-45 DLM local network ports with integral strain relief and dust cover
   4. WattStopper product numbers: LMRC-101, LMRC-102

C. On/Off/Dimming enhanced Room Controllers shall include:
   1. Real time current monitoring
   2. Multiple relay configurations
      a. One, two or three relays (LMRC-21x series)
      b. One or two relays (LMRC-22x series)
   3. Efficient 250 mA switching power supply
   4. Four RJ-45 DLM local network ports with integral strain relief and dust cover
   5. One dimming output per relay
      a. 0-10V Dimming - Where indicated, one 0-10 volt analog output per relay for control of compatible ballasts and LED drivers. The 0-10 volt output shall automatically open upon loss of power to the Room Controller to assure full light output from the controlled lighting. (LMRC-21x series)
      b. Line Voltage, Forward Phase Dimming - Where indicated, one forward phase control line voltage dimming output per relay for control of compatible
two-wire or three-wire ballasts, LED drivers, MLV, forward phase compatible ELV, neon/cold cathode and incandescent loads. (LMRC-22x series)

c. Each dimming output channel shall have an independently configurable minimum and maximum calibration trim level to set the dimming range to match the true dynamic range of the connected ballast or driver.
d. The LED level indicators on bound dimming switches shall utilize this new maximum and minimum trim.
e. Each dimming output channel shall have an independently configurable minimum and maximum trim level to set the dynamic range of the output within the new 0-100% dimming range defined by the minimum and maximum calibration trim.
f. Calibration and trim levels must be set per output channel.
g. Devices that set calibration or trim levels per controller are not acceptable.
h. All configuration shall be digital. Devices that set calibration or trim levels per output channel via trim pots or dip-switches are not acceptable.

6. Each load shall have an independently configurable preset on level for Normal Hours and After Hours events to allow different dimmed levels to be established at the start of both Normal Hours and After Hours events.

7. Fade rates for dimming loads shall be specific to bound switch buttons, and the load shall maintain a default value for any bound buttons that do not specify a unique value.

8. The following dimming attributes may be changed or selected using a wireless configuration tool:
   a. Establish preset level for each load from 0-100%
   b. Set high and low trim for each load
   c. Set lamp burn in time for each load up to 100 hours

9. Override button for each load provides the following functions:
   a. Press and release for on/off control
   b. Press and hold for dimming control

10. WattStopper product numbers: LMRC-211, LRMC-212, LRMC-213, LMRC-221, LMRC-222

D. Plug Load Room Controllers shall include:

1. One relay configuration with additional connection for unswitched load
2. Configurable additive time delay to extend plug load time delay beyond occupancy sensor time delay (e.g. a 10 minute additive delay in a space with a 20 minute occupancy sensor delay ensures that plug loads turn off 30 minutes after the space is vacated).
3. Factory default operation is Auto-on/Auto-off, based on occupancy
4. Real time current monitoring of both switched and un-switched load (LMPL-201 only)
5. Efficient switching power supply
   a. 150mA (LMPL-101)
   b. 250mA (LMPL-201)

6. RJ-45 DLM local network ports
   a. Three RJ-45 ports (LMPL-101)
   b. Four RJ-45 ports (LMPL-201)

2.12 DLM LOCAL NETWORK (ROOM NETWORK)

A. The DLM local network is a free topology lighting control physical connection and communication protocol designed to control a small area of a building.

B. Features of the DLM local network include:
   1. Plug n’ Go® automatic configuration and binding of occupancy sensors, switches and lighting loads to the most energy-efficient sequence of operation based upon the device attached.
   2. Simple replacement of any device in the network with a standard off the shelf unit without requiring commissioning, configuration or setup.
   3. Push n’ Learn® configuration to change the automatic configuration, including binding and load parameters without tools, using only the buttons on the digital devices in the local network.
   4. Two-way infrared communications for control by handheld remotes, and configuration by a handheld tool including adjusting load parameters, sensor configuration and binding, within a line of sight of up to 30 feet from a sensor, wall switch or IR receiver.

C. Digital room devices connect to the local network using pre-terminated Cat 5e cables with RJ-45 connectors, which provide both data and power to room devices. Systems that utilize RJ-45 patch cords but do not provide serial communication data from individual end devices are not acceptable.

D. If manufacturer’s pre-terminated Cat 5e cables are not used for the installation, the contractor is responsible for testing each cable following installation and supplying manufacturer with test results.

E. WattStopper Product Number: LMRJ-Series

2.13 DLM SEGMENT NETWORK (ROOM TO ROOM NETWORK)

A. The segment network shall be a linear topology, BACnet-based MS/TP subnet to connect DLM local networks (rooms) and LMCP relay panels for centralized control.
   1. Each connected DLM local network shall include a single network bridge (LMBC-300), and the network bridge is the only room-based device that is connected to the segment network.
   2. Network bridges, relay panels and segment managers shall include terminal blocks, with provisions for separate “in” and “out” terminations, for segment network connections.
   3. The segment network shall utilize 1.5 twisted pair, shielded, cable supplied by the lighting control manufacturer. The maximum cable run for each segment is 4,000 feet. Conductor-to-conductor capacitance of the twisted pair shall be less than 30 pf/ft and have a characteristic impedance of 120 Ohms.
   4. Network signal integrity requires that each conductor and ground wire be correctly terminated at every connected device.
   5. Substitution of manufacturer-supplied cable must be pre-approved: Manufacturer will not certify network reliability, and reserves the right to void warranty, if non-approved cable is installed, and if terminations are not completed according to manufacturer’s specific requirements.
   6. Segment networks shall be capable of connecting to BACnet-compliant BAS (provided by others) either directly, via MS/TP, or through NB-ROUTERS, via BACnet/IP or BACnet/Ethernet. Systems whose room-connected network...
infrastructure require gateway devices to provide BACnet data to a BAS are unacceptable.

B. WattStopper Product Number: LM-MSTP, LM-MSTP-DB

2.14 CONFIGURATION TOOLS

A. A wireless configuration tool facilitates optional customization of DLM local networks using two-way infrared communications, while PC software connects to each local network via a USB interface.

B. Features and functionality of the wireless configuration tool shall include but not be limited to:
   1. Two-way infrared (IR) communication with DLM IR-enabled devices within a range of approximately 30 feet.
   2. High visibility organic LED (OLED) display, pushbutton user interface and menu-driven operation.
   3. Must be able to read and modify parameters for room controllers, occupancy sensors, wall switches, daylighting sensors, network bridges and relay panels, and identify room devices by type and serial number.
   4. Save up to eight occupancy sensor setting profiles, and apply profiles to selected sensors.
   5. Temporarily adjust light level of any load(s) on the local network, and incorporate those levels in scene setting. Set room mode for testing of Normal Hours (NH) and After Hours (AH) parameter settings.
   6. Adjust or fine-tune daylighting settings established during auto-configuration, and input light level data to complete configuration of open loop daylighting controls.
   7. Set room mode for testing of Normal Hours (NH) and After Hours (AH) parameter settings.
   8. Verify status of building level network devices.

C. WattStopper Product Numbers: LMCT-100, LMCI-100/LMCS-100

2.15 NETWORK BRIDGE

A. The network bridge module connects a DLM local network to a BACnet-compliant segment network for communication between rooms, relay panels and a segment manager or BAS. Each local network shall include a network bridge component to provide a connection to the local network room devices. The network bridge shall use industry standard BACnet MS/TP network communication and an optically isolated EIA/TIA RS-485 transceiver.

   1. The network bridge shall be provided as a separate module connected on the local network through an available RJ-45 port.
   2. Provide Plug n’ Go operation to automatically discover room devices connected to the local network and make all device parameters visible to the segment manager via the segment network. No commissioning shall be required for set up of the network bridge on the local network.
   3. The network bridge shall automatically create standard BACnet objects for selected room device parameters to allow any BACnet-compliant BAS to include lighting control and power monitoring features as provided by the DLM room devices on each local network. BACnet objects will be created for the addition or replacement of any given in-room DLM device for the installed life of the system.
Products requiring that an application-specific point database be loaded to create or map BACnet objects are not acceptable. Systems not capable of providing BACnet data for control devices via a dedicated BACnet Device ID and physical MS/TP termination per room are not acceptable. Standard BACnet objects shall be provided as follows:

a. Read/write the normal or after hours schedule state for the room
b. Read the detection state of each occupancy sensor
c. Read the aggregate occupancy state of the room
d. Read/write the On/Off state of loads
e. Read/write the dimmed light level of loads
f. Read the button states of switches
g. Read total current in amps, and total power in watts through the room controller
h. Read/write occupancy sensor time delay, PIR sensitivity and ultrasonic sensitivity settings
i. Activate a preset scene for the room
j. Read/write daylight sensor fade time and day and night setpoints
k. Read the current light level, in footcandles, from interior and exterior photosensors and photocells
l. Set daylight sensor operating mode
m. Read/write wall switch lock status
n. Read watts per square foot for the entire controlled room
o. Write maximum light level per load for demand response mode
p. Read/write activation of demand response mode for the room
q. Activate/restore demand response mode for the room

B. WattStopper product numbers: LMBC-300

2.16 SEGMENT MANAGER

A. For networked applications, the Digital Lighting Management system shall include at least one segment manager to manage network communication. It shall be capable of serving up a graphical user interface via a standard web browser utilizing either unencrypted TCP/IP traffic via a configurable port (default is 80) or 256 bit AES encrypted SSL TCP/IP traffic via a configurable port (default is 443).

B. Each segment manager shall have integral support for at least three segment networks. Segment networks may alternately be connected to the segment manager via external routers and switches, using standard Ethernet structured wiring. Each router shall accommodate one segment network. Provide the quantity of routers and switches as shown on the plans.

C. Operational features of the Segment Manager shall include the following:

1. Connection to PC or LAN via standard Ethernet TCP/IP via standard Ethernet TCP/IP with the option to use SSL encrypted connections for all traffic.
2. Easy to learn and use graphical user interface, compatible with Internet Explorer 8, or equal browser. Shall not require installation of any lighting control software to an end-user PC. This issue needs confirmation with end user.
3. Log in security capable of restricting some users to view-only or other limited operations.
4. Automatic discovery of DLM devices and relay panels on the segment network(s). Commissioning beyond activation of the discovery function shall not be required
to provide communication, monitoring or control of all local networks and lighting control panels.

5. After discovery, all rooms and panels shall be presented in a standard navigation tree format. Selecting a device from the tree will allow the device settings and operational parameters to be viewed and changed by the user.

6. Ability to view and modify room device operational parameters. It shall be possible to set device parameters independently for normal hours and after hours operation including sensor time delays and sensitivities, and load response to sensor including Manual-On or Auto-On.

7. Ability to set up schedules for rooms and panels, view and override current status of panel channels and relays and assign relays to groups. Schedules shall automatically set controlled zones or areas to either a normal hours or after hours mode of operation. Support for a minimum of 100 unique schedules, each with up to four time events per day. Support for annual schedules, holiday schedules and unique date-bound schedules.

8. Ability to group rooms and loads for common control by schedules, switches or network commands.

9. Ability to monitor connected load current and display power consumption for areas equipped with room controllers incorporating the integral current monitoring feature.

10. Provide capabilities for integration with a BAS via BACnet protocol. At a minimum, the following points shall be available to the BAS via BACnet IP connection to the segment manager: room occupancy state; room schedule mode; room switch lock control; individual occupancy sensor state; room lighting power; room plug-load power; load ON/OFF state; load dimming level; panel channel schedule state; panel relay state; and Segment Manager Group schedule state control.

11. The Segment Manager shall allow access and control of the overall system database via Native Niagara AX FOX connectivity. Systems that must utilize a Tridium Niagara controller in addition to the programming, scheduling and configuration server are not acceptable.

D. Segment Manager shall support multiple DLM rooms as follows:

1. Support up to 120 network bridges and 900 digital in-room devices (LMSM-3E).
2. Support up to 300 network bridges and 2,200 digital in-room devices, connected via network routers and switches (LMSM-6E).

2.17 PROGRAMMING, CONFIGURATION AND DOCUMENTATION SOFTWARE

A. PC-native application for optional programming of detailed technician-level parameter information for all DLM products, including all parameters not accessible via BACnet and the handled IR configuration tool. Software must be capable of accessing room-level parameter information locally within the room when connected via the optional LMCI-100 USB programming adapter, or globally for many segment networks simultaneously utilizing standard BACnet/IP communication.

1. Additional parameters exposed through this method include but are not limited to:
   a. Occupancy sensor detection LED disable for performance and other aesthetic spaces where blinking LEDs present a distraction.
   b. Six occupancy sensor action behaviors for each controlled load, separately configurable for normal hours and after hours modes. Modes include: No Action, Follow Off Only, Follow On Only, Follow On and Off, Follow On Only...
with Override Time Delay, Follow Off Only with Blink Warn Grace Time, Follow On and Off with Blink Warn Grace Time.
c. Separate fade time adjustments per load for both normal and after hours from 0 - 4 hours.
d. Configurable occupancy sensor re-trigger grace period from 0 - 4 minutes separate for both normal hours and after hours.
e. Separate normal hours and after hours per-load button mode with modes including: Do nothing, on only, off only, on and off.
f. Load control polarity reversal so that on events turn loads off and vice versa.
g. Per-load DR (demand response) shed level in units of percent.
h. Load output pulse mode in increments of 1 second.
i. Fade trip point for each load for normal hours and after hours that establishes the dimmer command level at which a switched load closes its relay to allow for staggered On of switched loads in response to a dimmer.

2. Generation of reports at the whole file, partial file, or room level. Reports include but are not limited to:
   a. Device list report: All devices in a project listed by type.
   b. Load binding report: All load controller bindings showing interaction with sensors, switches, and daylighting.
   c. BACnet points report: Per room Device ID report of the valid BACnet points for a given site's BOM.
   d. Room summary report: Device manifest for each room, aggregated by common BOM, showing basic sequence of operations.
   e. Device parameter report: Per-room lists of all configured parameters accessible via hand held IR programmer for use with O&M documentation.
   f. Scene report: All project scene pattern values not left at defaults (i.e. 1 = all loads 100%, 2 = all loads 75%, 3 = all loads 50%, 4 = all loads 25%, 5-16 = same as scene 1).
   g. Occupancy sensor report: Basic settings including time delay and sensitivity(ies) for all occupancy sensors.

3. Network-wide programming of parameter data in a spreadsheet-like programming environment including but not limited to the following operations:
   a. Set, copy/paste an entire project site of sensor time delays.
   b. Set, copy/paste an entire project site of sensor sensitivity settings.
   c. Search based on room name and text labels.
   d. Filter by product type (i.e. LMRC-212) to allow parameter set by product.
   e. Filter by parameter value to search for product with specific configurations.

4. Network-wide firmware upgrading remotely via the BACnet/IP network.
   b. Mass firmware update of specifically selected rooms or areas.
   c. Mass firmware upgrade of specific products.

B. WattStopper Product Number: LMCS-100, LMCI-100

2.18 LMCP LIGHTING CONTROL PANELS

A. Provide lighting control panels in the locations and capacities as indicated on the plans and schedules. Each panel shall be of modular construction and consist of the following components:

1. Enclosure/Tub shall be NEMA 1, sized to accept an interior with 1 - 8 relays, 1 - 24 relays and 6 four-pole contactors, or 1 - 48 relays and 6 four-pole contactors.
2. Cover shall be configured for surface or flush wall mounting of the panel as indicated on the plans. The panel cover shall have a hinged and lockable door with restricted access to line voltage section of the panel.

3. Interior assembly shall be supplied as a factory assembled component specifically designed and listed for field installation. The interior construction shall provide total isolation of high voltage (Class 1) wiring from low voltage (Class 2) wiring within the assembled panel. The interior assembly shall include intelligence boards, power supply, DIN rails for mounting optional Class 2 control devices, and individually replaceable latching type relays. The panel interiors shall include the following features:

   a. Removable, plug-in terminal blocks with connections for all low voltage terminations.
   b. Individual terminal block, override pushbutton, and LED status light for each relay.
   c. Direct wired switch inputs associated with each relay shall support 2-wire momentary switches only.
   d. Digital inputs (four RJ-45 jacks) shall support 1-, 2-, 3-, 4-, and 8-button digital switches; digital IO modules capable of receiving 0-5V or 0-10V analog photocell inputs; digital IO modules capable of receiving momentary or maintained contact closure inputs or analog sensor inputs; digital daylighting sensors; and digital occupancy sensors. Inputs are divided into two separate digital networks, each capable of supplying 250mA to connected devices.
   e. True relay state shall be indicated by the on-board LED and shall be available to external control devices and systems via BACnet.
   f. Automatically sequenced operation of relays to reduce impact on the electrical distribution system when large loads are controlled simultaneously.
   g. Group and pattern control of relays shall be provided through a simple keypad interface from a handheld IR programmer. Any set of relays can be associated with a group for direct on/off control or pattern (scene) control via a simple programming sequence using the relay override pushbuttons and LED displays for groups 1-8 or a handheld IR programmer for groups 1-99.
   h. Relay group status for shall be provided through LED indicators for groups 1-8 and via BACnet for groups 1-99. A solid LED indicates that the last group action called for an ON state and relays in the group are on or in a mixed state.
   i. Single-pole latching relays with modular plug-in design. Relays shall provide the following ratings and features:

      1) Electrical:
         a) 30 amp ballast at 277V
         b) 20 amp ballast at 347V
         c) 20amp tungsten at 120V
         d) 30 amp resistive at 347V
         e) 1.5 HP motor at 120V
         f) 14,000 amp short circuit current rating (SCCR) at 347V
         g) Relays shall be specifically UL 20 listed for control of plug-loads

      2) Mechanical:
         a) Replaceable, ½” KO mounting with removable Class 2 wire harness.
         b) Actuator on relay housing provides manual override and visual status indication, accessible from Class 2 section of panel.
c) Dual line and load terminals each support two #14 - #12 solid or stranded conductors.

d) Tested to 300,000 mechanical on/off cycles.

4. Isolated low voltage contacts provide for true relay status feedback and pilot light indication.

5. Power supply shall be a multi-voltage transformer assembly with rated power to supply all electronics, occupancy sensors, switches, pilot lights, and photocells as necessary to meet the project requirements. Power supply to have internal overcurrent protection with automatic reset and metal oxide varistor protection.

6. Where indicated, lighting control panels designated for control of emergency lighting shall be provided with factory installed provision for automatic bypass of relays controlling emergency circuits upon loss of normal power. Panels shall be properly listed and labeled for use on emergency lighting circuits and shall meet the requirements of UL924 and NFPA 70 - Article 700.

7. Integral system clock shall provide scheduling capabilities for panel-only projects without DLM segment networks or BAS control.
   a. Each panel shall include digital clock capability able to issue system wide automation commands to up to (11) eleven other panels for a total of (12) twelve networked lighting control panels. The clock shall provide capability for up to 254 independent schedule events per panel for each of the ninety-nine system wide channel groups.
   b. The clock capability of each panel shall support the time-based energy saving requirements of applicable local energy codes.
   c. The clock module shall provide astronomic capabilities, time delays, blink warning, daylight savings, and holiday functions and will include a battery back up for the clock function and program retention in non-volatile FLASH memory. Clocks that require multiple events to meet local code lighting shut off requirements shall not be allowed.
   d. The clock capability of each panel shall operate on a basis of ON/OFF or Normal Hours/After Hours messages to automation groups that implement pre-configured control scenarios. Scenarios shall include:
      1) Scheduled ON / OFF
      2) Manual ON / Scheduled OFF
      3) Astro ON / OFF (or Photo ON / OFF)
      4) Astro and Schedule ON / OFF (or Photo and Schedule ON / OFF)
   e. The user interface shall be a portable IR handheld remote control capable of programming any panel in the system (LMCT-100)
   f. The clock capability of each panel shall employ non-volatile memory and shall retain user programming and time for a minimum of 10 years.
   g. Schedules programmed into the clock of any one panel shall be capable of executing panel local schedule or Dark/Light (photocell or Astro) events for that panel in the event that global network communication is lost. Lighting control panels that are not capable of executing events independently of the global network shall not be acceptable.

8. The lighting control panel can operate as a stand-alone system, or can support schedule, group, and photocell control functions, as configured in a Segment Manager controller, via a segment network connection.

9. The lighting control panel shall support digital communications to facilitate the extension of control to include interoperation with building automation systems and other intelligent field devices. Digital communications shall be RS485 MS/TP-based using the BACnet® protocol.
a. The panel shall have provision for an individual BACnet device ID and shall support the full 222 range (0 – 4,193,304). The device ID description property shall be writable via the network to allow unique identification of the lighting control panel on the network.

b. The panel shall support MS/TP MAC addresses in the range of 0 – 127 and baud rates of 9600k, 38400k, 76800k, and 115.2k bits per second.

c. Lighting control relays shall be controllable as binary output objects in the instance range of 1 – 64. The state of each relay shall be readable and writable by the BAS via the object present value property.

d. Lighting control relays shall report their true on/off state as binary input objects in the instance range of 1 – 64.

e. The 99 group Normal Hours/After Hours control objects associated with the panel shall be represented by binary value objects in the instance range of 201 – 299. The occupancy state of each channel group shall be readable and writable by the BAS via the object present value property. Commanding 1 to a channel group will put all relays associated with the channel into the normal hours mode. Commanding 0 or NULL shall put the relays into the after-hours mode.

f. Setup and commissioning of the panel shall not require manufacturer-specific software or a computer. All configuration of the lighting control panel shall be performed using standard BACnet objects or via the handheld IR programming remote. Provide BACnet objects for panel setup and control as follows:

1) Binary output objects in the instance range of 1 – 64 (one per relay) for on/off control of relays.
2) Binary value objects in the instance range of 1 – 99 (one per channel) for normal hours/after-hours schedule control.
3) Binary input objects in the instance range of 1 – 64 (one per relay) for reading true on/off state of the relays.
4) Analog value objects in the instance range of 101 – 199 (one per channel group) shall assign a blink warn time value to each channel. A value of 5 shall activate the blink warn feature for the channel and set a 5-minute grace-time period. A value of 250 shall activate the sweep feature for the channel and enable the use of sweep type automatic wall switches.

g. The description property for all objects shall be writable via the network and shall be saved in non-volatile memory within the panel.

h. The BO and BV 1 – 99 objects shall support BACnet priority array with a relinquish default of off and after hours respectively. Prioritized writes to the channel BV objects shall propagate prioritized control to each member relay in a way analogous to the BACnet Channel object described in addendum aa. (http://www.bacnet.org/Addenda/Add-135-2010aa.pdf)

i. Panel-aggregate control of relay Force Off at priority 2 shall be available via a single BV5 object. Force On at priority 1 shall be available via a single BV4 object.

j. Lockout of all digital switch buttons connected to a given panel shall be command-able via a single BV2 object. The lock status of any connected switch station shall be represented as BV101-196.

10. WattStopper Product Number: LMCP8, LMCP24 or LMCP48
2.19 USER INTERFACE

A. Each lighting control panel system shall be supplied with at least (1) handheld configuration tool (LMCT-100). As a remote programming interface the configuration tool shall allow setup, configuration, and diagnostics of the panel without the need for software or connection of a computer. The user interface shall have the following panel-specific functions as a minimum:

1. Set network parameters including panel device ID, MS/TP MAC address, baud rate and max master range.
2. Relay Group creation of up to 99 groups. Group creation shall result in programming of all seven key relay parameters for member relays. The seven parameters are as follows: After-hours Override Time Delay, Normal Hours Override Time Delay, Action on Transition to Normal Hours, Action on Transition to After Hours, Sensor Action During Normal Hours, Sensor Action During After Hours, Blink-Warn Time for After Hours.
3. Program up to 254 separate scheduled events. Events shall occur on seven day intervals with each day selectable as active or inactive, and shall be configurable as to whether the event is active on holidays. Holidays are also defined through the User Interface.
4. Program up to 32 separate Dark/Light events. Events shall have a selectable source as either calculated Astro with delay, or a digital IO module with an integral 0-5V or 0-10V analog photocell. Dark/Light events shall occur on seven day intervals with each day selectable as active or inactive, and shall be configurable as to whether the event is active on holidays.
5. Button binding of digital switches to groups shall be accessible via the handheld IR remote and accomplished from the digital switch station.
6. Programming of panel location information shall be accomplished by the handheld IR remote and include at a minimum LAT, LON, DST zone, and an approximate city/state location.
7. An additional handheld IR remote may optionally be specified to be permanently mounted to the panel interior via a retractable anti-theft lanyard to allow for convenient programming of the panel while assuring that the handheld programmer is always present at that panel. An unlimited number of handheld IR remotes may also be purchased for facilities staff as determined by the end user’s representative.

B. WattStopper Product Number: LMCT-100

2.20 EMERGENCY LIGHTING CONTROL DEVICES

A. Emergency Lighting Control Unit – A UL 924 listed device that monitors a switched circuit providing normal lighting to an area. The unit provides normal ON/OFF control of emergency lighting along with the normal lighting. Upon normal power failure the emergency lighting circuit will close, forcing the emergency lighting ON until normal power is restored. Features include:

1. 120/277 volts, 50/60 Hz, 20 amp ballast rating
2. Push to test button
3. Auxiliary contact for remote test or fire alarm system interface

B. WattStopper Product Numbers: ELCU-100, ELCU-200.
PART 3 - EXECUTION

3.1 PRE-INSTALLATION MEETING

A. A factory authorized manufacturer’s representative shall provide the electrical contractor a functional overview of the lighting control system prior to installation. The contractor shall schedule the pre-installation site visit after receipt of approved submittals to review the following:
   1. Confirm the location and mounting of all digital devices, with special attention to placement of occupancy and daylighting sensors.
   2. Review the specifications for low voltage control wiring and termination.
   3. Discuss the functionality and configuration of all products, including sequences of operation, per design requirements.
   4. Discuss requirements for integration with other trades.

3.2 EXAMINATION

A. Examine lighting control devices before installation. Reject lighting control devices that are wet, moisture damaged, or mold damaged.

B. Examine walls and ceilings for suitable conditions where lighting control devices will be installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.3 SENSOR INSTALLATION

A. Comply with NECA 1.

B. Coordinate layout and installation of ceiling-mounted devices with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, smoke detectors, fire-suppression systems, and partition assemblies.

C. Install and aim sensors in locations to achieve not less than 90-percent coverage of areas indicated. Do not exceed coverage limits specified in manufacturer's written instructions.

3.4 CONTACTOR INSTALLATION

A. Comply with NECA 1.

B. Mount electrically held lighting contactors with elastomeric isolator pads to eliminate structure-borne vibration unless contactors are installed in an enclosure with factory-installed vibration isolators.

3.5 WIRING INSTALLATION

A. Comply with NECA 1.
B. Wiring Method: Comply with Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables." Minimum conduit size is 3/4 inch.

C. Wiring within Enclosures: Comply with NECA 1. Separate power-limited and nonpower-limited conductors according to conductor manufacturer's written instructions.

D. Size conductors according to lighting control device manufacturer's written instructions unless otherwise indicated.

E. Splices, Taps, and Terminations: Make connections only on numbered terminal strips in junction, pull, and outlet boxes; terminal cabinets; and equipment enclosures.

3.6 IDENTIFICATION

A. Identify components and power and control wiring according to Section 26 05 53 "Identification for Electrical Systems."
   1. Identify controlled circuits in lighting contactors.
   2. Identify circuits or luminaires controlled by photoelectric and occupancy sensors at each sensor.

B. Label time switches and contactors with a unique designation.

3.7 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to evaluate lighting control devices and perform tests and inspections.

B. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

C. Perform the following tests and inspections with the assistance of a factory-authorized service representative:
   1. Operational Test: After installing time switches and sensors, and after electrical circuitry has been energized, start units to confirm proper unit operation.
   2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

D. Lighting control devices will be considered defective if they do not pass tests and inspections.

E. Prepare test and inspection reports.

3.8 FACTORY SERVICES

A. Upon completion of the installation, the manufacturer's factory authorized representative shall start up and verify a complete fully functional system.

B. The electrical contractor shall provide both the manufacturer and the electrical engineer with three weeks written notice of the system start up and adjustment date.
C. Upon completion of the system start up, the factory-authorized technician shall provide the proper training to the owner's personnel on the adjustment and maintenance of the system.

3.9 ADJUSTING

A. Occupancy Adjustments: When requested within 12 months from date of Substantial Completion, provide on-site assistance in adjusting lighting control devices to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.

1. For occupancy and motion sensors, verify operation at outer limits of detector range. Set time delay to suit Owner's operations.
2. For daylighting controls, adjust set points and deadband controls to suit Owner's operations.
3. Align high-bay occupancy sensors using manufacturer's laser aiming tool.

3.10 ACCEPTANCE TESTING SUPPORT SERVICES

A. On all California projects, a certified lighting controls acceptance test technician (CLCATT) must verify the installation of the lighting control system. Manufacturer should include an extra day of factory technician’s time to assist the CLCATT review the functionality and settings of the lighting control hardware per the requirements in the California State forms. It will be the CLCATT’s responsibility to create and complete any forms required for the commissioning process, although the manufacturer or contractor may offer spreadsheets and/or printouts to assist the CLCATT with this task.

3.11 COMMISSIONING SUPPORT SERVICES

A. On this project, a commissioning agent will be hired to verify the installation and programming of all building systems, which includes the lighting control system. Manufacturer should include an extra day of technician’s time to review the functionality and settings of the lighting control hardware with the commissioning agent, including reviewing submittal drawings and ensuring that instructions on how to configure each device are readily available. Manufacturer is NOT responsible for helping the commissioning agent inspect the individual devices. It will be the commissioning agent’s responsibility to create and complete any forms required for the commissioning process, although the manufacturer or contractor may offer spreadsheets and/or printouts to assist the agent with this task.

B. The commissioning agent shall work with the electrical contractor during installation of the lighting control hardware to become familiar with the specific products. The agent may also accompany the manufacturer’s technicians during their start-up work to better understand the process of testing, calibration and configuration of the products. However, the contractor and manufacturer shall ensure that interfacing with the agent does not prevent them from completing the requirements outlined in the contract documents.
3.12 SOFTWARE SERVICE AGREEMENT

A. Technical Support: Beginning at Substantial Completion, service agreement shall include software support for two years.

B. Upgrade Service: At Substantial Completion, update software to latest version. Install and program software upgrades that become available within two years from date of Substantial Completion. Upgrading software shall include operating system and new or revised licenses for using software.
   1. Upgrade Notice: At least 30 days to allow Owner to schedule and access the system and to upgrade computer equipment if necessary.

C. Provide a laptop computer with the lighting programming already installed in the laptop computer. The laptop computer shall be the latest version of HP or DELL computer with 6G capable with 10 meg of memory spare capacity.

3.13 DEMONSTRATION

A. Coordinate demonstration of products specified in this Section with demonstration requirements for low-voltage, programmable lighting control systems specified in Section 26 51 19 "LED Interior Lighting", Section 26 56 19 "LED Exterior Lighting" and Section 26 63 15 "Planetarium Lighting Technology (PLTS)".

B. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain lighting control devices.

END OF SECTION
SECTION 261219 – PAD MOUNTED, LIQUID-FILLED, MEDIUM-VOLTAGE TRANSFORMERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes pad-mounted, liquid-filled, medium-voltage distribution transformers, with primary and secondary bushings within or without air-terminal enclosures.

1.3 DEFINITIONS

A. BIL: Basic Impulse Insulation Level.
B. Bushing: An insulating structure including a central conductor, or providing a central passage for a conductor, with provision for mounting on a barrier, conducting or otherwise, for insulating the conductor from the barrier and conducting current from one side of the barrier to the other.
C. Bushing Elbow: An insulated device used to connect insulated conductors to separable insulated connectors on dead-front, pad-mounted transformers and to provide a fully insulated connection. This is also called an "elbow connector."
D. Bushing Insert: That component of a separable insulated connector that is inserted into a bushing well to complete a dead-front, load break or non-load break, separable insulated connector (bushing).
E. Bushing Well: A component of a separable insulated connector, either permanently welded or clamped to an enclosure wall or barrier, having a cavity that receives a replaceable component (bushing insert) to complete the separable insulated connector (bushing).
F. Elbow Connector: See "bushing elbow" above.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.
   1. Include rated capacities, operating characteristics, and furnished specialties and accessories.
B. Shop Drawings: For pad-mounted, liquid-filled, medium-voltage transformers.
   1. Include plans and elevations showing major components and features.
      a. Include a plan view and cross section of equipment base, showing clearances, required workspace, and locations of penetrations for grounding and conduits.
2. Include details of equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
3. Include single-line diagram.
4. Include list of materials.
5. Include nameplate data.
6. Manufacturer's published time-current curves of the transformer high-voltage fuses, with transformer damage curve, inrush curve, and thru fault current indicated.

1.5 INFORMATIONAL SUBMITTALS

A. Coordination Drawings:
   1. Provide ¼“ scale drawing demonstrating that installation has been coordinated with work of other trades. Use actual dimensions from approved equipment submittals to coordinate layout and installation of substation and components with other construction including conduit, piping, equipment, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels. Include utilities site plan, drawn to scale, showing heavy equipment or truck access paths for maintenance and replacement.

B. Qualification Data: For testing agency.

C. Seismic Qualification Certificates: For transformer assembly, accessories, and components, from manufacturer.
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
   2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity, and locate and describe mounting and anchorage provisions.
   3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

D. Product Certificates: For transformers, signed by product manufacturer.

E. Source quality-control reports.

F. Field quality-control reports.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For transformer and accessories to include in emergency, operation, and maintenance manuals.

1.7 QUALITY ASSURANCE

A. Testing Agency Qualifications: Member Company of NETA or an NRTL.
   1. Testing Agency's Field Supervisor: Certified by NETA to supervise on-site testing.
PART 2 - PRODUCTS

2.1 SYSTEM DESCRIPTION

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. Comply with IEEE C2.

C. Comply with IEEE C57.12.00.

2.2 PERFORMANCE REQUIREMENTS

A. Seismic Performance: The transformers shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.

1. The term "withstand" means "the transformer will remain in place without separation of any parts when subjected to the seismic forces specified and the transformer will be fully operational after the seismic event."

2. Equipment anchorage is not a deferred submittal nor a delegated design item. Refer to details on the drawings for anchorage requirements.

B. Windings Material: Copper.

C. Surge Arresters: Comply with IEEE C62.11, Distribution Class; metal-oxide-varistor type, fully shielded, separable-elbow type, suitable for plugging into the inserts provided in the high-voltage section of the transformer. Connected in each phase of incoming circuit and ahead of any disconnecting device.

D. Winding Connections: The connection of windings and terminal markings shall comply with IEEE C57.12.70.

E. Efficiency: Comply with 10 CFR 431, Subpart K.

F. Insulation: Transformer kVA rating shall be as follows: The average winding temperature rise above a 30 deg C ambient temperature shall not exceed 65 deg C and 80 deg C hottest-spot temperature rise at rated kVA when tested according to IEEE C57.12.90, using combination of connections and taps that give the highest average winding temperature rise.

G. Tap Changer: External handle, for de-energized operation.

H. Tank: Sealed, with welded-on cover. Designed to withstand internal pressure of not less than 7 psi (50 kPa) without permanent distortion and 15 psig (104 kPa) without rupture. Comply with IEEE C57.12.36.

I. Enclosure Integrity: Comply with IEEE C57.12.28 for pad-mounted enclosures that contain energized electrical equipment in excess of 600 V that may be exposed to the public.

J. Mounting: An integral skid mounting frame, suitable to allow skidding or rolling of transformer in any direction, and with provision for anchoring frame to pad.

K. Insulating Liquids:
1. Less-Flammable Liquids:
   a. Edible-Seed-Oil-Based Dielectric: Listed and labeled by an NRTL as complying with CEC 70 requirements for fire point of not less than 300 deg C when tested according to ASTM D92. Liquid shall be biodegradable and nontoxic, having passed the Organisation for Economic Co-operation and Development G.L.203 with zero mortality, and shall be certified by the U.S. Environmental Protection Agency as biodegradable, meeting Environmental Technology Verification requirements.

L. Sound level shall comply with NEMA TR 1 requirements.

M. Corrosion Protection:
   1. Fabricate front sill, hood, and tank base of single-compartment transformers from stainless steel according to ASTM A167, Type 304 or 304L, not less than No. 13 U.S. gage, complying with requirements of IEEE C57.12.28 and IEEE C57.12.29, standard color green.
   2. Base and Cabinets of Two Compartment Transformers: Fabricate from stainless steel according to ASTM A167, Type 304 or 304L, not less than No. 13 U.S. gage. Coat transformer with manufacturer's standard green color coating complying with requirements of IEEE C57.12.28 and IEEE C57.12.29, in manufacturer's standard color green.

2.3 THREE-PHASE TRANSFORMERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Schneider Electric.
   2. Cooper Industries, Inc.
   3. Eaton.
   4. ABB.
   5. General Electric Company.

B. Description:
   1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in CEC 70, by a qualified testing agency, and marked for intended location and application.

C. Compartment Construction:
   1. Double-Compartment Construction: Individual compartments for high- and low-voltage sections, formed by steel isolating barriers that extend full height and depth of compartments, with hinged, lift-off doors and three-point latching, with a stop in the open position and provision for padlocking.

D. Primary Fusing: Designed and rated to provide thermal protection of transformer by sensing overcurrent and high liquid temperature.
   1. 150-kV BIL current-limiting fuses, conforming to requirements of IEEE C37.47.
   2. Interrupting Rating: 50,000 rms A symmetrical at system voltage.
4. Provide bayonet fuse assembly with an oil retention valve and an external drip shield inside the housing to eliminate or minimize oil spills. Valve shall close when fuse holder is removed and an external drip shield is installed.

5. Provide a conspicuously displayed warning adjacent to bayonet fuse(s), cautioning against removing or inserting fuses unless transformer has been de-energized and tank pressure has been released.

E. High-Voltage Section: Dead-front design.

1. To connect primary cable, use separable insulated connectors; coordinated with and complying with requirements of Section 26 05 13 "Medium-Voltage Cables." Bushings shall be one-piece units, with ampere and BIL ratings the same as connectors.

2. Bushing inserts and feed-through inserts:
   a. Conform to the requirements of IEEE 386.
   b. Rated at 200 A, with voltage class matching connectors. Provide a parking stand near each bushing well. Parking stands shall be equipped with insulated standoff bushings for parking of energized load-break elbow connectors on parking stands.
   c. Provide insulated protective caps for insulating and sealing out moisture from unused bushing inserts and insulated standoff bushings.

3. Bushing wells configured for loop-feed application.

5. Dead-front surge arresters.

6. Tap-changer operator.

7. Load-Break Switch:
   a. Radial-feed, liquid-immersed type with voltage class and BIL matching that of separable connectors, with a continuous current rating and load-break rating of 200 amperes, and a make-and-latch rating of 12 kA rms symmetrical.
   b. Loop-feed sectionalizing switches, using three two-position, liquid-immersed-type switches for closed transition loop-feed and sectionalizing operation. Voltage class and BIL shall match that of separable connectors, with a continuous current rating and load-break rating of 200 amperes, and a make-and-latch rating of 12 kA rms symmetrical. Switch operation shall be as follows:
      1) Position I: Line A connected to line B and both lines connected to the transformer.
      2) Position II: Transformer connected to line A only.
      3) Position III: Transformer connected to line B only.
      4) Position IV: Transformer disconnected and line A not connected to line B.
      5) Position V: Transformer disconnected and line A connected to line B.

8. Ground pad.

F. Low-Voltage Section:

1. Bushings with spade terminals drilled for terminating the number of conductors indicated on the Drawings, and the lugs that comply with requirements of Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables."

2. Metering: Coordinated with and complying with requirements of Section 26 27 13 "Electricity Metering." Install the following:
   a. Sensors.
   b. BAS interface.
   c. Kilowatt-hour meter.
   d. Kilowatt-hour demand meter.

G. Transformer Accessories:
1. Drain and filter connection.
2. Filling and top filter press connections.
3. Pressure-vacuum gauge.
4. Dial-type analog thermometer with alarm contacts.
5. Magnetic liquid level indicator with high and low alarm contacts.
6. Automatically resetting pressure-relief device. Device flow shall be as recommended by manufacturer. With alarm contacts and a manual bleeder.
7. Stainless-steel ground connection pads.
9. Sudden pressure relay for remote alarm or trip when internal transformer pressure rises at field-set rate. Provide with seal-in delay.

2.4 SERVICE CONDITIONS

A. Transformers shall be suitable for operation under service conditions specified as usual service conditions in IEEE C57.12.00, except for the following.
   1. Altitudes above 3300 feet.
   2. Cooling air temperature exceeds limits.
   3. Excessive load current harmonic factor.
   4. Operation above rated voltage or below rated frequency.
   5. Exposure to explosive environments.
   6. Exposure to fumes, vapors, or dust.
   7. Exposure to hot and humid climate or to excessive moisture, including steam, salt spray, and dripping water.
   8. Exposure to seismic shock or to abnormal vibration, shock, or tilting.
   9. Exposure to excessively high or low temperatures.
10. Unusual transportation or storage conditions.
11. Unusual grounding resistance conditions.

2.5 CONTROL NETWORK

A. Controllers: Support serial MS/TP and Ethernet IP communications, and able to communicate directly via RS-485 serial networks and Ethernet 10Base-T networks as a native device.

2.6 WARNING LABELS AND SIGNS

A. Comply with requirements for labels and signs specified in Section 26 05 53 "Identification for Electrical Systems."
   1. High-Voltage Warning Label: Provide self-adhesive warning signs on outside of high-voltage compartment door(s). Sign legend shall be "DANGER HIGH VOLTAGE" printed in two lines of nominal 2-inch-high letters. The word "DANGER" shall be in white letters on a red background and the words "HIGH VOLTAGE" shall be in black letters on a white background.
   2. Arc Flash Warning Label: Provide self-adhesive warning signs on outside of high-voltage compartment door(s), warning of potential electrical arc flash hazards and appropriate personal protective equipment required.
2.7 SOURCE QUALITY CONTROL

A. Provide manufacturer's certificate that the transformer design tests comply with IEEE C57.12.90.

1. Perform the following factory-certified routine tests on each transformer for this Project:
   a. Resistance.
   b. Turns ratio, polarity, and phase relation.
   c. Transformer no-load losses and excitation current at 100 percent of ratings.
   d. Transformer impedance voltage and load loss.
   e. Operation of all devices.
   f. Lightning impulse.
   g. Low frequency.
   h. Leak.
   i. Transformer no-load losses and excitation current at 110 percent of ratings.
   j. Insulation power factor.
   k. Applied potential, except that this test is not required for single-phase transformers or for three-phase Y-Y-connected transformers.
   l. Induced potential.
   m. Resistance measurements of all windings on rated voltage connection and at tap extreme connections.
   n. Ratios on rated voltage connection and at tap extreme connections.
   o. Polarity and phase relation on rated voltage connection.
   p. No-load loss at rated voltage on rated voltage connection.
   q. Exciting current at rated voltage on rated voltage connection.
   r. Impedance.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine pad-mounted, liquid-filled, medium-voltage transformers upon delivery.

1. Upon delivery of transformers and prior to unloading, inspect equipment for any damage that may have occurred during shipment or storage.
2. Verify that tie rods and chains are undamaged and tight, and that all blocking and bracing is tight. Verify that there is no evidence of load shifting in transit, and that readings from transportation shock recorders, if equipped, are within manufacturer's recommendations.
3. Verify that there is no indication of external damage and no dents or scratches in doors and sill, tank walls, radiators and fins, or termination provisions.
4. Verify that there is no evidence of insulating-liquid leakage on transformer surfaces, at weld seams, on high- or low-voltage bushing parts, and at transformer base.
5. Verify that there is positive pressure or vacuum on tank. Check pressure gauge; it is required to read other than zero.
6. Compare transformers and accessories received with bill of materials to verify that shipment is complete. Verify that transformers and accessories conform with manufacturer's quotation and shop drawings. If shipment is incomplete or does not comply with Project requirements, notify manufacturer in writing immediately.
7. Verify presence of polychlorinated biphenyl content labeling.
8. Unload transformers carefully, observing all packing label warnings and handling instructions.
9. Open termination compartment doors and inspect components for damage or displaced parts, loose or broken connections, cracked or chipped insulators, bent mounting flanges, dirt or foreign material, and water or moisture.

B. Handling:
   1. Handle transformers carefully, in accordance with manufacturer recommendations, to avoid damage to enclosure, termination compartments, base, frame, tank, and internal components. Do not subject transformers to impact, jolting, jarring, or rough handling.
   2. Protect transformer termination compartments against entrance of dust, rain, and snow.
   3. Transport transformers upright, to avoid internal stresses on core and coil mounting assembly and to prevent trapping air in windings. Do not tilt or tip transformers.
   4. Verify that transformer weights are within rated capacity of handling equipment.
   5. Use only manufacturer-recommended points for lifting, jacking, and pulling. Use all lifting lugs when lifting transformers.
   6. Use jacks only at corners of tank base plate.
   7. Use nylon straps of same length to balance and distribute weight when handling transformers with a crane.
   8. Use spreaders or a lifting beam to obtain a vertical lift and to protect transformer from straps bearing against enclosure. Lifting cable pull angles may not be greater than 15 degrees from vertical.
   9. Exercise care not to damage tank base structure when handling transformer using skids or rollers. Use skids to distribute stresses over tank base when using rollers under large transformers.

C. Storage:
   1. Store transformers in accordance with manufacturer's recommendations.
   2. Transformers may be stored outdoors. If possible, store transformers at final installation locations on concrete pads. If dry concrete surfaces are unavailable, use pallets of adequate strength to protect transformers from direct contact with ground. Ensure transformer is level.
   3. Ensure that transformer storage location is clean and protected from severe conditions. Protect transformers from dirt, water, contamination, and physical damage. Do not store transformers in presence of corrosive or explosive gases. Protect transformers from weather when stored for more than three months.
   4. Store transformers with compartment doors closed.
   5. Regularly inspect transformers while in storage and maintain documentation of storage conditions, noting any discrepancies or adverse conditions. Verify that an effective pressure seal is maintained using pressure gauges. Visually check for insulating-liquid leaks and rust spots.

D. Examine areas and space conditions for compliance with requirements for pad-mounted, liquid-filled, medium-voltage transformers and other conditions affecting performance of the Work.

E. Examine roughing-in of conduits and grounding systems to verify the following:
   1. Wiring entries comply with layout requirements.
   2. Entries are within conduit-entry tolerances specified by manufacturer, and no feeders will cross section barriers to reach load or line lugs.

F. Examine concrete bases for suitable conditions for transformer installation.

G. Pre-Installation Checks:
2. Remove a sample of insulating liquid according to ASTM D 923. Insulating-liquid values shall comply with NETA ATS, Table 100.4. Sample shall be tested for the following:
   b. Acid Neutralization Number: ASTM D 974.
   c. Specific Gravity: ASTM D 1298.
   d. Interfacial Tension: ASTM D 971.
   e. Color: ASTM D 1500.
   g. Water in Insulating Liquids: Comply with ASTM D 1533.
   h. Power Factor or Dissipation Factor: ASTM D 924.

H. Verify that ground connections are in place and that requirements in Section 26 05 26 "Grounding and Bonding for Electrical Systems" have been met. Maximum ground resistance shall be 5 ohms at transformer location.

I. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install transformers on cast-in-place concrete equipment base(s). Comply with requirements for equipment bases and foundations specified in Section 03 30 00 "Cast-in-Place Concrete."

B. Transformer shall be installed level and plumb and shall tilt less than 1.5 degrees while energized.

C. Comply with requirements for vibration isolation and seismic control devices specified in Section 26 05 29 "Hangers and Supports for Electrical Systems" and Section 26 05 48.16 "Seismic Controls for Electrical Systems."

D. Maintain minimum clearances and workspace at equipment according to manufacturer's written instructions and IEEE C2.

3.3 CONNECTIONS

A. Ground equipment according to Section 26 05 26 "Grounding and Bonding for Electrical Systems."
   1. For counterpoise, use tinned bare copper cable not smaller than No. 4/0 AWG, buried not less than 30 inches below grade interconnecting the grounding electrodes. Bond surge arrester and neutrals directly to transformer enclosure and then to grounding electrode system with bare copper conductors, sized as shown. Keep lead lengths as short as practicable, with no kinks or sharp bends.
   2. Fence and equipment connections shall not be smaller than No. 4 AWG. Ground fence at each gate post and corner post and at intervals not exceeding 10 ft. Bond each gate section to fence post using 1/8 by 1-inch tinned flexible braided copper strap and clamps.
   3. Make joints in grounding conductors and loops by exothermic weld or compression connector.
   4. Terminate all grounding and bonding conductors on a common equipment grounding terminal on transformer enclosure.
   5. Complete transformer tank grounding and lightning arrester connections prior to making any other electrical connections.
B. Connect wiring according to Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables."
   1. Maintain air clearances between energized live parts and between live parts and ground for exposed connections in accordance with manufacturer recommendations.
   2. Bundle associated phase, neutral, and equipment grounding conductors together within transformer enclosure. Arrange conductors such that there is not excessive strain that could cause loose connections. Allow adequate slack for expansion and contraction of conductors.

C. Terminate medium-voltage cables in incoming section of transformers according to Section 26 05 13 "Medium-Voltage Cables."

3.4 SIGNS AND LABELS

A. Comply with installation requirements for labels and signs specified in Section 26 05 53 "Identification for Electrical Systems."

B. Install warning signs as required to comply with 29 CFR 1910.269.

3.5 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

C. Perform the following tests and inspections with the assistance of a factory-authorized service representative:

1. General Field-Testing Requirements:
   b. Perform each visual and mechanical inspection and electrical test. Certify compliance with test parameters.
   c. After installing transformer but before primary is energized, verify that grounding system at the transformer is tested at specified value or less.
   d. After installing transformer and after electrical circuitry has been energized, test for compliance with requirements.
   e. Visual and Mechanical Inspection:
      1) Verify equipment nameplate data complies with Contract Documents.
      2) Inspect bolted electrical connections for high resistance using one of the following two methods:
         a) Use a low-resistance ohmmeter to compare bolted connection resistance values to values of similar connections. Investigate values that deviate from those of similar bolted connections by more than 50 percent of the lowest value.
         b) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method according to manufacturer's published data or NETA ATS, Table 100.12. Bolt-torque levels shall be according to manufacturer's published data. In absence of manufacturer's published data, use NETA ATS, Table 100.12.
   f. Remove and replace malfunctioning units and retest.
g. Prepare test and inspection reports. Record as-left set points of all adjustable devices.

2. Medium-Voltage Surge Arrester Field Tests:
   a. Visual and Mechanical Inspection:
      1) Inspect physical and mechanical condition.
      2) Verify arresters are clean.
      3) Verify that ground lead on each device is individually attached to a ground bus or ground electrode.
   b. Electrical Test:
      1) Perform an insulation-resistance test on each arrester, phase terminal-to-ground. Apply voltage according to manufacturer's published data. In the absence of manufacturer's published data, comply with NETA ATS, Table 100.1. Replace units that fail to comply with recommended minimum insulation resistance listed in that table.
      2) Perform a watts-loss test. Evaluate watts-loss values by comparison with similar units and test equipment manufacturer's published data.

3. Liquid-Filled Transformer Field Tests:
   a. Visual and Mechanical Inspection:
      1) Test dew point of tank gases if applicable.
      2) Inspect anchorage, alignment, and grounding.
      3) Verify bushings are clean.
      4) Verify that alarm, control, and trip settings on temperature and level indicators are set and operate within manufacturer's recommended settings.
      5) Verify that liquid level in tanks is within manufacturer's published tolerances.
      6) Perform specific inspections and mechanical tests recommended by manufacturer.
      7) Verify presence of transformer surge arresters and that their ratings are as specified.
      8) Verify that as-left tap connections are as specified.
   b. Electrical Tests:
      1) Perform insulation-resistance tests winding-to-winding and each winding-to-ground. Apply voltage according to manufacturer's published data. In the absence of manufacturer's published data, comply with NETA ATS, Table 100.5. Calculate polarization index; the value of the index shall not be less than 1.0.
      2) Perform power-factor or dissipation-factor tests on all windings according to test equipment manufacturer's published data. Maximum winding insulation power-factor/dissipation-factor values shall be according to manufacturer's published data. In the absence of manufacturer's published data, comply with NETA ATS, Table 100.3.
      3) Measure core insulation resistance at 500-V dc if the core is insulated and the core ground strap is removable. Core insulation-resistance values shall not be less than 1 megohm at 500-V dc.
      4) Perform a power-factor or dissipation-factor tip-up test on windings greater than 2.5 kV.
      5) Perform turns-ratio tests at tap positions. Turns-ratio test results shall not deviate by more than one-half percent from either adjacent coils or calculated ratio. If test fails, replace transformer.
      6) Perform an excitation-current test on each phase. The typical excitation-current test data pattern for a three-legged core transformer is two similar
current readings and one lower current reading. Investigate and correct if test shows a different pattern.

7) Measure resistance of each winding at each tap connection, and record temperature-corrected winding-resistance values in the Operations and Maintenance Manual.

8) Perform an applied-voltage test on high- and low-voltage windings-to-ground. Comply with IEEE C57.12.91, Sections 10.2 and 10.9. This test is not required for single-phase transformers and for three-phase Y-Y-connected transformers.

9) Verify correct secondary voltage, phase-to-phase and phase-to-neutral, after energization and prior to loading.

10) Remove a sample of insulating liquid according to ASTM D 923, and perform dissolved-gas analysis according to IEEE C57.104 or ASTM D 3612.

3.6 FOLLOW-UP SERVICE

A. Voltage Monitoring and Adjusting: After Substantial Completion, if requested by Owner, but not more than six months after Final Acceptance, perform the following voltage monitoring:

1. During a period of normal load cycles as evaluated by Owner, perform seven days of three-phase voltage recording at the outgoing section of each transformer. Use voltmeters with calibration traceable to the National Institute of Science and Technology standards and with a chart speed of not less than 1 inch per hour. Voltage unbalance greater than 1 percent between phases, or deviation of any phase voltage from the nominal value by more than plus or minus 5 percent during test period, is unacceptable.

2. Corrective Action: If test results are unacceptable, perform the following corrective action, as appropriate:
   a. Adjust transformer taps.
   b. Prepare written request for voltage adjustment by electric utility.

3. Retests: Repeat monitoring, after corrective action is performed, until satisfactory results are obtained.

4. Report:
   a. Prepare a written report covering monitoring performed and corrective action taken.

B. Infrared Inspection: Perform survey during periods of maximum possible loading. Remove all necessary covers prior to inspection.

1. After Substantial Completion, but not more than 60 days after Final Acceptance, perform infrared inspection of transformer's electrical power connections.

2. Instrument: Inspect distribution systems with imaging equipment capable of detecting a minimum temperature difference of 1 Deg. C at 30 Deg. C.

3. Record of Infrared Inspection: Prepare a certified report that identifies testing technician and equipment used, and lists results as follows:
   a. Description of equipment to be tested.
   b. Discrepancies.
   c. Temperature difference between area of concern and reference area.
   d. Probable cause of temperature difference.
   e. Areas inspected. Identify inaccessible and unobservable areas and equipment.
   f. Identify load conditions at time of inspection.
   g. Provide photographs and thermograms of deficient area.
4. Act on inspection results according to recommendations of NETA ATS, Table 100.18. Correct possible and probable deficiencies as soon as Owner's operations permit. Retest until deficiencies are corrected.

3.7 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain systems.

END OF SECTION
SECTION 26 13 16.10 – MEDIUM VOLTAGE METAL-ENCLOSED LOAD INTERRUPTER SWITCHGEAR (AIR INTERRUPTER SWITCHES)

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Medium voltage metal-enclosed switchgear with air load interrupter switches.

1.2 REFERENCES

A. ANSI/IEEE C37.20.3 - Standard for Metal-Enclosed Interrupter Switchgear.

B. ANSI/IEEE C37.20.4 - Standard for Indoor AC Medium Voltage Switches used in Metal-Enclosed Switchgear.

E. ANSI Z55.1 - Gray Finishes for Industrial Apparatus and Equipment.

F. NEMA

G. IEC 420 High-Voltage Alternating Current Switch-Fuse Combinations (Applicable sections to ensure proper coordination of the switch-fuse combination when fuses are utilized for opening the switch automatically).

H. CAN/CSA C22.2 No. 31 Switchgear Assemblies.

I. CAN/CSA C22.2 No. 193 High Voltage Full-Load Interrupter Switches.

1.3 SUBMITTALS

A. The metal-enclosed switchgear assembly shall be in accordance with the contract documents, applicable codes whichever is the most stringent.

B. The manufacturer shall furnish a detailed Bill of Material and complete set of drawings as follows:

1. Detailed front elevation.
2. Single Line
3. Base Plan
4. Schematics
5. Wiring Diagrams

C. The manufacturer shall furnish comprehensive instruction manuals covering the installation of the switchgear and the operation of its various components.
1.4 QUALITY ASSURANCE

A. Manufacturer: Company specializing in medium voltage metal-enclosed switchgear with at least five years documented experience. The manufacturer of the switchgear must be the same as the manufacturer of the load interrupter switch.

B. Equipment shall be equipped with UL label for metal-enclosed type switchgear assemblies when UL recognized components are specified.

1.5 DELIVERY, STORAGE, AND HANDLING

A. The following paragraphs apply only to the installing contractor.

B. Accept equipment on site and inspect for shipping damage.

C. Protect equipment from weather and moisture by covering with heavy plastic or canvas and by maintaining heat within enclosure in accordance with manufacturer's instructions.

PART 2 - PRODUCT

2.1 MANUFACTURERS

A. Switchgear: The metal-enclosed load interrupter switchgear shall be Square D type HVL or approved equal.

B. Fuses (Select 1 or 2)

1. The switchgear shall be equipped with a FuseLogic system to provide single-phase protection with the following features:

a. Direct acting, (15 kV up to 65 A "E" rated fuses) fuse tripping, to automatically open the manually operated load interrupter switch in the event of a blown fuse. For fuses rated higher than those shown, system shall be shunt trip operated directly from blown fuse contacts (control power required). Blocking the closing of the switch shall further prevent potential single-phasing conditions when a fuse is blown or if a fuse is not installed.

b. Prevention of potential single-phase conditions by blocking the closing of the manually operated load interrupter switch when a fuse is blown or if a fuse is not installed.

c. Three Form C auxiliary switches (1 per phase) for phase blown/missing fuse indication. One Form C auxiliary switch (1 for all 3 phases) for blown/missing fuse indication.

d. Fuses shall be fixed in position in a non-disconnect fuse mounting with provisions for removal and replacement from the front of the gear.

e. Fuses shall be UL Listed.

f. The blown fuse indicator shall be an "Extended Travel" type with a minimum of 1 inch of travel.

2. Boric acid fuses:(Boric acid cannot be used in conjunction with FuseLogic system)

a. Fuses shall be Boric acid, expulsion type, fuse holders with replaceable refills or fuse units, complete with muffler exhaust control.
b. Fuses shall be affixed in position in a non-disconnect fuse mounting with provisions for removal and replacement from the front of the gear.
c. Fuse Rating: "E" rated, size as scheduled on drawings.
d. Voltage Class: 15.0 kV.
e. Interrupting Rating: As stated above to achieve the integrated interrupting rating; 600 amps, rms symmetrical.

2.2 LOAD INTERRUPTER SWITCHGEAR ASSEMBLY

A. The metal-enclosed switchgear with load interrupter switches shall consist of a multiple section line-up, and be of outdoor non-walk-in type construction. The sections shall contain the load interrupter switches and the necessary accessory components. The equipment shall be factory-assembled (except for necessary shipping splits) and operationally checked. The assembly shall be a self-supporting, floor mounted bay and shall be securely bolted to the transformer to form an integrated structure.

B. If Square D Company's, FuseLogic system is specified, automatic fuse tripping of the switch-fuse combination shall be tested to the applicable sections of IEC 420 to ensure proper coordination. A time delay relay may be required for certain fuse ratings to ensure that any fault current present has decayed to a value the load interrupter switch can safely interrupt.

C. In establishing the requirements for the enclosure design, consideration shall be given to such relevant factors as controlled access, tamper resistance, protection from ingress of rodents and insects, and the possibility of arcing faults within the enclosure.

D. Switchgear rated 600 amps continuous shall not require ventilation openings to aid in cooling of the associated components.

E. The integrated switchgear assembly shall withstand the effects of closing, carrying and interrupting currents up to the assigned maximum short circuit rating.

F. A viewing window shall be installed in the switch enclosure and located so as to enable visible inspection of the switch blades and blown fuse indicators from outside the enclosure.

G. System Voltage: 12 kV, 3-phase, solidly grounded, 3-phase, 3-wire without neutral bus.

H. Operating Frequency: 60 Hz.

I. Maximum Short Circuit Current: 600 kA rms symmetrical.

J. Maximum Design Voltage: 15.0 kV.

K. Basic Impulse Level (BIL): 95 kV.

L. Power Frequency Withstand: 36 kV.

M. Short-Time Current (two second): 25 kA.

N. in Bus Ampacity: 600 amps, continuous.

O. Integrated Short Circuit Rating: 40 kA, rms symmetrical.
P. The above integrated short circuit ratings represent some of the most commonly used ratings, however, they will vary according to the type, brand and size of fuse. Contact the manufacturer for the integrated rating with the particular fuse chosen.

2.3 COMPONENTS

A. Load Interrupter Switch (Select 1 or 2)

1. Over-Center Mechanism
   a. The load interrupter switch shall be rated at 600 amperes continuous and interrupting; fixed mounted on NEMA class A-20 glass reinforced polyester standoff insulators; manually operated; quick-make, quick-break with the speed of operation independent of the operator. Electrical operation of the device requires a 120 VAC source. To provide for dependable operation, the device shall not rely on chains or cables to drive the blade assemblies open and closed. The spring operator assembly shall be isolated from high voltage and coupled through a direct drive shaft.

2. Stored-Energy Mechanism
   a. The load interrupter switch shall be rated at 600 amperes continuous and interrupting; and fixed mounted on NEMA class A-20 glass reinforced polyester standoff insulators. The stored-energy, manually operated mechanism shall be equipped with separate opening and closing springs. The opening spring shall be charged prior to the closing spring. Operation of the load interrupter switch shall be by means of a close/open lever. Operation shall be quick-make, quick-break with the speed of operation independent of the operator. The mechanism shall be equipped with FuseLogic an opening coil a closing coil and operated from a 120 VAC source. To provide for dependable operation, the device shall not rely on chains or cables to drive the blade assemblies open and closed. The spring operator assembly shall be isolated from high voltage and coupled through a direct drive shaft.

B. Switches shall separate current carrying paths and arcing interruption paths.

C. Switch blades shall be mounted on insulators that are attached to grounded metal barriers. Switches that utilize blades mounted on a common shaft with insulation from blade to blade rather than blade to ground are unacceptable.

D. The switch operating handle shall be permanently attached to the outside front of the switchgear and ready for immediate use, except for outdoor applications where the front of the switchgear shall be covered by a full-height solid door. Removable handles are not acceptable. The handle must operate in the conventional fashion with the switch closed with the handle in the up position and the switch open with the handle in the down position. Provisions shall be available for padlocking the switch in either the open or closed position.

E. Voltage and Short Circuit Ratings: Match ratings specified for assembly.

F. Momentary Rating: 40 kA, rms asymmetrical.

G. Fault Closing: 40 kA, rms asymmetrical.
2.4 ACCESSORIES

A. Surge Arresters (metal-oxide type): Distribution class, rated 15 kV, MCOV; one per phase.

B. Incoming Cable Termination: Cable Lug.

C. Provide double clamping lugs for terminating cables onto the switchgear terminal pads.

D. Space Heaters: For 120 VAC external source, sized by the manufacturer, with thermostats.

E. Mechanical Interlocks: The high-voltage compartment door shall be interlocked to prevent opening with the load interrupter in the closed position. The interlock must be directly attached to the operating mechanism and should not rely on long cables and linkages.

F. Key Interlocks: 2

G. Voltage and Current Transformer Options:

1. Each bay containing a circuit interrupter shall include the following as shown on the drawings:
   a. PowerLogic Circuit Monitor, with digital display with waveform capture wired for communications to other devices.
   b. Ammeter with Selector Switch, 1% Accuracy.
   c. Voltmeter with Selector Switch, 1% Accuracy.
   d. MegaWatt Meter
   e. MegaWatt Demand with 15-minute interval
   f. MegaVAR Meter
   g. Power Factor Meter
   h. Frequency Meter
   i. Watt-hour Meter, 2 element

H. Metering Options:

1. Each bay containing a circuit interrupter shall include the following as shown on the drawings:

   a. PowerLogic Circuit Monitor, with digital display with waveform capture wired for communications to other devices.
   b. Ammeter with Selector Switch, 1% Accuracy.
   c. Voltmeter with Selector Switch, 1% Accuracy.
   d. MegaWatt Meter
   e. MegaWatt Demand with 15-minute interval
   f. MegaVAR Meter
   g. Power Factor Meter
   h. Frequency Meter
   i. Watt-hour Meter, 2 element

I. Automatic Load Transfer Control:

1. An automatic load transfer system shall be provided for a Main-Main (Common-Bus Primary-Selective System) arrangement. The system shall automatically control motor operated load interrupter switches to provide transfer of the medium-voltage circuit to an alternate circuit upon loss of voltage of the normal source(s). Potential transformers feeding phase balance and undervoltage relays are provided to continuously monitor all three phases on both sources.
   2. The system shall consist of a Modicon programmable logic controller or a relay system, potential transformers, control power transfer contactor, control selector switches, two-, three-phase, phase-balance/undervoltage (47N/27) relays, and status indicating lights.
   3. The potential transformers shall also provide 120 VAC control power for the motor operators and the logic control. Other accessories for the system include:
a. 1- Auto/Manual selector switch with indicating lights.
b. 1- Hold Return/Auto Return selector switch with indicating lights.
c. 1- Closed Transition/Open Transition selector switch with indicating lights.
d. 1- Preferred Source selector switch with indicating lights (main-main system).
e. 2- Undervoltage test push buttons.
f. 2- Close push buttons with indicating lights.
g. 2- Open bush buttons with indicating lights.

4. Sequence of operation:

a. Main - Main System:

1) The normal conditions shall be with one source (designated as preferred) closed and with the other source (designate as the alternate) open but available to provide power. A transfer is initiated after a six (6) second time delay upon detection of a phase unbalance and/or undervoltage condition on the preferred source. The normal source switch will open within three (3) cycles after the time delay. The alternate source switch will close within twelve (12) seconds after the time delay. The re-transfer will occur after the voltage on the normal source returns and stabilizes for a five (5) minute time delay. The time registers are adjustable by the use of a hand-held programmer.

2.5 FABRICATION

A. Construction: Outdoor, non-walk-in. Each equipment bay shall be a separately constructed cubicle assembled to form a rigid free-stading unit. Minimum sheet metal thickness shall be 11-gauge steel on all exterior surfaces. Adjacent bays shall be securely bolted together to form an integrated rigid structure. To assist installation and maintenance of bus and cables, the rear covers shall be removable provide split rear doors with a pad lockable handle and three-point latching. Each individual unit shall be braced to prevent distortion.

B. A viewing window shall be installed in a fixed panel of the enclosure to enable visual inspection of the disconnect blades from outside the enclosure.

C. All torqued bolts that are used for bus joints or for insulators and direct support of any current carrying parts shall be marked with a bead of highly visible bright orange "torque seal", that will readily show when a bolt has loosened.

D. The high voltage fuses (when required) and non-disconnect type fuse mountings, shall be accessible only through a separate door mechanically interlocked with the load interrupter switch, so the load interrupter switch is opened before the door is opened and that the switch cannot be closed when the door is open. Switchgear designs with full height doors for access to the fuses shall have a solid grounded metal barrier with a viewing window covering the area of the main cross bus and/or line side of the load interrupter switch. Screened or penetrable barriers which may allow intentional or inadvertent contact with energized parts shall not be permitted.

E. No energized parts should be within normal reach of the opened doorway. Four full-length vertical barriers of 3/16-inch thick glass-reinforced polyester, NEMA grade GPO-3, minimum, shall isolate the three phases of the load interrupter switch and fuses from each other and from the enclosure.

F. Height: 93.65 inches, maximum including auxiliary support members on top and bottom.

<table>
<thead>
<tr>
<th>Maximum Voltage</th>
<th>Outdoor Single / Multiple</th>

</thead>
<tbody>
<tr>
<td>15.0 kV</td>
<td>97 in</td>
</tr>
</tbody>
</table>
G. Main Bus shall be tin-plated copper, insulated rated 600 amps, and is to be supported from the top of the enclosure on NEMA class A-20 glass reinforced polyester standoff insulators.

H. For multiple bay lineups, include continuous ground bus through the switchgear assembly, securely connected to the steel frame of each cubicle.

I. Main bus and ground bus shall be drilled to allow for future extensions. Cutout areas with removable bolted on covers shall allow for future extension of the main bus. A knock-out shall be removable for the extension of the ground bus.

J. Outdoor units shall be designed with a sloped, drip-proof roof. The cubicles must have a door-indoor construction. The outer door shall be a bulkhead type door with three-point latching and vault type handle with provisions for padlocking. Cubicles are to be designed to allow front and rear access and shall not require the routing of line side or load side connections in front of the switch/fuse compartment.

K. The metal-enclosed switchgear shall be fully assembled, inspected and tested at the factory prior to shipment. Large line-ups shall be split to permit normal shipping and handling as well as for ease of rejoining at the job site.

2.6 FACTORY FINISHING

A. All steel parts, except galvanized (if used), shall be cleaned and a zinc-phosphate (outdoor equipment) or iron phosphate (indoor equipment) pre-treatment applied prior to paint application.

B. Paint color shall be [ANSI-61 (light gray); ANSI-49 (medium light gray)] TGIC polyester powder, applied electrostatically through air. Following paint application, parts shall be baked to produce a hard-durable finish. The average thickness of the paint film shall be 2.0 mils. Paint film shall be uniform in color and free from blisters, sags, flaking and peeling.

C. Adequacy of paint finish to inhibit the buildup of rust on ferrous metal materials shall be tested and evaluated per paragraphs 5.2.8.1-7 of ANSI C37.20.3-1987. Salt spray withstand tests in accordance with paragraph 5.2.8.4 shall be performed on a periodic basis to provide conformance to this corrosion resistance standard of at least 2500 hours minimum (outdoor equipment) or 600 hours minimum (indoor equipment).

PART 3 - EXECUTION

3.1 EXAMINATION

A. Visually inspect switchgear for evidence of damage and verify that surfaces are ready to receive work.

B. Visually inspect to confirm that all items and accessories are in accordance with specifications and drawings.

C. Verify field measurements are as shown on shop drawings.

D. Verify that required utilities (e.g. control voltage for heater circuits on outdoor switchgear) are available, in proper location, and ready for use.

E. Beginning of installation means installer accepts existing surface conditions.
3.2 INSTALLATION

A. Install in accordance with manufacturer's instructions, applicable requirements of the NEC and in accordance with recognized industry practices.

B. Use jumper cables, as provided by the switchgear manufacturer, to connect the primary surge arresters.

C. Bending of high-voltage cables should be avoided or minimized. All necessary bends should meet at least the minimum radii specified by the cable manufacturer.

3.3 FIELD QUALITY CONTROL

A. Field inspection and testing will be performed by the installing contractor.

B. Visually inspect for physical damage.

C. Perform mechanical operator tests in accordance with manufacturer's instructions. Check blade alignment and arc interrupter operations of each load interrupter switch.

D. Check torque of all bolted connections, including cable terminations, either by observing the bead of indicating compound to confirm that it is still intact, or with a torque wrench to confirm the joint is tightened to the manufacturer's specifications.

E. Touch-up paint all chips and scratches with manufacturer-supplied paint and leave remaining paint with Owner.

F. Verify key interlock operation.

G. Perform insulation resistance test on each phase to ground and each phase to phase. Record results.

H. Perform low-frequency withstand tests according to ANSI/IEEE C37.20.3, paragraph 5.5.

I. Perform contact resistance test across each switch blade; report any contact resistance in excess of 50 micro-ohms.

END OF SECTION
SECTION 262213 - LOW-VOLTAGE DISTRIBUTION TRANSFORMERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
   A. Section includes distribution, dry-type transformers with a nominal primary and secondary rating of 600 V and less, with capacities up to 1500 kVA.

1.3 ACTION SUBMITTALS
   A. Product Data: For each type of product.
      1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each type and size of transformer.
      2. Include rated nameplate data, capacities, weights, dimensions, minimum clearances, installed devices and features, and performance for each type and size of transformer.
   B. Shop Drawings:
      1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
      2. Vibration Isolation Base Details: Detail fabrication including anchorages and attachments to structure and to supported equipment.
      3. Include diagrams for power, signal, and control wiring.

1.4 INFORMATIONAL SUBMITTALS
   A. Qualification Data: For testing agency.
   B. Seismic Qualification Data: Certificates, for transformers, accessories, and components, from manufacturer.
      1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
      2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
      3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
      4. Certification: Indicate that equipment meets Project and equipment seismic requirements.
   C. Coordination
   D. Provide ¼” scale drawing demonstrating that installation has been coordinated with work of other trades. Use actual dimensions from approved equipment submittals to coordinate layout.
and installation of transformers and components with other construction including conduit, piping, equipment, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

E. Coordinate installation of wall-mounting and structure-hanging supports with actual transformer provided.

F. Source quality-control reports.

G. Field quality-control reports.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For transformers to include in emergency, operation, and maintenance manuals.

1.6 QUALITY ASSURANCE

A. Testing Agency Qualifications: Accredited by NETA.

1. Testing Agency's Field Supervisor: Certified by NETA to supervise on-site testing.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Inspection: On receipt, inspect for and note any shipping damage to packaging and transformer.

1. If manufacturer packaging is removed for inspection, and transformer will be stored after inspection, re-package transformer using original or new packaging materials that provide protection equivalent to manufacturer's packaging.

B. Storage: Store in a warm, dry, and temperature-stable location in original shipping packaging.

C. Temporary Heating: Apply temporary heat according to manufacturer's written instructions within the enclosure of each ventilated-type unit, throughout periods during which equipment is not energized and when transformer is not in a space that is continuously under normal control of temperature and humidity.

D. Handling: Follow manufacturer's instructions for lifting and transporting transformers.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Powersmiths International Corp.
2. Eaton.
5. Hammond Power Solutions Inc.
7. Sola/Hevi-Duty; a brand of Emerson Electric Co.
8. Square D; by Schneider Electric.

B. Source Limitations: Obtain each transformer type from single source from single manufacturer.

2.2 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Transformers shall withstand the effects of earthquake motions determined according to ASCE/SEI 7. Equipment anchorage is not a deferred submittal nor a delegated design item. Refer to details on drawings for anchorage requirements.

1. The term "withstand" means "the transformer will remain in place without separation of any parts when subjected to the seismic forces specified and the transformer will be fully operational after the seismic event."

2.3 GENERAL TRANSFORMER REQUIREMENTS

A. Description: Factory-assembled and -tested, air-cooled units for 60-Hz service.

B. Comply with CEC 70.

1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in CEC 70, by a qualified testing agency, and marked for intended location and use.

C. Transformers Rated 15 kVA and Larger:

1. Comply with 10 CFR 431 (DOE 2016) efficiency levels.
2. Marked as compliant with DOE 2016 efficiency levels by an NRTL.

D. Shipping Restraints: Paint or otherwise color-code bolts, wedges, blocks, and other restraints that are to be removed after installation and before energizing. Use fluorescent colors that are easily identifiable inside the transformer enclosure.

2.4 DISTRIBUTION TRANSFORMERS

A. Comply with CEC 70, and list and label as complying with UL 1561.

B. Provide transformers that are constructed to withstand seismic forces specified in Section 26 05 48.16 "Seismic Controls for Electrical Systems."

C. Cores: Electrical grade, non-aging silicon steel with high permeability and low hysteresis losses.

1. One leg per phase.
2. Core volume shall allow efficient transformer operation at 10 percent above the nominal tap voltage.
3. Grounded to enclosure.

D. Coils: Continuous windings without splices except for taps.

1. Coil Material: Copper.
2. Internal Coil Connections: Brazed or pressure type.
3. Terminal Connections: Bolted.

E. Encapsulation: Transformers smaller than 30 kVA shall have core and coils completely resin encapsulated.

F. Indoor Enclosure: Ventilated.
   1. NEMA 250, Type 2: Core and coil shall be encapsulated within resin compound to seal out moisture and air.
   2. KVA Ratings: Based on convection cooling only and not relying on auxiliary fans.
   3. Wiring Compartment: Sized for conduit entry and wiring installation.
   4. Finish: Comply with NEMA 250.
      a. Finish Color: Gray weather-resistant enamel.

G. Outdoor Enclosure: Totally enclosed, nonventilated.
   1. NEMA 250, Type 3R: Core and coil shall be encapsulated within resin compound, sealing out moisture and air.
   2. Wiring Compartment: Sized for conduit entry and wiring installation.
   3. Finish: Comply with NEMA 250.
      a. Finish Color: Gray weather-resistant enamel.

H. Taps for Transformers 3 kVA and Smaller: None.

I. Taps for Transformers 7.5 to 24 kVA: One 5 percent tap above and one 5 percent tap below normal full capacity.

J. Taps for Transformers 25 kVA and Larger: Two 2.5 percent taps above and two 2.5 percent taps below normal full capacity.

K. Insulation Class, Smaller Than 30 kVA: 180 deg C, UL-component-recognized insulation system with a maximum of 115 deg C rise above 40 deg C ambient temperature.

L. Insulation Class, 30 kVA and Larger: 220 deg C, UL-component-recognized insulation system with a maximum of 80 deg C rise above 40 deg C ambient temperature.

M. Grounding: Provide ground-bar kit or a ground bar installed on the inside of the transformer enclosure.

N. K-Factor Rating: Transformers indicated to be K-factor rated shall comply with UL 1561 requirements for nonsinusoidal load current-handling capability to the degree defined by designated K-factor.
   1. Unit shall not overheat when carrying full-load current with harmonic distortion corresponding to designated K-factor, without exceeding the indicated insulation class in a 40 deg C maximum ambient and a 24-hour average ambient of 30 deg C.
   2. Indicate value of K-factor on transformer nameplate.
   3. Unit shall comply with requirements of DOE 2016 efficiency levels when tested according to NEMA TP 2 with a K-factor equal to one.

O. Electrostatic Shielding: Each winding shall have an independent, single, full-width copper electrostatic shield arranged to minimize interwinding capacitance.
   1. Arrange coil leads and terminal strips to minimize capacitive coupling between input and output terminals.
   2. Include special terminal for grounding the shield.
P. Neutral: Rated 200 percent of full load current for K-factor-rated transformers.

Q. Wall Brackets: Manufacturer's standard brackets.

2.5 IDENTIFICATION

A. Nameplates: Engraved, laminated-acrylic or melamine plastic signs for each distribution transformer, mounted with corrosion-resistant screws. Nameplates and label products are specified in Section 26 05 53 "Identification for Electrical Systems."

2.6 SOURCE QUALITY CONTROL

A. Test and inspect transformers according to IEEE C57.12.01 and IEEE C57.12.91.
   1. Resistance measurements of all windings at rated voltage connections and at all tap connections.
   2. Ratio tests at rated voltage connections and at all tap connections.
   3. Phase relation and polarity tests at rated voltage connections.
   4. No load losses, and excitation current and rated voltage at rated voltage connections.
   5. Impedance and load losses at rated current and rated frequency at rated voltage connections.
   6. Applied and induced tensile tests.
   7. Regulation and efficiency at rated load and voltage.
   8. Insulation-Resistance Tests:
      a. High-voltage to ground.
      b. Low-voltage to ground.
      c. High-voltage to low-voltage.
   9. Temperature tests.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine conditions for compliance with enclosure- and ambient-temperature requirements for each transformer.

B. Verify that field measurements are as needed to maintain working clearances required by CEC 70 and manufacturer's written instructions.

C. Examine walls, floors, roofs, and concrete bases for suitable mounting conditions where transformers will be installed.

D. Verify that ground connections are in place and requirements in Section 26 05 26 "Grounding and Bonding for Electrical Systems" have been met. Maximum ground resistance shall be 5 ohms at location of transformer.

E. Environment: Enclosures shall be rated for the environment in which they are located. Covers for NEMA 250, Type 4X enclosures shall not cause accessibility problems.

F. Proceed with installation only after unsatisfactory conditions have been corrected.
3.2 INSTALLATION

A. Install wall-mounted transformers level and plumb with wall brackets fabricated by transformer manufacturer.
   1. Coordinate installation of wall-mounted and structure-hanging supports with actual transformer provided.
   2. Brace wall-mounted transformers as specified in Section 26 05 48.16 "Seismic Controls for Electrical Systems."

B. Install transformers level and plumb on a concrete base with vibration-dampening supports. Locate transformers away from corners and not parallel to adjacent wall surface.

C. Construct concrete bases according to Section 03 30 00 "Cast-in-Place Concrete" and anchor floor-mounted transformers according to manufacturer's written instructions, seismic codes applicable to Project, and requirements in Section 26 05 29 "Hangers and Supports for Electrical Systems."
   1. Coordinate size and location of concrete bases with actual transformer provided. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified with concrete.

D. Secure transformer to concrete base according to manufacturer's written instructions.

E. Secure covers to enclosure and tighten all bolts to manufacturer-recommended torques to reduce noise generation.

F. Remove shipping bolts, blocking, and wedges.

3.3 CONNECTIONS

A. Ground equipment according to Section 26 05 26 "Grounding and Bonding for Electrical Systems."

B. Connect wiring according to Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables."

C. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B.

D. Provide flexible connections at all conduit and conductor terminations and supports to eliminate sound and vibration transmission to the building structure.

3.4 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

C. Perform tests and inspections with the assistance of a factory-authorized service representative.
D. Small (Up to 167-kVA Single-Phase or 500-kVA Three-Phase) Dry-Type Transformer Field Tests:

1. Visual and Mechanical Inspection.
   a. Inspect physical and mechanical condition.
   b. Inspect anchorage, alignment, and grounding.
   c. Verify that resilient mounts are free and that any shipping brackets have been removed.
   d. Verify the unit is clean.
   e. Perform specific inspections and mechanical tests recommended by manufacturer.
   f. Verify that as-left tap connections are as specified.
   g. Verify the presence of surge arresters and that their ratings are as specified.

2. Electrical Tests:
   a. Measure resistance at each winding, tap, and bolted connection.
   b. Perform insulation-resistance tests winding-to-winding and each winding-to-ground. Apply voltage according to manufacturer's published data. In the absence of manufacturer's published data, comply with NETA ATS, Table 100.5. Calculate polarization index: the value of the index shall not be less than 1.0.
   c. Perform turns-ratio tests at all tap positions. Test results shall not deviate by more than one-half percent from either the adjacent coils or the calculated ratio. If test fails, replace the transformer.
   d. Verify correct secondary voltage, phase-to-phase and phase-to-neutral, after energization and prior to loading.

E. Large (Larger Than 167-kVA Single Phase or 500-kVA Three Phase) Dry-Type Transformer Field Tests:

1. Visual and Mechanical Inspection:
   a. Inspect physical and mechanical condition.
   b. Inspect anchorage, alignment, and grounding.
   c. Verify that resilient mounts are free and that any shipping brackets have been removed.
   d. Verify the unit is clean.
   e. Perform specific inspections and mechanical tests recommended by manufacturer.
   f. Verify that as-left tap connections are as specified.
   g. Verify the presence of surge arresters and that their ratings are as specified.

2. Electrical Tests:
   a. Measure resistance at each winding, tap, and bolted connection.
   b. Perform insulation-resistance tests winding-to-winding and each winding-to-ground. Apply voltage according to manufacturer's published data. In the absence of manufacturer's published data, comply with NETA ATS, Table 100.5. Calculate polarization index: the value of the index shall not be less than 1.0.
   c. Perform power-factor or dissipation-factor tests on all windings.
   d. Perform turns-ratio tests at all tap positions. Test results shall not deviate by more than one-half percent from either the adjacent coils or the calculated ratio. If test fails, replace the transformer.
   e. Perform an excitation-current test on each phase.
   f. Perform an applied voltage test on all high- and low-voltage windings to ground.
      See IEEE C57.12.91, Sections 10.2 and 10.9.
   g. Verify correct secondary voltage, phase-to-phase and phase-to-neutral, after energization and prior to loading.

F. Remove and replace units that do not pass tests or inspections and retest as specified above.
G. Infrared Scanning: Two months after Substantial Completion, perform an infrared scan of transformer connections.
   1. Use an infrared-scanning device designed to measure temperature or detect significant deviations from normal values. Provide documentation of device calibration.
   2. Perform two follow-up infrared scans of transformers, one at four months and the other at 11 months after Substantial Completion.
   3. Prepare a certified report identifying transformer checked and describing results of scanning. Include notation of deficiencies detected, remedial action taken, and scanning observations after remedial action.

H. Test Labeling: On completion of satisfactory testing of each unit, attach a dated and signed "Satisfactory Test" label to tested component.

3.5 ADJUSTING
   A. Record transformer secondary voltage at each unit for at least 48 hours of typical occupancy period. Adjust transformer taps to provide optimum voltage conditions at secondary terminals. Optimum is defined as not exceeding nameplate voltage plus 5 percent and not being lower than nameplate voltage minus 3 percent at maximum load conditions. Submit recording and tap settings as test results.

   B. Output Settings Report: Prepare a written report recording output voltages and tap settings.

3.6 CLEANING
   A. Vacuum dirt and debris; do not use compressed air to assist in cleaning.

END OF SECTION
SECTION 262413 - SWITCHBOARDS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Service and distribution switchboards rated 600 V and less.
   2. Surge protection devices.
   3. Disconnecting and overcurrent protective devices.
   4. Instrumentation.
   5. Control power.
   6. Accessory components and features.
   7. Identification.

B. Related Requirements
   1. Section 26 05 72 “Overcurrent Protective Device Short-circuit Study” for fault-current and protective device short-circuit studies.
   2. Section 26 05 73 “Overcurrent Protective Device Coordination Study” for fault-current and protective device coordination studies.
   3. Section 26 05 74 "Overcurrent Protective Device Arc-Flash Hazard Study" for arc-flash analysis and arc-flash label requirements.

1.3 ACTION SUBMITTALS

A. Product Data: For each switchboard, overcurrent protective device, surge protection device, ground-fault protector, accessory, and component.
   1. Include dimensions and manufacturers’ technical data on features, performance, electrical characteristics, ratings, accessories, and finishes.

B. Shop Drawings: For each switchboard and related equipment.
   1. Include dimensioned plans, elevations, sections, and details, including required clearances and service space around equipment. Show tabulations of installed devices, equipment features, and ratings.
   2. Detail enclosure types for types other than NEMA 250, Type 1.
   3. Detail bus configuration, current, and voltage ratings.
   5. Detail utility company’s metering provisions with indication of approval by utility company.
   6. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.
   7. Include time-current coordination curves for each type and rating of overcurrent protective device included in switchboards. Submit on translucent log-log graft paper; include selectable ranges for each type of overcurrent protective device.
   8. Include schematic and wiring diagrams for power, signal, and control wiring.
C. Delegated Design Submittal:
   1. For arc-flash hazard analysis.
   2. For arc-flash labels.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For testing agency.

B. Seismic Qualification Data: Certificates, for switchboards, overcurrent protective devices, accessories, and components, from manufacturer.
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
   2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
   3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

C. Field Quality-Control Reports:
   1. Test procedures used.
   2. Test results that comply with requirements.
   3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For switchboards and components to include in emergency, operation, and maintenance manuals.
   1. In addition to items specified in Section 01785 "Operation and Maintenance Data," include the following:
      a. Routine maintenance requirements for switchboards and all installed components.
      b. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.
      c. Time-current coordination curves for each type and rating of overcurrent protective device included in switchboards. Submit on translucent log-log graft paper; include selectable ranges for each type of overcurrent protective device.

1.6 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Potential Transformer Fuses: Equal to 10 percent of quantity installed for each size and type but no fewer than two of each size and type.
   2. Control-Power Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than two of each size and type.
   3. Fuses and Fusible Devices for Fused Circuit Breakers: Equal to 10 percent of quantity installed for each size and type but no fewer than three of each size and type.
   4. Fuses for Fused Switches: Equal to 10 percent of quantity installed for each size and type but no fewer than three of each size and type.
5. Fuses for Fused Power-Circuit Devices: Equal to 10 percent of quantity installed for each size and type but no fewer than three of each size and type.
6. Indicating Lights: Equal to 10 percent of quantity installed for each size and type but no less than one of each size and type.

1.7 QUALITY ASSURANCE

A. Installer Qualifications: An employer of workers qualified as defined in NEMA PB 2.1 and trained in electrical safety as required by NFPA 70E.

B. Testing Agency Qualifications: Accredited by NETA.
   1. Testing Agency's Field Supervisor: Certified by NETA to supervise on-site testing.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Deliver switchboards in sections or lengths that can be moved past obstructions in delivery path.

B. Remove loose packing and flammable materials from inside switchboards and install temporary electric heating (250 W per section) to prevent condensation.

C. Handle and prepare switchboards for installation according to NEMA PB 2.1.

1.9 FIELD CONDITIONS

A. Installation Pathway: Remove and replace access fencing, doors, lift-out panels, and structures to provide pathway for moving switchboards into place.

B. Environmental Limitations:
   1. Do not deliver or install switchboards until spaces are enclosed and weathertight, wet work in spaces is complete and dry, work above switchboards is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.
   2. Rate equipment for continuous operation under the following conditions unless otherwise indicated:
      a. Ambient Temperature: Not exceeding 104 deg F.
      b. Altitude: Not exceeding 6600 feet.

C. Unusual Service Conditions: NEMA PB 2, as follows:
   1. Ambient temperatures within limits specified.
   2. Altitude not exceeding 6600 feet.

D. Interruption of Existing Electric Service: Do not interrupt electric service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary electric service according to requirements indicated:
   1. Notify Construction Manager no fewer than seven days in advance of proposed interruption of electric service.
   2. Indicate method of providing temporary electric service.
   3. Do not proceed with interruption of electric service without Owner's written permission.
4. Comply with NFPA 70E.

1.10 COORDINATION

A. Coordinate layout and installation of switchboards and components with other construction that penetrates walls or is supported by them, including electrical and other types of equipment, raceways, piping, encumbrances to workspace clearance requirements, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

B. Coordinate sizes and locations of concrete bases with actual equipment provided. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified with concrete.

C. Provide ¼” scale drawing demonstrating that installation has been coordinated with work of other trades. Use actual dimensions from approved equipment submittals to coordinate layout and installation of panelboard, switchgear, transformers and components with other construction including conduit, piping, equipment, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

1.11 WARRANTY

A. Manufacturer's Warranty: Manufacturer agrees to repair or replace switchboard enclosures, buswork, overcurrent protective devices, accessories, and factory installed interconnection wiring that fail in materials or workmanship within specified warranty period.
   1. Warranty Period: Three years from date of Substantial Completion.

B. Manufacturer's Warranty: Manufacturer's agrees to repair or replace surge protection devices that fail in materials or workmanship within specified warranty period.
   1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Switchboards shall withstand the effects of earthquake motions determined according to ASCE/SEI 7. Equipment anchorage is not a deferred submittal nor a delegated design item. Refer to details on drawings for anchorage requirements.
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation. Shake-table testing shall comply with ICC-ES AC156.
   2. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
2.2 SWITCHBOARDS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Eaton.
   2. General Electric Company.
   4. Square D; by Schneider Electric.

B. Source Limitations: Obtain switchboards, overcurrent protective devices, components, and accessories from single source from single manufacturer.

C. Product Selection for Restricted Space: Drawings indicate maximum dimensions for switchboards including clearances between switchboards and adjacent surfaces and other items. Comply with indicated maximum dimensions.

D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in CEC 70, by a qualified testing agency, and marked for intended location and application.

E. Comply with NEMA PB 2.

F. Comply with CEC 70.

G. Comply with UL 891.

H. Front-Connected, Front-Accessible Switchboards:
   1. Main Devices: Panel mounted.
   3. Sections front and rear aligned.

I. Seismic Requirements: Fabricate and test switchboards according to IEEE 344 to withstand seismic forces defined in Section 26 05 48.16 "Seismic Controls for Electrical Systems."
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation. Shake-table testing shall comply with ICC-ES AC156.
      a. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

J. Indoor Enclosures: Steel, NEMA 250, Type 1.

K. Enclosure Finish for Indoor Units: Factory-applied finish in manufacturer's standard gray finish over a rust-inhibiting primer on treated metal surface.

L. Outdoor Enclosures: Type 3R.
   1. Finish: Factory-applied finish in manufacturer's standard color; undersurfaces treated with corrosion-resistant undercoating.
   2. Enclosure: Downward, rearward sloping roof; rear hinged doors for each section, with provisions for padlocking.
M. Space Heaters: Factory-installed electric space heaters of sufficient wattage in each vertical section to maintain enclosure temperature above expected dew point.
   1. Space-Heater Control: Thermostats to maintain temperature of each section above expected dew point.

N. Service Entrance Rating: Switchboards intended for use as service entrance equipment shall contain from one to six service disconnecting means with overcurrent protection, a neutral bus with disconnecting link, a grounding electrode conductor terminal, and a main bonding jumper.

O. Customer Metering Compartment: A separate customer metering compartment and section with front hinged door, and section with front hinged door, for indicated metering, and current transformers for each meter. Current transformer secondary wiring shall be terminated on shorting-type terminal blocks. Include potential transformers having primary and secondary fuses with disconnecting means and secondary wiring terminated on terminal blocks.

P. Bus Transition and Incoming Pull Sections: Matched and aligned with basic switchboard.

Q. Removable, Hinged Rear Doors and Compartment Covers: Secured by captive thumb screws, for access to rear interior of switchboard.

R. Hinged Front Panels: Allow access to circuit breaker, metering, accessory, and blank compartments.

S. Buses and Connections: Three phase, four wire unless otherwise indicated.
   1. Provide phase bus arrangement A, B, C from front to back, top to bottom, and left to right when viewed from the front of the switchboard.
   3. Copper feeder circuit-breaker line connections.
   4. Load Terminals: Insulated, rigidly braced, runback bus extensions, of same material as through buses, equipped with mechanical connectors for outgoing circuit conductors. Provide load terminals for future circuit-breaker positions at full-ampere rating of circuit-breaker position.
   5. Ground Bus: 1/4-by-2-inch-hard-drawn copper of 98 percent conductivity, equipped with compression connectors for feeder and branch-circuit ground conductors.
   6. Main-Phase Buses and Equipment-Ground Buses: Uniform capacity for entire length of switchboard's main and distribution sections. Provide for future extensions from both ends.
   7. Disconnect Links:
      a. Isolate neutral bus from incoming neutral conductors.
      b. Bond neutral bus to equipment-ground bus for switchboards utilized as service equipment or separately derived systems.
   8. Neutral Buses: 100 percent of the ampacity of phase buses unless otherwise indicated, equipped with mechanical connectors for outgoing circuit neutral cables. Brace bus extensions for busway feeder neutral bus.

T. Future Devices: Equip compartments with mounting brackets, supports, bus connections, and appurtenances at full rating of circuit-breaker compartment.

U. Fungus Proofing: Permanent fungicidal treatment for overcurrent protective devices and other components including instruments and instrument transformers.
2.3 SURGE PROTECTION DEVICES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Advanced Protection Technologies Inc. (APT).
   2. Eaton.
   5. Square D; by Schneider Electric.

B. SPDs: Listed and labeled by an NRTL acceptable to authorities having jurisdiction as complying with UL 1449, Type 1 and Type 2.

C. Features and Accessories:
   1. Integral disconnect switch.
   2. Internal thermal protection that disconnects the SPD before damaging internal suppressor components.
   3. Indicator light display for protection status.
   4. Form-C contacts rated at 5 A and 250-V ac, one normally open and one normally closed, for remote monitoring of protection status. Contacts shall reverse on failure of any surge diversion module or on opening of any current-limiting device. Coordinate with building power monitoring and control system.
   5. Surge counter.

D. Peak Surge Current Rating: The minimum single-pulse surge current withstand rating per phase shall not be less than 300 kA. The peak surge current rating shall be the arithmetic sum of the ratings of the individual MOVs in a given mode.

E. Protection modes and UL 1449 VPR for grounded wye circuits with 480Y/277 V and 208Y/120 V, three-phase, four-wire circuits shall not exceed the following:
   1. Line to Neutral: 1200 V for 480Y/277 V, 700 V for 208Y/120 V.
   2. Line to Ground: 1200 V for 480Y/277 V, 1200 V for 208Y/120 V.
   3. Line to Line: 2000 V for 480Y/277 V, 1000 V for 208Y/120 V.

F. SCCR: Equal or exceed 100 kA.

G. Nominal Rating: 20 kA.

2.4 DISCONNECTING AND OVERCURRENT PROTECTIVE DEVICES

A. Molded-Case Circuit Breaker (MCCB): Comply with UL 489, with interrupting capacity to meet available fault currents.
   3. Electronic trip circuit breakers with rms sensing; field-replaceable rating plug or field-replaceable electronic trip; and the following field-adjustable settings:
      a. Instantaneous trip.
      b. Long- and short-time pickup levels.
4. GFCI Circuit Breakers: Single- and double-pole configurations with Class A ground-fault protection (6-mA trip).

5. Mccb Features and Accessories:
   a. Standard frame sizes, trip ratings, and number of poles.
   b. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge (HID) lighting circuits.
   c. Ground-Fault Protection: Integrally mounted relay and trip unit with adjustable pickup and time-delay settings, push-to-test feature, and ground-fault indicator.
   d. Zone-Selective Interlocking: Integral with electronic trip unit; for interlocking ground-fault protection function.
   e. Communication Capability: Circuit-breaker-mounted Universal-mounted Integral communication module with functions and features compatible with power monitoring and control system specified in Section 26.09.13 "Electrical Power Monitoring and Control."
   f. Shunt Trip: 120-V trip coil energized from separate circuit, set to trip at 55 percent of rated voltage.
   g. Undervoltage Trip: Set to operate at 35 to 75 percent of rated voltage without intentional time delay.
   h. Auxiliary Contacts: Two SPDT switches with "a" and "b" contacts; "a" contacts mimic circuit-breaker contacts, "b" contacts operate in reverse of circuit-breaker contacts.
   i. Key Interlock Kit: Externally mounted to prohibit circuit-breaker operation; key shall be removable only when circuit breaker is in off position.

B. Bolted-Pressure Contact Switch: Operating mechanism uses rotary-mechanical-bolting action to produce and maintain high clamping pressure on the switch blade after it engages the stationary contacts.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Eaton.
   b. SIEMENS Industry, Inc.; Energy Management Division.
   c. Square D.

2. Main-Contact Interrupting Capability: Minimum of 12 times the switch current rating.
3. Operating Mechanism: Manual handle operation to close switch; stores energy in mechanism for opening and closing.
   a. Electrical Trip: Operation of lever or push-button trip switch, or trip signal from ground-fault relay or remote-control device, causes switch to open.

4. Auxiliary Switches: Factory installed, SPDT, with leads connected to terminal block, and including one set more than quantity required for functional performance indicated.
5. Service-Rated Switches: Labeled for use as service equipment.
6. Ground-Fault Relay: Comply with UL 1053; self-powered type with mechanical ground-fault indicator, test function, tripping relay with internal memory, and three-phase current transformer/sensor.
   a. Configuration: Integrally mounted relay and trip unit with adjustable pickup and time-delay settings, push-to-test feature, and ground-fault indicator.
   b. Internal Memory: Integrates the cumulative value of intermittent arcing ground-fault currents and uses the effect to initiate tripping.
   c. No-Trip Relay Test: Permits ground-fault simulation test without tripping switch.
d. Test Control: Simulates ground fault to test relay and switch (or relay only if "no-trip" mode is selected).

7. Open-Fuse Trip Device: Arranged to trip switch open if a phase fuse opens.

C. Fused Switch: NEMA KS 1, Type HD; clips to accommodate specified fuses; lockable handle.

D. Fuses are specified in Section 26 28 13 "Fuses."

2.5 INSTRUMENTATION

A. Instrument Transformers: NEMA EI 21.1, and the following:

1. Potential Transformers: NEMA EI 21.1; 120 V, 60 Hz, single secondary; disconnecting type with integral fuse mountings. Burden and accuracy shall be consistent with connected metering and relay devices.

2. Current Transformers: NEMA EI 21.1; 5 A, 60 Hz, secondary; wound type; single secondary winding and secondary shorting device. Burden and accuracy shall be consistent with connected metering and relay devices.

3. Control-Power Transformers: Dry type, mounted in separate compartments for units larger than 3 kVA.

B. Multifunction Digital-Metering Monitor: Microprocessor-based unit suitable for three- or four-wire systems and with the following features:

1. Switch-selectable digital display of the following values with maximum accuracy tolerances as indicated:
   a. Phase Currents, Each Phase: Plus or minus 0.5 percent.
   b. Phase-to-Phase Voltages, Three Phase: Plus or minus 0.5 percent.
   c. Phase-to-Neutral Voltages, Three Phase: Plus or minus 0.5 percent.
   d. Megawatts: Plus or minus 1 percent.
   e. Megavars: Plus or minus 1 percent.
   f. Power Factor: Plus or minus 1 percent.
   g. Frequency: Plus or minus 0.1 percent.
   h. Accumulated Energy, Megawatt Hours: Plus or minus 1 percent; accumulated values unaffected by power outages up to 72 hours.
   i. Megawatt Demand: Plus or minus 1 percent; demand interval programmable from five to 60 minutes.
   j. Contact devices to operate remote impulse-totalizing demand meter.

2. Mounting: Display and control unit flush or semiflush mounted in instrument compartment door.

2.6 CONTROL POWER

A. Control Circuits: 120-V ac, supplied through secondary disconnecting devices from control-power transformer.
2.7 ACCESSORY COMPONENTS AND FEATURES

A. Accessory Set: Include tools and miscellaneous items required for overcurrent protective device test, inspection, maintenance, and operation.

B. Portable Test Set: For testing functions of solid-state trip devices without removing from switchboard. Include relay and meter test plugs suitable for testing switchboard meters and switchboard class relays.

D. Mounting Accessories: For anchors, mounting channels, bolts, washers, and other mounting accessories, comply with requirements in Section 26 05 48.16 "Seismic Controls for Electrical Systems" or manufacturer's instructions.

2.8 IDENTIFICATION

A. Presentation Media: Painted graphics in color contrasting with background color to represent bus and components, complete with lettered designations.

B. Service Equipment Label: NRTL labeled for use as service equipment for switchboards with one or more service disconnecting and overcurrent protective devices.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Receive, inspect, handle, and store switchboards according to NEMA PB 2.1.

1. Lift or move panelboards with spreader bars and manufacturer-supplied lifting straps following manufacturer's instructions.

2. Use rollers, slings, or other manufacturer-approved methods if lifting straps are not furnished.

3. Protect from moisture, dust, dirt, and debris during storage and installation.

4. Install temporary heating during storage per manufacturer's instructions.

B. Examine switchboards before installation. Reject switchboards that are moisture damaged or physically damaged.

C. Examine elements and surfaces to receive switchboards for compliance with installation tolerances and other conditions affecting performance of the Work or that affect the performance of the equipment.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install switchboards and accessories according to NEMA PB 2.1.
B. Equipment Mounting: Install switchboards on concrete base, 4-inch nominal thickness. Comply with requirements for concrete base specified in Section 03 30 00 "Cast-in-Place Concrete."

1. Install conduits entering underneath the switchboard, entering under the vertical section where the conductors will terminate. Install with couplings flush with the concrete base. Extend 2 inches above concrete base after switchboard is anchored in place.
2. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.
3. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
4. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
5. Install anchor bolts to elevations required for proper attachment to switchboards.
6. Anchor switchboard to building structure at the top of the switchboard if required or recommended by the manufacturer.

C. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, straps and brackets, and temporary blocking of moving parts from switchboard units and components.

D. Comply with mounting and anchoring requirements specified in Section 26 05 48.16 "Seismic Controls for Electrical Systems."

E. Operating Instructions: Frame and mount the printed basic operating instructions for switchboards, including control and key interlocking sequences and emergency procedures. Fabricate frame of finished wood or metal and cover instructions with clear acrylic plastic. Mount on front of switchboards.

F. Install filler plates in unused spaces of panel-mounted sections.

G. Install overcurrent protective devices, surge protection devices, and instrumentation.
   1. Set field-adjustable switches and circuit-breaker trip ranges.

H. Install spare-fuse cabinet.

I. Comply with NECA 1.

3.3 CONNECTIONS

A. Comply with requirements for terminating cable trays specified in Section 26 05 36 "Cable Trays for Electrical Systems." Drawings indicate general arrangement of cable trays, fittings, and specialties.

B. Bond conduits entering underneath the switchboard to the equipment ground bus with a bonding conductor sized per CEC 70.

C. Support and secure conductors within the switchboard according to CEC 70.

D. Extend insulated equipment grounding cable to busway ground connection and support cable at intervals in vertical run.
3.4 IDENTIFICATION

A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs complying with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."

B. Switchboard Nameplates: Label each switchboard compartment with a nameplate complying with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."

C. Device Nameplates: Label each disconnecting and overcurrent protective device and each meter and control device mounted in compartment doors with a nameplate complying with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."

3.5 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

C. Perform tests and inspections with the assistance of a factory-authorized service representative.

D. Tests and Inspections:
   1. Acceptance Testing:
      a. Test insulation resistance for each switchboard bus, component, connecting supply, feeder, and control circuit. Open control and metering circuits within the switchboard, and remove neutral connection to surge protection and other electronic devices prior to insulation test. Reconnect after test.
      b. Test continuity of each circuit.
   2. Test ground-fault protection of equipment for service equipment per CEC 70.
   4. Correct malfunctioning units on-site where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
   5. Perform the following infrared scan tests and inspections, and prepare reports:
      a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each switchboard. Remove front panels so joints and connections are accessible to portable scanner.
      b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each switchboard 11 months after date of Substantial Completion.
      c. Instruments and Equipment:
         1) Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
   6. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.

E. Switchboard will be considered defective if it does not pass tests and inspections.
F. Prepare test and inspection reports, including a certified report that identifies switchboards included and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.6 ADJUSTING

A. Adjust moving parts and operable components to function smoothly and lubricate as recommended by manufacturer.

B. Set field-adjustable circuit-breaker trip ranges as specified in Section 26 05 73 "Overcurrent Protective Device Coordination Study."

3.7 PROTECTION

A. Temporary Heating: Apply temporary heat, to maintain temperature according to manufacturer’s written instructions, until switchboard is ready to be energized and placed into service.

3.8 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain switchboards, overcurrent protective devices, instrumentation, and accessories, and to use and reprogram microprocessor-based trip, monitoring, and communication units.

END OF SECTION
SECTION 262416 - PANELBOARDS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Distribution panelboards.
   2. Lighting and appliance branch-circuit panelboards.
   3. Electronic-grade panelboards.

1.3 DEFINITIONS

A. ATS: Acceptance testing specification.
B. GFCI: Ground-fault circuit interrupter.
C. GFEP: Ground-fault equipment protection.
D. HID: High-intensity discharge.
E. MCCB: Molded-case circuit breaker.
F. SPD: Surge protective device.
G. VPR: Voltage protection rating.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of panelboard.
   1. Include materials, switching and overcurrent protective devices, SPDs, accessories, and components indicated.
   2. Include dimensions and manufacturers’ technical data on features, performance, electrical characteristics, ratings, and finishes.

B. Shop Drawings: For each panelboard and related equipment.
   1. Include dimensioned plans, elevations, sections, and details.
   2. Show tabulations of installed devices with nameplates, conductor termination sizes, equipment features, and ratings.
   3. Detail enclosure types including mounting and anchorage, environmental protection, knockouts, corner treatments, covers and doors, gaskets, hinges, and locks.
   4. Detail bus configuration, current, and voltage ratings.
   5. Short-circuit current rating of panelboards and overcurrent protective devices.
6. Include evidence of NRTL listing for SPD as installed in panelboard.
7. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.
8. Include wiring diagrams for power, signal, and control wiring.
9. Key interlock scheme drawing and sequence of operations.
10. Include time-current coordination curves for each type and rating of overcurrent protective device included in panelboards. Submit on translucent log-log graft paper; include selectable ranges for each type of overcurrent protective device. Include an Internet link for electronic access to downloadable PDF of the coordination curves.

C. Delegated Design Submittal:
   1. For arc-flash hazard study.
   2. For arc-flash labels.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For testing agency.

B. Panelboard Schedules: For installation in panelboards. Submit final versions after load balancing.

C. Provide ¼” scale drawing demonstrating that installation has been coordinated with work of other trades. Use actual dimensions from approved equipment submittals to coordinate layout and installation of transformers and components with other construction including conduit, piping, equipment, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For panelboards and components to include in emergency, operation, and maintenance manuals. In addition to items specified in Section 01785 “Operation and Maintenance Data,” include the following:
   1. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.
   2. Time-current curves, including selectable ranges for each type of overcurrent protective device that allows adjustments.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Keys: Two spares for each type of panelboard cabinet lock.
   2. Circuit Breakers Including GFCI and GFEP Types: Two spares for each panelboard.
   3. Fuses for Fused Switches: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.
   4. Fuses for Fused Power-Circuit Devices: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.
1.8 QUALITY ASSURANCE
   A. Manufacturer Qualifications: ISO 9001 or 9002 certified.

1.9 DELIVERY, STORAGE, AND HANDLING
   A. Remove loose packing and flammable materials from inside panelboards; install temporary electric heating (250 W per panelboard) to prevent condensation.

1.10 FIELD CONDITIONS
   A. Environmental Limitations:
      1. Do not deliver or install panelboards until spaces are enclosed and weathertight, wet work in spaces is complete and dry, work above panelboards is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.
      2. Rate equipment for continuous operation under the following conditions unless otherwise indicated:
         a. Ambient Temperature: Not exceeding 23 deg F to plus 104 deg F.
         b. Altitude: Not exceeding 6600 feet.
   B. Service Conditions: NEMA PB 1, usual service conditions, as follows:
      1. Ambient temperatures within limits specified.
      2. Altitude not exceeding 6600 feet.
   C. Interruption of Existing Electric Service: Do not interrupt electric service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary electric service according to requirements indicated:
      1. Notify Construction Manager no fewer than two days in advance of proposed interruption of electric service.
      2. Do not proceed with interruption of electric service without Owner's written permission.
      3. Comply with NFPA 70E.

1.11 WARRANTY
   A. Manufacturer's Warranty: Manufacturer agrees to repair or replace panelboards that fail in materials or workmanship within specified warranty period.
      1. Panelboard Warranty Period: 18 months from date of Substantial Completion.
   B. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace SPD that fails in materials or workmanship within specified warranty period.
      1. SPD Warranty Period: Five years from date of Substantial Completion.
PART 2 - PRODUCTS

2.1 PANELBOARDS COMMON REQUIREMENTS

A. Fabricate and test panelboards according to IEEE 344 to withstand seismic forces defined in Section 26 05 48.16 "Seismic Controls for Electrical Systems."

B. Product Selection for Restricted Space: Drawings indicate maximum dimensions for panelboards including clearances between panelboards and adjacent surfaces and other items. Comply with indicated maximum dimensions.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in CEC 70, by a qualified testing agency, and marked for intended location and application.

D. Comply with NEMA PB 1.

E. Comply with CEC 70.

F. Enclosures: Flush and Surface-mounted, dead-front cabinets.
   1. Rated for environmental conditions at installed location.
      a. Indoor Dry and Clean Locations: NEMA 250, Type 1.
      b. Outdoor Locations: NEMA 250, Type 3R.
      c. Other Wet or Damp Indoor Locations: NEMA 250, Type 4.
      d. Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids: NEMA 250, Type 12.
   2. Height: 90 inches to top of trim maximum.
   3. Hinged Front Cover: Entire front trim hinged to box and with standard door within hinged trim cover. Trims shall cover all live parts and shall have no exposed hardware.
   4. Skirt for Surface-Mounted Panelboards: Same gage and finish as panelboard front with flanges for attachment to panelboard, wall, and ceiling or floor.
   5. Gutter Extension and Barrier: Same gage and finish as panelboard enclosure; integral with enclosure body. Arrange to isolate individual panel sections.
   6. Finishes:
      a. Panels and Trim: Steel and galvanized steel, factory finished immediately after cleaning and pretreating with manufacturer's standard two-coat, baked-on finish consisting of prime coat and thermosetting topcoat.
      b. Back Boxes: Same finish as panels and trim.
      c. Fungus Proofing: Permanent fungicidal treatment for overcurrent protective devices and other components.

G. Incoming Mains:
   1. Location: Convertible between top and bottom.
   2. Main Breaker: Main lug interiors up to 400 amperes shall be field convertible to main breaker.

H. Phase, Neutral, and Ground Buses:
      a. Plating shall run entire length of bus.
      b. Bus shall be fully rated the entire length.
2. Interiors shall be factory assembled into a unit. Replacing switching and protective devices shall not disturb adjacent units or require removing the main bus connectors.
3. Equipment Ground Bus: Adequate for feeder and branch-circuit equipment grounding conductors; bonded to box.
4. Isolated Ground Bus: Adequate for branch-circuit isolated ground conductors; insulated from box.
5. Full-Sized Neutral: Equipped with full-capacity bonding strap for service entrance applications. Mount electrically isolated from enclosure. Do not mount neutral bus in gutter.
6. Extra-Capacity Neutral Bus: Neutral bus rated 200 percent of phase bus and listed and labeled by an NRTL acceptable to authority having jurisdiction, as suitable for nonlinear loads in electronic-grade panelboards and others designated on Drawings. Connectors shall be sized for double-sized or parallel conductors as indicated on Drawings. Do not mount neutral bus in gutter.
7. Split Bus: Vertical buses divided into individual vertical sections.

I. Conductor Connectors: Suitable for use with conductor material and sizes.
   2. Terminations shall allow use of 75 deg C rated conductors without derating.
   3. Size: Lugs suitable for indicated conductor sizes, with additional gutter space, if required, for larger conductors.
   4. Main and Neutral Lugs: Mechanical type, with a lug on the neutral bar for each pole in the panelboard.
   5. Ground Lugs and Bus-Configured Terminators: Mechanical type, with a lug on the bar for each pole in the panelboard.
   6. Feed-Through Lugs: Mechanical type, suitable for use with conductor material. Locate at opposite end of bus from incoming lugs or main device.
   7. Subfeed (Double) Lugs: Mechanical type suitable for use with conductor material. Locate at same end of bus as incoming lugs or main device.
   8. Gutter-Tap Lugs: Mechanical type suitable for use with conductor material and with matching insulating covers. Locate at same end of bus as incoming lugs or main device.

J. NRTL Label: Panelboards shall be labeled by an NRTL acceptable to authority having jurisdiction for use as service equipment with one or more main service disconnecting and overcurrent protective devices. Panelboards shall have meter enclosures, wiring, connections, and other provisions for utility metering. Coordinate with utility company for exact requirements.

K. Future Devices: Panelboards shall have mounting brackets, bus connections, filler plates, and necessary appurtenances required for future installation of devices.
   1. Percentage of Future Space Capacity: 50 percent.

L. Panelboard Short-Circuit Current Rating: Fully rated to interrupt symmetrical short-circuit current available at terminals. Assembly listed by an NRTL for 100 percent interrupting capacity.
   1. Panelboards and overcurrent protective devices rated 240 V or less shall have short-circuit ratings calculated in Section 26 05 73 Overcurrent Protective Device Short-Circuit Study, but not less than 10,000 A rms symmetrical.
   2. Panelboards and overcurrent protective devices rated above 240 V and less than 600 V shall have short-circuit ratings calculated in Section 26 05 73 Overcurrent Protective Device Short-Circuit Study, but not less than 14,000 A rms symmetrical.
2.2 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Panelboards shall withstand the effects of earthquake motions determined according to ASCE/SEI 7. Equipment anchorage is not a deferred submittal nor a delegated design item. Refer to details on drawings for anchorage requirements.

1. The term “withstand” means “the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified.”

B. Surge Suppression: Factory installed as an integral part of indicated panelboards, complying with UL 1449 SPD Type 2.

2.3 POWER PANELBOARDS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Eaton.
4. Square D; by Schneider Electric.

B. Panelboards: NEMA PB 1, distribution type.

C. Doors: Secured with vault-type latch with tumbler lock; keyed alike.

1. For doors more than 36 inches high, provide two latches, keyed alike.

D. Mains: Circuit breaker.

F. Branch Overcurrent Protective Devices for Circuit-Breaker Frame Sizes Larger than 125 A: Bolt-on circuit breakers.

2.4 LIGHTING AND APPLIANCE BRANCH-CIRCUIT PANELBOARDS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Eaton.
4. Square D; by Schneider Electric.

B. Panelboards: NEMA PB 1, lighting and appliance branch-circuit type.

C. Mains: Circuit breaker or lugs only as indicated on schedule.

D. Branch Overcurrent Protective Devices: Bolt-on circuit breakers, replaceable without disturbing adjacent units.
E. Contactors in Main Bus: NEMA ICS 2, Class A, electrically or mechanically held, general-purpose controller, with same short-circuit interrupting rating as panelboard.
   1. Internal Control-Power Source: Control-power transformer, with fused primary and secondary terminals, connected to main bus ahead of contactor connection.

F. Doors: Door-in-door construction with concealed hinges; secured with multipoint latch with tumbler lock; keyed alike. Outer door shall permit full access to the panel interior. Inner door shall permit access to breaker operating handles and labeling, but current carrying terminals and bus shall remain concealed.

2.5 DISCONNECTING AND OVERCURRENT PROTECTIVE DEVICES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Eaton.
   4. Square D; by Schneider Electric.

B. MCCB: Comply with UL 489, with interrupting capacity to meet available fault currents calculated in Section 26 05 73 Overcurrent Protective Device Short-Circuit Study.
   1. Thermal-Magnetic Circuit Breakers:
      a. Inverse time-current element for low-level overloads.
      b. Instantaneous magnetic trip element for short circuits.
      c. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.
   3. Electronic Trip Circuit Breakers:
      a. RMS sensing.
      b. Field-replaceable rating plug or electronic trip.
      c. Digital display of settings, trip targets, and indicated metering displays.
      d. Multi-button keypad to access programmable functions and monitored data.
      e. Ten-event, trip-history log. Each trip event shall be recorded with type, phase, and magnitude of fault that caused the trip.
      f. Integral test jack for connection to portable test set or laptop computer.
      g. Field-Adjustable Settings:
         1) Instantaneous trip.
         2) Long- and short-time pickup levels.
         3) Long and short time adjustments.
         4) Ground-fault pickup level, time delay, and I squared T response.
   4. GFCI Circuit Breakers: Single- and double-pole configurations with Class A ground-fault protection (6-mA trip).
   5. GFEP Circuit Breakers: Class B ground-fault protection (30-mA trip).
   8. MCCB Features and Accessories:
      a. Standard frame sizes, trip ratings, and number of poles.
      b. Breaker handle indicates tripped status.
2.7 ACCESSORY COMPONENTS AND FEATURES

A. Accessory Set: Include tools and miscellaneous items required for overcurrent protective device test, inspection, maintenance, and operation.

B. Portable Test Set: For testing functions of solid-state trip devices without removing from panelboard. Include relay and meter test plugs suitable for testing panelboard meters and switchboard class relays.
PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify actual conditions with field measurements prior to ordering panelboards to verify that equipment fits in allocated space in, and comply with, minimum required clearances specified in NFPA 70.

B. Receive, inspect, handle, and store panelboards according to NECA 407.

C. Examine panelboards before installation. Reject panelboards that are damaged, rusted, or have been subjected to water saturation.

D. Examine elements and surfaces to receive panelboards for compliance with installation tolerances and other conditions affecting performance of the Work.

E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Coordinate layout and installation of panelboards and components with other construction that penetrates walls or is supported by them, including electrical and other types of equipment, raceways, piping, encumbrances to workspace clearance requirements, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

B. Comply with NECA 1.

C. Install panelboards and accessories according to NECA 407.

D. Equipment Mounting:

1. Install panelboards on cast-in-place concrete equipment base(s). Comply with requirements for equipment bases and foundations specified in Section 03 30 00 "Cast-in-Place Concrete."

2. Attach panelboard to the vertical finished or structural surface behind the panelboard.

3. Comply with requirements for seismic control devices specified in Section 26 05 48.16 "Seismic Controls for Electrical Systems."

E. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from panelboards.

F. Comply with mounting and anchoring requirements specified in Section 26 05 48.16 "Seismic Controls for Electrical Systems."

G. Mount top of trim 90 inches above finished floor unless otherwise indicated.

H. Mount panelboard cabinet plumb and rigid without distortion of box.

I. Mount recessed panelboards with fronts uniformly flush with wall finish and mating with back box.
J. Mount surface-mounted panelboards to steel slotted supports 5/8 inch in depth. Orient steel slotted supports vertically.

K. Install overcurrent protective devices and controllers not already factory installed.
   1. Set field-adjustable, circuit-breaker trip ranges.
   2. Tighten bolted connections and circuit breaker connections using calibrated torque wrench or torque screwdriver per manufacturer's written instructions.

L. Make grounding connections and bond neutral for services and separately derived systems to ground. Make connections to grounding electrodes, separate grounds for isolated ground bars, and connections to separate ground bars.

M. Install filler plates in unused spaces.

N. Stub four 1-inch empty conduits from panelboard into accessible ceiling space or space designated to be ceiling space in the future. Stub four 1-inch empty conduits into raised floor space or below slab not on grade.

O. Arrange conductors in gutters into groups and bundle and wrap with wire ties.

P. Mount spare fuse cabinet in accessible location.

3.3 IDENTIFICATION

A. Identify field-installed conductors, interconnecting wiring, and components; install warning signs complying with requirements in Section 26 05 53 "Identification for Electrical Systems."

B. Create a directory to indicate installed circuit loads after balancing panelboard loads; incorporate Owner's final room designations. Obtain approval before installing. Handwritten directories are not acceptable. Install directory inside panelboard door.

C. Panelboard Nameplates: Label each panelboard with a nameplate complying with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."

D. Device Nameplates: Label each branch circuit device in power panelboards with a nameplate complying with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."

E. Install warning signs complying with requirements in Section 26 05 53 "Identification for Electrical Systems" identifying source of remote circuit.

3.4 FIELD QUALITY CONTROL

A. Perform tests and inspections.
   1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

B. Acceptance Testing Preparation:
   1. Test insulation resistance for each panelboard bus, component, connecting supply, feeder, and control circuit.
2. Test continuity of each circuit.

C. Tests and Inspections:
   1. Perform each visual and mechanical inspection and electrical test for low-voltage air circuit breakers and low-voltage surge arrestors stated in NETA ATS, Paragraph 7.6 Circuit Breakers. Do not perform optional tests. Certify compliance with test parameters.
   2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
   3. Perform the following infrared scan tests and inspections and prepare reports:
      a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each panelboard. Remove front panels so joints and connections are accessible to portable scanner.
      b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each panelboard 11 months after date of Substantial Completion.
      c. Instruments and Equipment:
         1) Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.

D. Panelboards will be considered defective if they do not pass tests and inspections.

E. Prepare test and inspection reports, including a certified report that identifies panelboards included and that describes scanning results, with comparisons of the two scans. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.5 ADJUSTING

A. Adjust moving parts and operable components to function smoothly and lubricate as recommended by manufacturer.

B. Set field-adjustable circuit-breaker trip ranges as specified in Section 26 05 73 "Overcurrent Protective Device Coordination Study."

3.6 PROTECTION

A. Temporary Heating: Prior to energizing panelboards, apply temporary heat to maintain temperature according to manufacturer's written instructions.

END OF SECTION
SECTION 262726 - WIRING DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Straight-blade convenience, industrial-grade, isolated-ground, and tamper-resistant receptacles.
   2. GFCI receptacles.
   3. SPD receptacles.
   4. Hazardous (classified) location receptacles.
   5. Twist-locking receptacles.
   6. Pendant cord-connector devices.
   7. Cord and plug sets.
   8. Toggle switches.
   9. Wall plates.
  10. Floor service outlets.
  11. Poke-through assemblies.
  12. Prefabricated multioutlet assemblies.

1.3 DEFINITIONS

A. Abbreviations of Manufacturers’ Names:
   1. Cooper: Cooper Wiring Devices; Division of Cooper Industries, Inc.

B. BAS: Building automation system.

C. EMI: Electromagnetic interference.

D. GFCI: Ground-fault circuit interrupter.

E. Pigtail: Short lead used to connect a device to a branch-circuit conductor.

F. RFI: Radio-frequency interference.

G. SPD: Surge protective device.

H. UTP: Unshielded twisted pair.
1.4 ACTION SUBMITTALS
   A. Samples: One for each type of device and wall plate specified, in each color specified.

1.5 INFORMATIONAL SUBMITTALS
   A. Field quality-control reports.

1.6 CLOSEOUT SUBMITTALS
   A. Operation and Maintenance Data: For wiring devices to include in all manufacturers’ packing-label warnings and instruction manuals that include labeling conditions.

PART 2 - PRODUCTS

2.1 GENERAL WIRING-DEVICE REQUIREMENTS
   A. Wiring Devices, Components, and Accessories: Listed and labeled as defined in CEC 70, by a qualified testing agency, and marked for intended location and application.
   B. Comply with CEC 70.
   C. Devices that are manufactured for use with modular plug-in connectors may be substituted under the following conditions:
      1. Connectors shall comply with UL 2459 and shall be made with stranded building wire.
      2. Devices shall comply with the requirements in this Section.
   D. Devices for Owner-Furnished Equipment:
      1. Receptacles: Match plug configurations.
      2. Cord and Plug Sets: Match equipment requirements.
   E. Source Limitations: Obtain each type of wiring device and associated wall plate from single source from single manufacturer.

2.2 STRAIGHT-BLADE RECEPCTACLES
   A. Duplex Convenience Receptacles: 125 V, 20 A; comply with NEMA WD 1, NEMA WD 6 Configuration 5-20R, UL 498, and FS W-C-596.
      1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
         a. Eaton (Arrow Hart).
         b. Hubbell Incorporated; Wiring Device-Kellems.
         c. Leviton Manufacturing Co., Inc.
         d. Pass & Seymour/Legrand (Pass & Seymour).
   B. Isolated-Ground, Duplex Convenience Receptacles: 125 V, 20 A; comply with NEMA WD 1, NEMA WD 6 Configuration 5-20R, UL 498, and FS W-C-596.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Eaton (Arrow Hart).
   b. Hubbell Incorporated; Wiring Device-Kellems.
   c. Leviton Manufacturing Co., Inc.
   d. Pass & Seymour/Legrand (Pass & Seymour).

2. Description: Straight blade; equipment grounding contacts shall be connected only to the green grounding screw terminal of the device and with inherent electrical isolation from mounting strap. Isolation shall be integral to receptacle construction and not dependent on removable parts.

C. Tamper-Resistant Convenience Receptacles: 125 V, 20 A; comply with NEMA WD 1, NEMA WD 6 Configuration 5-20R, UL 498, and FS W-C-596.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Eaton (Arrow Hart).
   b. Hubbell Incorporated; Wiring Device-Kellems.
   c. Leviton Manufacturing Co., Inc.
   d. Pass & Seymour/Legrand (Pass & Seymour).

2. Description: Labeled and complying with NFPA 70, "Health Care Facilities" Article, "Pediatric Locations" Section.

2.3 GFCI RECEPTACLES

A. General Description:

   1. 125 V, 20 A, straight blade, non-feed-through type.
   2. Comply with NEMA WD 1, NEMA WD 6 Configuration 5-20R, UL 498, UL 943 Class A, and FS W-C-596.
   3. Include indicator light that shows when the GFCI has malfunctioned and no longer provides proper GFCI protection.

B. Duplex GFCI Convenience Receptacles:

   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Eaton (Arrow Hart).
      b. Hubbell Incorporated; Wiring Device-Kellems.
      c. Leviton Manufacturing Co., Inc.
      d. Pass & Seymour/Legrand (Pass & Seymour).

C. Tamper-Resistant, Duplex GFCI Convenience Receptacles:

   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Hubbell Incorporated; Wiring Device-Kellems.
      b. Pass & Seymour/Legrand (Pass & Seymour).
2.4 SPD RECEPCTACLES

A. General Description: Comply with NEMA WD 1, NEMA WD 6 Configuration 5-20R, UL 498, UL 1449, and FS W-C-596, with integral SPD in line to ground, line to neutral, and neutral to ground.

1. 125 V, 20 A, straight-blade type.
2. SPD Components: Multiple metal-oxide varistors; with a nominal clamp-level rating of 400 V and minimum single transient pulse energy dissipation of 240 J, according to IEEE C62.41.2 and IEEE C62.45.
3. Active SPD Indication: Visual and audible, with light visible in face of device to indicate device is "active" or "no longer in service."

B. Duplex SPD Convenience Receptacles:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Eaton (Arrow Hart).
   b. Hubbell Incorporated; Wiring Device-Kellems.
   c. Leviton Manufacturing Co., Inc.
   d. Pass & Seymour/Legrand (Pass & Seymour).

C. Isolated-Ground, Duplex SPD Convenience Receptacles:

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Eaton (Arrow Hart).
   b. Hubbell Incorporated; Wiring Device-Kellems.
   c. Leviton Manufacturing Co., Inc.
   d. Pass & Seymour/Legrand (Pass & Seymour).

2. Grounding: Equipment grounding contacts shall be connected only to the green grounding screw terminal of the device and with inherent electrical isolation from mounting strap. Isolation shall be integral to receptacle construction and not dependent on removable parts.

2.5 HAZARDOUS (CLASSIFIED) LOCATION RECEPCTACLES

A. Hazardous (Classified) Locations Receptacles: Comply with NEMA FB 11 and UL 1010.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Eaton (Arrow Hart).
   b. EGS/Appleton Electric.
   c. Killark.

2.6 TWIST-LOCKING RECEPCTACLES

A. Twist-Lock, Single Convenience Receptacles: 125 V, 20 A; comply with NEMA WD 1, NEMA WD 6 Configuration L5-20R, and UL 498.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Eaton (Arrow Hart).
b. Hubbell Incorporated; Wiring Device-Kellems.
c. Leviton Manufacturing Co., Inc.
d. Pass & Seymour/Legrand (Pass & Seymour).

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Eaton (Arrow Hart).
   b. Hubbell Incorporated; Wiring Device-Kellems.
   c. Leviton Manufacturing Co., Inc.
   d. Pass & Seymour/Legrand (Pass & Seymour).
2. Grounding: Equipment grounding contacts shall be connected only to the green grounding screw terminal of the device and with inherent electrical isolation from mounting strap. Isolation shall be integral to receptacle construction and not dependent on removable parts.

2.7 PENDANT CORD-CONNECTOR DEVICES
A. Description:
1. Matching, locking-type plug and receptacle body connector.
2. NEMA WD 6 Configurations L5-20P and L5-20R, heavy-duty grade, and FS W-C-596.
4. External Cable Grip: Woven wire-mesh type made of high-strength, galvanized-steel wire strand, matched to cable diameter, and with attachment provision designed for corresponding connector.

2.8 CORD AND PLUG SETS
A. Description:
1. Match voltage and current ratings and number of conductors to requirements of equipment being connected.
2. Cord: Rubber-insulated, stranded-copper conductors, with Type SOW-A jacket; with green-insulated grounding conductor and ampacity of at least 130 percent of the equipment rating.

2.9 TOGGLE SWITCHES
A. Comply with NEMA WD 1, UL 20, and FS W-S-896.
B. Switches, 120/277 V, 20 A:
1. Single Pole:
   a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      1) Eaton (Arrow Hart).
2) Hubbell Incorporated; Wiring Device-Kellems.
3) Leviton Manufacturing Co., Inc.
4) Pass & Seymour/Legrand (Pass & Seymour).

2. Two Pole:
   a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      1) Eaton (Arrow Hart).
      2) Hubbell Incorporated; Wiring Device-Kellems.
      3) Leviton Manufacturing Co., Inc.
      4) Pass & Seymour/Legrand (Pass & Seymour).

3. Three Way:
   a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      1) Eaton (Arrow Hart).
      2) Hubbell Incorporated; Wiring Device-Kellems.
      3) Leviton Manufacturing Co., Inc.
      4) Pass & Seymour/Legrand (Pass & Seymour).

4. Four Way:
   a. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      1) Eaton (Arrow Hart).
      2) Hubbell Incorporated; Wiring Device-Kellems.
      3) Leviton Manufacturing Co., Inc.
      4) Pass & Seymour/Legrand (Pass & Seymour).

C. Pilot-Light Switches: 120/277 V, 20 A.
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Eaton (Arrow Hart).
      b. Hubbell Incorporated; Wiring Device-Kellems.
      c. Leviton Manufacturing Co., Inc.
      d. Pass & Seymour/Legrand (Pass & Seymour).
   2. Description: Single pole, with LED-lighted handle, illuminated when switch is off.

D. Key-Operated Switches: 120/277 V, 20 A.
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Eaton (Arrow Hart).
      b. Hubbell Incorporated; Wiring Device-Kellems.
      c. Leviton Manufacturing Co., Inc.
      d. Pass & Seymour/Legrand (Pass & Seymour).
   2. Description: Single pole, with factory-supplied key in lieu of switch handle.

E. Single-Pole, Double-Throw, Momentary-Contact, Center-off Switches: 120/277 V, 20 A; for use with mechanically held lighting contactors.
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
a. Eaton (Arrow Hart).
b. Hubbell Incorporated; Wiring Device-Kellems.
c. Leviton Manufacturing Co., Inc.
d. Pass & Seymour/Legrand (Pass & Seymour).

e. Key-Operated, Single-Pole, Double-Throw, Momentary-Contact, Center-off Switches: 120/277 V, 20 A; for use with mechanically held lighting contactors, with factory-supplied key in lieu of switch handle.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Eaton (Arrow Hart).
   b. Hubbell Incorporated; Wiring Device-Kellems.
   c. Leviton Manufacturing Co., Inc.
   d. Pass & Seymour/Legrand (Pass & Seymour).
   e. <Insert manufacturer's name>.

2.10 WALL PLATES

A. Single and combination types shall match corresponding wiring devices.
   1. Plate-Securing Screws: Metal with head color to match plate finish.
   2. Material for Finished Spaces: 0.035-inch-thick, satin-finished, Type 302 stainless steel.
   4. Material for Damp Locations: Cast aluminum with spring-loaded lift cover, and listed and labeled for use in wet and damp locations.

B. Wet-Location, Weatherproof Cover Plates: NEMA 250, complying with Type 3R, weather-resistant, die-cast aluminum with lockable cover.

2.11 FLOOR SERVICE FITTINGS

A. Type: Modular, flush-type, dual-service units suitable for wiring method used.

B. Compartments: Barrier separates power from voice and data communication cabling.

C. Service Plate: Round, die-cast aluminum with satin finish.

D. Power Receptacle: NEMA WD 6 Configuration 5-20R, gray finish, unless otherwise indicated.

E. Data Communication Outlet: Blank cover with bushed cable opening. Two modular, keyed, color-coded, RJ-45 jacks for twisted pair cable complying with requirements in Section 27 15 13 "Communications Copper Horizontal Cabling."

2.12 POKE-THROUGH ASSEMBLIES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Hubbell Incorporated; Wiring Device-Kellems.
   2. Pass & Seymour/Legrand (Pass & Seymour).
   3. Square D; by Schneider Electric.
   4. Wiremold / Legrand.
B. Description:
1. Factory-fabricated and wired assembly of below-floor junction box with multi-channeled, through-floor raceway/firestop unit and detachable matching floor service-outlet assembly.
2. Comply with UL 514 scrub water exclusion requirements.
3. Service-Outlet Assembly: Flush type with four simplex receptacles and space for four RJ-45 jacks complying with requirements in Section 27 15 13 "Communications Horizontal Twisted Pair Cabling."
4. Size: Selected to fit nominal 8-inch cored holes in floor and matched to floor thickness.
5. Fire Rating: Unit is listed and labeled for fire rating of floor-ceiling assembly.
6. Closure Plug: Arranged to close unused cored openings and reestablish fire rating of floor.
7. Wiring Raceways and Compartments: For a minimum of four No. 12 AWG conductors and a minimum of two, four-pair cables that comply with requirements in Section 27 15 13 "Communications Horizontal Twisted Pair Cabling."

2.13 PREFABRICATED MULTIOUTLET ASSEMBLIES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Hubbell Incorporated; Wiring Device-Kellems.
2. Wiremold / Legrand.

B. Description:
1. Two-piece surface metal raceway, with factory-wired multioutlet harness.
2. Components shall be products from single manufacturer designed for use as a complete, matching assembly of raceways and receptacles.

C. Raceway Material: Metal, with manufacturer's standard finish.

D. Monument:
1. WaterSaver pedestal electrical box with ¾" hub,
   a. Single-gang catalog number E300SA, single gang, single face.
   b. Two-gang catalog number E400SA, single gang, double face and E500SA, double gang, single face.
   c. Four-gang catalog number E600SA, double gang, double face.

2. Manufacturer:
   a. Hubbell.
   b. LeGrand.
   c. Or approved equal.

3. Pedestals shall have single-piece aluminum base and housing, integral raised threaded hub, and shall contain devices as shown on drawings. Housing finish shall be brushed.

E. Multioutlet Harness:
1. Receptacles: 20-A, 125-V, NEMA WD 6 Configuration 5-20R receptacles complying with NEMA WD 1, UL 498, and FS W-C-596.
2. Receptacle Spacing: Refer to plans.
3. Wiring: No. 12 AWG solid, Type THHN copper, multi circuit, connecting alternating receptacles.
2.14 FINISHES

A. Device Color:
1. Wiring Devices Connected to Normal Power System: As selected by Architect unless otherwise indicated or required by CEC 70 or device listing.
3. SPD Devices: Blue.
4. Isolated-Ground Receptacles: As specified above, with orange triangle on face.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Comply with NECA 1, including mounting heights listed in that standard, unless otherwise indicated.

B. Coordination with Other Trades:
1. Protect installed devices and their boxes. Do not place wall finish materials over device boxes and do not cut holes for boxes with routers that are guided by riding against outside of boxes.
2. Keep outlet boxes free of plaster, drywall joint compound, mortar, cement, concrete, dust, paint, and other material that may contaminate the raceway system, conductors, and cables.
3. Install device boxes in brick or block walls so that the cover plate does not cross a joint unless the joint is troweled flush with the face of the wall.
4. Install wiring devices after all wall preparation, including painting, is complete.

C. Conductors:
1. Do not strip insulation from conductors until right before they are spliced or terminated on devices.
2. Strip insulation evenly around the conductor using tools designed for the purpose. Avoid scoring or nicking of solid wire or cutting strands from stranded wire.
3. The length of free conductors at outlets for devices shall meet provisions of CEC 70, Article 300, without pigtails.
4. Existing Conductors:
   a. Cut back and pigtail, or replace all damaged conductors.
   b. Straighten conductors that remain and remove corrosion and foreign matter.
   c. Pigtail existing conductors is permitted, provided the outlet box is large enough.

D. Device Installation:
1. Replace devices that have been in temporary use during construction and that were installed before building finishing operations were complete.
2. Keep each wiring device in its package or otherwise protected until it is time to connect conductors.
3. Do not remove surface protection, such as plastic film and smudge covers, until the last possible moment.
4. Connect devices to branch circuits using pigtails that are not less than 6 inches in length.
5. When there is a choice, use side wiring with binding-head screw terminals. Wrap solid conductor tightly clockwise, two-thirds to three-fourths of the way around terminal screw.
6. Use a torque screwdriver when a torque is recommended or required by manufacturer.
7. When conductors larger than No. 12 AWG are installed on 20-A circuits, splice No. 12 AWG pigtails for device connections.
8. Tighten unused terminal screws on the device.
9. When mounting into metal boxes, remove the fiber or plastic washers used to hold device-mounting screws in yokes, allowing metal-to-metal contact.

E. Receptacle Orientation:
   1. Install ground pin of vertically mounted receptacles up, and on horizontally mounted receptacles to the left.

F. Device Plates: Do not use oversized or extra-deep plates. Repair wall finishes and remount outlet boxes when standard device plates do not fit flush or do not cover rough wall opening.

G. Dimmers:
   1. Install dimmers within terms of their listing.
   2. Verify that dimmers used for fan-speed control are listed for that application.
   3. Install unshared neutral conductors on line and load side of dimmers according to manufacturers’ device listing conditions in the written instructions.

H. Arrangement of Devices: Unless otherwise indicated, mount flush, with long dimension vertical and with grounding terminal of receptacles on top. Group adjacent switches under single, multigang wall plates.

I. Adjust locations of floor service outlets and service poles to suit arrangement of partitions and furnishings.

3.2 GFCI RECEPTACLES
A. Install non-feed-through-type GFCI receptacles where protection of downstream receptacles is not required.

3.3 IDENTIFICATION
A. Comply with Section 26 05 53 "Identification for Electrical Systems."
B. Identify each receptacle with panelboard identification and circuit number. Use hot, stamped, or engraved machine printing with black-filled lettering on face of plate, and durable wire markers or tags inside outlet boxes.

3.4 FIELD QUALITY CONTROL
A. Test Instrument for Convenience Receptacles: Digital wiring analyzer with digital readout or illuminated digital-display indicators of measurement.
B. Perform the following tests and inspections:
   1. Test Instrument for Convenience Receptacles: Digital wiring analyzer with digital readout or illuminated digital-display indicators of measurement.
C. Tests for Convenience Receptacles:
   1. Line Voltage: Acceptable range is 105 to 132 V.
2. Percent Voltage Drop under 15-A Load: A value of 6 percent or higher is unacceptable.
3. Ground Impedance: Values of up to 2 ohms are acceptable.
4. GFCI Trip: Test for tripping values specified in UL 1436 and UL 943.
5. Using the test plug, verify that the device and its outlet box are securely mounted.
6. Tests shall be diagnostic, indicating damaged conductors, high resistance at the circuit breaker, poor connections, inadequate fault current path, defective devices, or similar problems. Correct circuit conditions remove malfunctioning units and replace with new ones, and retest as specified above.

D. Wiring device will be considered defective if it does not pass tests and inspections.

E. Prepare test and inspection reports.

END OF SECTION
SECTION 262813 - FUSES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Cartridge fuses rated 600 V ac and less for use in the following:
   a. Control circuits.
   b. Panelboards.
   c. Switchboards.
   d. Enclosed controllers.
   e. Enclosed switches.

2. Spare-fuse cabinets.

3. E-Rated Series – Medium Voltage Fuses

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for spare-fuse cabinets. Include the following for each fuse type indicated:

1. Ambient Temperature Adjustment Information: If ratings of fuses have been adjusted to accommodate ambient temperatures, provide list of fuses with adjusted ratings.
   a. For each fuse having adjusted ratings, include location of fuse, original fuse rating, local ambient temperature, and adjusted fuse rating.
   b. Provide manufacturer's technical data on which ambient temperature adjustment calculations are based.

2. Dimensions and manufacturer's technical data on features, performance, electrical characteristics, and ratings.

4. Time-current coordination curves (average melt) and current-limitation curves (instantaneous peak let-through current) for each type and rating of fuse. Submit in electronic format suitable for use in coordination software and in PDF format.

5. Coordination charts and tables and related data.

6. Fuse sizes for elevator feeders and elevator disconnect switches.

1.4 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For fuses to include in emergency, operation, and maintenance manuals. In addition to items specified in Section 01770 "Contract Closeout Procedures," include the following:
1. Ambient temperature adjustment information.
2. Current-limitation curves for fuses with current-limiting characteristics.
3. Time-current coordination curves (average melt) and current-limitation curves (instantaneous peak let-through current) for each type and rating of fuse used on the Project. Submit in electronic format suitable for use in coordination software and in PDF format.
4. Coordination charts and tables and related data.

1.5 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.

1.6 FIELD CONDITIONS

A. Where ambient temperature to which fuses are directly exposed is less than 40 deg F or more than 100 deg F, apply manufacturer's ambient temperature adjustment factors to fuse ratings.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Bussmann, an Eaton business.
   2. Edison; a brand of Bussmann by Eaton.
   3. Littelfuse, Inc.
   4. Mersen USA.

B. Source Limitations: Obtain fuses, for use within a specific product or circuit, from single source from single manufacturer.

2.2 CARTRIDGE FUSES

A. Characteristics: NEMA FU 1, current-limiting, nonrenewable cartridge fuses with voltage ratings consistent with circuit voltages.
   1. Type RK-1: 600-V, zero- to 600-A rating, 200 kAIC, time delay.
   2. Type RK-5: 600-V, zero- to 600-A rating, 200 kAIC, time delay.
   3. Type J: 600-V, zero- to 600-A rating, 200 kAIC, time delay.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in CEC 70, by a qualified testing agency, and marked for intended location and application.

C. Comply with NEMA FU 1 for cartridge fuses.

D. Comply with CEC 70.
E. Coordinate fuse ratings with utilization equipment nameplate limitations of maximum fuse size and with system short-circuit current levels.

2.3 SPARE-FUSE CABINET

A. Characteristics: Wall-mounted steel unit with full-length, recessed piano-hinged door and key-coded cam lock and pull.
   1. Size: Adequate for storage of spare fuses specified with 15 percent spare capacity minimum.
   2. Finish: Gray, baked enamel.
   3. Identification: "SPARE FUSES" in 1-1/2-inch-high letters on exterior of door.
   4. Fuse Pullers: For each size of fuse, where applicable and available, from fuse manufacturer.

2.4 MEDIUM VOLTAGE FUSES

A. Characteristics: NEMA Standards for E-rated medium voltage fuses,
   1. E-rated fuses with time current characteristics.
   2. Provide current-limiting protection for power transformers.
   3. Provide protection for high and low fault currents.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine fuses before installation. Reject fuses that are moisture damaged or physically damaged.

B. Examine holders to receive fuses for compliance with installation tolerances and other conditions affecting performance, such as rejection features.

C. Examine utilization equipment nameplates and installation instructions. Install fuses of sizes and with characteristics appropriate for each piece of equipment.

D. Evaluate ambient temperatures to determine if fuse rating adjustment factors must be applied to fuse ratings.

E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 FUSE APPLICATIONS

A. Cartridge Fuses:
   1. Motor Branch Circuits: Class RK1 Class RK5, time delay.
   2. Other Branch Circuits: Class RK1, time delay Class RK5, time delay.
   3. Transformer current limiting protection.
3.3 INSTALLATION

A. Install fuses in fusible devices. Arrange fuses so rating information is readable without removing fuse.

B. Install spare-fuse cabinet(s) in location shown on the Drawings or as indicated in the field by Architect.

3.4 IDENTIFICATION

A. Install labels complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems" and indicating fuse replacement information inside of door of each fused switch and adjacent to each fuse block, socket, and holder.

END OF SECTION
SECTION 262816 - ENCLOSED SWITCHES AND CIRCUIT BREAKERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
   A. Section Includes:
      1. Fusible switches.
      2. Nonfusible switches.
      3. Receptacle switches.
      4. Shunt trip switches.
      5. Molded-case circuit breakers (MCCBs).
      7. Enclosures.

1.3 DEFINITIONS
   A. NC: Normally closed.
   B. NO: Normally open.
   C. SPDT: Single pole, double throw.

1.4 INFORMATIONAL SUBMITTALS
   A. Field quality-control reports.

1.5 CLOSEOUT SUBMITTALS
   A. Operation and Maintenance Data: For enclosed switches and circuit breakers to include in emergency, operation, and maintenance manuals.
      1. In addition to items specified in Section 01785 "Operation and Maintenance Data," include the following:
         a. Manufacturer's written instructions for testing and adjusting enclosed switches and circuit breakers.

1.6 MAINTENANCE MATERIAL SUBMITTALS
   A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
1. Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.
2. Fuse Pullers: Two for each size and type.

1.7 QUALITY ASSURANCE
A. Testing Agency Qualifications: Accredited by NETA.
1. Testing Agency's Field Supervisor: Currently certified by NETA to supervise on-site testing.

1.8 FIELD CONDITIONS
A. Environmental Limitations: Rate equipment for continuous operation under the following conditions unless otherwise indicated:
1. Ambient Temperature: Not less than minus 22 deg F and not exceeding 104 deg F.
2. Altitude: Not exceeding 6600 feet.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS
A. Seismic Performance: Enclosed switches and circuit breakers shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
1. The term "withstand" means "the unit will remain in place without separation of any parts from the device when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

2.2 GENERAL REQUIREMENTS
A. Source Limitations: Obtain enclosed switches and circuit breakers, overcurrent protective devices, components, and accessories, within same product category, from single manufacturer.
B. Product Selection for Restricted Space: Drawings indicate maximum dimensions for enclosed switches and circuit breakers, including clearances between enclosures, and adjacent surfaces and other items. Comply with indicated maximum dimensions.
C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in CEC 70, by an NRTL, and marked for intended location and application.
D. Comply with CEC 70.

2.3 FUSIBLE SWITCHES
A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. ABB Inc.
2. Eaton.
5. Square D; by Schneider Electric.

B. Type HD, Heavy Duty:
1. Single throw.
2. Three pole.
3. 600-V ac.
4. 1200 A and smaller.
5. UL 98 and NEMA KS 1, horsepower rated, with clips or bolt pads to accommodate specified fuses.
6. Lockable handle with capability to accept three padlocks and interlocked with cover in closed position.

C. Accessories:
1. Auxiliary Contact Kit: Two NO/NC (Form "C") auxiliary contact(s), arranged to activate before switch blades open. Contact rating - 240-V ac.
2. Hookstick Handle: Allows use of a hookstick to operate the handle.
3. Lugs: Mechanical type, suitable for number, size, and conductor material.
4. Service-Rated Switches: Labeled for use as service equipment.

2.4 NONFUSIBLE SWITCHES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Eaton.
2. General Electric Company.
4. Square D; by Schneider Electric.

B. Type HD, Heavy Duty, Three Pole, Single Throw, 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

C. Type HD, Heavy Duty, Three Pole, Double Throw, 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

D. Accessories:
1. Auxiliary Contact Kit: One NO/NC (Form "C") auxiliary contact(s), arranged to activate before switch blades open. Contact rating - 240-V ac.
2. Hookstick Handle: Allows use of a hookstick to operate the handle.
3. Lugs: Mechanical type, suitable for number, size, and conductor material.
4. Service-Rated Switches: Labeled for use as service equipment.

2.5 SHUNT TRIP SWITCHES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Bussmann, an Eaton business.
2. Littelfuse, Inc.
3. Mersen USA.

B. General Requirements: Comply with ASME A17.1, UL 50, and UL 98, with Class J fuse block and 200-kA interrupting and short-circuit current rating.

C. Type HD, Heavy-Duty, Three Pole, Single-Throw Nonfusible Switch: 600-V ac, amperage as indicated on construction documents. 30 Amp minimum; UL 98 and NEMA KS 1; integral shunt trip mechanism; horsepower rated, lockable handle with capability to accept three padlocks; interlocked with cover in closed position.

D. Control Circuit: 120-V ac; obtained from integral control power transformer, with primary and secondary fuses, with a control power source of enough capacity to operate shunt trip, pilot, indicating and control devices.

E. Accessories:
   1. Oiltight key switch for key-to-test function.
   2. Mechanically interlocked auxiliary contacts that change state when switch is opened and closed.
   3. Three-pole, double-throw, fire-alarm voltage monitoring relay complying with NFPA 72.
   4. Class R Fuse Kit: Provides rejection of other fuse types when Class R fuses are specified.
   5. Auxiliary Contact Kit: Two NO/NC (Form "C") auxiliary contact(s), arranged to activate before switch blades open. Contact rating - 240-V ac.
   6. Hookstick Handle: Allows use of a hookstick to operate the handle.
   7. Lugs: Mechanical type, suitable for number, size, and conductor material.
   8. Service-Rated Switches: Labeled for use as service equipment.

2.6 MOLDED-CASE CIRCUIT BREAKERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Eaton.
   2. General Electric Company.
   4. Square D; by Schneider Electric.

B. Circuit breakers shall be constructed using glass-reinforced insulating material. Current carrying components shall be completely isolated from the handle and the accessory mounting area.

C. Circuit breakers shall have a toggle operating mechanism with common tripping of all poles, which provides quick-make, quick-break contact action. The circuit-breaker handle shall be over center, be trip free, and reside in a tripped position between on and off to provide local trip indication. Circuit-breaker escutcheon shall be clearly marked on and off in addition to providing international I/O markings. Equip circuit breaker with a push-to-trip button, located on the face of the circuit breaker to mechanically operate the circuit-breaker tripping mechanism for maintenance and testing purposes.

D. The maximum ampere rating and UL, IEC, or other certification standards with applicable voltage systems and corresponding interrupting ratings shall be clearly marked on face of circuit breaker. Circuit breakers shall be 100 percent rated Series rating is not allowed.
E. MCCBs shall be equipped with a device for locking in the isolated position.

F. Standard: Comply with UL 489 with interrupting capacity to comply with available fault currents.

I. Electronic Trip Circuit Breakers: Field-replaceable rating plug, rms sensing, with the following field-adjustable settings:
   1. Instantaneous trip.
   2. Long- and short-time pickup levels.
   3. Long- and short-time time adjustments.
   4. Ground-fault pickup level, time delay, and I-squared t response.

J. Ground-Fault Circuit-Interrupter (GFCI) Circuit Breakers: Single- and two-pole configurations with Class A ground-fault protection (6-mA trip).

K. Ground-Fault Equipment-Protection (GFEP) Circuit Breakers: With Class B ground-fault protection (30-mA trip).

L. Features and Accessories:
   1. Standard frame sizes, trip ratings, and number of poles.
   2. Lugs: Mechanical type, suitable for number, size, trip ratings, and conductor material.
   3. Ground-Fault Protection: Comply with UL 1053; integrally mounted, self-powered type with mechanical ground-fault indicator; relay with adjustable pickup and time-delay settings, push-to-test feature, internal memory, and shunt trip unit; and three-phase, zero-sequence current transformer/sensor.
   4. Undervoltage Trip: Set to operate at 35 to 75 percent of rated voltage without intentional time delay.
   5. Auxiliary Contacts: Two SPDT switches with "a" and "b" contacts; "a" contacts mimic circuit-breaker contacts, "b" contacts operate in reverse of circuit-breaker contacts.
   6. Alarm Switch: One NC contact that operates only when circuit breaker has tripped.
   7. Zone-Selective Interlocking: Integral with electronic trip unit; for interlocking ground-fault protection function.
   8. Electrical Operator: Provide remote control for on, off, and reset operations.

2.7 ENCLOSED SWITCHES AND CIRCUIT BREAKERS

A. Enclosed Switches and Circuit Breakers: UL 489, NEMA KS 1, NEMA 250, and UL 50, to comply with environmental conditions at installed location.

B. Enclosure Finish: The enclosure shall be gray baked enamel paint, electrodeposited on cleaned, phosphatized galvannealed steel (NEMA 250 Types 3R, 12).

C. Conduit Entry: NEMA 250 Types 4, 4X, and 12 enclosures shall contain no knockouts. NEMA 250 Types 7 and 9 enclosures shall be provided with threaded conduit openings in both endwalls.
D. Operating Mechanism: The circuit-breaker operating handle shall be externally operable with
the operating mechanism being an integral part of the box, not the cover. The cover interlock
mechanism shall have an externally operated override. The override shall not permanently
disable the interlock mechanism, which shall return to the locked position once the override is
released. The tool used to override the cover interlock mechanism shall not be required to enter
the enclosure in order to override the interlock.

E. Enclosures designated as NEMA 250 Type 4, 4X stainless steel, 12, or 12K shall have a dual
cover interlock mechanism to prevent unintentional opening of the enclosure cover when the
circuit breaker is ON and to prevent turning the circuit breaker ON when the enclosure cover is
open.

F. NEMA 250 Type 7/9 enclosures shall be furnished with a breather and drain kit to allow their
use in outdoor and wet location applications.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine elements and surfaces to receive enclosed switches and circuit breakers for
compliance with installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.
   1. Commencement of work shall indicate Installer's acceptance of the areas and conditions
      as satisfactory.

3.2 PREPARATION

A. Interruption of Existing Electric Service: Do not interrupt electric service to facilities occupied by
Owner or others unless permitted under the following conditions and then only after arranging
to provide temporary electric service according to requirements indicated:
   1. Notify Construction Manager no fewer than seven days in advance of proposed
      interruption of electric service.
   2. Indicate method of providing temporary electric service.
   3. Do not proceed with interruption of electric service without Owner's written permission.
   4. Comply with NFPA 70E.

3.3 ENCLOSURE ENVIRONMENTAL RATING APPLICATIONS

A. Enclosed Switches and Circuit Breakers: Provide enclosures at installed locations with the
following environmental ratings.
   1. Indoor, Dry and Clean Locations: NEMA 250, Type 1.
   2. Outdoor Locations: NEMA 250, Type 3R
   3. Other Wet or Damp, Indoor Locations: NEMA 250, Type 4.
   4. Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids: NEMA 250, Type 12.
   5. Hazardous Areas Indicated on Drawings: NEMA 250, Type 9 with cover attached by
      Type 316 stainless steel bolts.
3.4 INSTALLATION

A. Coordinate layout and installation of switches, circuit breakers, and components with equipment served and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

B. Install individual wall-mounted switches and circuit breakers with tops at uniform height unless otherwise indicated.

C. Comply with mounting and anchoring requirements specified in Section 26 05 48.16 "Seismic Controls for Electrical Systems."

D. Install fuses in fusible devices.

E. Comply with CEC 70 and NECA 1.

3.5 IDENTIFICATION

A. Comply with requirements in Section 26 05 53 "Identification for Electrical Systems."

1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.

2. Label each enclosure with engraved metal or laminated-plastic nameplate.

3.6 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

B. Perform tests and inspections with the assistance of a factory-authorized service representative.

C. Tests and Inspections for Switches:

1. Visual and Mechanical Inspection:
   a. Inspect physical and mechanical condition.
   b. Inspect anchorage, alignment, grounding, and clearances.
   c. Verify that the unit is clean.
   d. Verify blade alignment, blade penetration, travel stops, and mechanical operation.
   e. Verify that fuse sizes and types match the Specifications and Drawings.
   f. Verify that each fuse has adequate mechanical support and contact integrity.
   g. Inspect bolted electrical connections for high resistance using one of the two following methods:
      1) Use a low-resistance ohmmeter.
         a) Compare bolted connection resistance values to values of similar connections. Investigate values that deviate from those of similar bolted connections by more than 50 percent of the lowest value.
      2) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or NETA ATS Table 100.12.
a) Bolt-torque levels shall be in accordance with manufacturer's published data. In the absence of manufacturer's published data, use NETA ATS Table 100.12.

h. Verify that operation and sequencing of interlocking systems is as described in the Specifications and shown on the Drawings.

i. Verify correct phase barrier installation.

j. Verify lubrication of moving current-carrying parts and moving and sliding surfaces.

2. Electrical Tests:

a. Perform resistance measurements through bolted connections with a low-resistance ohmmeter. Compare bolted connection resistance values to values of similar connections. Investigate values that deviate from adjacent poles or similar switches by more than 50 percent of the lowest value.

b. Measure contact resistance across each switchblade fuseholder. Drop values shall not exceed the high level of the manufacturer's published data. If manufacturer's published data are not available, investigate values that deviate from adjacent poles or similar switches by more than 50 percent of the lowest value.

c. Perform insulation-resistance tests for one minute on each pole, phase-to-phase and phase-to-ground with switch closed, and across each open pole. Apply voltage in accordance with manufacturer's published data. In the absence of manufacturer's published data, use Table 100.1 from the NETA ATS. Investigate values of insulation resistance less than those published in Table 100.1 or as recommended in manufacturer's published data.

d. Measure fuse resistance. Investigate fuse-resistance values that deviate from each other by more than 15 percent.

e. Perform ground fault test according to NETA ATS 7.14 "Ground Fault Protection Systems, Low-Voltage."

D. Tests and Inspections for Molded Case Circuit Breakers:

1. Visual and Mechanical Inspection:

a. Verify that equipment nameplate data are as described in the Specifications and shown on the Drawings.

b. Inspect physical and mechanical condition.

c. Inspect anchorage, alignment, grounding, and clearances.

d. Verify that the unit is clean.

e. Operate the circuit breaker to ensure smooth operation.

f. Inspect bolted electrical connections for high resistance using one of the two following methods:

1) Use a low-resistance ohmmeter.

   a) Compare bolted connection resistance values to values of similar connections. Investigate values that deviate from those of similar bolted connections by more than 50 percent of the lowest value.

2) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer's published data or NETA ATS Table 100.12.

   a) Bolt-torque levels shall be in accordance with manufacturer's published data. In the absence of manufacturer's published data, use NETA ATS Table 100.12.

   g. Inspect operating mechanism, contacts, and chutes in unsealed units.

   h. Perform adjustments for final protective device settings in accordance with the coordination study.
2. Electrical Tests:
   a. Perform resistance measurements through bolted connections with a low-
      resistance ohmmeter. Compare bolted connection resistance values to values of
      similar connections. Investigate values that deviate from adjacent poles or similar
      switches by more than 50 percent of the lowest value.
   b. Perform insulation-resistance tests for one minute on each pole, phase-to-phase
      and phase-to-ground with circuit breaker closed, and across each open pole. Apply
      voltage in accordance with manufacturer's published data. In the absence of
      manufacturer's published data, use Table 100.1 from the NETA ATS. Investigate
      values of insulation resistance less than those published in Table 100.1 or as
      recommended in manufacturer's published data.
   c. Perform a contact/pole resistance test. Drop values shall not exceed the high level
      of the manufacturer's published data. If manufacturer's published data are not
      available, investigate values that deviate from adjacent poles or similar switches by
      more than 50 percent of the lowest value.
   d. Perform insulation resistance tests on all control wiring with respect to ground.
      Applied potential shall be 500-V dc for 300-V rated cable and 1000-V dc for 600-V
      rated cable. Test duration shall be one minute. For units with solid state
      components, follow manufacturer's recommendation. Insulation resistance values
      shall be no less than two megohms.
   e. Determine the following by primary current injection:
      1) Long-time pickup and delay. Pickup values shall be as specified. Trip
         characteristic shall not exceed manufacturer's published time-current
         characteristic tolerance band, including adjustment factors.
      2) Short-time pickup and delay. Short-time pickup values shall be as specified.
         Trip characteristic shall not exceed manufacturer's published time-current
         characteristic tolerance band, including adjustment factors.
      3) Ground-fault pickup and time delay. Ground-fault pickup values shall be as
         specified. Trip characteristic shall not exceed manufacturer's published
         time-current characteristic tolerance band, including adjustment factors.
      4) Instantaneous pickup. Instantaneous pickup values shall be as specified
         and within manufacturer's published tolerances.
   f. Test functionality of the trip unit by means of primary current injection. Pickup
      values and trip characteristics shall be as specified and within manufacturer's
      published tolerances.
   g. Perform minimum pickup voltage tests on shunt trip and close coils in accordance
      with manufacturer's published data. Minimum pickup voltage of the shunt trip and
      close coils shall be as indicated by manufacturer.
   h. Verify correct operation of auxiliary features such as trip and pickup indicators;
      zone interlocking; electrical close and trip operation; trip-free, anti-pump function;
      and trip unit battery condition. Reset all trip logs and indicators. Investigate units
      that do not function as designed.
   i. Verify operation of charging mechanism. Investigate units that do not function as
      designed.
   3. Correct malfunctioning units on-site, where possible, and retest to demonstrate
      compliance; otherwise, replace with new units and retest.
   4. Perform the following infrared scan tests and inspections and prepare reports:
      a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days
         after Final Acceptance, perform an infrared scan of each enclosed switch and
         circuit breaker. Remove front panels so joints and connections are accessible to
         portable scanner.
b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each enclosed switch and circuit breaker 11 months after date of Substantial Completion.

c. Instruments and Equipment: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.

5. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.

E. Enclosed switches and circuit breakers will be considered defective if they do not pass tests and inspections.

F. Prepare test and inspection reports.
   1. Test procedures used.
   2. Include identification of each enclosed switch and circuit breaker tested and describe test results.
   3. List deficiencies detected, remedial action taken, and observations after remedial action.

3.7 ADJUSTING

A. Adjust moving parts and operable components to function smoothly, and lubricate as recommended by manufacturer.

B. Set field-adjustable circuit-breaker trip ranges as specified in Section 26 05 73 "Overcurrent Protective Device Coordination Study."

END OF SECTION
SECTION 263213.13 - DIESEL EMERGENCY ENGINE GENERATORS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
   A. Section includes packaged diesel engine generators for emergency use with the following features:
      1. Diesel engine.
      2. Diesel fuel-oil system.
      3. Control and monitoring.
      4. Generator overcurrent and fault protection.
      5. Generator, exciter, and voltage regulator.
      7. Outdoor engine generator enclosure.
      8. Vibration isolation devices.

   B. Related Requirements:
      1. Section 26 36 00 "Transfer Switches" for transfer switches, including sensors and relays to initiate automatic-starting and -stopping signals for engine generators.

1.3 DEFINITIONS
   A. EPS: Emergency power supply.

   B. EPSS: Emergency power supply system.

   C. Operational Bandwidth: The total variation, from the lowest to highest value of a parameter over the range of conditions indicated, expressed as a percentage of the nominal value of the parameter.

1.4 ACTION SUBMITTALS
   A. Product Data: For each type of product.
      1. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
      2. Include thermal damage curve for generator.
      3. Include time-current characteristic curves for generator protective device.
      4. Include fuel consumption in gallons per hour at 0.8 power factor at 0.5, 0.75, and 1.0 times generator capacity.
      5. Include generator efficiency at 0.8 power factor at 0.5, 0.75, and 1.0 times generator capacity.
6. Include airflow requirements for cooling and combustion air in cubic feet per minute at 0.8 power factor, with air-supply temperature of 95, 80, 70, and 50 deg F. Provide Drawings indicating requirements and limitations for location of air intake and exhausts.

7. Include generator characteristics, including, but not limited to, kilowatt rating, efficiency, reactances, and short-circuit current capability.

B. Shop Drawings:
   1. Include plans and elevations for engine generator and other components specified. Indicate access requirements affected by height of subbase fuel tank.
   2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   3. Identify fluid drain ports and clearance requirements for proper fluid drain.
   4. Design calculations for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.
   5. Vibration Isolation Base Details: Detail fabrication, including anchorages and attachments to structure and supported equipment. Include base weights.
   6. Include diagrams for power, signal, and control wiring. Complete schematic, wiring, and interconnection diagrams showing terminal markings for EPS equipment and functional relationship between all electrical components.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For installer manufacturer and testing agency.

B. Seismic Qualification Data: Certificates for engine generator, accessories, and components, from manufacturer.
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
   2. Dimensioned Outline Drawings of Equipment Unit: With engine and generator mounted on rails, identify center of gravity and total weight, supplied enclosure, external silencer, subbase-mounted fuel tank, and each piece of equipment not integral to the engine generator, and locate and describe mounting and anchorage provisions.
   3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

C. Source Quality-Control Reports: Including, but not limited to, the following:
   1. Certified summary of prototype-unit test report.
   2. Certified Test Reports: For components and accessories that are equivalent, but not identical, to those tested on prototype unit.
   4. Report of factory test on units to be shipped for this Project, showing evidence of compliance with specified requirements.
   6. Report of exhaust emissions showing compliance with applicable regulations.

D. California Diesel operation Permit.
   1. Provide and assist owner in obtaining permits to construct and operate diesel engine generator.
   2. Provide completed forms including all unit required information to owner.
3. Assist owner in submission and procurement of permits

E. Provide ¼” scale drawing demonstrating that installation has been coordinated with work of other trades. Use actual dimensions from approved equipment submittals to coordinate layout and installation of generator and components with other construction including architectural and structural elements, conduit, piping, equipment, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

F. Field quality-control reports.

G. Warranty: For special warranty.

1.9 WARRANTY

1. Warranty Period: 5 years from date of Substantial Completion.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For engine generators to include in emergency, operation, and maintenance manuals.

1. In addition to items specified in Section 01785 "Operation and Maintenance Data," include the following:
   a. List of tools and replacement items recommended to be stored at Project for ready access. Include part and drawing numbers, current unit prices, and source of supply.
   b. Operating instructions laminated and mounted adjacent to generator location.
   c. Training plan.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Fuses: One for every 10 of each type and rating, but no fewer than one of each.
2. Indicator Lamps: Two for every six of each type used, but no fewer than two of each.
3. Filters: One set each of lubricating oil, fuel, and combustion-air filters.
4. Tools: Each tool listed by part number in operations and maintenance manual.

1.8 QUALITY ASSURANCE

A. Installer Qualifications: An authorized representative who is trained and approved by manufacturer.

B. Testing Agency Qualifications: Accredited by NETA.

1. Testing Agency's Field Supervisor: Certified by NETA to supervise on-site testing.

1.9 WARRANTY

A. Manufacturer's Warranty: Manufacturer agrees to repair or replace components of packaged engine generators and associated auxiliary components that fail in materials or workmanship within specified warranty period.

1. Warranty Period: 5 years from date of Substantial Completion.
PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   2. Cummins Power Generation.

B. Source Limitations: Obtain packaged engine generators and auxiliary components from single source from single manufacturer.

2.2 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Engine generator housing, subbase fuel tank, day tank, engine generator, batteries, battery racks, silencers, load banks, sound attenuating equipment, accessories, and components shall withstand the effects of earthquake motions determined according to ASCE/SEI 7. Equipment anchorage is not a deferred submittal nor a delegated design item. Refer to details on drawings for anchorage requirements.
   1. The term "withstand" means "the unit will remain in place without separation of any parts when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."
   2. Shake-table testing shall comply with ICC-ES AC156. Testing shall be performed with all fluids at worst-case normal levels. Water shall be substituted for diesel fuel in fuel tank during test.
   3. Component Importance Factor: 1.5.

B. B11 Compliance: Comply with B11.19.

C. NFPA Compliance:
   2. Comply with NFPA 70.
   4. Comply with NFPA 110 requirements for Level 1 EPSS.

D. UL Compliance: Comply with UL 2200.

E. Engine Exhaust Emissions: Comply with EPA Tier 3 requirements and applicable state and local government requirements.

F. Noise Emission: Comply with applicable state and local government requirements for maximum noise level at adjacent property boundaries due to sound emitted by engine generator, including engine, engine exhaust, engine cooling-air intake and discharge, and other components of installation.

G. Environmental Conditions: Engine generator system shall withstand the following environmental conditions without mechanical or electrical damage or degradation of performance capability:
   1. Ambient Temperature: 41 to 104 deg F.
2. Relative Humidity: Zero to 95 percent.
3. Altitude: Sea level to 60 feet.

H. Unusual Service Conditions: Engine generator equipment and installation are required to operate under the following conditions:

2.3 ENGINE GENERATOR ASSEMBLY DESCRIPTION

A. Factory-assembled and -tested, water-cooled engine, with brushless generator and accessories.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

C. EPSS Class: Engine generator shall be classified as a Class 2 according to NFPA 110.

D. Induction Method: Turbocharged.

E. Governor: Adjustable isochronous, with speed sensing.

F. Mounting Frame: Structural steel framework to maintain alignment of mounted components without depending on concrete foundation. Provide lifting attachments sized and spaced to prevent deflection of base during lifting and moving.

1. Rigging Diagram: Inscribed on metal plate permanently attached to mounting frame to indicate location and lifting capacity of each lifting attachment and engine generator center of gravity.

G. Capacities and Characteristics:

1. Power Output Ratings: Nominal ratings as indicated at 0.8 power factor excluding power required for the continued and repeated operation of the unit and auxiliaries, with capacity as required to operate as a unit as evidenced by records of prototype testing.

2. Nameplates: For each major system component to identify manufacturer's name and address, and model and serial number of components.

H. Engine Generator Performance:

1. Steady-State Voltage Operational Bandwidth: 3 percent of rated output voltage, from no load to full load.

2. Transient Voltage Performance: Not more than 20 percent variation for 50 percent step-load increase or decrease. Voltage shall recover and remain within the steady-state operating band within three seconds.

3. Steady-State Frequency Operational Bandwidth: 0.5 percent of rated frequency, from no load to full load.

4. Steady-State Frequency Stability: When system is operating at any constant load within the rated load, there shall be no random speed variations outside the steady-state operational band and no hunting or surging of speed.

5. Transient Frequency Performance: Less than 5 percent variation for 50 percent step-load increase or decrease. Frequency shall recover and remain within the steady-state operating band within five seconds.

6. Output Waveform: At no load, harmonic content measured line to line or line to neutral shall not exceed 5 percent total and 3 percent for single harmonics. Telephone influence factor, determined according to NEMA MG 1, shall not exceed 50 percent.
7. Sustained Short-Circuit Current: For a three-phase, bolted short circuit at system output terminals, system shall supply a minimum of 250 percent of rated full-load current for not less than 10 seconds and then clear the fault automatically, without damage to generator system components.

8. Start Time: Comply with NFPA 110, Type 10 system requirements.

2.4 DIESEL ENGINE

A. Fuel: ASTM D 975 diesel fuel oil, Grade 2-D S15.

B. Rated Engine Speed: 1800 rpm.

C. Lubrication System: Engine or skid mounted.
   1. Filter and Strainer: Rated to remove 90 percent of particles 5 micrometers and smaller while passing full flow.
   2. Thermostatic Control Valve: Control flow in system to maintain optimum oil temperature. Unit shall be capable of full flow and is designed to be fail-safe.
   3. Crankcase Drain: Arranged for complete gravity drainage to an easily removable container with no disassembly and without use of pumps, siphons, special tools, or appliances.

D. Jacket Coolant Heater: Electric-immersion type, factory installed in coolant jacket system. Comply with NFPA 110 requirements for Level 1 equipment for heater capacity and with UL 499.

E. Cooling System: Closed loop, liquid cooled, with radiator factory mounted on engine generator mounting frame and integral engine-driven coolant pump.
   1. Coolant: Solution of 50 percent ethylene-glycol-based antifreeze and 50 percent water, with anticorrosion additives as recommended by engine manufacturer.
   2. Size of Radiator: Adequate to contain expansion of total system coolant, from cold start to 110 percent load condition.
   3. Temperature Control: Self-contained, thermostatic-control valve modulates coolant flow automatically to maintain optimum constant coolant temperature as recommended by engine manufacturer.
      a. Rating: 50-psig maximum working pressure with coolant at 180 deg F, and noncollapsible under vacuum.
      b. End Fittings: Flanges or steel pipe nipples with clamps to suit piping and equipment connections.

F. Muffler/Silencer: Critical type, sized as recommended by engine manufacturer and selected with exhaust piping system to not exceed engine manufacturer's engine backpressure requirements.
   1. Minimum sound attenuation of 25 dB at 500 Hz.
   2. Sound level measured at a distance of 25 feet from exhaust discharge after installation is complete shall be 78 dBA or less.

G. Air-Intake Filter: Heavy-duty, engine-mounted air cleaner with replaceable dry-filter element and "blocked filter" indicator.

H. Starting System: 12 V electric, with negative ground.
1. Components: Sized so they are not damaged during a full engine-cranking cycle, with ambient temperature at maximum specified in "Performance Requirements" Article.
2. Cranking Motor: Heavy-duty unit that automatically engages and releases from engine flywheel without binding.
3. Cranking Cycle: As required by NFPA 110 for system level specified.
4. Battery: Nickel cadmium, with capacity within ambient temperature range specified in "Performance Requirements" Article to provide specified cranking cycle at least three times without recharging.
5. Battery Cable: Size as recommended by engine manufacturer for cable length indicated. Include required interconnecting conductors and connection accessories.
6. Battery Compartment: Factory fabricated of metal with acid-resistant finish and thermal insulation. Thermostatically controlled heater shall be arranged to maintain battery above 50 deg F regardless of external ambient temperature within range specified in "Performance Requirements" Article. Include accessories required to support and fasten batteries in place. Provide ventilation to exhaust battery gases.
7. Battery Stand: Factory-fabricated, two-tier metal with acid-resistant finish designed to hold the quantity of battery cells required and to maintain the arrangement to minimize lengths of battery interconnections.
9. Battery Charger: Current-limiting, automatic-equalizing, and float-charging type designed for nickel-cadmium batteries. Unit shall comply with UL 1236 and include the following features:
   a. Operation: Equalizing-charging rate of 10 A shall be initiated automatically after battery has lost charge until an adjustable equalizing voltage is achieved at battery terminals. Unit shall then be automatically switched to a lower float-charging mode and shall continue to operate in that mode until battery is discharged again.
   b. Automatic Temperature Compensation: Adjust float and equalize voltages for variations in ambient temperature from minus 40 deg F to 140 deg F to prevent overcharging at high temperatures and undercharging at low temperatures.
   c. Automatic Voltage Regulation: Maintain constant output voltage regardless of input voltage variations up to plus or minus 10 percent.
   e. Safety Functions: Sense abnormally low battery voltage and close contacts providing low battery voltage indication on control and monitoring panel. Sense high battery voltage and loss of ac input or dc output of battery charger. Either condition shall close contacts that provide a battery-charger malfunction indication at system control and monitoring panel.
   f. Enclosure and Mounting: NEMA 250, Type 1 wall-mounted cabinet.

2.5 DIESEL FUEL-OIL SYSTEM

A. Comply with NFPA 30.

B. Main Fuel Pump: Mounted on engine to provide primary fuel flow under starting and load conditions.

C. Fuel Filtering: Remove water and contaminants larger than 1 micron.

D. Relief-Bypass Valve: Automatically regulates pressure in fuel line and returns excess fuel to source.
E. Subbase-Mounted, Double-Wall, Fuel-Oil Tank: Factory installed and piped, complying with UL 142 fuel-oil tank. Features include the following:

1. Tank level indicator.
2. Fuel-Tank Capacity: Minimum 133 percent of total fuel required for periodic maintenance operations between fuel refills, plus fuel for the hours of continuous operation for indicated EPSS class.
3. Leak detection in interstitial space.
4. Vandal-resistant fill cap.
5. Containment Provisions: Comply with requirements of authorities having jurisdiction including the following:
   a. CFC Sec. 5004.2.2.4.
   b. CFC Sec. 5004.2.2.5.
   c. CFC Sec. 5003.5.
   d. CFC Sec. 5704.2.3.1.
   e. CFC Sec. 5704.2.3.2.
   f. CFC Sec. 5704.2.7.3.2.
   g. CFC Sec. 5704.2.7.3.3.
   h. CFC Sec. 5704.4.2.4.
   i. CFC Sec. 5704.2.9.7.8.
6. Exterior walkway for generator enclosure access. Maximum height from top of access panel to walkway surface shall be 7.5 feet

2.6 CONTROL AND MONITORING

A. Automatic-Starting System Sequence of Operation: When mode-selector switch on the control and monitoring panel is in the automatic position, remote-control contacts in one or more separate automatic transfer switches initiate starting and stopping of engine generator. When mode-selector switch is switched to the on position, engine generator starts. The off position of same switch initiates engine generator shutdown. When engine generator is running, specified system or equipment failures or derangements automatically shut down engine generator and initiate alarms.

B. Provide minimum run time control set for 30 minutes, with override only by operation of a remote emergency-stop switch.

C. Comply with UL 508A.

D. Configuration: Operating and safety indications, protective devices, basic system controls, and engine gages shall be grouped in a common control and monitoring panel mounted on the engine generator. Mounting method shall isolate the control panel from engine generator vibration. Panel shall be powered from the engine generator battery.

E. Control and Monitoring Panel:

1. Digital controller with integrated LCD display, controls, and microprocessor, capable of local and remote control, monitoring, and programming, with battery backup.
2. Instruments: Located on the control and monitoring panel and viewable during operation.
   a. Engine lubricating-oil pressure gage.
   b. Engine-coolant temperature gage.
   c. DC voltmeter (alternator battery charging).
d. Running-time meter.
e. AC voltmeter, for each phase.
f. AC ammeter, for each phase.
g. AC frequency meter.
h. Generator-voltage-adjusting rheostat.

3. Controls and Protective Devices: Controls, shutdown devices, and common visual alarm indication as required by NFPA 110 for Level 1 system, including the following:
   a. Cranking control equipment.
   c. Control switch not in automatic position alarm.
   d. Overcrank alarm.
   e. Overcrank shutdown device.
   f. Low water temperature alarm.
   g. High engine temperature pre-alarm.
   h. High engine temperature.
   i. High engine temperature shutdown device.
   j. Overspeed alarm.
   k. Overspeed shutdown device.
   l. Low-fuel main tank.
      1) Low-fuel-level alarm shall be initiated when the level falls below that required for operation for the duration required for the indicated EPSS class.

   m. Coolant low-level alarm.
   n. Coolant low-level shutdown device.
   o. Coolant high-temperature alarm.
   q. Coolant high-temperature shutdown device.
   r. EPS load indicator.
   s. Battery high-voltage alarm.
   t. Low-cranking voltage alarm.
   u. Battery-charger malfunction alarm.
   v. Battery low-voltage alarm.
   w. Lamp test.
   x. Contacts for local and remote common alarm.
   y. Remote manual-stop shutdown device.
   z. Air shutdown damper alarm when used.
   aa. Air shutdown damper shutdown device when used.
   bb. Generator overcurrent-protective-device not-closed alarm.

F. Connection to Datalog:
   1. Provide connections for datalink transmission of indications to remote data terminals via ModBus LonWorks or Ethernet. Data system connections to terminals are covered in Section 26 09 13 "Electrical Power Monitoring and Control."

G. Common Remote Panel with Common Audible Alarm: Comply with NFPA 110 requirements for Level 1 systems. Include necessary contacts and terminals in control and monitoring panel. Remote panel shall be powered from the engine generator battery.

H. Remote Alarm Annunciator: Comply with NFPA 99. An LED indicator light labeled with proper alarm conditions shall identify each alarm event, and a common audible signal shall sound for each alarm condition. Silencing switch in face of panel shall silence signal without altering visual indication. Connect so that after an alarm is silenced, clearing of initiating condition will reactivate alarm until silencing switch is reset. Cabinet and faceplate are surface- or flush-mounting type to suit mounting conditions indicated.
1. Overcrank alarm.
2. Coolant low-temperature alarm.
3. High engine temperature prealarm.
4. High engine temperature alarm.
5. Low lube oil pressure alarm.
6. Overspeed alarm.
7. Low-fuel main tank alarm.
8. Low coolant level alarm.
9. Low-cranking voltage alarm.
10. Contacts for local and remote common alarm.
12. Air shutdown damper when used.
14. Control switch not in automatic position alarm.
15. Lamp test.
16. Low-cranking voltage alarm.
17. Generator overcurrent protective device not closed.

I. Supporting Items: Include sensors, transducers, terminals, relays, and other devices and include wiring required to support specified items. Locate sensors and other supporting items on engine or generator unless otherwise indicated.

J. Remote Emergency-Stop Switch: Flush; wall mounted, unless otherwise indicated; and labeled. Push button shall be protected from accidental operation.

2.7 GENERATOR OVERCURRENT AND FAULT PROTECTION

A. Overcurrent protective devices for the entire EPSS shall be coordinated to optimize selective tripping when a short circuit occurs. Coordination of protective devices shall consider both utility and EPSS as the voltage source.

1. Overcurrent protective devices for the EPSS shall be accessible only to authorized personnel.

B. Generator Circuit Breaker: Molded-case, electronic-trip type; 100 percent rated; complying with UL 489.

2. Trip Settings: Selected to coordinate with generator thermal damage curve.
3. Shunt Trip: Connected to trip breaker when engine generator is shut down by other protective devices.
4. Mounting: Adjacent to or integrated with control and monitoring panel.

C. Generator Protector: Microprocessor-based unit shall continuously monitor current level in each phase of generator output, integrate generator heating effect over time, and predict when thermal damage of alternator will occur. When signaled by generator protector or other engine generator protective devices, a shunt-trip device in the generator disconnect switch shall open the switch to disconnect the generator from load circuits. Protector performs the following functions:

1. Initiates a generator overload alarm when generator has operated at an overload equivalent to 110 percent of full-rated load for 60 seconds. Indication for this alarm is integrated with other engine generator malfunction alarms. Contacts shall be available for load shed functions.
2. Under single- or three-phase fault conditions, regulates generator to 300 percent of rated full-load current for up to 10 seconds.
3. As overcurrent heating effect on the generator approaches the thermal damage point of the unit, protector switches the excitation system off, opens the generator disconnect device, and shuts down the engine generator.
4. Senses clearing of a fault by other overcurrent devices and controls recovery of rated voltage to avoid overshoot.

D. Ground-Fault Indication: Comply with CEC 70, "Emergency System" signals for ground fault.
   1. Indicate ground fault with other engine generator alarm indications.
   2. Trip generator protective device on ground fault.

2.8 GENERATOR, EXCITER, AND VOLTAGE REGULATOR

A. Comply with NEMA MG 1.
B. Drive: Generator shaft shall be directly connected to engine shaft. Exciter shall be rotated integrally with generator rotor.
C. Electrical Insulation: Class H or Class F.
D. Stator-Winding Leads: Brought out to terminal box to permit future reconnection for other voltages if required. Provide 12-lead alternator.
E. Range: Provide broad range of output voltage by adjusting the excitation level.
F. Construction shall prevent mechanical, electrical, and thermal damage due to vibration, overspeed up to 125 percent of rating, and heat during operation at 110 percent of rated capacity.
G. Enclosure: Dripproof.
H. Instrument Transformers: Mounted within generator enclosure.
I. Voltage Regulator: Solid-state type, separate from exciter, providing performance as specified and as required by NFPA 110.
   1. Adjusting Rheostat on Control and Monitoring Panel: Provide plus or minus 5 percent adjustment of output-voltage operating band.
   2. Maintain voltage within 30 percent on one step, full load.
   3. Provide anti-hunt provision to stabilize voltage.
   4. Maintain frequency within 10 percent and stabilize at rated frequency within two seconds.
J. Strip Heater: Thermostatically controlled unit arranged to maintain stator windings above dew point.
K. Windings: Two-thirds pitch stator winding and fully linked amortisseur winding.
L. Subtransient Reactance: 12 percent, maximum.

2.9 OUTDOOR ENGINE GENERATOR ENCLOSURE

A. Description: Vandal-resistant, sound-attenuating, weatherproof steel housing, wind resistant up to 100 mph. Multiple panels shall be lockable and provide adequate access to components
requiring maintenance. Panels shall be removable by one person without tools. Instruments and control shall be mounted within enclosure.

1. Sound Attenuation Level: 25dB.

B. Description: Prefabricated or pre-engineered, galvanized-steel-clad, integral structural-steel-framed, walk-in enclosure, erected on concrete foundation.

C. Structural Design and Anchorage: Comply with ASCE/SEI 7 for wind loads of up to 115 mph. Equipment anchorage is not a deferred submittal nor a delegated design item. Refer to details on drawings for anchorage requirements.

D. Seismic Design: Comply with seismic requirements in Section 26.05.48.16 "Seismic Controls for Electrical Systems."

E. Fire Protection: Provide fire protection according to Section 26.05.48.16. Provide smoke detector in enclosure; mounted according to NFPA 72.

F. Hinged Doors: With padlocking provisions.

G. Space Heater: Thermostatically controlled and sized to prevent condensation.

H. Lighting: Provide weather-resistant LED lighting with 50-fc average maintained.

I. Thermal Insulation: Manufacturer's standard materials and thickness selected in coordination with space heater to maintain winter interior temperature within operating limits required by engine generator components.

J. Muffler Location: Within enclosure.

K. Engine-Cooling Airflow through Enclosure: Maintain temperature rise of system components within required limits when unit operates at 110 percent of rated load for two hours with ambient temperature at top of range specified in system service conditions.

1. Louvers: Fixed-engine, cooling-air inlet and discharge. Storm-proof and drainable louvers prevent entry of rain and snow.
2. Automatic Dampers: At engine cooling-air inlet and discharge. Dampers shall be closed to reduce enclosure heat loss in cold weather when unit is not operating.
3. Ventilation: Provide temperature-controlled exhaust fan interlocked to prevent operation when engine is running.

L. Interior Lights with Switch: Factory-wired, vapor-proof luminaires within housing; arranged to illuminate controls and accessible interior. Arrange for external electrical connection.

1. AC lighting system and connection point for operation when remote source is available.
2. DC lighting system for operation when remote source and generator are both unavailable.

M. Convenience Outlets: Factory-wired GFCI. Arrange for external electrical connection.

2.10 VIBRATION ISOLATION DEVICES

A. Restrained Spring Isolators: Freestanding, steel, open-spring isolators with seismic restraint.

1. Housing: Steel with resilient, vertical-limit stops to prevent spring extension due to wind loads or if weight is removed; factory-drilled baseplate bonded to 1/4-inch-thick,
elastomeric isolator pad attached to baseplate underside; and adjustable equipment-
mounting and -leveling bolt that acts as blocking during installation.
2. Outside Spring Diameter: Not less than 80 percent of compressed height of the spring at rated load.
3. Minimum Additional Travel: 50 percent of required deflection at rated load.
4. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.

B. Comply with requirements in Section 23 21 16 "Hydronic Piping Specialties" for vibration isolation and flexible connector materials for steel piping.

C. Comply with requirements in Section 23 31 00 "HVAC Metal Ducts" for vibration isolation and flexible connector materials for exhaust shroud and ductwork.

D. Vibration isolation devices shall not be used to accommodate misalignments or to make bends.

2.11 FINISHES

A. Indoor and Outdoor Enclosures and Components: Manufacturer's standard finish over corrosion-resistant pretreatment and compatible primer.

2.12 SOURCE QUALITY CONTROL

A. Prototype Testing: Factory test engine generator using same engine model, constructed of identical or equivalent components and equipped with identical or equivalent accessories.

B. Project-Specific Equipment Tests: Before shipment, factory test engine generator and other system components and accessories manufactured specifically for this Project. Perform tests at rated load and power factor. Include the following tests:
1. Test components and accessories furnished with installed unit that are not identical to those on tested prototype to demonstrate compatibility and reliability.
2. Test generator, exciter, and voltage regulator as a unit.
3. Full-load run.
4. Maximum power.
5. Voltage regulation.
6. Transient and steady-state governing.
8. Safety shutdown.
9. Provide 14 days' advance notice of tests and opportunity for observation of tests by Owner's representative.
10. Report factory test results within 10 days of completion of test.
PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas, equipment bases, and conditions, with Installer present, for compliance with requirements for installation and other conditions affecting packaged engine generator performance.

B. Examine roughing-in for piping systems and electrical connections. Verify actual locations of connections before packaged engine generator installation.

C. Do not deliver or install packaged engine generator until all permits for construction have been submitted and approved by Authority Having Jurisdiction.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Interruption of Existing Electrical Service: Do not interrupt electrical service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary electrical service according to requirements indicated:
   1. Notify Construction Manager no fewer than two working days in advance of proposed interruption of electrical service.
   2. Do not proceed with interruption of electrical service without Owner's written permission.

3.3 INSTALLATION

A. Comply with NECA 1 and NECA 404.

B. Comply with packaged engine generator manufacturers' written installation and alignment instructions and with NFPA 110.

C. Equipment Mounting:
   1. Install packaged engine generators on cast-in-place concrete equipment bases. Comply with requirements for equipment bases and foundations specified in Section 03 30 00 "Cast-in-Place Concrete."
   2. Coordinate size and location of concrete bases for packaged engine generators. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified with concrete.
   3. Install packaged engine generator with restrained spring isolators having a minimum deflection of 1 inch on 4-inch-high concrete base. Secure enclosure to anchor bolts installed in concrete bases. Concrete base construction is specified in Section 26 05 48.16 "Seismic Controls for Electrical Systems."

D. Install packaged engine generator to provide access, without removing connections or accessories, for periodic maintenance.

E. Exhaust System: Install Schedule 40 black steel piping with welded joints and connect to engine muffler. Install thimble at wall. Piping shall be same diameter as muffler outlet.
1. Piping materials and installation requirements are specified in Section 23 21 13 "Hydronic Piping."
2. Install flexible connectors and steel piping materials according to requirements in Section 23 21 16 "Hydronic Piping Specialties."
3. Insulate muffler/silencer and exhaust system components according to requirements in Section 23 07 16 "HVAC Insulation."
4. Install isolating thimbles where exhaust piping penetrates combustible surfaces with a minimum of 9 inches of clearance from combustibles.

F. Drain Piping: Install condensate drain piping to muffler drain outlet with a shutoff valve, stainless-steel flexible connector, and Schedule 40 black steel pipe with welded joints.
1. Piping materials and installation requirements are specified in Section 23 21 13 "Hydronic Piping."
2. Drain piping valves, connectors, and installation requirements are specified in Section 23 21 16 "Hydronic Piping Specialties."

G. Fuel Piping:
1. Copper and galvanized steel shall not be used in the fuel-oil piping system.

H. Electrical Wiring: Install electrical devices furnished by equipment manufacturers but not specified to be factory mounted.

3.4 CONNECTIONS

A. Piping installation requirements are specified in other Sections. Drawings indicate general arrangement of piping and specialties.

B. Connect fuel, cooling-system, and exhaust-system piping adjacent to packaged engine generator to allow space for service and maintenance.

C. Connect cooling-system water piping to engine generator and with flexible connectors.

D. Connect engine exhaust pipe to engine with flexible connector.

E. Connect fuel piping to engines with a gate valve and union and flexible connector.
   1. Additional requirements for diesel storage tanks, tank accessories, piping, valves, and specialties for fuel systems.

F. Ground equipment according to Section 26 05 26 "Grounding and Bonding for Electrical Systems."

G. Connect wiring according to Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables." Provide a minimum of one 90-degree bend in flexible conduit routed to the engine generator from a stationary element.

H. Balance single-phase loads to obtain a maximum of 10 percent unbalance between any two phases.
3.5 IDENTIFICATION

A. Identify system components according to Section 23 05 53 "Identification for HVAC Piping and Equipment" and Section 26 05 53 "Identification for Electrical Systems."

B. Install a sign indicating the generator neutral is bonded to the main service neutral at the main service location.

3.6 FIELD QUALITY CONTROL2

A. Testing Agency: Contractor will engage a qualified testing agency to perform tests and inspections.

B. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

C. Perform tests and inspections with the assistance of a factory-authorized service representative.

D. Tests and Inspections:

1. Perform tests recommended by manufacturer and in "Visual and Mechanical Inspection" and "Electrical and Mechanical Tests" subparagraphs below, as specified in the NETA ATS. Certify compliance with test parameters.
   
a. Visual and Mechanical Inspection:
      1) Compare equipment nameplate data with Drawings and the Specifications.
      2) Inspect physical and mechanical condition.
      3) Inspect anchorage, alignment, and grounding.
      4) Verify that the unit is clean.
   
b. Electrical and Mechanical Tests:
      1) Perform insulation-resistance tests according to IEEE 43.
         a) Machines Larger Than 200 hp: Test duration shall be 10 minutes. Calculate polarization index.
         b) Machines 200 hp or Less: Test duration shall be one minute. Calculate the dielectric-absorption ratio.
      2) Test protective relay devices.
      3) Verify phase rotation, phasing, and synchronized operation as required by the application.
      4) Functionally test engine shutdown for low oil pressure, overtemperature, overspeed, and other protection features as applicable.
      5) Conduct performance test according to NFPA 110.
      6) Verify correct functioning of the governor and regulator.

2. NFPA 110 Acceptance Tests: Perform tests required by NFPA 110 that are additional to those specified here, including, but not limited to, single-step full-load pickup test. Submit documentation verifying successful completion of load test with building load, or other loads to simulate the intended load, shall be continued for a minimum time required 2 hours maximum, observing and recording load changes and the resultant effect on voltage and frequency.

3. Battery Tests: Equalize charging of battery cells according to manufacturer's written instructions. Record individual cell voltages.
3.7 MAINTENANCE SERVICE

A. Engage a vendor-authorized service representative to perform maintenance service to the engine generator equipment.

B. All electrical protective relays and circuit breakers shall be set to the values recommended by the manufacturer or to the values specified in the drawings/contracts.

C. Engage a vendor-authorized service representative to perform maintenance service to the engine generator equipment.

D. Engage a vendor-authorized service representative to perform maintenance service to the engine generator equipment.

3.8 DEMONSTRATION

A. Engage a vendor-authorized service representative to perform maintenance service to the engine generator equipment.

B. Engage a vendor-authorized service representative to perform maintenance service to the engine generator equipment.

C. Engage a vendor-authorized service representative to perform maintenance service to the engine generator equipment.

D. Engage a vendor-authorized service representative to perform maintenance service to the engine generator equipment.

SECTION 263600 - TRANSFER SWITCHES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes automatic transfer switches rated 600 V and less, including the following:
   1. Bypass/isolation switches.
   2. Remote annunciator system.
   3. Remote annunciator and control system.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.
   1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for transfer switches.
   2. Include rated capacities, operating characteristics, electrical characteristics, and accessories.

B. Shop Drawings:
   1. Include plans, elevations, sections, details showing minimum clearances, conductor entry provisions, gutter space, and installed features and devices.
   2. Include material lists for each switch specified.
   3. Single-Line Diagram: Show connections between transfer switch, bypass/isolation switch, power sources, and load; and show interlocking provisions for each combined transfer switch and bypass/isolation switch.
   4. Riser Diagram: Show interconnection wiring between transfer switches, bypass/isolation switches, annunciators, and control panels.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For testing agency.

B. Seismic Qualification Data: Certificates, for transfer switches, accessories, and components, from manufacturer.
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
   2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
   3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

C. Coordination
1. Provide ¼” scale drawing demonstrating that installation has been coordinated with work of other trades. Use actual dimensions from approved equipment submittals to coordinate layout and installation of transfer switches and components with other construction including conduit, piping, equipment, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

2. Coordinate installation of wall-mounting and structure-hanging supports with actual transfer switch provided.

D. Field quality-control reports.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For each type of product to include in emergency, operation, and maintenance manuals.

1. In addition to items specified in Section 01785 "Operation and Maintenance Data," include the following:
   a. Features and operating sequences, both automatic and manual.
   b. List of all factory settings of relays; provide relay-setting and calibration instructions, including software, where applicable.

1.6 QUALITY ASSURANCE

A. Testing Agency Qualifications:

1. Member Company of NETA.
   a. Testing Agency's Field Supervisor: Certified by NETA to supervise on-site testing.

1.7 FIELD CONDITIONS

A. Interruption of Existing Electrical Service: Do not interrupt electrical service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary electrical service:

1. Notify Construction Manager no fewer than two days in advance of proposed interruption of electrical service.
2. Do not proceed with interruption of electrical service without Owner's written permission.

1.8 WARRANTY

A. Manufacturer's Warranty: Manufacturer agrees to repair or replace components of transfer switch or transfer switch components that fail in materials or workmanship within specified warranty period.

1. Warranty Period: Two years from date of Substantial Completion.
PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in CEC 70, by a qualified testing agency, and marked for intended location and application.

B. Comply with NEMA ICS 1.

C. Comply with NFPA 110.

D. Comply with UL 1008 unless requirements of these Specifications are stricter.

E. Indicated Current Ratings: Apply as defined in UL 1008 for continuous loading and total system transfer, including tungsten filament lamp loads not exceeding 30 percent of switch ampere rating, unless otherwise indicated.

F. Tested Fault-Current Closing and Short-Circuit Ratings: Adequate for duty imposed by protective devices at installation locations in Project under the fault conditions indicated, based on testing according to UL 1008.
   1. Short-time withstand capability for three cycles.

G. Repetitive Accuracy of Solid-State Controls: All settings shall be plus or minus 2 percent or better over an operating temperature range of minus 20 to plus 70 deg C.

H. Resistance to Damage by Voltage Transients: Components shall meet or exceed voltage-surge withstand capability requirements when tested according to IEEE C62.62. Components shall meet or exceed voltage-impulse withstand test of NEMA ICS 1.

I. Electrical Operation: Accomplish by a nonfused, momentarily energized solenoid or electric-motor-operated mechanism. Switches for emergency or standby purposes shall be mechanically and electrically interlocked in both directions to prevent simultaneous connection to both power sources unless closed transition.

J. Neutral Switching: Where four-pole switches are indicated, provide overlapping neutral contacts.

K. Annunciation, Control, and Programming Interface Components: Devices at transfer switches for communicating with remote programming devices, annunciators, or annunciator and control panels shall have communication capability matched with remote device.

L. Factory Wiring: Train and bundle factory wiring and label, consistent with Shop Drawings, by color-code or by numbered or lettered wire and cable shrinkable sleeve markers at terminations. Color-coding and wire and cable markers are specified in Section 26 05 53 "Identification for Electrical Systems."
   1. Designated Terminals: Pressure type, suitable for types and sizes of field wiring indicated.
   2. Power-Terminal Arrangement and Field-Wiring Space: Suitable for top, side, or bottom entrance of feeder conductors as indicated.
   3. Control Wiring: Equipped with lugs suitable for connection to terminal strips.
   4. Accessible via front access.
2.2 CONTACTOR-TYPE AUTOMATIC TRANSFER SWITCHES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. ASCO
   2. Eaton.
   3. Emerson.
   4. GE Zenith Controls.
   5. Russelectric, Inc.

B. Comply with Level 1 equipment according to NFPA 110.

C. Switch Characteristics: Designed for continuous-duty repetitive transfer of full-rated current between active power sources.
   1. Switch Action: Double throw; mechanically held in both directions.
   2. Contacts: Silver composition or silver alloy for load-current switching. Contactor-style automatic transfer-switch units, rated 600 A and higher, shall have separate arcing contacts.
   3. Conductor Connectors: Suitable for use with conductor material and sizes.
   5. Main and Neutral Lugs: Compression type.
   7. Connectors shall be marked for conductor size and type according to UL 1008.

D. Automatic Delayed-Transition Transfer Switches: Pauses or stops in intermediate position to momentarily disconnect both sources, with transition controlled by programming in the automatic transfer-switch controller. Interlocked to prevent the load from being closed on both sources at the same time.
   1. Adjustable Time Delay: For override of normal-source voltage sensing to delay transfer and engine start signals for alternative source. Adjustable from zero to six seconds, and factory set for one second.
   2. Sources shall be mechanically and electrically interlocked to prevent closing both sources on the load at the same time.
   3. Fully automatic break-before-make operation with transfer when two sources have near zero phase difference.

E. Manual Switch Operation: Under load, with door closed and with either or both sources energized. Transfer time is same as for electrical operation. Control circuit automatically disconnects from electrical operator during manual operation.

F. Signal-Before-Transfer Contacts: A set of normally open/normally closed dry contacts operates in advance of retransfer to normal source. Interval shall be adjustable from 1 to 30 seconds.

G. Digital Communication Interface: Matched to capability of remote annunciator or annunciator and control panel.

H. Automatic Transfer-Switch Controller Features:
   1. Controller operates through a period of loss of control power.
2. Undervoltage Sensing for Each Phase of Normal and Alternate Source: Sense low phase-to-ground voltage on each phase. Pickup voltage shall be adjustable from 85 to 100 percent of nominal, and dropout voltage shall be adjustable from 75 to 98 percent of pickup value. Factory set for pickup at 90 percent and dropout at 85 percent.

3. Voltage/Frequency Lockout Relay: Prevent premature transfer to generator. Pickup voltage shall be adjustable from 85 to 100 percent of nominal. Factory set for pickup at 90 percent. Pickup frequency shall be adjustable from 90 to 100 percent of nominal. Factory set for pickup at 95 percent.

4. Time Delay for Retransfer to Normal Source: Adjustable from zero to 30 minutes, and factory set for 10 minutes. Override shall automatically defeat delay on loss of voltage or sustained undervoltage of emergency source, provided normal supply has been restored.

5. Test Switch: Simulate normal-source failure.

6. Switch-Position Pilot Lights: Indicate source to which load is connected.

   a. Normal Power Supervision: Green light with nameplate engraved "Normal Source Available."

8. Unassigned Auxiliary Contacts: Two normally open, single-pole, double-throw contacts for each switch position, rated 10 A at 240-V ac.

9. Transfer Override Switch: Overrides automatic retransfer control so transfer switch will remain connected to emergency power source regardless of condition of normal source. Pilot light indicates override status.

10. Engine Starting Contacts: One isolated and normally closed, and one isolated and normally open; rated 10 A at 32-V dc minimum.

11. Engine Shutdown Contacts: Time delay adjustable from zero to five minutes, and factory set for five minutes. Contacts shall initiate shutdown at remote engine-generator controls after retransfer of load to normal source.

12. Engine-Generator Exerciser: Solid-state, programmable-time switch starts engine generator and transfers load to it from normal source for a preset time, then retransfers and shuts down engine after a preset cool-down period. Initiates exercise cycle at preset intervals adjustable from 7 to 30 days. Running periods shall be adjustable from 10 to 30 minutes. Factory settings shall be for 7-day exercise cycle, 20-minute running period, and 5-minute cool-down period. Exerciser features include the following:
   a. Exerciser Transfer Selector Switch: Permits selection of exercise with and without load transfer.
   b. Push-button programming control with digital display of settings.
   c. Integral battery operation of time switch when normal control power is unavailable.

I. Large-Motor-Load Power Transfer:

1. Motor Disconnect and Timing Relay Controls: Designated starters in loss of power scenario shall disconnect motors before transfer and reconnect them selectively at an adjustable time interval after transfer. Control connection to motor starters shall be through wiring external to automatic transfer switch. Provide adjustable time delay between 1 and 60 seconds for reconnecting individual motor loads. Provide relay contacts rated for motor-control circuit inrush and for actual seal currents to be encountered.

2. Programmed Neutral Switch Position: Switch operator with programmed neutral position arranged to provide a midpoint between the two working switch positions, with an intentional, time-controlled pause at midpoint during transfer. Adjustable pause from 0.5 to 30 seconds minimum, and factory set for 0.5 second unless otherwise indicated. Time delay occurs for both transfer directions. Disable pause unless both sources are live.
2.3 TRANSFER SWITCH ACCESSORIES

A. Bypass/Isolation Switches:
   1. Source Limitations: Same manufacturer as transfer switch in which installed.
   2. Comply with requirements for Level 1 equipment according to NFPA 110.
   3. Description: Manual type, arranged to select and connect either source of power directly to load, isolating transfer switch from load and from both power sources. Include the following features for each combined automatic transfer switch and bypass/isolation switch:
      a. Means to lock bypass/isolation switch in the position that isolates transfer switch with an arrangement that permits complete electrical testing of transfer switch while isolated. Interlocks shall prevent transfer-switch operation, except for testing or maintenance, while automatic transfer switch is isolated.
      b. Provide means to make power available to transfer-switch control circuit for testing and maintenance purposes.
      c. Drawout Arrangement for Transfer Switch: Provide physical separation from live parts and accessibility for testing and maintenance operations. Transfer switch and bypass/isolation switch shall be in isolated compartments.
      d. Transition: Provide closed-transition operation when transferring from main transfer switch to bypass/isolation switch on the same power source.
      e. Transition: Provide open-transition operation when transferring between power sources.
      f. Bypass/Isolation Switch Current, Voltage, Closing, and Short-Circuit Withstand Ratings: Equal to or greater than those of associated automatic transfer switch, and with same phase arrangement and number of poles.
      g. Contact temperatures of bypass/isolation switches shall not exceed those of automatic transfer-switch contacts when they are carrying rated load.
      h. Automatic and Nonautomatic Control: Automatic transfer-switch controller shall also control the bypass/isolation switch.
      i. Legend: Manufacturer's standard legend for control labels and instruction signs shall describe operating instructions.
      j. Maintainability: Fabricate to allow convenient removal of major components from front without removing other parts or main power conductors.
   4. Interconnection of Bypass/Isolation Switches with Automatic Transfer Switches: Factory-installed copper bus bars; plated at connection points and braced for the indicated available short-circuit current.

B. Remote Annunciator System:
   1. Source Limitations: Same manufacturer as transfer switch in which installed.
   2. Functional Description: Remote annunciator panel shall annunciate conditions for indicated transfer switches.
   3. Annunciation panel display shall include the following indicators:
      a. Sources available, as defined by actual pickup and dropout settings of transfer-switch controls.
      b. Switch position.
      c. Switch in test mode.
      d. Failure of communication link.
      a. Indicating Lights: Grouped for each transfer switch monitored.
      b. Label each group, indicating transfer switch it monitors, location of switch, and identity of load it serves.
      c. Mounting: Flush, modular, steel cabinet unless otherwise indicated.
d. Lamp Test: Push-to-test or lamp-test switch on front panel.

C. Remote Annunciator and Control System:

1. Source Limitations: Same manufacturer as transfer switch in which installed.
2. Include the following functions for indicated transfer switches:
   a. Indication of sources available, as defined by actual pickup and dropout settings of transfer-switch controls.
   b. Indication of switch position.
   c. Indication of switch in test mode.
   d. Indication of failure of digital communication link.
   e. Key-switch or user-code access to control functions of panel.
   f. Control of switch-test initiation.
   g. Control of time-delay bypass for transfer to normal source.

3. Malfunction of annunciator, annunciation and control panel, or communication link shall not affect functions of automatic transfer switch. In the event of failure of communication link, automatic transfer switch automatically shall revert to standalone, self-contained operation. Automatic transfer-switch sensing, controlling, or operating function shall not depend on remote panel for proper operation.

4. Remote Annunciation and Control Panel: Solid-state components. Include the following features:
   a. Controls and indicating lights grouped together for each transfer switch.
   b. Label each indicating light control group. Indicate transfer switch it controls, location of switch, and load it serves.
   c. Digital Communication Capability: Matched to that of transfer switches supervised.
   d. Mounting: Flush, modular, steel cabinet unless otherwise indicated.

2.4 SOURCE QUALITY CONTROL

A. Factory Tests: Test and inspect components, assembled switches, and associated equipment according to UL 1008. Ensure proper operation. Check transfer time and voltage, frequency, and time-delay settings for compliance with specified requirements. Perform dielectric strength test complying with NEMA ICS 1.

B. Prepare test and inspection reports.

1. For each of the tests required by UL 1008, performed on representative devices, for emergency systems. Include results of test for the following conditions:
   a. Overvoltage.
   b. Undervoltage.
   c. Loss of supply voltage.
   d. Reduction of supply voltage.
   e. Alternative supply voltage or frequency is at minimum acceptable values.
   f. Temperature rise.
   g. Dielectric voltage-withstand; before and after short-circuit test.
   h. Overload.
   i. Contact opening.
   j. Endurance.
   k. Short circuit.
   l. Short-time current capability.
   m. Receptacle withstand capability.
   n. Insulating base and supports damage.
PART 3 - EXECUTION

3.1 INSTALLATION

A. Floor-Mounting Switch: Anchor to floor by bolting.
   1. Install transfer switches on cast-in-place concrete equipment base(s). Comply with requirements for equipment bases and foundations specified in Section 03 30 00 "Cast-in-Place Concrete."
   2. Comply with requirements for seismic control devices specified in Section 26 05 48.16 "Seismic Controls for Electrical Systems."
   4. Provide workspace and clearances required by CEC 70.

B. Annunciator and Control Panel Mounting: Flush in wall unless otherwise indicated.

C. Identify components according to Section 26 05 53 "Identification for Electrical Systems."

D. Set field-adjustable intervals and delays, relays, and engine exerciser clock.

E. Comply with NECA 1.

3.2 CONNECTIONS

A. Wiring to Remote Components: Match type and number of cables and conductors to generator sets, control, and communication requirements of transfer switches as recommended by manufacturer. Increase raceway sizes at no additional cost to Owner if necessary to accommodate required wiring.

B. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii.

C. Ground equipment according to Section 26 05 26 "Grounding and Bonding for Electrical Systems."

D. Connect wiring according to Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables."

E. Route and brace conductors according to manufacturer's written instructions. Do not obscure manufacturer's markings and labels.

F. Brace and support equipment according to Section 26 05 48.16 "Seismic Controls for Electrical Systems."

3.3 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.
C. Perform the following tests and inspections with the assistance of a factory-authorized service representative:

1. After installing equipment, test for compliance with requirements according to NETA ATS.
2. Visual and Mechanical Inspection:
   a. Compare equipment nameplate data with Drawings and Specifications.
   b. Inspect physical and mechanical condition.
   c. Inspect anchorage, alignment, grounding, and required clearances.
   d. Verify that the unit is clean.
   e. Verify appropriate lubrication on moving current-carrying parts and on moving and sliding surfaces.
   f. Verify that manual transfer warnings are attached and visible.
   g. Verify tightness of all control connections.
   h. Inspect bolted electrical connections for high resistance using one of the following methods, or both:
      1) Use of low-resistance ohmmeter.
      2) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method according to manufacturer's published data.
   i. Perform manual transfer operation.
   j. Verify positive mechanical interlocking between normal and alternate sources.
   k. Perform visual and mechanical inspection of surge arresters.
   l. Inspect control power transformers.
      1) Inspect for physical damage, cracked insulation, broken leads, tightness of connections, defective wiring, and overall general condition.
      2) Verify that primary and secondary fuse or circuit-breaker ratings match Drawings.
      3) Verify correct functioning of drawout disconnecting contacts, grounding contacts, and interlocks.

3. Electrical Tests:
   a. Perform insulation-resistance tests on all control wiring with respect to ground.
   b. Perform a contact/pole-resistance test. Compare measured values with manufacturer's acceptable values.
   c. Verify settings and operation of control devices.
   d. Calibrate and set all relays and timers.
   e. Verify phase rotation, phasing, and synchronized operation.
   f. Perform automatic transfer tests.
   g. Verify correct operation and timing of the following functions:
      1) Normal source voltage-sensing and frequency-sensing relays.
      2) Engine start sequence.
      3) Time delay on transfer.
      4) Alternative source voltage-sensing and frequency-sensing relays.
      5) Automatic transfer operation.
      6) Interlocks and limit switch function.
      7) Time delay and retransfer on normal power restoration.
      8) Engine cool-down and shutdown feature.

   a. Check for electrical continuity of circuits and for short circuits.
b. Inspect for physical damage, proper installation and connection, and integrity of barriers, covers, and safety features.
c. Verify that manual transfer warnings are properly placed.
d. Perform manual transfer operation.

5. After energizing circuits, perform each electrical test for transfer switches stated in NETA ATS and demonstrate interlocking sequence and operational function for each switch at least three times.
   a. Simulate power failures of normal source to automatic transfer switches and retransfer from emergency source with normal source available.
   b. Simulate loss of phase-to-ground voltage for each phase of normal source.
   c. Verify time-delay settings.
   d. Verify pickup and dropout voltages by data readout or inspection of control settings.
   e. Test bypass/isolation unit functional modes and related automatic transfer-switch operations.
   f. Perform contact-resistance test across main contacts and correct values exceeding 500 microhms and values for one pole deviating by more than 50 percent from other poles.
   g. Verify proper sequence and correct timing of automatic engine starting, transfer time delay, retransfer time delay on restoration of normal power, and engine cool-down and shutdown.

   a. Verify grounding connections and locations and ratings of sensors.

D. Coordinate tests with tests of generator and run them concurrently.

E. Report results of tests and inspections in writing. Record adjustable relay settings and measured insulation and contact resistances and time delays. Attach a label or tag to each tested component indicating satisfactory completion of tests.

F. Transfer switches will be considered defective if they do not pass tests and inspections.

G. Remove and replace malfunctioning units and retest as specified above.

H. Prepare test and inspection reports.

I. Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each switch. Remove all access panels so joints and connections are accessible to portable scanner.
   1. Instrument: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
   2. Record of Infrared Scanning: Prepare a certified report that identifies switches checked and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.
   3. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each switch 11 months after date of Substantial Completion.
3.4 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain transfer switches and related equipment.

B. Training shall include testing ground-fault protective devices and instructions to determine when the ground-fault system shall be retested. Include instructions on where ground-fault sensors are located and how to avoid negating the ground-fault protection scheme during testing and circuit modifications.

C. Coordinate this training with that for generator equipment.

END OF SECTION
SECTI0N 264313 - SURGE PROTECTION FOR LOW-VOLTAGE ELECTRICAL POWER CIRCUITS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
   A. Section includes field-mounted SPDs for low-voltage (120 to 600 V) power distribution and control equipment.
   B. Related Requirements:
      1. Section 262413 "Switchboards" for factory-installed SPDs.
      2. Section 262416 "Panelboards" for factory-installed SPDs.

1.3 DEFINITIONS
   A. Inominal: Nominal discharge current.
   B. MCOV: Maximum continuous operating voltage.
   C. Mode(s), also Modes of Protection: The pair of electrical connections where the VPR applies.
   D. MOV: Metal-oxide varistor; an electronic component with a significant non-ohmic current-voltage characteristic.
   E. OCPD: Overcurrent protective device.
   F. SCCR: Short-circuit current rating.
   G. SPD: Surge protective device.
   H. VPR: Voltage protection rating.

1.4 ACTION SUBMITTALS
   A. Product Data: For each type of product.
      1. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
      2. Copy of UL Category Code VZCA certification, as a minimum, listing the tested values for VPRs, Inominal ratings, MCOVs, type designations, OCPD requirements, model numbers, system voltages, and modes of protection.
1.5  COORDINATION

A. Provide ¼” scale drawing demonstrating that installation has been coordinated with work of other trades. Use actual dimensions from approved equipment submittals to coordinate layout and installation of SPD with panelboard, switchgear, transformers and components with other construction including conduit, piping, equipment, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

1.6  INFORMATIONAL SUBMITTALS

A. Field quality-control reports.

B. Sample Warranty: For manufacturer's special warranty.

1.7  CLOSEOUT SUBMITTALS

A. Maintenance Data: For SPDs to include in maintenance manuals.

1.8  WARRANTY

A. Manufacturer's Warranty: Manufacturer agrees to replace or replace SPDs that fail in materials or workmanship within specified warranty period.

1. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1  GENERAL SPD REQUIREMENTS

A. SPD with Accessories: Listed and labeled as defined in CEC 70, by a qualified testing agency, and marked for intended location and application.

B. Comply with CEC 70.

C. Comply with UL 1449.

D. MCOV of the SPD shall be the nominal system voltage.

2.2  SERVICE ENTRANCE AND TRANSFER SWITCH SUPPRESSOR

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. ABB USA.
3. Current Technology Inc.
4. Eaton.
5. General Electric Company.
6. Intermatic, Inc.
7. Leviton Manufacturing Co., Inc.
8. Schneider Electric USA, Inc.
10. Square D; by Schneider Electric.

B. SPDs: Listed and labeled by an NRTL acceptable to authorities having jurisdiction as complying with UL 1449, Type 1 and Type 2

1. SPDs with the following features and accessories:
   a. Integral disconnect switch.
   b. Internal thermal protection that disconnects the SPD before damaging internal suppressor components.
   c. Indicator light display for protection status.
   d. Form-C contacts rated at 5 A and 250-V ac, one normally open and one normally closed, for remote monitoring of protection status. Contacts shall reverse on failure of any surge diversion module or on opening of any current-limiting device. Coordinate with building power monitoring and control system.
   e. Surge counter.

C. Peak Surge Current Rating: The minimum single-pulse surge current withstand rating per phase shall not be less than 320 kA. The peak surge current rating shall be the arithmetic sum of the ratings of the individual MOVs in a given mode.

D. Protection modes and UL 1449 VPR for grounded wye circuits with 480Y/277 V and 208Y/120 V, three-phase, four-wire circuits shall not exceed the following:

1. Line to Neutral: 1200 V for 480Y/277 V, 700 V for 208Y/120 V.
2. Line to Ground: 1200 V for 480Y/277 V, 1200 V for 208Y/120 V.
3. Line to Line: 2000 V for 480Y/277 V, 1000 V for 208Y/120 V.

E. SCCR: Equal or exceed 200 kA.

F. Nominal Rating: 20 kA.

2.3 PANEL SUPPRESSORS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. ABB USA.
3. Current Technology Inc.
4. Eaton.
5. General Electric Company.
6. Intermatic, Inc.
7. Leviton Manufacturing Co., Inc.
8. Liebert; a brand of Emerson Electric Co.
9. Schneider Electric USA, Inc.
11. Square D; by Schneider Electric.
12. SSI, an ILSCO Company.

B. SPDs: Comply with UL 1449, Type 2.

1. Include LED indicator lights for power and protection status.
2. Internal thermal protection that disconnects the SPD before damaging internal suppressor components.
3. Include Form-C contacts rated at 5 A and 250-V ac, one normally open and one normally closed, for remote monitoring of protection status. Contacts shall reverse on failure of any surge diversion module or on opening of any current-limiting device. Coordinate with building power monitoring and control system.

C. Peak Surge Current Rating: The minimum single-pulse surge current withstand rating per phase shall not be less than 100 kA. The peak surge current rating shall be the arithmetic sum of the ratings of the individual MOVs in a given mode.

D. Protection modes and UL 1449 VPR for grounded wye circuits with 480Y/277 V and 208Y/120 V, three-phase, four-wire circuits shall not exceed the following:
   1. Line to Neutral: 1200 V for 480Y/277 V, 700 V for 208Y/120 V.
   2. Line to Ground: 1200 V for 480Y/277 V, 700 V for 208Y/120 V.
   3. Neutral to Ground: 1200 V for 480Y/277 V, 700 V for 208Y/120 V.

E. SCCR: Equal or exceed 100 kA.
F. Nominal Rating: 10 kA.

2.4 ENCLOSURES

A. Indoor Enclosures: NEMA 250, Type 1.
B. Outdoor Enclosures: NEMA 250, Type 3R.

2.5 CONDUCTORS AND CABLES

A. Power Wiring: Same size as SPD leads, complying with Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

PART 3 - EXECUTION

3.1 INSTALLATION

A. Comply with NECA 1.
B. Install an OCPD or disconnect as required to comply with the UL listing of the SPD.
C. Install SPDs with conductors between suppressor and points of attachment as short and straight as possible, and adjust circuit-breaker positions to achieve shortest and straightest leads. Do not splice and extend SPD leads unless specifically permitted by manufacturer. Do not exceed manufacturer's recommended lead length. Do not bond neutral and ground.
D. Use crimped connectors and splices only. Wire nuts are unacceptable.
E. Wiring:
1. Power Wiring: Comply with wiring methods in Section 260519 "Low-Voltage Electrical Power Conductors and Cables."
2. Controls: Comply with wiring methods in Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

3.2 FIELD QUALITY CONTROL

A. Perform the following tests and inspections with the assistance of a factory-authorized service representative.
   1. Compare equipment nameplate data for compliance with Drawings and Specifications.
   2. Inspect anchorage, alignment, grounding, and clearances.
   3. Verify that electrical wiring installation complies with manufacturer's written installation requirements.

B. An SPD will be considered defective if it does not pass tests and inspections.

C. Prepare test and inspection reports.

3.3 STARTUP SERVICE

A. Complete startup checks according to manufacturer's written instructions.

B. Do not perform insulation-resistance tests of the distribution wiring equipment with SPDs installed. Disconnect SPDs before conducting insulation-resistance tests, and reconnect them immediately after the testing is over.

C. Energize SPDs after power system has been energized, stabilized, and tested.

3.4 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to operate and maintain SPDs.

END OF SECTION
SECTION 265119 - LED INTERIOR LIGHTING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes the following types of LED luminaires:
   1. Materials.
   2. Finishes.
   3. Luminaire support.

B. Related Requirements:
   1. Section 26 09 23.02 "Lighting Control Devices" for automatic control of lighting, including time switches, photoelectric relays, occupancy sensors, and multipole lighting relays and contactors.

1.3 DEFINITIONS

A. CCT: Correlated color temperature.

B. CRI: Color Rendering Index.

C. Fixture: See "Luminaire."

D. IP: International Protection or Ingress Protection Rating.

E. LED: Light-emitting diode.

F. Lumen: Measured output of lamp and luminaire, or both.

G. Luminaire: Complete lighting unit, including lamp, reflector, and housing.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.
   1. Arrange in order of luminaire designation.
   2. Include data on features, accessories, and finishes.
   3. Include physical description and dimensions of luminaires.
   4. Include emergency lighting units, including batteries and chargers.
   5. Include life, output (lumens, CCT, and CRI), and energy efficiency data.
   6. Photometric data and adjustment factors based on laboratory tests, complying with IES Lighting Measurements Testing and Calculation Guides, of each luminaire type. The
adjustment factors shall be for lamps and accessories identical to those indicated for the luminaire as applied in this Project IES LM-80.

a. Manufacturers’ Certified Data: Photometric data certified by manufacturer's laboratory with a current accreditation under the National Voluntary Laboratory Accreditation Program for Energy Efficient Lighting Products.

B. Shop Drawings: For nonstandard or custom luminaires.
   1. Include plans, elevations, sections, and mounting and attachment details.
   2. Include details of luminaire assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   3. Include diagrams for power, signal, and control wiring.

C. Samples: For each luminaire and for each color and texture with standard factory-applied finish.

D. Samples for Initial Selection: For each type of luminaire with custom factory-applied finishes.
   1. Include Samples of luminaires and accessories involving color and finish selection.

E. Samples for Verification: For each type of luminaire.
   1. Include Samples of luminaires and accessories to verify finish selection.

F. Product Schedule: For luminaires and lamps. Use same designations indicated on Drawings.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For testing laboratory providing photometric data for luminaires.

B. Seismic Qualification Certificates: For luminaires, accessories, and components, from manufacturer.
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
   2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

C. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

D. Product Certificates: For each type of luminaire.

E. Product Test Reports: For each luminaire, for tests performed by manufacturer and witnessed by a qualified testing agency.

F. Sample warranty.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For luminaires and lighting systems to include in operation and maintenance manuals.
   1. Provide a list of all lamp types used on Project; use ANSI and manufacturers’ codes.
1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Lamps: Ten for every 100 of each type and rating installed. Furnish at least one of each type.
   2. Diffusers and Lenses: One for every 100 of each type and rating installed. Furnish at least one of each type.
   3. Globes and Guards: One for every 20 of each type and rating installed. Furnish at least one of each type.

1.8 QUALITY ASSURANCE

A. Luminaire Photometric Data Testing Laboratory Qualifications: Provided by an independent agency, with the experience and capability to conduct the testing indicated, that is an NRTL as defined by OSHA in 29 CFR 1910.7, accredited under the NVLAP for Energy Efficient Lighting Products, and complying with the applicable IES testing standards.

B. Provide luminaires from a single manufacturer for each luminaire type.

C. Each luminaire type shall be binned within a three-step MacAdam Ellipse to ensure color consistency among luminaires.

D. Mockups: For interior luminaires in room or module mockups, complete with power and control connections.
   1. Obtain Architect’s approval of luminaires in mockups before starting installations.
   2. Maintain mockups during construction in an undisturbed condition as a standard for judging the completed Work.
   3. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
   4. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Protect finishes of exposed surfaces by applying a strippable, temporary protective covering before shipping.

1.10 WARRANTY

A. Warranty: Manufacturer and Installer agree to repair or replace components of luminaires that fail in materials or workmanship within specified warranty period.

B. Warranty Period: Five year(s) from date of Substantial Completion.
PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Luminaires shall withstand the effects of earthquake motions determined according to ASCE 7. Light fixture fastening, and bracing is not a deferred submittal nor a delegated design item. Refer to details on drawings for anchorage requirements.

B. Seismic Performance: Luminaires and lamps shall be labeled vibration and shock resistant.
   1. The term “withstand” means “the luminaire will remain in place without separation of any parts when subjected to the seismic forces specified and the luminaire will be fully operational during and after the seismic event.”

2.2 LUMINAIRE REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. Standards:
   1. ENERGY STAR certified.
   2. California Title 24 compliant.
   3. NRTL Compliance: Luminaires for hazardous locations shall be listed and labeled for indicated class and division of hazard by an NRTL.
   4. FM Global Compliance: Luminaires for hazardous locations shall be listed and labeled for indicated class and division of hazard by FM Global.
   5. UL Listing: Listed for damp location.
   6. Recessed luminaires shall comply with NEMA LE 4.
   7. User Replaceable Lamps:
      a. Bulb shape complying with ANSI C78.79.
      b. Lamp base complying with ANSI C81.61 or IEC 60061-1.

C. Lamps dimmable from 100 percent to 0 percent of maximum light output.

D. Internal driver.

2.3 MATERIALS

A. Metal Parts:
   1. Free of burrs and sharp corners and edges.
   2. Sheet metal components shall be steel unless otherwise indicated.
   3. Form and support to prevent warping and sagging.

B. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position.

C. Diffusers and Globes:
1. Tempered Fresnel glass, prismatic glass, diffuse glass, clear glass, prismatic acrylic and clear, UV-stabilized acrylic.
2. Acrylic Diffusers: One hundred percent virgin acrylic plastic, with high resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.
3. Glass: Annealed crystal glass unless otherwise indicated.
4. Lens Thickness: At least 0.125 inch minimum unless otherwise indicated.

D. Housings:
1. Extruded-aluminum housing and heat sink. Subject to Architect approval.
2. Clear anodized, powder-coat and painted finish. Subject to Architect approval.

E. Factory-Applied Labels: Comply with UL 1598. Include recommended lamps. Locate labels where they will be readily visible to service personnel, but not seen from normal viewing angles when lamps are in place.
1. Label shall include the following lamp characteristics:
   a. "USE ONLY" and include specific lamp type.
   b. Lamp diameter, shape, size, wattage, and coating.
   c. CCT and CRI for all luminaires.

2.4 METAL FINISHES

   A. Variations in finishes are unacceptable in the same piece. Variations in finishes of adjoining components are acceptable if they are within the range of approved Samples and if they can be and are assembled or installed to minimize contrast.

2.5 LUMINAIRE SUPPORT

   A. Comply with requirements in Section 26 05 29 "Hangers and Supports for Electrical Systems" for channel and angle iron supports and nonmetallic channel and angle supports.
   
   B. Single-Stem Hangers: 1/2-inch steel tubing with swivel ball fittings and ceiling canopy. Finish same as luminaire.

   
   D. Rod Hangers: 3/16-inch minimum diameter, cadmium-plated, threaded steel rod.

   E. Hook Hangers: Integrated assembly matched to luminaire, line voltage, and equipment with threaded attachment, cord, and locking-type plug.

PART 3 - EXECUTION

3.1 EXAMINATION

   A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
B. Examine roughing-in for luminaire to verify actual locations of luminaire and electrical connections before luminaire installation. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 TEMPORARY LIGHTING

A. If approved by the Architect, use selected permanent luminaires for temporary lighting. When construction is sufficiently complete, clean luminaires used for temporary lighting and install new lamps.

3.3 INSTALLATION

A. Comply with NECA 1.

B. Install luminaires level, plumb, and square with ceilings and walls unless otherwise indicated.

C. Install lamps in each luminaire.

D. Supports:
   1. Sized and rated for luminaire weight.
   2. Able to maintain luminaire position after cleaning and relamping.
   3. Provide support for luminaire without causing deflection of ceiling or wall.
   4. Luminaire mounting devices shall be capable of supporting a horizontal force of 100 percent of luminaire weight and vertical force of 400 percent of luminaire weight.

E. Flush-Mounted Luminaire Support:
   1. Secured to outlet box.
   2. Attached to ceiling structural members at four points equally spaced around circumference of luminaire.
   3. Trim ring flush with finished surface.

F. Wall-Mounted Luminaire Support:
   1. Attached to structural members in walls or Attached to a minimum 20 gauge backing plate attached to wall structural members.
   2. Do not attach luminaires directly to gypsum board.

G. Ceiling-Mounted Luminaire Support:
   1. Ceiling mount with two 5/32-inch- diameter aircraft cable supports adjustable to 120 inches in length.
   2. Ceiling mount with pendant mount, four-point pendant mount with 5/32-inch- diameter aircraft cable supports adjustable to 120 inches in length.
   3. Ceiling mount with hook mount.

H. Suspended Luminaire Support:
   1. Pendants and Rods: Where longer than 48 inches, brace to limit swinging.
3.6 STARTUP SERVICE

3.6.1 Operational Tests: After installing luminaires, switches, and accessories, and after electrical circuitry has been energized, test units to confirm proper operation.

3.6.2 Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation.

3.6.3 Verifying transfer from normal power to battery power and retransfer to normal.

3.6.4 Ceiling-Grid-Mounted Luminaires:

- Secure luminaire to the luminaire opening using approved fasteners in a minimum of four locations, spaced near corners of luminaire.

3.6.5 Use approved devices and support components to connect luminaire to ceiling grid and building structure in a minimum of four locations, spaced near corners of luminaire.

3.6.6 Continuous Rows of Luminaires: Use tubing or stem for wiring at one point and tubing or rod and wire support for suspension for each unit length of luminaire chassis, including one at each end.

3.6.7 Security Luminaires: Use emergency lighting at each building entrance, exit, stairwell, or other area where the building structure or doors to these areas are to be kept locked.

3.6.8 Adjusting and Inspecting Luminaires:

- Use approved devices and support components to connect luminaire to ceiling grid and building structure in a minimum of four locations, spaced near corners of luminaire.

3.6.9 Perform the following tests and inspections:

- Luminaires will be considered defective if it does not pass operation tests and inspections.

3.6.10 Preparation of Test and Inspection Reports:

- Prepare test and inspection reports.

3.6.11 Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation.

- Verifying transfer from normal power to battery power and retransfer to normal.

3.6.12 Identifying System Components, Wiring, Cabling, and Terminals:

- Identify system components, wiring, cabling, and terminals.

- Comply with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."

3.6.13 Operational Test: After installing luminaires, switches, and accessories, and after electrical circuitry has been energized, test units to confirm proper operation.

3.6.14 Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation.

3.6.15 Verifying transfer from normal power to battery power and retransfer to normal.

3.6.16 Adjacent Luminaires:

- Use approved devices and support components to connect luminaire to ceiling grid and building structure in a minimum of four locations, spaced near corners of luminaire.

3.6.17 Preparation of Test and Inspection Reports:

- Prepare test and inspection reports.

3.6.18 Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation.

- Verifying transfer from normal power to battery power and retransfer to normal.

3.6.19 Identifying System Components, Wiring, Cabling, and Terminals:

- Identify system components, wiring, cabling, and terminals.

- Comply with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."

3.6.20 Operational Test: After installing luminaires, switches, and accessories, and after electrical circuitry has been energized, test units to confirm proper operation.

3.6.21 Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation.

- Verifying transfer from normal power to battery power and retransfer to normal.

3.6.22 Adjacent Luminaires:

- Use approved devices and support components to connect luminaire to ceiling grid and building structure in a minimum of four locations, spaced near corners of luminaire.

3.6.23 Preparation of Test and Inspection Reports:

- Prepare test and inspection reports.

3.6.24 Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation.

- Verifying transfer from normal power to battery power and retransfer to normal.

3.6.25 Identifying System Components, Wiring, Cabling, and Terminals:

- Identify system components, wiring, cabling, and terminals.

- Comply with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."

3.6.26 Operational Test: After installing luminaires, switches, and accessories, and after electrical circuitry has been energized, test units to confirm proper operation.

3.6.27 Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation.

- Verifying transfer from normal power to battery power and retransfer to normal.

3.6.28 Adjacent Luminaires:

- Use approved devices and support components to connect luminaire to ceiling grid and building structure in a minimum of four locations, spaced near corners of luminaire.

3.6.29 Preparation of Test and Inspection Reports:

- Prepare test and inspection reports.

3.6.30 Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation.

- Verifying transfer from normal power to battery power and retransfer to normal.

3.6.31 Identifying System Components, Wiring, Cabling, and Terminals:

- Identify system components, wiring, cabling, and terminals.

- Comply with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."

3.6.32 Operational Test: After installing luminaires, switches, and accessories, and after electrical circuitry has been energized, test units to confirm proper operation.

3.6.33 Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation.

- Verifying transfer from normal power to battery power and retransfer to normal.

3.6.34 Adjacent Luminaires:

- Use approved devices and support components to connect luminaire to ceiling grid and building structure in a minimum of four locations, spaced near corners of luminaire.

3.6.35 Preparation of Test and Inspection Reports:

- Prepare test and inspection reports.

3.6.36 Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation.

- Verifying transfer from normal power to battery power and retransfer to normal.

3.6.37 Identifying System Components, Wiring, Cabling, and Terminals:

- Identify system components, wiring, cabling, and terminals.

- Comply with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."

3.6.38 Operational Test: After installing luminaires, switches, and accessories, and after electrical circuitry has been energized, test units to confirm proper operation.

3.6.39 Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation.

- Verifying transfer from normal power to battery power and retransfer to normal.

3.6.40 Adjacent Luminaires:

- Use approved devices and support components to connect luminaire to ceiling grid and building structure in a minimum of four locations, spaced near corners of luminaire.

3.6.41 Preparation of Test and Inspection Reports:

- Prepare test and inspection reports.

3.6.42 Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation.

- Verifying transfer from normal power to battery power and retransfer to normal.

3.6.43 Identifying System Components, Wiring, Cabling, and Terminals:

- Identify system components, wiring, cabling, and terminals.

- Comply with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."

3.6.44 Operational Test: After installing luminaires, switches, and accessories, and after electrical circuitry has been energized, test units to confirm proper operation.

3.6.45 Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation.

- Verifying transfer from normal power to battery power and retransfer to normal.

3.6.46 Adjacent Luminaires:

- Use approved devices and support components to connect luminaire to ceiling grid and building structure in a minimum of four locations, spaced near corners of luminaire.

3.6.47 Preparation of Test and Inspection Reports:

- Prepare test and inspection reports.

3.6.48 Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation.

- Verifying transfer from normal power to battery power and retransfer to normal.

3.6.49 Identifying System Components, Wiring, Cabling, and Terminals:

- Identify system components, wiring, cabling, and terminals.

- Comply with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."

3.6.50 Operational Test: After installing luminaires, switches, and accessories, and after electrical circuitry has been energized, test units to confirm proper operation.

3.6.51 Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation.

- Verifying transfer from normal power to battery power and retransfer to normal.
2. Parts and supplies shall be manufacturer's authorized replacement parts and supplies.
3. Adjust the aim of luminaires in the presence of the Architect.

END OF SECTION
SECTION 265613 - LIGHTING POLES AND STANDARDS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Poles and accessories for support of luminaires.
   2. Luminaire-lowering devices.

1.3 DEFINITIONS

A. EPA: Equivalent projected area.
B. Luminaire: Complete luminaire.
C. Pole: Luminaire-supporting structure, including tower used for large-area illumination.
D. Standard: See "Pole."

1.4 ACTION SUBMITTALS

A. Product Data: For each pole, accessory, and luminaire-supporting and -lowering device, arranged as indicated.
   1. Include data on construction details, profiles, EPA, cable entrances, materials, dimensions, weight, rated design load, and ultimate strength of individual components.
   2. Include finishes for lighting poles and luminaire-supporting devices.
   3. Anchor bolts.
   4. Manufactured pole foundations.
B. Shop Drawings:
   1. Include plans, elevations, sections, and mounting and attachment details.
   2. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   3. Detail fabrication and assembly of poles and pole accessories.
   4. Foundation construction details, including material descriptions, dimensions, anchor bolts, support devices, and calculations, signed and sealed by a professional engineer licensed in the state of installation.
   5. Anchor bolt templates keyed to specific poles and certified by manufacturer.
   6. Method and procedure of pole installation. Include manufacturer's written installations.
C. Samples: For each exposed lighting pole, standard, and luminaire-supporting device and for each color and texture specified.

1.5 INFORMATIONAL SUBMITTALS

A. Pole and Support Component Certificates: Signed by manufacturers of poles, certifying that products are designed for indicated load requirements according to AASHTO LTS-6-M and that load imposed by luminaire and attachments has been included in design. The certification shall be based on design calculations signed and sealed by a professional engineer.

B. Source quality-control reports.

C. Sample Warranty: Manufacturer's standard warranty.

D. Soil test reports

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For poles and luminaire-lowering devices to include in emergency, operation, and maintenance manuals.

1. In addition to items specified in Section 01785 "Operation and Maintenance Data," include pole inspection and repair procedures.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Pole repair materials.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Package aluminum poles for shipping according to ASTM B 660.

B. Store poles on decay-resistant skids at least 12 inches above grade and vegetation. Support poles to prevent distortion and arrange to provide free air circulation.

C. Handle wood poles so they will not be damaged. Do not use pointed tools that can indent pole surface more than 1/4 inch deep. Do not apply tools to section of pole to be installed below finished grade.

D. Retain factory-applied pole wrappings on fiberglass and laminated wood poles until right before pole installation. Handle poles with web fabric straps.

E. Retain factory-applied pole wrappings on metal poles until right before pole installation. Handle poles with web fabric straps.

1.9 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace components of pole(s) and luminaire-lowering device(s) that fail in materials or workmanship; that corrode; or that fade, stain, perforate, erode, or chalk due to effects of weather or solar radiation within a specified

Contra Costa Community College District
Contra Costa College
C-4016 New Science Building – DSA Backcheck
warranty period. Manufacturer may exclude lightning damage, hail damage, vandalism, abuse, or unauthorized repairs from special warranty period.

1. Warranty Period: Five years from date of Substantial Completion.
2. Warranty Period for Corrosion Resistance: Five years from date of Substantial Completion.
3. Warranty Period for Color Retention: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Light pole design is not deferred submittal nor delegated design item. A complete design shall be provided on the construction drawings.

B. Seismic Performance: Foundation and pole shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
   1. The term "withstand" means "the system will remain in place without separation of any parts when subjected to the seismic forces specified and the system will be fully operational after the seismic event."
   2. Component Importance Factor: 1.5.

C. Structural Characteristics: Comply with AASHTO LTS-6-M.

D. Dead Load: Weight of luminaire and its horizontal and vertical supports, lowering devices, and supporting structure, applied according to AASHTO LTS-6-M.

E. Live Load: Single load of 500 lbf distributed according to AASHTO LTS-6-M.

F. Wind Load: Pressure of wind on pole and luminaire, calculated and applied according to ASCE 7-10.
   1. Basic wind speed for calculating wind load for poles 12 feet high is 115 mph.
      a. Wind Importance Factor: 1.0.

G. Strength Analysis: For each pole, multiply the actual EPA of luminaires and brackets by a factor of 1.1 to obtain the EPA to be used in pole selection strength analysis.

H. Luminaire Attachment Provisions: Comply with luminaire manufacturers’ mounting requirements. Use stainless-steel fasteners and mounting bolts unless otherwise indicated.

2.2 ALUMINUM POLES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. American LitePole.
   2. Bridgewell Resources.
   3. Cooper Lighting, an Eaton business.
   4. E-conolight.
   5. EGS/Appleton Electric.
   6. H.E. Williams.
8. Hubbell Incorporated.
9. KIM Lighting.
10. LSI Industries.

B. Poles: Seamless, extruded structural tube complying with ASTM B 221, Alloy 6061-T6, 55 KSI minimum yield strength and tensile of 75-95 KSI, with access handhole in in pole wall.
   1. Shape: Round, tapered.
   2. Mounting Provisions: Butt flange for bolted mounting on foundation or breakaway support.

C. Mast Arms: Aluminum Davit type, continuously welded to pole attachment plate. Material and finish same as plate.

D. Brackets for Luminaires: Detachable, cantilever, without underbrace.
   1. Adaptor fitting welded to pole, allowing the bracket to be bolted to the pole-mounted adapter, then bolted together with stainless-steel bolts.
   2. Cross Section: Tapered oval, with straight tubular end section to accommodate luminaire. Match pole material and finish.

E. Pole-Top Tenons: Fabricated to support luminaire or luminaires and brackets indicated, and securely fastened to pole top.

F. Grounding and Bonding Lugs: Bolted 1/2-inch threaded lug, complying with requirements in Section 26 05 26 "Grounding and Bonding for Electrical Systems," listed for attaching grounding and bonding conductors of type and size listed in that Section, and accessible through handhole.

G. Fasteners: Stainless steel, size and type as determined by manufacturer. Corrosion-resistant items compatible with support components.
   1. Materials: Compatible with poles and standards as well as to substrates to which poles and standards are fastened and shall not cause galvanic action at contact points.

H. Handhole: Oval shaped, with minimum clear opening of 2-1/2 by 5 inches, with cover secured by stainless-steel captive screws.

I. Prime-Coat Finish: Manufacturer's standard prime-coat finish ready for field painting.

J. Aluminum Finish: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" recommendations for applying and designating finishes.
   1. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.
   2. Natural Satin Finish: Provide fine, directional, medium satin polish (AA-M32); buff complying with AA-M20 requirements; and seal aluminum surfaces with clear, hard-coat wax.
   3. Class I, Clear-Anodic Finish: AA-M32C22A41 (Mechanical Finish: Medium satin; Chemical Finish: Etched, medium matte; Anodic Coating: Architectural Class I clear coating of 0.018 mm or thicker), complying with AAMA 611.
   4. Class I, Color-Anodic Finish: AA-M32C22A42/A44 (Mechanical Finish: Medium; Chemical Finish: Etched, medium matte; Anodic Coating: Architectural Class I integrally
colored or electrolytically deposited color coating 0.018 mm or thicker), complying with AAMA 611.

K. Factory-Painted Finish: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" recommendations for applying and designating finishes.

1. Surface Preparation: Clean surfaces to comply with SSPC-SP 1 to remove dirt, oil, grease, and other contaminants that could impair paint bond. Grind welds and polish surfaces to a smooth, even finish. Remove mill scale and rust, if present, from uncoated steel, according to SSPC-SP 5/NACE No. 1 or SSPC-SP 8.
2. Interior Surfaces of Pole: One coat of bituminous paint, or otherwise treat for equal corrosion protection.
3. Exterior Surfaces: Manufacturer's standard finish consisting of one or more coats of primer and two finish coats of high-gloss, high-build polyurethane enamel.
   a. Color: As selected by Architect from manufacturer's full range.

L. Powder-Coat Finish: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" recommendations for applying and designating finishes.

1. Surface Preparation: Clean surfaces to comply with SSPC-SP 1 to remove dirt, oil, grease, and other contaminants that could impair powder coat bond. Grind welds and polish surfaces to a smooth, even finish. Remove mill scale and rust, if present, from uncoated steel, according to SSPC-SP 5/NACE No. 1 or SSPC-SP 8.
2. Powder coat shall comply with AAMA 2604.
   a. Electrostatic applied powder coating; single application with a minimum 2.5- to 3.5-mils dry film thickness; cured according to manufacturer's instructions. Coat interior and exterior of pole for equal corrosion protection.
   b. Color: As selected by Architect from manufacturer's full range.

2.3 MOUNTING HARDWARE

A. Anchor Bolts: Manufactured to ASTM F 1554, Grade 55, with a minimum yield strength of 55,000 psi.
   1. Galvanizing: Hot dip galvanized according to ASTM A 153, Class C.
   2. Headed rods manufacturer in diameter by manufacturer in length.
   3. Threading: Uniform National Coarse, Class 2A.

B. Nuts: ASTM A 563, Grade A, Heavy-Hex
   1. Galvanizing: Hot dip galvanized according to ASTM A 153, Class C.
   2. Four nuts provided per anchor bolt, shipped with nuts pre-assembled to the anchor bolts.

C. Washers: ASTM F 436, Type 1.
   1. Galvanizing: Hot dip galvanized according to ASTM A 153, Class C.
   2. Two washers provided per anchor bolt.

2.4 GENERAL FINISH REQUIREMENTS

A. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
B. Appearance of Finished Work: Noticeable variations in same piece are unacceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine poles, luminaire-mounting devices, lowering devices, and pole accessories before installation. Components that are scratched, dented, marred, wet, moisture damaged, or visibly damaged are considered defective.

C. Examine roughing-in for foundation and conduit to verify actual locations of installation.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 POLE FOUNDATION

A. Concrete Pole Foundations: Cast in place, with anchor bolts to match pole-base flange. Structural steel complying with ASTM A 36/A 36M and hot-dip galvanized according to ASTM A 123/A 123 M; and with top-plate and mounting bolts to match pole-base flange and strength required to support pole, luminaire, and accessories. Concrete, reinforcement, and formwork are specified in Section 03 30 00 "Cast-in-Place Concrete."

B. Power-Installed Screw Foundations: Factory fabricated by pole manufacturer, with structural steel complying with ASTM A 36/A 36M and hot-dip galvanized according to ASTM A 123/A 123M; and with top-plate and mounting bolts to match pole-base flange and strength required to support pole, luminaire, and accessories.
   1. Baseplate: Stamped with manufacturer's name, date of production, and cable entry.

C. Anchor Bolts: Install plumb using manufacturer-supplied template, uniformly spaced.

3.3 POLE INSTALLATION

A. Alignment: Align pole foundations and poles for optimum directional alignment of luminaires and their mounting provisions on pole.

B. Clearances: Maintain the following minimum horizontal distances of poles from surface and underground features unless otherwise indicated on drawing.
   1. Fire Hydrants and Water Piping: 60 inches.
   3. Trees: 15 feet from tree trunk.

C. Concrete Pole Foundations: Set anchor bolts according to anchor-bolt templates furnished by pole manufacturer. Concrete materials, installation, and finishing requirements are specified in.
D. Foundation-Mounted Poles: Mount pole with leveling nuts and tighten top nuts to torque level according to pole manufacturer's written instructions.
   1. Use anchor bolts and nuts selected to resist seismic forces defined for the application and approved by manufacturer.
   2. Grout void between pole base and foundation. Use nonshrink or expanding concrete grout firmly packed to fill space.
   3. Install base covers unless otherwise indicated.
   4. Use a short piece of 1/2-inch diameter pipe to make a drain hole through grout. Arrange to drain condensation from interior of pole.

E. Poles and Pole Foundations Set in Concrete-Paved Areas: Install poles with a minimum 6-inch-wide, unpaved gap between the pole or pole foundation and the edge of the adjacent concrete slab. Fill unpaved ring with pea gravel. Insert material to a level 1 inch below top of concrete slab.

F. Raise and set pole using web fabric slings (not chain or cable) at locations indicated by manufacturer.

3.4 CORROSION PREVENTION

A. Aluminum: Do not use in contact with earth or concrete. When in direct contact with a dissimilar metal, protect aluminum using insulating fittings or treatment.

B. Steel Conduits: Comply with requirements in Section 26 05 33 "Raceways and Boxes for Electrical Systems." In concrete foundations, wrap conduit with 0.010-inch-thick, pipe-wrapping plastic tape applied with a 50-percent overlap.

3.5 GROUNDING

A. Ground Metal Poles and Support Structures: Comply with requirements in Section 26 05 26 "Grounding and Bonding for Electrical Systems."
   1. Install grounding electrode for each pole unless otherwise indicated.
   2. Install grounding conductor pigtail in the base for connecting luminaire to grounding system.

B. Ground Nonmetallic Poles and Support Structures: Comply with requirements in Section 26 05 26 "Grounding and Bonding for Electrical Systems."
   1. Install grounding electrode for each pole.
   2. Install grounding conductor and conductor protector.
   3. Ground metallic components of pole accessories and foundation.

3.6 IDENTIFICATION

A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."
3.7 FIELD QUALITY CONTROL

A. Special Inspections: Engage a qualified special inspector to perform the following special inspections:

1. Inspect poles for nicks, mars, dents, scratches, and other damage.
2. System function tests.

END OF SECTION
IDENTIFICATION

A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

FIELD QUALITY CONTROL

A. Special Inspections:

1. Inspect poles for nicks, mars, dents, scratches, and other damage.

2. System function tests.

END OF SECTION
SECTION 265619 – LED EXTERIOR LIGHTING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Exterior solid-state luminaires that are designed for and exclusively use LED lamp technology.
   2. Luminaire supports.
   3. Luminaire-mounted photoelectric relays.

B. Related Requirements:
   1. Section 26 09 23.02 "Lighting Control Devices" for automatic control of lighting, including time switches, photoelectric relays, occupancy sensors, and multipole lighting relays and contactors.
   2. Section 26 56 13 "Lighting Poles and Standards" for poles and standards used to support exterior lighting equipment.

1.3 DEFINITIONS

A. CCT: Correlated color temperature.
B. CRI: Color rendering index.
C. Fixture: See "Luminaire."
D. IP: International Protection or Ingress Protection Rating.
E. Lumen: Measured output of lamp and luminaire, or both.
F. Luminaire: Complete lighting unit, including lamp, reflector, and housing.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of luminaire.
   1. Arrange in order of luminaire designation.
   2. Include data on features, accessories, and finishes.
   3. Include physical description and dimensions of luminaire.
   4. Lamps, include life, output (lumens, CCT, and CRI), and energy-efficiency data.
   5. Photometric data and adjustment factors based on laboratory tests, complying with IES Lighting Measurements Testing and Calculation Guides, of each luminaire type. The
adjustment factors shall be for lamps and accessories identical to those indicated for the luminaire as applied in this Project.

a. Manufacturer’s Certified Data: Photometric data certified by manufacturer’s laboratory with a current accreditation under the NVLAP for Energy Efficient Lighting Products.
b. Testing Agency Certified Data: For indicated luminaires, photometric data certified by a qualified independent testing agency. Photometric data for remaining luminaires shall be certified by manufacturer.

6. Wiring diagrams for power, control, and signal wiring.
7. Photoelectric relays.
8. Means of attaching luminaires to supports and indication that the attachment is suitable for components involved.

B. Shop Drawings: For nonstandard or custom luminaires.
   1. Include plans, elevations, sections, and mounting and attachment details.
   2. Include details of luminaire assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   3. Include diagrams for power, signal, and control wiring.

C. Samples: For each luminaire and for each color and texture indicated with factory-applied finish.

D. Product Schedule: For luminaires and lamps. Use same designations indicated on Drawings.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For testing laboratory providing photometric data for luminaires.

B. Seismic Qualification Data: For luminaires, accessories, and components, from manufacturer.
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
   2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
   3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

C. Product Certificates: For each type of the following:
   1. Luminaire.
   2. Photoelectric relay.
   3. Factory installed lighting control devices.

D. Product Test Reports: For each luminaire, for tests performed by manufacturer and witnessed by a qualified testing agency.

E. Source quality-control reports.

F. Sample warranty.
1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For luminaires to include in operation and maintenance manuals.
   1. Provide a list of all lamp types used on Project. Use ANSI and manufacturers’ codes.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Lamps: Ten for every 100 of each type and rating installed. Furnish at least one of each type.
   2. Glass, Acrylic, and Plastic Lenses, Covers, and Other Optical Parts: One for every 100 of each type and rating installed. Furnish at least one of each type.
   3. Diffusers and Lenses: One for every 100 of each type and rating installed. Furnish at least one of each type.
   4. Globes and Guards: One for every 20 of each type and rating installed. Furnish at least one of each type.

1.8 QUALITY ASSURANCE

A. Luminaire Photometric Data Testing Laboratory Qualifications: Luminaire manufacturers’ laboratory that is accredited under the NVLAP for Energy Efficient Lighting Products.

B. Luminaire Photometric Data Testing Laboratory Qualifications: Provided by an independent agency, with the experience and capability to conduct the testing indicated, that is an NRTL as defined by OSHA in 29 CFR 1910.7, accredited under the NVLAP for Energy Efficient Lighting Products and complying with applicable IES testing standards.

C. Provide luminaires from a single manufacturer for each luminaire type.

D. Each luminaire type shall be binned within a three-step MacAdam Ellipse to ensure color consistency among luminaires.

E. Installer Qualifications: An authorized representative who is trained and approved by manufacturer.

F. Mockups: For exterior luminaires, complete with power and control connections.
   1. Obtain Architect's approval of luminaires in mockups before starting installations.
   2. Maintain mockups during construction in an undisturbed condition as a standard for judging the completed work.
   3. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
   4. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.
1.9 DELIVERY, STORAGE, AND HANDLING
A. Protect finishes of exposed surfaces by applying a strippable, temporary protective covering prior to shipping.

1.10 FIELD CONDITIONS
A. Verify existing and proposed utility structures prior to the start of work associated with luminaire installation.
B. Mark locations of exterior luminaires for approval by Architect prior to the start of luminaire installation.

1.11 WARRANTY
A. Warranty: Manufacturer and Installer agree to repair or replace components of luminaires that fail in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Structural failures, including luminaire support components.
      b. Faulty operation of luminaires and accessories.
      c. Deterioration of metals, metal finishes, and other materials beyond normal weathering.
   2. Warranty Period: 2 year(s) from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS
A. Seismic Performance: Luminaires shall withstand the effects of earthquake motions determined according to ASCE/SEI 7. Seismic restraints for lighting is not a deferred submittal nor a delegated design item. Refer to details on drawings for anchorage requirements.
B. Seismic Performance: Luminaires and lamps shall be labeled vibration and shock resistant.
   1. The term "withstand" means “the luminaire will remain in place without separation of any parts when subjected to the seismic forces specified and the luminaire will be fully operational during and after the seismic event.”

2.2 LUMINAIRE REQUIREMENTS
A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in CEC 70, by a qualified testing agency, and marked for intended location and application.
B. NRTL Compliance: Luminaires shall be listed and labeled for indicated class and division of hazard by an NRTL.
C. FM Global Compliance: Luminaires for hazardous locations shall be listed and labeled for indicated class and division of hazard by FM Global.

D. UL Compliance: Comply with UL 1598 and listed for wet location.

E. Lamp base complying with ANSI C81.61 or IEC 60061-1.

F. Bulb shape complying with ANSI C79.1.

G. Lamps dimmable from 100 percent to 0 percent of maximum light output.

H. Internal driver.

I. In-line Fusing: Separate in-line fuse for each luminaire.

J. Lamp Rating: Lamp marked for outdoor use and in enclosed locations.

K. Source Limitations: For luminaires, obtain each color, grade, finish, type, and variety of luminaire from single source with resources to provide products of consistent quality in appearance and physical properties.

2.3 LUMINAIRE-MOUNTED PHOTOELECTRIC RELAYS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   2. Cooper Lighting, an Eaton business.
   3. Deco Lighting.
   4. Eaton.
   5. GE Lighting Solutions.
   6. Intelligent Illuminations, Inc.
   7. Intermatic, Inc.
   8. Lithonia Lighting; Acuity Brands Lighting, Inc.
   10. Schneider Electric USA, Inc.
   11. Siemens Building Technologies, Inc.

B. Comply with UL 773 or UL 773A.

C. Contact Relays: Factory mounted, single throw, designed to fail in the on position, and factory set to turn light unit on at 1.5 to 3 fc and off at 4.5 to 10 fc with 15-second minimum time delay. Relay shall have directional lens in front of photocell to prevent artificial light sources from causing false turnoff.
   1. Relay with locking-type receptacle shall comply with ANSI C136.10.
   2. Adjustable window slide for adjusting on-off set points.

2.4 MATERIALS

A. Metal Parts: Free of burrs and sharp corners and edges.
B. Sheet Metal Components: Corrosion-resistant aluminum. Form and support to prevent warping and sagging.

C. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position. Doors shall be removable for cleaning or replacing lenses.

D. Reflecting surfaces shall have minimum reflectance as follows unless otherwise indicated:
   1. White Surfaces: 85 percent.
   2. Specular Surfaces: 83 percent.
   3. Diffusing Specular Surfaces: 75 percent.

E. Housings:
   1. Rigidly formed, weather- and light-tight enclosure that will not warp, sag, or deform in use.
   2. Provide filter/breather for enclosed luminaires.

F. Factory-Applied Labels: Comply with UL 1598. Include recommended lamps. Labels shall be located where they will be readily visible to service personnel, but not seen from normal viewing angles when lamps are in place.
   1. Label shall include the following lamp characteristics:
      a. "USE ONLY" and include specific lamp type.
      b. Lamp diameter, shape, size, wattage and coating.
      c. CCT and CRI for all luminaires.

2.5 FINISHES

A. Variations in Finishes: Noticeable variations in same piece are unacceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled to minimize contrast.

B. Luminaire Finish: Manufacturer's standard paint applied to factory-assembled and -tested luminaire before shipping. Where indicated, match finish process and color of pole or support materials.

C. Factory-Applied Finish for Aluminum Luminaires: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
   1. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.
   2. Natural Satin Finish: Provide fine, directional, medium satin polish (AA-M32); buff complying with AA-M20 requirements; and seal aluminum surfaces with clear, hard-coat wax.
   3. Class I, Clear-Anodic Finish: AA-M32C22A41 (Mechanical Finish: Medium satin; Chemical Finish: Etched, medium matte; Anodic Coating: Architectural Class I, clear coating 0.018 mm or thicker) complying with AAMA 611.
   4. Class I, Color-Anodic Finish: AA-M32C22A42/A44 (Mechanical Finish: Medium satin; Chemical Finish: Etched, medium matte; Anodic Coating: Architectural Class I, integrally...
colored or electrolytically deposited color coating 0.018 mm or thicker), complying with AAMA 611.

D. Factory-Applied Finish for Steel Luminaires: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

1. Surface Preparation: Clean surfaces to comply with SSPC-SP 1, to remove dirt, oil, grease, and other contaminants that could impair paint bond. Grind welds and polish surfaces to a smooth, even finish. Remove mill scale and rust, if present, from uncoated steel, complying with SSPC-SP 5/NACE No. 1 or SSPC-SP 8.

2. Exterior Surfaces: Manufacturer's standard finish consisting of one or more coats of primer and two finish coats of high-gloss, high-build polyurethane enamel.

a. Color: As selected from manufacturer's standard catalog of colors.

c. Color: As selected by Architect from manufacturer's full range.

2.6 LUMINAIRE SUPPORT COMPONENTS

A. Comply with requirements in Section 26 05 29 "Hangers and Supports for Electrical Systems" for channel and angle iron supports and nonmetallic channel and angle supports.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for luminaire electrical conduit to verify actual locations of conduit connections before luminaire installation.

C. Examine walls, roofs, and canopy ceilings and overhang ceilings for suitable conditions where luminaires will be installed.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 GENERAL INSTALLATION REQUIREMENTS

A. Comply with NECA 1.

B. Use fastening methods and materials selected to resist seismic forces defined for the application and approved by manufacturer.

C. Install lamps in each luminaire.

D. Fasten luminaire to structural support.

E. Supports:
1. Sized and rated for luminaire weight.
2. Able to maintain luminaire position after cleaning and relamping.
3. Support luminaires without causing deflection of finished surface.
4. Luminaire-mounting devices shall be capable of supporting a horizontal force of 100 percent of luminaire weight and a vertical force of 400 percent of luminaire weight.

F. Wall-Mounted Luminaire Support:
1. Attached to structural members in walls, Attached to a minimum 1/8 inch backing plate attached to wall structural members, Attached using through bolts and backing plates on either side of wall.

H. Install luminaires level, plumb, and square with finished grade unless otherwise indicated. Install luminaires at height and aiming angle as indicated on Drawings.

I. Coordinate layout and installation of luminaires with other construction.

J. Adjust luminaires that require field adjustment or aiming. Include adjustment of photoelectric device to prevent false operation of relay by artificial light sources, favoring a north orientation.

K. Comply with requirements in Section 26 05 19 "Low-Voltage Electrical Power Conductors and Cables" and Section 26 05 33 "Raceways and Boxes for Electrical Systems" for wiring connections and wiring methods.

3.3 BOLLARD LUMINAIRE INSTALLATION:

A. Align units for optimum directional alignment of light distribution.

1. Install on concrete base with top 4 inches above finished grade or surface at luminaire location. Cast conduit into base, and shape base to match shape of bollard base. Finish by troweling and rubbing smooth. Concrete materials, installation, and finishing are specified in Section 03 30 00 "Cast-in-Place Concrete."

3.4 INSTALLATION OF INDIVIDUAL GROUND-MOUNTED LUMINAIRES

A. Aim as indicated on Drawings.

B. Install on concrete base with top 4 inches above finished grade or surface at luminaire location. Cast conduit into base, and finish by troweling and rubbing smooth. Concrete materials, installation, and finishing are specified in Section 03 30 00 "Cast-in-Place Concrete."

3.5 CORROSION PREVENTION

A. Aluminum: Do not use in contact with earth or concrete. When in direct contact with a dissimilar metal, protect aluminum by insulating fittings or treatment.

B. Steel Conduits: Comply with Section 26 05 33 "Raceways and Boxes for Electrical Systems." In concrete foundations, wrap conduit with 0.010-inch-thick, pipe-wrapping plastic tape applied with a 50 percent overlap.
3.6 IDENTIFICATION
A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 26 05 53 "Identification for Electrical Systems."

3.7 FIELD QUALITY CONTROL
A. Inspect each installed luminaire for damage. Replace damaged luminaires and components.
B. Perform the following tests and inspections with the assistance of a factory-authorized service representative:
   1. Operational Test: After installing luminaires, switches, and accessories, and after electrical circuitry has been energized, test units to confirm proper operation.
   2. Verify operation of photoelectric controls.
C. Illumination Tests:
   1. Measure light intensities at night. Use photometers with calibration referenced to NIST standards. Comply with the following IES testing guide(s):
      a. IES LM-5.
      b. IES LM-50.
      c. IES LM-52.
      d. IES LM-64.
      e. IES LM-72.
   2. Operational Test: After installing luminaires, switches, and accessories, and after electrical circuitry has been energized, test units to confirm proper operation.
D. Luminaire will be considered defective if it does not pass tests and inspections.
E. Prepare a written report of tests, inspections, observations, and verifications indicating and interpreting results. If adjustments are made to lighting system, retest to demonstrate compliance with standards.

3.8 DEMONSTRATION
A. Train Owner's maintenance personnel to adjust, operate, and maintain luminaires and photocell relays.

END OF SECTION
PART 1 – GENERAL

1.1 PROJECT DESCRIPTION/WORK INCLUDED

A. The selected contractor shall provide, install, train for, and support a PLANETARIUM LIGHTING TECHNOLOGY PACKAGE (PLTS) for the CCC Planetarium. Please refer to diagrammatic and schematic level drawings E.1. PL LIGHTING, E.1. PL, A.1 PL, AV1. BLOCK DRAWING, A1.CONSOLE, and TE1.PL. E.1.

B. The Planetarium takes the form of multi-use domed theater and, in addition to astronomy, is also used for general instruction/lecture and visualization by various College Departments including: Science, Engineering, and Math.

C. The lighting design is composed of the following components and functions:

1. RED, GREEN, BLUE LED COVE LIGHTING to serve as program lighting for planetarium usage. Lighting resides in 6” deep x 3” high cove trough provided by dome manufacturer. MINIMUM TOTAL LUMENS/FOOT WITH RGB AT 100% IS 280 LUMENS/FOOT. HIGHER OUTPUT IS ACCEPTABLE.

2. WHITE LIGHT LED COVE LIGHTING to serve as classroom lighting. MINIMUM LUMENS/FOOT WITH WHITE AT 100% IS 656 LUMENS/FOOT. HIGHER OUTPUT IS ACCEPTABLE. Lighting resides in 6” deep x 3” high cove trough provided by dome manufacturer. This lighting is divided into two independently controllable sections:
   a. A 90 degree section in the front of the theater as measured from center. This the section of the dome cove lighting beneath the INSET projector’s dome image.
   b. A 270 degree section as measured from center that makes up the remaining perimeter of the cove trough classroom lighting.

3. A low-profile MR-16 track lighting system per drawing E.1. PL LIGHTING attached to the dome tension ring, that lights the White Board in the front of the theater and the floor and walls of the perimeter of the theater.

4. Per drawing E.1. PL LIGHTING, a recessed in-wall RED LIGHT LED floor wash system that runs along the perimeter of the theater and around the central projector barrier. MINIMUM LUMENS/FOOT WITH RED AT 100% IS 140 LUMENS/FOOT. HIGHER OUTPUT IS ACCEPTABLE.

D. All lighting is to be dimmable and DMX 512 controllable from a lighting control computer system provided by the LED provider and said control system is located at the Control Console at the rear of the theater. This control system will also be controllable wirelessly from a touch screen device such as an IPAD from anywhere in the theater.

E. Also, Lighting systems numbers 2, 3, & 4 are to controllable from DMX 512 wall-dimmers switches located at the entrance as shown in drawing E.1. PL LIGHTING. These wall mounted dimmers and switches and their connections are to be provided by the selected electrical contractor.
F. LED Lighting design and control at Control Console is based on LED fixtures and controls provided by either of the following approved specified manufacturers:

1. ChromaCove, LLC
   7777 Wall Street, Ste. A
   Cleveland, OH 44125 USA
   Phone: +1 844-RGB-COVE (742-2683) Email: sales@chromacove.com
   URL http://www.chromacove.com
   a. Specified Products: Medium Signature RGB, Medium White, and ChromaCove Designer Controller

2. BOWEN TECHNOVATION
   7999 East 88th Street
   Indianapolis, IN 46256
   Phone: +1-317-863-0525 Email: jeffb@bowentechnovation.com
   URL: http://bowentechnovation.com
   a. Specified Products: ASTRO FX AURORA advanced RGB, ASTRO FX AURORA advanced WHITE, and ASTRO FX AURORA LIGHTING CONTROLLER.

3. Unless otherwise noted, a substituted component may be proposed and included, but only if approved in advance by the Planetarium Design Consultant and/or the Contra Costa College.

G. Track Lighting system design is based upon a JUNO low-profile MR-16 fixture:

1. Specified Product: Juno TRAC-MASTER, Avant Garde STUDIO II T291BL (black)

1.2 RELATED DOCUMENTS AND SECTIONS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 specification sections, apply to this section.

B. Division 06 sections for the construction of a custom audiovisual console for racks, cabling, wiring, devices, controls, adapters, etc. and other material and equipment required to complete the PLTS.

C. Division 26 sections for connections to fire-alarm systems, wiring, disconnect switches, and other electrical materials required to complete the PLTS.

D. Division 27 sections for communications racks, cabling, wiring, devices, adapters, etc. and other electrical materials required to complete PLTS.

1.3 GENERAL REQUIREMENTS

A. Guarantee: Furnish a written guarantee for a period of two years from date of acceptance.

B. All of the equipment in this specification shall be furnished and installed by the Authorized Factory Installer of the equipment with the most current software and firmware package available at the time of installation. At the time of Owner Acceptance of the installation, all equipment shall include any and all updated software or hardware
revisions. In addition, when the software is available in disk format, a backup copy of the most up to date revision, in disk format, shall be handed to Owner at the completion of the project.

C. Verifying Drawings and Job Conditions:
   1. Examine all project drawings and specifications to ensure full awareness of all work required under this Section.
   2. Visit the site and verify existing conditions. Where existing conditions differ from drawings, make adjustments and allowances for all necessary equipment to complete all parts of the work. Verify actual dimensions of construction contiguous with Planetarium equipment by field measurements before fabrication.
   3. Pre-installation Conferences: Conduct a minimum of one conference at the project site prior to the start of installation work. Where existing conditions differ from drawings, make adjustment and allowances for all necessary equipment to complete all parts of the work.

1.4 WORK IN COOPERATION WITH OTHER TRADES
   A. Examine the drawings and specifications and determine the work to be performed by the electrical and other trades. Provide the type and amount of audiovisual systems materials and equipment necessary to place this work in proper operation, completely wired, tested and ready for use.
   B. Confirm Low voltage conduit, boxes and power have been provided by the division 26 00 00 contractor.

1.5 TESTING AND ADJUSTMENT
   A. Upon completion of all audiovisual systems work, provide testing and demonstrating in the presence of the owner's inspector that the all audio, digital video and control parameters are as stated in the factory data sheets.
   B. Promptly repair or replace all equipment and parts discovered to be in need of correction. Then retest that part of the system and all associated components to correct the error. Perform all such replacement or repair at no additional cost to the Owner.

1.6 FINAL INSPECTION AND ACCEPTANCE
   A. After all requirements of the specifications and/or the drawings have been fully completed, representatives of the Owner will inspect the work. Provide competent personnel to demonstrate the operation of any item or system to the full satisfaction of each representative.
   B. Final acceptance of the work will be made by the Owner after receipt of approval and recommendation of acceptance from each representative.

1.7 RECORD DRAWINGS
   A. Drawings of Record: Provide and keep up-to-date, a complete record set of drawings. Keep these corrected daily and show every change from the original drawings. Keep this set of prints on the job site for use only as a record set. This shall not be construed as
authorization for your firm to make changes in the layout without Owner approval in each case.

B. Upon completion of the work, obtain a set of Contract Drawings from the General Contractor and create a record set professionally using a PDF editor. Deliver this set in PDF format as indicated in Submittals – Close-Out, below.

1.8 APPROVALS, EQUALS, SUBSTITUTIONS, ALTERNATIVES, NO KNOW EQUAL

A. Approvals: Where the words (or similar terms) “approved”, “approval”, “acceptable”, and “acceptance” are used, these refer to the requirement that acceptance by the Owner, Architect and Engineer is required.

B. Equal: Where the words (or similar terms) “equal”, “approved equal”, “equal to”, “or equal by”, “or equal” and “equivalent” are used, it shall be understood that these words are followed by the expression “in the opinion of the Owner, Architect, and Engineer.” For the purposes of specifying products, the above words shall indicate the same size, made of the same construction materials, manufactured with equivalent life expectancy, having the same aesthetic appearance/style (includes craftsmanship, physical attributes, color and finish), and the same performance.

C. Substitution: For the purposes of specifying products “substitution” shall refer to the submittal of a product not explicitly approved by the construction documents/specifications.

1. Substitutions of specified equipment shall be submitted and received by the Engineer ten days prior to the bid date for review and written approval. Regulatory Agency approval for all substitutions will be the sole responsibility of the Contractor. To receive consideration, requests for substitutions must be accompanied by documentary proof of its equality with the specified material. Documentary proof shall be in letterform and identify the specified values/materials alongside proposed equal values/materials. In addition, catalog brochures and samples, if requested, must be included in the submittal.

ONLY PRE-BID APPROVED PRODUCTS, ISSUED VIA A FORMAL BID ADDENDUM TO ALL BIDDERS, WILL BE ALLOWED ON THE PROJECT. REGARDLESS OF THE APPROVAL ON ANY SUBSTITUTION, ALL BIDS SHALL BE BASED ON THE PRODUCTS EXACTLY AS SPECIFIED. PRICING FOR EACH APPROVED SUBSTITUTION SHALL BE INCLUDED IN THE BID SUBMITTAL AS A SEPARATE LINE ITEM.

2. The Contractor warrants that substitutions proposed for specified items will fully perform the functions required.

D. Alternates/Alternatives: For the purposes of specifying products, “alternates” may be established to enable the Owner/Architect/Engineer to compare costs where alternative materials or methods might be used. An alternate price shall be submitted in addition to the base bid for consideration. If the alternate is deemed acceptable, written authorization will be issued.
E. **No Known Equal:** For the purposes of specifying products, “No Known Equal” shall mean that the Owner/Architect/Engineer is not aware of an equivalent product. The Contractor will need to submit a “Substitution” item, per the requirements listed above, if a different product is proposed to be utilized.

1.9 **SUBMITTALS – PRE-CONSTRUCTION**

A. Submit the shop drawing submittal as PDF files accompanied by Letter of Transmittal, which shall give a list of the number and dates of the drawings submitted.

B. Provide consecutively numbered drawings featuring the name of the project that indicate the name of the specific staff that checked and approved each drawing. Any drawings submitted without this approval will be rejected.

C. If the shop drawings show variations from the requirements of the Contract because of standard shop practice or other reasons, make specific mention of such variations in the Contractor’s letter of transmittal. If the substitution is accepted, the Contractor shall be responsible for proper adjustment that may be caused by the substitution. Submit samples upon request.

D. Only products listed as “Equal” within the contract documents, along with formally approved “Substitutions” will be reviewed. Products not conforming to these items will be rejected.

E. Shop drawings shall be submitted on the following but not limited to:
   1. System functional diagrams, including control system wiring
   2. Equipment locations and methods for mounting
   3. Console layout, equipment placement, etc.
   4. All other products called out on drawings that call for shop drawing submittal.

1.10 **SUBMITTALS – CLOSE-OUT**

A. Subsequent to completing preliminary testing, provide to the Construction Manager, Owner, and Planetarium consultant, a letter/report documenting the results of the preliminary tests and the documentation detailed below. The receipt of this documentation will constitute the acknowledgment that the installation is complete, that it conforms to this specification, and that it is ready to be reviewed and tested.

B. **Operation and Maintenance Manuals:** Provide all manuals as PDF files on three duplicate CD-ROM disks or USB drives, named consistently with the manufacturer’s name and the model number in separate folders for the planetarium and exhibit hall. Copy the same file and folder organization to the Owner.
   1. Provide step-by-step operating instructions for the day-to-day use of the system including power activation, connection of source devices, adjustment of volume levels, selection of sources, etc. Include illustrations and references to individual equipment manuals as necessary. Hyperlink the references to the individual operation manual files included in this submission.
   2. Organize the manual PDF files into folders by subsystem: audio, video, control, etc.
3. Equipment List: Include an Excel or other spreadsheet file listing all equipment including connectors and specialty hardware. Include columns for manufacturer, model, physical location, MAC address, IP address, if fixed or DHCP, VLAN, serial number, and cable label identification.

C. As-built drawings: Provide all as-built documentation as PDF files on the disks and online service mentioned above. In addition, provide a single copy each of the functional drawings, floor plans, and ceiling plans as laminated full-size drawing sets.

PART 2 - PRODUCTS

2.1 PLANETARIUM LIGHTING CONTROL SYSTEM

A. Objective: Provide an automated computer-based lighting control system to enhance the ease of presenting shows/lessons. System must be capable of controlling all dimmable RGB, RED, and WHITE light LED and MR-16 lighting systems with smooth transition (no flicker) from 0% to 100% and 100% to 0% levels.

B. The system should be able to control all DMX512 compatible lighting.

C. Have the ability to create and store for playback lighting cues with programmable fade rates and light levels.

D. In addition to the controller at the Planetarium Control console, system has a wireless interface touch screen interface to allow all lighting control from anywhere in the theater.

PART 3 - EXECUTION

3.1 ACCEPTANCE TESTS

A. Acceptance Test: Demonstrate each major component to function as specified.

B. Such tests may be performed on any piece of the system or individual equipment/device. If any test shows the equipment or system is defective or does not comply with the specifications, perform any remedies at your firm’s expense and pay the subsequent expenses of any required retesting.

3.2 TRAINING AND FIELD SUPPORT

A. Training: System Functionality

1. Provide a minimum of one, eight-hour day of prepared and organized training sessions (separate from full dome training sessions) for the benefit of the Owner's personnel. Demonstrate the location, wiring, operation and capabilities of each system component.

2. Develop with CCC, a training schedule to allow for training on the planetarium technology package that will allow for appropriate groups of personnel to be scheduled for training on the various subsystems. Training shall be of sufficient duration and depth and the schedule shall allow adequate time for personnel to absorb the training.
3. At minimum, include training on each component of the system.

3.3 MISCELLANEOUS PROJECT REQUIREMENTS

A. Single Point of Contact: Provide an English-proficient, single point of contact, i.e., project manager, to speak for the Contractor and to provide the following functions:
   1. Initiate and coordinate tasks with Owner’s Project Manager, and others as specified by Owner’s Project Manager.
   2. Provide day-to-day direction and on-site supervision of Contractor personnel.
   3. Ensure conformance with all Contract provisions.
   4. Participate in weekly site project meetings as needed.
   5. This individual will remain as Project Manager for the duration of the project. The Contractor may change Project Managers only with the Owner’s Project Manager’s written approval.

B. Planning meetings and schedule: Within thirty (30) calendar days after the date of award of the Contract, an initial planning meeting will be held with the successful bidder to clarify all requirements (systems, services, distribution methods, etc.), identify responsibilities, and schedule the events that will transpire during the implementation of the project. Within one week of this initial meeting, the Contractor shall provide a written report and project schedule to clearly document the events and responsibilities associated with the project.

C. Site Cleaning: Throughout the progress of the plant construction, the Contractor shall keep the working area free from debris of all types and remove from the premises all rubbish resulting from any work done by Contractor. On a daily basis and at the completion of its work, the Contractor shall, to the extent possible, leave the premises in a clean and finished condition.

D. Safety Requirements: Contractor will utilize appropriate personnel and display warning signs, signals, flags and/or barricades at the work site to ensure adherence to safety regulations and as prudence requires.

E. Specification/Drawing Status: All specifications and drawings related to this project will be “frozen” after shop drawing approval. The Owner reserves the right to negotiate any future changes with the Contractor at any time.

F. Upon approval of shop drawings, contractor shall immediately place orders for all required materials, components, and supplies. In addition, contractor shall secure and forward written confirmations (including orders and shipping dates) direct from each manufacturer/vendor to the Owner’s Project Manager.

G. Contractor shall expedite shipment of all materials, components and supplies, as necessary to ensure the successful completion of the Project by the date required. All costs for expediting shall be included within contractor’s pricing as provided below.

H. The system cost herein shall include administration/maintenance training for at least ten Owner’s representatives with a minimum allotment of sixteen (16) hours. All training shall include written and/or video materials that shall remain the property of Owner. If materials are written, they shall be provided in quantities sufficient for each person.
trained; if materials are video, one copy of each will be required. The administration/maintenance training shall include, but not be limited to, the following:

1. Review of as-built documentation, including a site demonstration.
2. All warranty information.

3.4 DAMAGES

A. The Contractor will be held responsible for any and all damages to portions of the building caused by it, its employees or sub-contractors; including but not limited to:

1. Damage to any portion of the building caused by the movement of tools, materials or equipment.
2. Damage to any component of the construction of spaces.
3. Damage to the electrical distribution system.
4. Damage to the electrical, mechanical and/or life safety or other systems caused by inappropriate operation or connections made by the Contractor or other actions of Contractor.
5. Damage to the materials, tools and / or equipment of the Owner, its consultants, agents and tenants.
6. Damage to the projection dome surface
7. Damage, interference, or outage to campus wide area or local area networks.

3.5 INSPECTIONS

A. On-going inspections shall be performed during construction by the Owner’s Project Manager. All work shall be performed in a high-quality manner and the overall appearance shall be clean, neat and orderly. The following points will be examined and must be satisfactorily complied with:

1. Are all cables properly labeled, from end-to-end?
2. Have all terminated cables been properly tested in accordance with the specifications for the specific category as well as tested for opens, shorts, polarity reversals, transposition and presence of AC and/or DC voltage?
3. Have the pathway guidelines been followed? Are all cable penetrations installed properly and fire stopped according to code?
4. Has the Contractor avoided excessive cable bending?
5. Is Cable fill correct?
6. Are terminations compatible with applications equipment?
7. Are connectors properly turned right side up in the Jack Panels or faceplates without cables wrapped or twisted?
8. Is the jacket maintained right up to the termination?
9. Are identification markings uniform, permanent and readable?

3.6 COMPLETION OF WORK

A. At the completion of the System, restore to its former condition, all aspects of the project site. On a daily basis, remove all waste and excess materials, rubbish debris, tools and equipment resulting from or used in the services provided under this Contract. Provide all clean up, restoration, and removal noted above at no cost to Owner. If the Contractor fails in its duties under this paragraph, the Owner may upon notice to the Contractor perform the necessary clean up and deduct the costs thereof from any amounts due or
to become due to the Contractor. Remove trash from work areas and bring it to the Contractor-provided dumpster.

B. Final Punch Walk: Complete a final inspection to determine if all conditions of the scope of work are completed to the owner’s satisfaction. Provide a punch list within ten days of the punch walk, unless otherwise indicated, and present it to the Contractor for completion prior to final project sign-off by the owner. If an item is missed during the punch walk or not included on the “punch list” for any reason, it does not release the Contractor from completing the scope of work as defined in the specification or drawings.

C. Contractor shall submit complete Record Documentation as outlined in submittals section prior to project sign-off by owner.

3.7 SYSTEM AND/OR NETWORK TESTING

A. Upon completion of installation, execute all of the tests listed in this specification. Provide the Owner, written notice when all such tests have been completed to Owner’s satisfaction and Manufacturer’s specifications, Contractor shall give the Owner written notice thereof.

B. Assume responsibility of assuring that the system and network interface installed operates properly, including any required coordination with other suppliers.

3 3.13 FINAL ACCEPTANCE

A. The Owner or Owner’s representative may visit the site during the installation of the system to ensure that correct installation practices are being followed.

B. Notify the Owner’s representative when the systems are ready for a final job review. The review will take place within one week after notification.

C. If need for additional adjustment becomes evident during final acceptance and/or demonstration and testing, continue adjustment until the system functions fully as designed.

D. The Owner or Owner’s representative will review the installation and certification data prior to the system acceptance.

E. The Owner or Owner's representative may test some of the system’s features to ensure that the certification data is correct. If a substantial discrepancy is found, the Owner reserves the right to have an independent consultant perform a certification of the entire system. If such a procedure is undertaken, the cost of the testing will be billed back to the Contractor.

F. In the event that repairs or adjustments are necessary, make these repairs at your firm’s expense. Complete all repairs within five days from the time they are disclosed to your firm.

END OF SECTION
SECTION 27 00 00 - BASIC COMMUNICATIONS REQUIREMENTS

PART 1 - GENERAL

1.1 SUMMARY

A. This section includes general administrative and procedural requirements for Division 27, and is intended to supplement, not supersede, the general requirements specified in Division 00.

B. The requirements described herein include the following:

1. References
2. Definitions
3. System Description and Project Conditions
4. Submittals
5. Quality Assurance
6. Delivery, Storage, and Handling
7. Scheduling
8. Warranty
9. Product Substitutions
10. Project Management and Coordination Services
11. Permits and Inspections
12. Field Quality Control
13. Project Closeout and Record Documents

C. Related Items

1. General and Supplementary Conditions: General provisions of the Prime Contract and Divisions 00 and 01 apply to Division 27.
2. Consult other Divisions and Sections, determine the extent and character of related work, and coordinate Work of Division 27 with that specified elsewhere to produce a complete and operable installation.
3. Section 27 05 26, “Communication Grounding and Bonding”
4. Section 27 05 28, “Communication Building Pathways”
5. Section 27 05 33, “Communication Building Pathways – Conduits and Boxes”
6. Section 27 05 36, “Communication Building Pathways – Cable Tray”
7. Section 27 08 11, “Communication Twisted Pair Testing”
8. Section 27 08 21, “Communication Optical Fiber Testing”
9. Section 27 11 00, “Communication Equipment Rooms”
10. Section 27 13 13, “Communication Backbone ISP Twisted Pair Cabling”
11. Section 27 13 14, “Communication Backbone OSP Twisted Pair Cabling”
12. Section 27 13 23, “Communication Backbone ISP Fiber Optic Cabling”
13. Section 27 13 24, “Communication Backbone OSP Fiber Optic Cabling”
14. Section 27 15 13, “Communication Horizontal Twisted Pair Cabling”

1.2 REFERENCES

A. General

1. Codes, standards, and industry manuals/guidelines listed by reference, including revisions by issuing authority, form a part of this specification section to extent indicated. Consider such codes and/or standards a part of this specification as though fully repeated herein.
2. Standards listed are identified by issuing authority, authority abbreviation, designation number, title or other designation established by issuing authority. Standards subsequently referenced herein are referred to by issuing authority abbreviation and standard designation.

3. Reference to codes, standards, specifications and recommendations of technical societies, trade organizations and governmental agencies shall mean that latest edition of such publications adopted and published prior to submittal of the bid unless otherwise specifically stated.

B. Codes: Perform work and furnish materials and equipment under Division 27 in accordance with applicable requirements of the latest edition of governing codes, rules and regulations including but not limited to the following minimum standards, whether statutory or not:

1. California Code of Regulations (CCR):
   a. Title 8, “Industrial Relations”
      1) Chapter 3.22, “California Occupational Safety and Health Regulations (CAL/OSHA)”
   b. Title 24, “California Building Standards Code”
      2) Part 2, “California Building Code” (CBC)
      3) Part 3, “California Electrical Code” (CEC)
      4) Part 11, “California Green Building Standards Code” (CALGeen)”

2. National Fire Protection Agency (NFPA)
   a. NFPA 75, “Protection of Information Technology Equipment”

4. Other applicable national, state, and local binding building and fire codes

C. Standards: Perform work and furnish materials and equipment under Division 27 in accordance with the latest editions of the following standards as applicable:

1. Building Industry Consulting Services International (BICSI):
   a. Telecommunications Distribution Methods Manual (TDMM)
   c. Wireless Design Reference Manual (WDRM)

2. EIA testing standards

3. National Electrical Contractors Association (NECA):

4. Telecommunications Industry Association (TIA):
   a. ANSI/TIA-568-C.0, “Generic Telecommunications Cabling for Customer Premises”
   b. ANSI/TIA-568-C.1, “Commercial Building Telecommunications Cabling Standards - Part 1 General Requirements”
   c. ANSI/TIA-568-C.2, “Balanced Twisted Pair Telecommunications Cabling and Components”
   e. ANSI/TIA-569-B, “Commercial Building Standard for Telecommunications Pathways and Spaces”
   f. ANSI/TIA/EIA-598-B, “Optical Fiber Cable Color Coding”
   g. ANSI/TIA-606-B, “Administration Standard for Telecommunications Infrastructure”
h. ANSI/TIA-607-C, “Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises”
i. ANSI/TIA-758-A, “Customer-Owned Outside Plant Telecommunications Infrastructure Standard”
j. ANSI/TIA-1005, “Telecommunications Infrastructure Standard for Industrial Premises”

5. CCCCD Infrastructure Standard
   a. Districtwide Technology Infrastructure Standard Rev. 02.60, Dated August 2018

1.3 DEFINITIONS

A. The definitions of Divisions 00 and 01 shall apply to Division 27 sections.

B. In addition to those definitions of Divisions 00 and 01, the following list of terms as used in this specification defined as follows:

1. “AFF”: Above Finished Floor
2. “As directed”: As directed or instructed by the Owner, or their authorized representative
3. “AHJ”: Authority Having Jurisdiction
4. “Cabling”: installed media ready for electronic or optical signal circuit use; a complete media connection comprised of cables, termination apparatus (patch panels, blocks, connectors), outlets, connecting media (path cord, crossconnect), labeling
5. “CBC”: California Building Code (CCR Title 24 Part 2)
6. “CCR”: California Code of Regulations
7. “CEC”: California Electrical Code (CCR Title 24 Part 3)
8. “Connect”: To install patch cords, equipment cords, crossconnect wire, etc. to complete an electronic or optical signal circuit
9. “Cord”: a length of cordage having connectors at each end. The term “Cord” is synonymous with the term “Jumper” and “Lead”
10. “Engineer”: TEECOM
11. “Furnish”: To purchase, procure, acquire, and deliver complete with related accessories
12. “General Contractor”: Successful bidder
13. “Identifier”: A unique code assigned to an element of the Telecommunications infrastructure that links it to its corresponding record
14. “Install”: To set in place, join, unite, fasten, link, attach, set up or otherwise connect together and test before turning over to the Owner, parts, items, or equipment supplied by contractor or others. Make installation complete and ready for regular operation
15. “IOR”: Inspector Of Record
16. “ISP”: Inside Plant
17. “LED”: Light Emitting Diode
18. “MSDS”: Material Safety Data Sheets
19. “NEC”: National Electrical Code (NFPA 70)
20. “NEMA”: National Electrical Manufacturers Association
22. “NIC”: Not In Contract (work or equipment)
23. “OFCI”: Owner-furnished contractor-installed; coordinate the integration of components furnished by the Owner; provide mounting hardware, cable, connectors, etc. to ensure proper integration of OFCI equipment
24. “OFE”: Owner Furnished Equipment
25. “OSP”: Outside Plant
26. “Owner”: Contra Costa College
27. “Owner’s Representative”: Critical Solutions Inc.
29. “Pigtails”: a length of cordage having connectors at one end
30. “Provide”: To furnish, transport, install, erect, connect, test and turn over to the Owner, complete and ready for regular operation

31. “UL”: Underwriters Laboratories

1.4 SYSTEM DESCRIPTION AND PROJECT CONDITIONS

A. In circumstances where the Specifications and Drawings conflict, the Drawings shall govern quantity and the Specifications shall govern quality.

1.5 SUBMITTALS

A. General: Refer to Division 01 for Submittal requirements applicable to this Section.

B. Submit required submittals to the General Contractor in the quantities and formats as required under the general contract. In the absence of requirements, provide as described in the following with reference to quantity and format.

C. Failure to comply with requirements in part or whole shall constitute grounds for rejection.

D. Resubmittals: For resubmittals, provide a cover letter with the resubmittal that lists the action taken and revisions made to each product in response to the Engineer’s submittal review comments. Lack of this actions-taken cover letter shall constitute grounds for non-review and/or rejection of resubmittal packages.

E. Submittal Description: Product Data

1. Obtain written approval from the Engineer for the product data submittal prior to materials and equipment purchase order and prior to installation.

2. Quantity and Media: Submit product data as described in Division 01. In the absence of requirements given, submit product data submittal as directed in writing either as an electronic submittal (preferred) via approved means (e.g., email, e-transmit) or as four printed submittals (not preferred).

3. Format and Organization – Electronic Submittal:

   a. File format shall be PDF, either as a single compiled PDF file or as a PDF portfolio. PDF files should be produced from original electronic media, not scans of printed media. If scans from prints are the only option, annotate electronically, not on the prints prior to scanning.

   b. Pages should be letter size (8.5” x 11”)

   c. Organize the Content in the following order:

      1) Cover
      2) Table of Contents (TOC)
      3) Statement of compliance
      4) Product information
      5) Seismic calculations (as required)

   d. Clearly and precisely indicate the submitted product and accessories by part number using an electronic annotation (arrow, rectangle, oval, etc.). Where the product data presents “part number builds”, list the exact part number of the submitted products and accessories.

   e. Add page numbers in numerical order with no gaps to each page that correctly correspond to the TOC.
4. Format and Organization – Printed Submittal:
   a. Paper shall be letter size (8.5” x 11”).
   b. Package printed submittal using a 3-ring binder, clear-front report cover, or similar.
      1) For 3-ring binders, clearly label the cover and spine of each binder with the required “Cover” information (e.g., insert the cover in the front and spine transparent pockets):
   c. Organize the content in the following order:
      1) Cover
      2) Table of Contents (TOC)
      3) Statement of compliance
      4) Product information
      5) Seismic calculations (as required)
   d. Include tabbed separators for improved navigation through the submittal.
   e. Clearly, precisely, and permanently indicate the submitted product and accessories by part number using an arrow stamp or other permanent indicator. Where the product data presents “part number builds”, indicate the exact part number of the submitted products and accessories.

5. Content:
   a. Cover: Include a cover that clearly displays the following information:
      1) Owner name
      2) Project name and address
      3) Submittal name (e.g., “Product Data Submittal for Telecommunications Equipment Rooms”)
      4) Project submittal number
      5) Contractor’s submittal number (discretionary)
      6) Submittal date; format: Month Day, Year (e.g., “January 1, 2019”)
      7) Specification section numbers included in the submittal (e.g., “Section 271100”)
      8) Contractor name and contact information
   b. Table of Contents (TOC): Include a TOC that lists materials by section number, article and paragraph number. Add a brief product description (what it is, size or color or other optional features), manufacturer and part number. List the submittal page number per product. Example heading for TOC:

<table>
<thead>
<tr>
<th>Section</th>
<th>Article</th>
<th>Paragraph</th>
<th>Description</th>
<th>Manufacturer</th>
<th>Part #</th>
<th>Page #</th>
</tr>
</thead>
</table>

   c. Statement of Compliance: Include a “Statement of Compliance” letter or memorandum on the submitter’s company letterhead from the highest ranking employee assigned to this project stating the submittal has been reviewed (quality control check) and is in full compliance with the requirements of the contract documents, and listing the submittal’s contents. Wet sign (and stamped, if applicable) the letter.
   d. Product Information: Include manufacturer’s technical data, product literature, "catalog cuts", data sheets, specifications, and block wiring diagrams (if necessary) that clearly describe the product’s characteristics, physical and dimensional information, electrical performance data, materials used in fabrication, material color and finish, and other relevant information such as test data, typical usage examples, independent test agency information, and storage requirements. Include products listed in the specifications, at a minimum. Include relevant products that will be installed, which are not listed in the specifications.
F. Submittal Description: Shop Drawings
   1. Prior to the start of work, submit shop drawings and obtain written approval from the Engineer for the shop drawings submittal.
   2. Quantity and Media: Submit shop drawings as described in Division 01. In the absence of requirements given, submit shop drawings as directed in writing either an electronic submittal (preferred) via approved means (email, e-transmit, FTP upload) or four printed and bound sets on bond.
   3. Format:
      a. Use the same sheet size as the contract drawings.
      b. Use the same title block as the contract drawings, modified to include contractor information.
      c. Text: 3/32" - 1/8" high when plotted at full size.
      d. Use identical symbols as those in the contract drawings.
      e. Screen background information.
      f. Plot system components (symbols, outlet, devices, pathways, cable routes, etc.) and text using a heavier line weight sufficient enough to stand out against background information.
      g. Scaling:
         1) Scale floor plans and reflected ceiling plans at 1/8"=1'-0" 
         2) Scale enlarged room plans at 1/4"=1'-0"
         3) Scale wall elevations at 1"=1'-0"
         4) Scale rack elevations at 1"=1'-0"

G. Submittal Description: As-Built Drawings
   1. Quantity and Media: Submit as-built drawings as described in Division 01. In the absence of requirements given, submit as-built drawings as directed in writing as electronic files via approved media (or four printed and bound sets on bond, if approved).
   2. Format:
      a. Use the same sheet size as the contract drawings.
      b. Use the same title block as the contract drawings, modified to include contractor information.
      c. Text: 3/32" - 1/8" high when plotted at full size.
      d. Use symbols identical to the symbols shown on the contract drawings.
      e. Screen background information.
      f. Plot system components (symbols, outlet, devices, pathways, cable routes, etc.) and text using a heavier line weight sufficient enough to stand out against background information.
      g. Electronic files shall be native format and plotted PDF files. The file names shall include the sheet number.

   3. Content:
      a. Submit as-built drawings that fully represent actual installed conditions and that incorporate modifications made during the course of construction.
      b. Symbols List
      c. Diagrams, such as (but not limited to) point-to-point diagrams, block diagrams, riser diagrams, line diagrams, and other diagrams that conceptually describe the system
      d. Floor Plans and Reflected Ceiling Plans: Scale plans at 1/8"=1'-0". Plans shall show:
         1) Locations and identifiers of telecommunications outlets
         2) Routes, types, sizes, and quantities of pathways (such as cable trays, conduits, hangers, and other pathways)
e. Enlarged Rooms Layouts: Applicable rooms: Entrance facilities, BDF, IDF's. Room drawings shall show:
1) Floor layouts – scaled at either 1/4"=1'-0", showing dimensioned placement of equipment cabinets/frames, rack bays, etc.
2) Overhead layouts – scaled at either 1/4"=1'-0", showing dimensioned placement of overhead cable support (e.g., cable tray, cable runway, conduit sleeves, etc.)
3) Rack elevations – scaled at 1"=1'-0", showing placement of termination apparatus and other equipment installed onto rack bays
4) Wall Elevations – scaled at 1"=1'-0", showing dimensioned placement of termination apparatus (e.g., termination/crossconnect blocks)

H. Submittal Description: Operation and Maintenance (O&M) Manual
1. Quantity and Media: Submit O&M Manual as described in Division 01. In the absence of requirements given, submit one packaged O&M Manual set.
2. Format and Organization:
   a. Include contents in a 3-ring binder with front cover and spine clear pockets for insertion of the cover information.
   b. Cover shall include the following information:
      1) Owner name
      2) Project name and address
      3) Manual name (e.g., “Operation and Maintenance Manual for Telecommunications Cabling System”)
      4) Date; format: Month Day, Year (e.g., “January 1, 2014”)
      5) Contractor name and contact information
   c. Include a ToC at the beginning that lists the contents.
   d. Include tabbed separators for improved navigation through the manual.
3. Content:
   a. Instructions on making a warranty claim during the warranty period
   b. Contact information during the warranty period
   c. Contact information beyond the warranty period for maintenance and related service
   d. As-built drawings, as described above, printed on tabloid size (17”x11”) paper and as electronic files – both native files and plotted PDF files
   e. Product catalog/technical information sheets for each component provided under applicable section (typically, this is the {or similar to} the accepted product data submittal), printed on letter size (8.5” x 11”) paper and as electronic files in PDF format
   f. Warranty certificate from the manufacturer and the contractor, printed on letter size (8.5” x 11”) paper, wet signed as applicable
   g. Manufacturer’s instructions for system or component use
   h. Instructions and requirements for proper maintenance (according to the manufacturer) and as to maintain warranty

1.6 QUALITY ASSURANCE

A. Manufacturer Qualifications
1. Five continuous years, minimum, design and manufacture of the materials and equipment specified herein.
2. Manufacturer(s) of products and equipment specified herein shall demonstrate that they have a quality assurance program in place to assure that the specifications are met. Include in the program, at a minimum, provisions for:
   a. Incoming inspection of raw materials
   b. In-process inspection and final inspection of the cable product
   c. Calibration procedures of test equipment to be used in the qualifications of the product
   d. Recall procedures in the event that out of calibration equipment is identified.

3. Conform to government standards on quality assurance for applications within these specifications.

B. Contractor Qualifications:
   1. A current, active, and valid C7 or C10 California State Contractors License
   2. Five, minimum, continuous years of experience
   3. Five, minimum, completed projects similar to scope and cost
   4. Evidence of technicians qualified for the work

C. Materials
   1. Materials, support hardware, equipment, parts comprising units, etc., shall be new, unused, without defects and of current manufacturer, materials
   2. Use specified products and applications, unless otherwise submitted and approved in writing.

D. Regulatory Requirements
   1. Work and materials shall conform to the latest rules of National Board of Fire Underwriters wherever such standards have been established and shall conform to the regulations of the State Fire Marshal, OSHA and the codes of the governing local municipalities. Work under Division 27 shall confirm to the most stringent of the applicable codes.
   2. Provide the quality identified within these specifications and drawings when codes, standards, regulations, etc. allow Work of lesser quality or extent. The contract documents address the minimum requirements for construction.

E. Drawings
   1. Follow the general layout shown on the drawings except where other work may conflict with the drawings.
   2. Drawings for the work within this division are essentially diagrammatic within the constraints of the symbology applied.
   3. The drawings do not fully represent the entire installation. Drawings indicate the general route for pathways and cables, and show general locations of outlets. The drawings might not expressly show every conduit, sleeve, hanger, etc., but a complete system is required.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Delivery
   1. Do not deliver products to the site until protected storage space is available.
   2. Coordinate materials delivery with installation schedule to minimize storage time at jobsite.
3. Deliver materials in manufacturer’s original, unopened, undamaged packaging and containers with identification labels (name of the manufacturer, product name and number, type, grade, UL classification, etc.) intact.
4. Immediately replace equipment damaged during shipping at no cost to the Owner, so as not to impact the construction schedule.

B. Storage and Protection
1. Store materials in clean, dry, ventilated space free from temperature and humidity conditions (as recommended by manufacturer) and protected from exposure to harmful weather conditions.
2. Comply with manufacturer’s storage requirements for each product. Comply with recommended procedures, precautions or remedies as described in the MSDS as applicable.
3. Maintain factory wrapping or provide a heavy canvas/plastic cover to protect units from dirt, water, construction debris, and traffic.
4. Storage outdoors covered by rainproof material is not acceptable.
5. Provide heat where required to prevent condensation or temperature related damage.

C. Handling
1. Handle materials and equipment in accordance with manufacturer’s written instructions. Handle with care to prevent damage, breakage, denting, and scoring.
2. Do not install damaged materials and equipment. Replace damaged equipment at no cost to the Owner.

1.8 SCHEDULING
A. Unless otherwise specified, the construction schedules of the Sections within Division 27 may be combined into a single, overall schedule.
B. Do not proceed without written approval from the Owner or Owner’s Representative for schedule of this Work.

1.9 PROJECT MANAGEMENT AND COORDINATION
A. Project Management and Coordination Services
1. Provide a project manager for the duration of the project to coordinate this Work with other trades. Coordination services, procedures and documentation responsibility include, but are not limited to, the items listed in this section.
2. Review of Shop Drawings Prepared by Other Subcontractors:
   a. Obtain copies of shop drawings for equipment provided by others that require telecommunication service connections or interface with work.
   b. Thoroughly review other trades’ shop drawings to confirm compliance with the service requirements contained in the Division 27 contract documents. Document discrepancies or deviations as follows:
      1) Prepare memo summarizing the discrepancy
      2) Submit a copy of the specific shop drawing, indicating via cloud, the discrepancy
   c. Prepare and maintain a shop drawing review log indicating the following information:
      1) Shop drawing number and brief description of the system/material
2) Date of the review
3) Name of the individual performing the review
4) Indication if follow-up coordination is required

3. Should existing conditions prohibit construction progress as submitted and approved, coordinate the adjusted installed locations with the other contractors (AV, electrical, etc).

B. Concurrent Installation
1. The network will be installed concurrent with the work of Division 27. Coordinate your work with the Owner’s/network integrator’s work. For example, coordinate scope and dates for rack and cabling (terminations) readiness to allow the network integrator to plan and schedule installation of the network equipment (for example, access switches).

C. Role of the Engineer
1. The Owner has retained the Engineer’s services through construction. During construction, the Engineer will work with and assist the Contractor as follows (in general):
   a. Review product data and shop drawings submittals for general compliance with the contract drawings and specifications.
   b. Provide interpretation and clarification of project contract documents
   c. Reply to (and ‘process’) relevant Requests for Information (RFIs)
   d. Review changes as they arise, and confirm that the proposed solutions maintain the intended functionality of the system.
   e. Interpret field problems for Owner, and translate between Owner and Construction Team.
   f. Review the testing procedures to confirm compliance with industry-accepted practices.
   g. Observe the work for general compliance with the contract documents and to ensure that the installation meets the design intent of the system, and report progress to the Owner.

D. Use of Electronic Drawing Files
1. Should the Contractor require the Engineer’s electronic files to produce shop drawings and/or as-built drawings, the Engineer will require the Contractor sign a file release agreement.

1.10 WARRANTY

A. As a minimum, warrant products and labor provided will, under normal use and service, be free from defects and faulty workmanship for period of 1 year from the date of acceptance. During the warranty period the entire system shall be kept in operating condition at no additional material or labor costs to the Owner. Also refer to specific sections for additional warranty requirements that supersedes the project’s minimum warranty.

B. Render service within 24 hours of system failure notification. Note deviations or improvements to this service at the time of bid and obtain written acceptance from the Owner, or Owner’s Representative.

C. Manufacturers of the major system components shall maintain a replacement parts department and provide testing equipment when needed. Provide complete replacement parts within 24 hours during the warranty period.
D. Conformance to certain government standards on quality assurance may be required for some applications outlined in these specifications.

PART 2 - PRODUCTS

2.1 GENERAL

A. Materials used shall present no environmental or toxicological hazards as defined by current industry standards and shall comply with OSHA and EPA standards, other applicable federal, state, and local laws.

B. Product numbers are subject to change by the manufacturer without notification. In the event a product number is invalid or conflicts with the written description, notify the Engineer in writing prior to ordering the material and performing installation work.

2.2 PRODUCT SUBMITTAL AT TIME OF BID

A. At the time of bid, include a list of major products in the Contract documenting the intended cabling system solution, AV equipment, etc.

2.3 SUBSTITUTIONS

A. Conform to the substitutions requirements and procedures outlined in Division 01

B. Only one substitution for each product specified will be considered.

C. Where products are noted as "or equal", a product of equivalent design, manufacture, and performance will be considered. Submit product data (product information, catalog cuts, pertinent test data, etc.) to substantiate that the product is in fact equivalent to that specified. The burden of proof that the substituted product is equivalent to the specified product rests with the Contractor. Whenever material, process or equipment is specified in accordance with an industry specification (ANSI, TIA, etc), UL rating, or other association standard, present an affidavit from the manufacturer certifying that the product complies with the particular standard specification. When requested by the Engineer, submit supporting test data to substantiate compliance.

D. Manufacturers’ names and model numbers used in conjunction with materials, processes or equipment included in the contract documents are used to establish standards of quality, utility and appearance. Materials, processes or equipment that, in the opinion of the Engineer, are equivalent in quality, utility and appearance will be approved as substitutions to that specified when "or equal" follows the manufacturers’ names or model number(s).

E. When the Engineer accepts a substitution in writing, it is with the understanding that the Contractor guarantees the substituted product, component, article, or material to be equivalent to the one specified and dimensioned to fit within the construction according to contract documents. Do not provide substituted material, processes, or equipment without written authorization from the Engineer. Assumptions on the acceptability of a proposed substitution, prior to acceptance by the Engineer, are at the sole risk of the Contractor.

F. Approved substitutions shall not relieve the Contractor of responsibilities for the proper execution of the work, or from provisions of the specifications.
G. Pay expenses, without additional charge to the Owner, in connection with substitution materials, processes and equipment, including the effect of substitution on self, subcontractor's or other Contractor's work.

PART 3 - EXECUTION

3.1 PERMITS AND INSPECTIONS

A. Obtain and pay for permits and inspections required for the work.

B. Furnish materials and execute workmanship for this work in conformance with applicable legal and code requirements.

C. Perform tests required herein, or as may be reasonably required to demonstrate conformance with the Specifications or with the requirements of legal authority having jurisdiction.

D. Arrange and pay for review/inspection from compliance officials responsible for enforcement of applicable codes and regulations to establish that the work is in compliance with requirements of reference codes indicated herein.

3.2 EXAMINATION

A. Verify existing conditions, stated under other sections, are acceptable for installation in accordance with manufacturer's instructions.

3.3 FIELD QUALITY CONTROL

A. Staffing: Provide a qualified foreman to supervise the crew performing the work and who is present at the job site at times work is being performed.

B. Construction Meetings: Participate in construction coordination meetings throughout the course of construction to review the progress and to resolve issues and conflicts. Prepare and distribute meeting agenda for telecommunication issues prior to, and meeting notes after meetings, in a format acceptable to the Owner. Publish meeting notes within 3 business days following the meeting.

C. Scheduling: Perform the work within the approved construction schedule. Keep the construction schedule current, based on the results of the construction meetings. At minimum, schedule shall document critical due dates, tasks, and milestones. Submit revised schedules for approval within 3 business days whenever there are modifications.

D. Inspection: Inspect the work after installation. Keep areas of work accessible and notify code authorities, or designated inspectors, of work completion ready for inspection. Document completion and inspection as required.

3.4 INSTALLATION

A. Complete work in a neat, high-quality manner, relative to common industry practices, and in accordance to NECA “Standard of Installation”.

Contra Costa Community College District
Contra Costa College
C-4016 New Science Building – DSA Increment 2
B. Complete work in conformance to applicable federal, state and local codes, and telephone standards.

C. Coordinate the entire installation throughout the construction team (general contractor and subcontractors).

D. Manufacturer's Instructions: Comply with manufacturer's published installation instructions, product data, product technical bulletins, product catalog, and other instructions for installation. Maintain a file on the jobsite of MSDSs for each product delivered to jobsite packaged with an MSDS.

E. Adjusting: Make changes and revisions to systems to optimize operation for final use. Make changes to systems such that defects in workmanship are corrected and completed systems pass the minimum test requirements.

F. Protection: Protect installed products and finish surfaces from damage during construction.

G. Repair/Restoration: Replace or repair work completed by others that you deface or destroy. Pay the full cost of this repair/replacement. Repair defects prior to system acceptance.

3.5 CLEANING

A. Remove temporary coverings and protection of adjacent work areas. Remove unused, excess, and left over products, debris, spills, or other excess materials. Remove installation equipment.

B. Leave finished work and adjacent surfaces in neat, clean condition with no evidence of damage.

C. Repair or replace damaged installed products.

D. Legally dispose of debris.

E. Clean installed products in accordance with manufacturer's instructions prior to Owner's, or Owner's Representative's, punch walk.

3.6 PUNCH WALKS AND PUNCH LISTS

A. Punching the Work of individual Sections of Division 27 may be combined when noted so.

B. Execute a punch walk with the Engineer and the Owner or Owner's Representative to observe Work.

C. Develop a punch list for items needing correction. Issue this punch list to Engineer.

D. Correct the Work as noted on punch list.

E. Execute follow up punch walk with the Engineer and the Owner or Owner's Representative to verify punch list items have been corrected.

3.7 SYSTEM ACCEPTANCE

A. Complete corrections (punch list items) prior to submitting acceptance certificate.
B. On completion of the acceptance test, submit system acceptance certificate to the Owner or Owner’s Representative requesting their signature and return of the certificate. Issue copies of the signed certificate back to the Owner or Owner’s Representative with copy to the Engineer.

3.8 TRAINING

A. After acceptance, schedule a time convenient with the Owner, or Owner’s Representative, for instruction in the configuration, operation, and maintenance of the system.

B. Refer to individual sections within Division 27 for additional training requirements.

END OF SECTION
SECTION 270413 - COMMON SUBMITTAL REQUIREMENTS FOR COMMUNICATIONS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Supplementary administrative and procedural requirements for submitting Shop Drawings, Product Data, Samples, and other submittals specific to the work of this Division.

B. Related Requirements:
   1. Division 01 submittal requirements.

1.3 DEFINITIONS

A. Contractor: Refers to an entity in direct Contract with the Owner to furnish and/or perform any portion of the Work of the Contract.
   1. Contractor shall review and approve Product Submittals prior to forwarding them to the Architect.

B. Product Submittals: In general, Product Submittals show characteristics of the proposed construction in one of the following forms:
   1. Shop Drawings.
   2. Product Data.
   3. Samples.

C. Action Submittals: Written and graphic information and physical samples that require Architect/Engineer's responsive action. Action submittals are those submittals indicated in individual Specification Sections as "action submittals."

D. Sustainable Design Submittals: Submittals required by Section 01813 "Sustainable Design Requirements." Submit documentation for products and materials contributing to achievement of LEED rating indicated. Sustainable Design Submittals are in addition to other submittal requirements.

E. Informational Submittals: Written and graphic information and physical samples that do not require Architect/Engineer's responsive action. Submittals may be rejected for not complying with requirements. Informational submittals are those submittals indicated in individual Specification Sections as "informational submittals."

F. Submittal Review Sheet: Specific form required to accompany each submittal. Obtain Submittal Review Sheet from the SmithGroup Project Manager.
1.4 SUBMITTAL ADMINISTRATIVE REQUIREMENTS

A. Requirements specified for submittals are intended to provide efficient handling, while permitting review responsibilities to be carried out.

B. Avoidable Resubmittals: The first two reviews of each specified submittal will be processed without cost to the Contractor. After the second review, the Owner may charge the Contractor for the cost of such additional processing, unless the processing results from approved Change Orders causing revisions to previously approved submittals.

C. Coordination: Coordinate preparation and processing of submittals with performance of construction activities.
   1. Coordinate each submittal with fabrication, purchasing, testing, delivery, other submittals, and related activities that require sequential activity.
   2. Submit all submittal items required for each Specification Section concurrently unless partial submittals for portions of the Work are indicated on approved submittal schedule.
   3. Submit action submittals and informational submittals required by the same Specification Section as separate packages under separate transmittals.
   4. Coordinate transmittal of different types of submittals for related parts of the Work so processing will not be delayed because of need to review submittals concurrently for coordination.
      a. Architect and Engineer reserve the right to withhold action on a submittal requiring coordination with other submittals until related submittals are received.

D. Processing Time: Allow time for submittal review, including time for resubmittals, as follows. Time for review shall commence on Architect's receipt of submittal. No extension of the Contract Time will be authorized because of failure to transmit submittals enough in advance of the Work to permit processing, including resubmittals.
   1. Refer to Section 01330 for quantity of days allowed for review.
   2. When a large volume of submittal materials is scheduled, additional review time may be required. Similarly, a particular submittal may require review completion in less than the agreed normal time. Due to variations in submittal volume and processing needs, agreed review time is not intended to apply to extreme conditions.

E. Maintain at the Project Site ready access to the latest reviewed Shop Drawings and Product Data, and one set of samples.

PART 2 - PRODUCTS

2.1 SUSTAINABLE DESIGN REQUIREMENTS

A. The District requires the Contractor to implement practices and procedures to meet the project's environmental performance goals. The Contractor shall ensure that the minimum requirements related to these goals, as defined in Section 01813 "Sustainable Design Requirements" are implemented to the fullest extent possible. Specific materials and systems have been selected to this end. Substitutions, or other changes to the work proposed by the Contractor or their Subcontractors, shall not be allowed if such changes compromise the aforementioned environmental goals and LEED certification.
B. Specific material goals, beyond inherently designed facility service systems, that may impact this area of work include: use of products with third-party verified Environmental Product Declaration, use of products with Health Product Declarations, use of products from manufacturers with publicly disclosed Corporate Sustainability Reports, use of products with recycled-content materials; use of locally-purchased, manufactured and extracted materials; use of FSC certified wood; use of low-emitting materials; construction waste recycling; and the implementation of a construction indoor air quality management plan.

PART 3 - EXECUTION

3.1 CONTRACTOR’S REVIEW

A. Project Closeout and Maintenance Material Submittals: See requirements in Division 01.

B. Be responsible for quantities, weights, and dimensions to be confirmed and correlated at the site; for information that pertains solely to the fabrication processes and to the means, methods, techniques, sequences, and procedures of construction; and for coordination of the work of every trade, supplier, and subcontractor.

C. Be responsible for each submittal to be in conformance with information given and the design intent expressed in the Contract Documents.

D. Provide with each submittal specific written notice of any variation from the requirements of the Contract Documents by causing a specific notation to be made on the Submittal Review Sheet and Submittal Transmittal. Changes to the approved construction documents are subject to DSA review and approval, submitted by the Architect as a CCD per DSA IR A-6.

3.2 ARCHITECT/ENGINEER’S AND GENERAL CONTRACTOR’S ACTION

A. General: Architect will not review submittals that do not include the Submittal Review Sheet.

B. Action Submittals: Architect’s staff and consultants will review the submittal, and mark the Submittal Review Sheet with an action code. The code meanings are described below.

C. Additional codes may be provided within comments or as an electronic submittal review stamp and shall be used in help indicating return of partial submittals.

E. Review Code meanings are as follows:

1. Action Codes Permitting Use:

   a. When an action code permitting use is assigned to a submittal, it does not authorize work that does not comply with the requirements of the Contract Documents. Acceptance of the Work will depend on compliance.

   b. Code AP - Approved: The Work covered by the submittal item may proceed, provided it complies with Contract Document requirements.

   c. Code AN - Approved as Noted: The Work covered by the submittal item may proceed, provided it complies with the Architect’s notations and Contract Document requirements.
d. Code AN-R - Approved as Noted - Resubmit: Do not deliver or install the related work until the resubmittal has received Code AP or AN. However, fabrication and other off-site work covered by the submittal item may proceed, at the Contractor's risk, provided it complies with the Architect's notations and Contract Document requirements.

2. Action Code Prohibiting Use:
   a. Action Code REJ - Not Approved: The Work covered by the submittal item, including purchasing, fabrication, delivery, and other activity, shall not proceed. Revise the submittal item or prepare a new item in accordance with the Architect's notations. Resubmit the corrected or new item without delay; do not permit submittal items marked "Not Approved" to be used. Work incorporating such items will be rejected.

3. Action Code for Items Not Required:
   a. Action Code X - Not Requested by Contract Documents: The submittal item is not called for by the Contract Documents and is being returned unreviewed by the Architect except to the extent necessary to determine its status.

F. Informational Submittals: For Architect's information only. Architect will review each submittal and will not return it, or will return it if it does not comply with requirements. Architect will forward each submittal to appropriate party.

1. Action Code for Information Only:
   a. Action Code INF - Information Only - Received: The submittal item is not called for a return with a reviewed action code by the Contract Documents and is being returned unreviewed by the Architect except to the extent necessary to determine its status.

G. Partial submittals prepared for a portion of the Work will be reviewed when use of partial submittals has received prior approval from Architect.

H. Incomplete submittals are not acceptable, will be considered non-responsive, and will be returned without review.

I. Architect will return without review or discard submittals received from sources other than the Contractor.

J. Submittals not required by the Contract Documents may be returned by the Architect without action.

1. Do not submit Material Safety Data Sheets. They will be returned without review or discarded.

3.3 SUBMITTAL TRANSMITTAL REQUIREMENTS

A. Submittal Transmittal shall be a PDF file in electronic format. It is recommended, to expedite the submittal review, the electronic form be emailed for review to the Architect as early as possible.

1. Submittal Numbering: See below.
2. Contact Information: Full Name, Phone Number and Email Address.

B. Submittal Definition

1. Each submittal consists of items from only ONE Specifications section.
2. Complete Submittal: If ALL the items required by the Specifications section are listed on
one Submittal Form (including continuation sheet), it is a complete submittal.

3. Partial Submittals: If it is necessary to divide the required items of a given Specifications
section into two or more submittals to meet schedule or handling requirements, the
separate submittals are partial submittals. All partial submittals have the same submittal
number, and are differentiated by sequential P-numbers (see below).

4. All items in each submittal, whether complete or partial, will be processed together:
Individual items will not be 'broken out' for special handling. Arrange submittals
accordingly.

C. Submittal Numbering

1. Number submittals as described below to assist tracking.
2. Number each submittal in the format nnnnnn-nn.
   a. The 6-digit number is the number of the section that requires the submittal. For
      example, 044200.
   b. The 2-digit number is based on the numerical sequence of submittals from that
      section. In other words, for each section, the first submittal is 01, the second is
      02, and so on. The 2-digit number does not change for partial or re-submittals, so
      that the submittal can be tracked.
   c. P-Number for Partial Submittals: Number each partial submittal in the pee space,
      beginning with P1, and increasing by one for each partial submittal of that
      submittal. If the submittal is a complete submittal, leave the P space blank.
   d. R-Number for Re-submittals: Number each re-submittal in the arr space,
      beginning with R1, and increasing by one for each re-submittal of that submittal.
      Do not include an R-Number for the initial submittal.
   e. Examples:

3.4 SUBMITTAL REVIEW SHEET REQUIREMENTS

A. Provide Submittal Review Sheet in PDF format. Submit as the page after the Submittal
   Transmittal.

B. When attached, the Submittal Review Sheet shall not obscure information contained in the
   submittal.

C. Do not edit any of the information contained within the Submittal Review Sheet except as
   follows:
   1. Submittal Number: See Submittal Numbering in Submittal Transmittal Requirements
      paragraph.

D. The Contractor shall submit the PDF file in a manner that will allow editing of the Submittal
   Review Sheet fields by SmithGroup and its consultants.

END OF SECTION
SECTION 27 05 26 - COMMUNICATIONS GROUNDING AND BONDING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes: Communications Grounding Backbone and Bonding of communications infrastructure and equipment to Communications Grounding Backbone.

B. Related Sections

1. Comply with the Related Sections requirements of Section 27 00 00.
2. Section 26 05 26, “Grounding and Bonding for electrical systems”

1.2 REFERENCES

A. Comply with the References requirements of Section 27 00 00.

B. In particular or addition to the codes and standards listed in Section 27 00 00, comply with the latest edition of the following applicable specifications and standards except as otherwise shown or specified:

1. NFPA 70, “National Electrical Code”, particularly the following Articles:
   a. Article 250: Grounding
   b. Article 770: Optical Fiber Cables and Raceways
   c. Article 800: Communications Systems
2. Underwriters Laboratories, Inc. (UL) UL 467: Grounding and Bonding Equipment
3. Electronic Industries Association/Telecommunication Industry Association:
4. Institute of Electrical and Electronics Engineers, Inc. (IEEE):

1.3 DEFINITIONS

A. Definitions as described in Section 27 00 00 shall apply to this section.

B. In addition to those Definitions of Section 27 00 00, the following list of terms as used in this specification defined as follows:

1. “BCT”: Bonding Conductor for Telecommunications
2. “CM” and “cmil”: Circular Millionths of an inch
3. “GE”: Grounding Equalizer Conductor
4. “MBRGB”: Main Building Reference Grounding Busbar
5. “TBB”: Telecommunications Bonding Backbone
6. “TBC”: Telecommunications Bonding Conductor
7. “TGB”: Telecommunication Grounding Busbar
8. “THHN”: Thermoplastic High Heat-resistant Nylon-coated
9. “TMGB”: Telecommunication Main Grounding Busbar

1.4 SYSTEM DESCRIPTION

A. Base Bid Work: The Work under this section includes furnishing materials, installation, and coordination through the General Contractor with other trades for a Communications Grounding Backbone and for bonding of telecommunications equipment and apparatus to the Communications Grounding Backbone.

B. Communications Grounding Backbone System: The Communications Grounding Backbone System contains grounding busbars, grounding conductors, bonding conductors, and connecting devices (including but not limited to pressure connectors, lugs, clamps, or exothermic welds). These components, upon completion of installation and testing, shall provide the means of a low impedance path to earth for unintentional and/or stray voltages or spurious signals present on telecommunications media and equipment. The Communications Grounding Backbone System will consist of the following aspects (refer to Drawings for additional information)

1. TMGB: Locate the TMGB in the BDF with the following connections:
   a. MBRGB, via BCT (refer to Drawings for wire size)
   b. Each TBB
   c. Ground bushings installed on each entrance conduit opening within the space, via TBC
   d. Overhead cable tray within the space, via TBC
   e. Dedicated power panel’s ACEG within the space serving communication equipment, via TBC
   f. Metallic pathways (conduits, surface raceway, etc.) within the space, via TBC

2. TBB: TBB(s) are the primary bonding conductor between the TMGB and other TGBs provided throughout a single building. The length of TBBs shall not exceed 500 feet. The TBB shall route from the MDF through each of the IDF's bonding each of the TGBs to the TMGB. Maintain TBB continuity and do not break continuity in order to bond to a TGB.

3. TGB: Locate the TGB in each IDF with the following connections:
   a. TBB
   b. Building steel, via TBC
   c. Each entrance conduit into the space, via TBC and ground bushings
   d. Overhead cable tray within the space, via TBC
   e. Panelboard’s ACEG within the space serving telecommunication equipment, via TBC
   f. Metallic pathways (conduits, surface raceway, etc.) within the space, via TBC

C. Performance Criteria for the Grounding Backbone:
   1. Resistance from any point of the communication grounding backbone system to the ground electrode and to earth shall not exceed 20 Ohms.
   2. Field test resistance and document, both electronically and printed, measured values.

D. Bonding: Bonding consists of TBCs within telecommunications rooms from the TMGB and TGBs to the following components:
   1. Rack bay
   2. Overhead cable support and vertical cable support
   3. Wall-mounted termination equipment
4. Conduit ground bushings
5. Exit pathways
6. Bonding jumpers between basket tray, cable runway, and cable tray joints & splices, and between basket tray/cable runway/cable tray and equipment racks

E. Conductor Gauge Criteria:
1. Size TBB, GE, and TBCs as 6 AWG minimum, then as 2,000 cmil per linear foot up to 3/0 AWG.

1.5 SUBMITTALS

A. Comply with Submittal procedural, quantity, and format requirements of Section 27 00 00.

B. Submittal Requirements at Start Of Construction:
1. Product Data Submittal
2. Shop Drawing Submittal(s), if the Contractor’s installation intent differs from the Contract Documents or the design intent

C. Substitutions
1. Requests for substitutions shall conform to the general requirements and procedure outlined in Section 27 00 00.

D. Submittal Requirements at Closeout: Submit to the Owner at the time of project closeout the following and before certificate of final payment is issued.
2. As-Built Drawings, consisting primarily of the Communications Grounding Backbone (not necessarily each bonded component or apparatus)

1.6 QUALITY ASSURANCE

A. Comply with Quality Assurance requirements of Section 27 00 00.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Comply with Delivery, Storage and Handling requirements of Section 27 00 00.

1.8 WARRANTY

A. Warrant Work to perform as described within this Section for a period of 1 year. Correct deficiencies within 24 hours of notification.
PART 2 - PRODUCTS

2.1 GROUNDING AND BONDING CONDUCTORS

A. Application: Suitable for indoor installation as a BCT, TBB, GE, and/or TBC.

B. Type: THHN (or THWN)

C. Approvals:
   1. UL 83 as Type THHN

D. Conductor: soft drawn annealed copper, stranded

E. Gauge: Refer to System Description for conductor sizing criteria.

F. Insulation: PVC, high-heat and moisture resistant

G. Jacket: Nylon, abrasion, moisture, gasoline and oil resistant

H. Color: green

I. Flame Resistance: Meet the flame resistance requirements of IEEE 383, CSA FT-4 and UL VW-1.

2.2 CONNECTOR – “PARALLEL” TAP

A. Application: H-type thick wall compression tap, for making conductor-to-conductor (e.g., TBB-to-TBC) permanent connection (pigtailling, tapping, or splicing). Connectors shall be UL Listed.

B. Manufacturers:
   1. Panduit
      a. #HTCT2-2-1; “H-type” compression tap, run = #6-#2, tap = #2-#6.
      b. #HTCT250-2-1; “H-type” compression tap, run = #2-250MCM, tap = #6-#2

   2. Or equal

2.3 CONNECTOR – “C” TAP

A. Application: C-type copper thick wall compression tap, for making conductor-to-conductor (e.g., TBB-to-TBC) permanent connection (pigtailling, tapping, or splicing). Connectors shall be UL Listed.

B. Manufacturer:
   1. Panduit
      a. #CTAPF4-12-C; CTAP for #6 AWG run—to— #6 AWG tap
      b. #CTAPF2-12-C; CTAP for #2 AWG run—to— #6 AWG tap
      c. #CTAPF1/0-12-L; CTAP for 1/0 AWG run—to— #6 AWG tap
      d. #CTAPF2/0-12-Q; CTAP for 2/0 AWG run—to— #6 AWG tap
e.  #CTAPF3/0-12-Q; CTAP for 3/0 AWG run –to– #6 AWG tap

2.  Or equal

2.4  GROUNDING BUSBAR

A.  General:  Busbar shall be UL listed.

B.  Standards:  Compliant to ANSI/TIA-607-C

C.  Material:  Solid copper

D.  Holes:  Predrilled, compatible with standard NEMA bolt hole sizing and spacing and with ANSI/TIA-607-C recommendations for 2-hole lugs.

E.  Mounting:  Wall-mounted with standoffs.  Standoffs shall insulate busbar from the mounting substrate.

F.  Manufacturer:
   1.  Chatsworth Products Inc
      a.  #13622-020; busbar, 20”L x 4”W x ¼”T, TMGB hole pattern
      b.  #40153-012; busbar, 12”L x 4”W x ¼”T, TMGB hole pattern
      c.  #13622-012; busbar, 12”L x 2”W x ¼”T, TGB hole pattern
      d.  #13622-010; busbar, 10”L x 2”W x ¼”T, TGB hole pattern
   2.  Or equal

2.5  CONNECTION TO STRUCTURAL STEEL

A.  Application:  Exothermic welds shall be used for cable-to-cable, cable-to-ground rod, and cable-to-structural steel.

B.  Manufacturers:
   1.  Cadweld
      a.  Each particular type of weld shall use a kit unique to that type of weld
   2.  Or equal

2.6  CONNECTOR – COMPRESSION LUG

A.  Application:  Conductor-to-busbar and/or –rack (or other flat surfaces) connection

B.  Type:  compression lug, standard or long barrel, two-hole (1/4 inch diameter 5/8 inch on center)

C.  Manufacturers:
   1.  Panduit
      a.  #LCC6-14JAW-L; for 6 AWG conductor
      b.  #LCC4-14ADW-L; for 4 AWG conductor
      c.  #LCC2-14AW-Q; for 2 AWG conductor
      d.  #LCC1-14AW-E; for 1 AWG conductor
2.7 CONNECTOR – SPLIT-BOLT, MECHANICAL TYPE

A. Application: Conductor-to-conductor (or other round component) connection

B. Type: split-bolt mechanical connector

C. Material: high-strength copper alloy

D. Manufacturers:
   1. Cooper B-Line
      a. #WB2GC; split bolt bonding clamp
   2. Panduit
      a. #SBC3-C; split bolt bonding clamp for #6 to #3 conductor

2.8 BONDING STRAPS

A. Cable Runway Bonding Straps
   1. Application: makes multiple sections of cable tray conductively continuous
   2. Conductor: Flexible braided straps with factory terminated connectors.
   3. Manufacturers:
      a. Chatsworth Products Inc
         1) #12061-001
      b. Cooper B-Line
         1) #SB6691x7¾
      c. OZ/Gedney
         1) Type BJ
      d. Thomas & Betts
         1) #3840 series
      e. Or equal

B. Cable Tray Bonding Straps
   1. Application: makes multiple sections of cable runway conductively continuous
   2. Conductor: Flexible braided straps with factory terminated connectors.
   3. Manufacturers:
      a. Cooper B-Line
         1) #99-N1
      b. Thomas & Betts
         1) #FB95
2.9 LABELS

A. Labels for Busbars
   1. Labels shall be machine-printable (such as by a laser printer or hand-held printer)
   2. Printable area should be approximately 2 inch wide x 0.5 inch high
   3. Printable area color shall be white
   4. Manufacturer:
      a. Panduit
         1) #C200X100FJJ; laser/ink jet labels, white – for busbars
      b. Or equal

B. Labels for Conductors
   1. Labels shall be machine-printable (such as by a laser printer or hand-held printer)
   2. Labels shall be adhesive-backed and have a self-laminating feature
   3. Printable area should be 1 inch wide x 0.5 inch high, or larger
   4. Printable area color shall be white
   5. Manufacturer:
      a. Panduit
         1) #S100X150YAJ; laser/ink jet labels, white – for #6 wires
         2) # S100X225YAJ; laser/ink jet labels, white – for #6 to #1/0 wires
      b. Or equal

2.10 MISCELLANEOUS

A. Wire Clamp
   1. Material: nylon, UV stabilized.
   2. Color: black
   3. Size: 0.25" holding diameter for 6 AWG; or size as required based on conductor size.
   4. Manufacturer:
      a. Richco Inc.
         1) #N4B-BLK
      b. Or equal

PART 3 - EXECUTION

3.1 GENERAL

A. Comply with the Execution requirements of Section 27 00 00.
B. Work shall comply with the International Building Code, International Fire Code, National Electrical Code, UL 467, and ANSI/TIA-607-C standards, as well as local codes that may specify additional grounding and/or bonding requirements. If discrepancies between codes and/or standards arise, codes shall prevail, and then the more stringent requirement shall prevail, and as directed by the AHJ.

C. Install components to manufacturer’s instructions and recommendations and as required per UL listing.

D. Identify grounding and bonding conductors and components according to local codes.

E. Terminations must be accessible for inspection and maintenance during the life of the system.

3.2 EXAMINATION AND PREPARATION

A. Prior to the start of this section’s work, examine pathways and communications rooms for completeness, compatibility with the work of this section, and readiness for connections with the work of this section.

3.3 INSTALLATION

A. BCT, TBB, and GE Conductors
   1. Install BCT and TBB conductors in conduit and in a manner to protect them from physical damage.
   2. When routing BCT and TBB conductors through metallic conduit 3 feet or longer, bond the conductor to the conduit at both ends using a #6 AWG bonding conductor as a pigtail, an irreversible connection (preferably exothermic weld) for the conductor-to-pigtail connection, and insulated ground bushings at the conduit ends.
   3. Install the BCT and TBB conductors without splices.
      a. In the event that a splice is necessary, notify the Engineer in writing. Do not proceed with splicing work until the Engineer has accepted in writing the installation of a splice.
      b. Locate the splice in a telecommunications space and ensure accessibility.
      c. Perform the splice using an exothermic weld and an irreversible compression-type connector.
   4. Where shown on the drawings, connect grounding conductors to structural steel using exothermic welds. Each particular type of weld shall use a kit unique to that type of weld.

B. TMGB and TGB Busbars
   1. Mount busbars as noted on Drawings and using insulating standoffs. If not noted on drawings, install busbars onto wall at 24 inches AFF located within 5 feet of backbone pathways or rack bay.

C. Panelboard Bonding
   1. Where a panelboard is located in the same communications room as a TMGB/TGB and serves that room, provide TBC between busbar and that panelboard’s Alternating Current Equipment Ground (ACEG) bus (where equipped) or the enclosure.
E. Bonding

1. Provide TBC and appropriate grounding hardware between the nearest TMGB/TGB and the equipment racks / rack bay, overhead cable support, vertical cable support, telecommunication conduits, primary pathways that enter/exit the room (if applicable), and other metallic telecommunication infrastructure components. Refer to Drawings for additional information.

2. Minimum size: #6. If longer than 25 feet, size TBCs based on length using 2000 cmil per foot, up to 2/0 AWG.

3. Install TBCs in a manner that will protect them from physical and mechanical damage.

4. Routing:
   a. Route TBCs in the shortest possible path, using right angles for turns and routed parallel to building lines. Route on outside edges of wall plywood. Do not cut across the middle of the plywood taking space away from other equipment or components.
   b. Utilize a minimum 1-foot bend radius.

5. Connection to TMGB/TGBs:
   a. Thoroughly clean busbars prior to attaching connectors to the busbar.
   b. Fasten connectors (e.g., lugs) to the busbar using matching size bolt, flat washer Belleville washer, and nut. Torque hardware set.

6. Rack Bay Bonding
   a. Refer to Drawings for detailed diagrammatic requirements for bonding the rack bay.
   b. Bond equipment racks, frames, frame bays, cabinets, server racks, and other similar support systems located within the same room or space as the TMGB/TGB to the busbar.
   c. Use approved connectors for TBC-to-rack, -frame, and -cabinet connections.
   d. Rack bays may be bonded in series using either of the following configurations:
      1) Series: Provide a TBC from the TGB to the rack closest to the busbar; then provide a TBC to the other racks in the rack bay in series using a common lug/connection per rack. The rack shall not be used as a ‘conductor’ in the series connection.
      2) String: Provide one ‘main’ TBC from the TGB along the length of the rack bay, and provide a pigtail from the ‘main’ TBC per rack. Use an irreversible connection (such as “C” tap) for the ‘main’-to-pigtail connection.

7. Overhead and Vertical Cable Support Bonding
   a. Bond overhead and vertical cable support located within the same room or space as the TMGB/TGB to the busbar.
   b. Provide either UL listed connectors and splice plates or UL Listed bonding strap to bond sections of overhead cable support for ground continuity. This requirement applies to runway sections and junctions within a single telecommunication room.

8. Termination Field Bonding
   a. Bond termination blocks to the TMGB/TGB within the same room or space. Termination blocks may be bonded in series, with the block closest to the TMGB/TGB bonded to the busbar. Refer to Drawings for detailed diagrammatic requirements for bonding the termination blocks.

9. Metallic Surface Raceway Bonding
   a. Bond metallic surface raceways for telecommunications cabling to approved electrical ground located within the same room or space as the surface raceway.
3.4 LABELING

A. General Requirements
1. Labeling, identifier assignment, and label colors shall conform to TIA/EIA-606-A Administration Standard and as approved by the Engineer before installation.
2. Permanently label TBCs. Affix label as close as practical to each end of the conductor.

B. Label Format
1. Provide permanent labels with machine-generated text; hand written labels will not be accepted.
2. Labels on TBCs shall fully wrap around conductors with a self-laminating feature to provide permanent marking.

C. Identifier Assignment
1. Separate label fields of the identifier with a hyphen.
2. Assign identifiers according to current practice and as approved by the Engineer before installation.
3. BCT and TBB
   a. First field: "BCT" or "TBB" (the conductor type).
   b. Second field: a unique sequential number, for example, "01".
   c. Example: "TBB-01"
4. Ground Busbars
   a. First field: "TMGB" or "TGB" (the busbar type)
   b. Second field: the room’s identity (TR identifier’s suffix) where the busbar is installed; for example, “3A2.1”.
   c. Example: “TGB-3A2.1”
5. TBC:
   a. First field: “TBC” (the bonding conductor type).
   b. Second field: The room identity where TBC exists; for example: “A1.1”.
   c. Third field: A unique sequential number; for example: “01”, “02”, etc.
   d. Fourth field: describe the device, equipment, component, or raceway being bonded.
   e. Example: “TBC-A1.1-01 (RACK BAY)”

3.5 GROUNDING BACKBONE RESISTIVITY MEASUREMENT

A. Measure ground resistance from each ground busbar to earth; record measurement. Provide additional grounding electrodes, bonding, and other elements as required to comply with resistance limits specified in this Section.

B. Submit computer-generated records of measured resistance values to Engineer for approval and for inclusion into the Operation and Maintenance Manual.

3.6 FINAL INSPECTION AND CERTIFICATION

A. Punch the Work of this Section compliant to the requirements of Section 27 00 00. Punching the Work of this Section may be combined with punching the rooms.
B. Comply with system acceptance and certification requirements of Section 27 00 00.

END OF SECTION
SECTION 27 05 28 COMMUNICATIONS BUILDING PATHWAYS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes: Pathway systems within buildings to support low voltage systems: namely cable hangers and rated sleeves.

B. Related Sections

1. Comply with the Related Sections paragraph of Section 270000.
2. Section 26 05 33, “Raceways and Boxes for Electrical Systems”
3. Section 27 05 33, “Communications Conduits and Boxes”
4. Section 27 05 36, “Communications Cable Trays”
5. Section 27 05 26, “Communications Grounding and Bonding”
6. Section 27 11 00, “Communication Rooms”

1.2 REFERENCES

A. Comply with the References requirements of Section 270000.

B. In additional to those codes, standards, etc., listed in 270000, comply with the latest edition of the following applicable specifications and standards except as otherwise shown or specified:

1. Underwriters Laboratories (UL)
   a. UL 5, “Standard for Surface Metal Raceways and Fittings”
   b. UL 5A, “Nonmetallic Surface Raceways and Fittings”
   c. UL 5C, “Standard for Surface Raceways and Fittings for Use with Data, Signal, and Control Circuits”

2. Underwriters Laboratories (UL)
   a. UL 467, “Grounding and Bonding Equipment”

1.3 DEFINITIONS

A. Definitions of Section 27 00 00 apply to this Section.

B. In addition to those Definitions of Section 27 00 00, the following list of terms as used in this Section defined as follows:

1. “Cable Hanger”: A cable support component often shaped (section view) similar to the letter J (thus gaining the nickname “J hanger”), metallic (most often steel) or non-metallic (most often thermoplastic); available in different sizes (to support different quantities of cables) and with different attachment hardware suiting multiple installation methods (e.g., wire support, beam flange clip, etc.).

2. “Cable Strap”: A flexible cable support that generally ‘wraps’ around cables and ‘latches’ into a fixed position, most often textile, available in different sizes (to support different quantities of cables) and with different attachment hardware suiting multiple installation methods (e.g., wire support, beam flange clip, etc.).

3. “Enclosure”: The case or housing of apparatus, or the fence or walls surrounding an installation to prevent personnel from accidentally contacting energized parts or to protect the equipment from physical damage.

4. “J Hanger” and “J Hook”: nickname for cable hanger

5. “NEC”: National Electrical Code (NFPA 70)
7. “UL”: Underwriters Laboratories

1.4 SYSTEM DESCRIPTION

A. Base Bid Work:
1. The Work of this section includes planning and coordination with General Contractor (and other trades) of inside plant pathway systems and components, furnishing necessary materials, and labor and associated services required to install pathways.

B. Cable Hanger Systems
1. Provide a complete cable hanger system compliant with requirements of the CEC (in particular, compliant with the requirements of Article 300.11), in accordance with NECA’s “Standards of Installation” (pertaining to general electrical installation practices), compliant with applicable portions of NFPA 70B, in accordance with manufacturer’s instructions, and in accordance with recognized industry practices. A “complete system” shall include cable hangers, supports, anchors, fasteners, and other required accessories.
2. Provide cable hangers between primary pathways (or telecommunications rooms) and work area pathways and/or outlet locations at intervals up to 48 inches on center per a given route, at transitions downward/upward, and within 24 inches of an outlet stub/outlet location.
3. Supports:
   a. Provide dedicated supports for cable hangers. Do not support cable hangers on ceiling grid support wires. Do not share supports with other trades. Do not support hangers from ductwork, piping, or other equipment hangers.
   b. Support Wires:
      1) Support wires shall consist of #12 drop wire (or as approved) with integral clip and fastener (such as power-actuated deck pin, beam flange, or other fastener appropriate for the use).
      2) Secure support wires at both ends in accordance with CEC.
   c. Support Rods:
      1) Support rods shall consist of 1/4 inch (6.3mm) or 3/8 inch (9.5mm) threaded or smooth rod and concrete anchor or beam flange clip or angled flange clip (as required for attachment to the building structure).

4. Clearances (minimum):
   a. From fluorescent light fixtures, or other EMI sources = 6 inches
   b. From any motor = 48 inches
   c. From flue, hot water, steam line or other non-insulated heat sources = 12 inches

C. Fire Rated Sleeves
1. Provide complete fire rated sleeve systems where shown on the drawings and where cables penetrate rated walls, in accordance with ASTM E814 (UL1479). Complete shall include sleeves, brackets, frames, plates, etc, and other required accessories necessary for a complete installation according to UL System drawings.
2. Provide complete fire rated sleeve systems equal to (or greater than) the F rating of the barrier in which the device is installed.
3. Provide a system label at each penetration instance.

D. Surface Raceway
1. Provide a complete surface raceway system in accordance with NEC Article 386 and or NEC Article 388 where required by manufacturer's installations. Complete shall include base and cover straight sections, couplers, corners, 'T' junctions, feed connectors, compartment dividers, end caps, and hardware required for a fully enclosed pathway system that fully houses and conceals cables and wires. Refer to Drawings for locations and routes.

2. Surface raceway shall be mechanically and electrically continuous. Bond surface raceway system to approved electrical ground in accordance with NEC Article 250 and ANSI/TIA-607-C. Provide bonding straps where necessary to assure electrical continuity.

3. Surface raceway shall have a minimum two inch radius control at all bend points.

4. Coordinate raceway lengths with building walls, counter, and other actual field conditions. Raceways mounted above benches and counters shall align with each end of bench or counter, within 1/16-inch tolerance.

5. Finish:
   a. Paint surface raceway system to match existing walls.
   b. Touch-up any marks, blemishes or other finish damage suffered during installation.

E. Spiral Wrap
   1. Provide spiral wrap to support and dress cables from feed pathways to the point where the cables enter the furniture system.

1.5 SUBMITTALS

A. General: Conform to Submittal requirements as described in Section 270000.

B. Quantity: Furnish quantities of each submittal as noted in Section 270000.

C. Submittal Requirements Prior to the Start of Construction:
   1. Product Data Submittal, showing product dimensions, fabrications materials, fabrication details, knockout sizes and locations, capacities, finishes, and accessories.
   2. Shop Drawings Submittal, consisting of proposed changes to pathways (routes, types, sizes, etc.) compared to the contract documents.

D. Submittal Requirements at Close Out:
   1. As-Built Drawings, showing the routes/locations, dimensions, types, sizes, quantities, etc., of pathways/pathway devices.
   2. O&M Manual, including as-builds, a parts list, repair information, and detailing ongoing maintenance requirements.

E. Substitutions
   1. Requests for substitutions shall conform to the general requirements and procedure outlined in Section 270000.

1.6 QUALITY ASSURANCE

A. Comply with Quality Assurance requirements of section 27 00 00.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Comply with Delivery, Storage and Handling requirements of section 27 00 00.
1.8 WARRANTY

A. Comply with Warranty requirements of section 27 00 00.

PART 2 - PRODUCTS

2.1 HANGERS AND STRAPS

A. Application: Suitable for indoor installation within ceiling space for the support of communications cables.
B. Hanger shall be rated for use in air handling space.
C. Hangers shall contain a closing loop, retainer, or latch to prevent cables from falling off the hanger.
D. Manufacturer:
   1. Eaton B-Line
      a. #BCH21-W2; for drop wire installation
      b. #BCH32-W2; for drop wire installation
      c. #BCH21; for wall installation
      d. #BCH32; for wall installation
   2. Erico
      a. #CAT12 (or variation per installation method); cable hanger
      b. #CAT21 (or variation per installation method); cable hanger
      c. #CAT32 (or variation per installation method); cable hanger
      d. #CAT425 (or variation per installation method); cable strap
   3. Panduit
      a. #JMJH2-X20
   4. Or equal

2.2 DROP WIRE

A. Application: Suitable for indoor installation within ceiling space into structure above (e.g., deck or slab) for the support of cable supports such as cable hangers.
B. Listings: UL 2043, for use in air handling spaces
C. Drop wire shall be equipped with pre-mounted ceiling clip, fastening pin, and pre-tied wire. Pin shall be 7/8". Wire shall be 12 gauge.
D. Manufacturers:
   1. Hilti #CC27 X-AL-H22P8T x ft. PT (100); drop wire assembly, "x" for length
   2. Armstrong #7891
   3. Dottie #CWC
   4. Garvin Industries
   5. Oregon Wire Products
   6. Or Equal

2.3 DROP ROD

A. Application: Suitable for indoor installation within ceiling space into building structure above (e.g., deck or slab) for the support of cable supports such as cable hangers.
B. Listings: UL 2043, for use in air handling spaces
C. Zinc plated for corrosion resistance
D. Manufacturers:
   1. CEAS #01014801; “Stiffy” straight rod, 1-1/4” power-actuated pin, 48 inches (or configured as required per instance)
   2. Or equal

2.4 FIRE RATED SLEEVE
A. Application: Suitable as a sleeve for cables to pass through a full-height partition or floor, and as a through-penetration fire stop system maintaining the fire rating of the penetrated partition.
B. Sleeve system shall be tested in accordance with ASTM E 814 (ANSI/UL1479).
C. Sleeve system shall be UL Listed and shall bear a UL Classification marking.
D. Sleeve system shall match (or exceed) the partition’s/floor’s F and T rating.
E. Manufacturers:
   1. Specified Technologies Inc (STI)

2.5 SPIRAL WRAP
A. Application: Suitable for an indoor installation for the support of telecommunications cables from a feed pathway to furniture systems, or similar.
B. Material shall be flame retardant polyethylene (UL94V-0), or equivalent.
C. Color: Black.
D. Size: As required to support the given cable bundle size (e.g., 3/4” minimum).
E. Manufacturers:
   1. Panduit
   2. Or equal

PART 3 - EXECUTION

3.1 GENERAL
A. Comply with the Execution requirements of Section 270000.

3.2 EXAMINATION AND PREPARATION
A. Prior to starting the work of this section, examine areas to receive pathways systems to verify conditions are ready for work and to verify conformance with manufacturer and specification tolerances. Notify the Owner’s Representative in writing of conditions that would adversely affect the installation, or subsequent utilization, of the system. Do not proceed with installation until unsatisfactory conditions are corrected.
B. Prior to installation, plan routes and locations of pathway systems and coordinate with other trades (ductwork, plumbing, electrical raceways, wall construction, ceilings, etc.). Pathway systems shall not unnecessarily cross other trade’s work, shall not prevent removal of ceiling tiles or panels, and shall not block access to mechanical or electrical equipment. Provide offsets as required to avoid obstruction of pathway systems with other trades.
3.3 INSTALLATION

A. Hangers and Straps
1. Install hangers so they are accessible through the ceiling grid and are not blocked by other building infrastructure.
2. Install hangers above ceiling grid to result in cables sag 6 to 12 inches (150 to 300 mm), minimum, above ceiling grid. Cables shall not rest on the ceiling grid and/or ceiling tiles.
3. Where hangers have loops/retainers, close loop/retainer (latch after cable installation).

B. Fire Rated Sleeve
1. Install the sleeves in strict accordance with the UL System drawing, with the approved shop drawings, and with the equipment manufacturer’s instructions.
2. Framed Walls – Pre-Framed and Cut-In
   a. Coordinate location of penetration with other trades such as framing (wall studs), electrical (lighting), mechanical (ducts), and other trades.
   b. For cut-in instances, cut wallboard to fit rated sleeve system – no more wallboard than is necessary to fit the system.
   c. Apply the factory-supplied gasket prior to the installation of the wall plates.
   d. Secure wall plates to sleeves per the equipment manufacturer’s recommendations.
3. Affix a label at each fire sleeve location onto the wall or floor – within 2 to 3 feet. Place label in a location that will not be obscured after cables get installed through the sleeve. Label shall describe the system’s applicable ratings, such as F, T, and L ratings.

3.4 FINAL INSPECTION AND CERTIFICATION

A. Punch the Work of this Section compliant to the requirements of Section 27 00 00.
B. Comply with system acceptance and certification requirements of Section 27 00 00.

END OF SECTION
SECTION 27 05 33 COMMUNICATIONS BUILDING PATHWAYS – CONDUITS AND BOXES

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes: Pathway systems within buildings consisting of conduit and boxes (outlet, device, pull, and other boxes) to support low voltage systems

B. Related Sections

1. Comply with the Related Sections paragraph of Section 27 00 00.
2. Section 27 05 26, “Communications Grounding and Bonding”
3. Section 27 11 00, “Communications Equipment Rooms”

1.2 REFERENCES

A. Comply with the References requirements of Section 27 00 00.

B. In addition to those codes, standards, etc., listed in 27 00 00, comply with the latest edition of the following applicable specifications and standards except as otherwise shown or specified:

1. American National Standards Institute (ANSI)
   a. ANSI C80.1, "Specifications for Rigid Steel Conduit, Zinc Coated"
   b. ANSI C80.3, "Specifications for Electrical Metallic Tubing"
   c. ANSI C80.6, "Electrical Intermediate Metal Conduit"

2. ASTM International
   b. ASTM A653, “Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process”

3. International Electronic Committee (IEC)
   a. ANSI/IEC 60529, “Degrees of Protection Provided by Enclosures (IP Code)”

4. National Electrical Manufacturers Association (NEMA)
   a. NEMA 250, “Enclosures for Electrical Equipment (1000 volts maximum)”
   b. NEMA FB 1, “Fittings, Cast Metal Boxes, and Conduit Bodies for Conduit, Electrical Metallic Tubing, and Cable”
   c. NEMA OS 1, “Sheet-Steel Outlet Boxes, Device Boxes, Covers, and Box Supports”
   d. NEMA OS 2, “Nonmetallic Outlet Boxes, Device Boxes, Covers, and Box Supports”
   e. NEMA OS 3, “Selection and Installation Guidelines for Electrical Outlet Boxes”
   f. NEMA TC 2, “Electrical Polyvinyl Chloride (PVC) Conduit”
   g. NEMA TC 3, “Polyvinyl Chloride (PVC) Fittings for Use with Rigid PVC Conduit and Tubing”
   h. NEMA TC 7, “Smooth-Wall Coilable Electrical Polyethylene Conduit”

5. Underwriters Laboratories (UL)
   a. UL 1, “Flexible Metal Conduit”
b. UL 6, “Electrical Rigid Metal Conduit - Steel”
c. UL 50, “Enclosures for Electrical Equipment, Non-Environmental Considerations”
d. UL 360, “Liquid-Tight Flexible Steel Conduit”
e. UL 467, “Grounding and Bonding Equipment”
f. UL 514A, “Metal Outlet Boxes”
g. UL 514B, “Conduit, Tubing, and Cable Fittings”
h. UL 514C, “Nonmetallic Outlet Boxes, Flush-Device Boxes, and Covers”
i. UL 651, “Schedule 40 and 80 Rigid PVC Conduit”
j. UL 797, “Electrical Metallic Tubing - Steel”
k. UL 1242, “Electrical Intermediate Metal Conduit - Steel”
l. UL 2024, “Signaling, Optical Fiber and Communications Raceways and Cable Routing Assemblies”

1.3 DEFINITIONS

A. Definitions of Section 27 00 00 apply to this Section.

B. In addition to those Definitions of Section 27 00 00, the following list of terms as used in this Section defined as follows:

1. “Backbox”: A box [see "Box"] used to house cable terminations, to house devices, and to interface with cords/equipment; a backbox is installed with walls (such as within the cavities of framed walls and/or cast-in-place within concrete walls) such that the outlet/device finish (e.g., the coverplate/faceplate) is flush with the wall finish

2. “Box”: A box (often 5-sided with 1 side open) manufactured of sheet metal with welded corners, drawn metal, cast metal, or nonmetallic material (thermoplastic) in accordance with NEMA OS 1 or NEMA OS 2 and installed in accordance with NFPA 70 Article 314; available in different sizes (volumes) and modular design configurations (gangable) that may be field assembled, one to another, to accommodate multiple devices; boxes may be used as outlet boxes, device boxes, backboxes, junction boxes, or pull boxes, depending on their intended use, and handhole enclosures.

3. “CEC”: California Electrical Code (California Code of Regulations, Title 24 Part 3)

4. “Device Box”: A box [see "Box"] with provisions for attaching and housing electrical devices (switches, receptacles, or similar wiring devices) manufactured in accordance with NEMA OS 1 and NEMA OS 2 and installed in accordance with NFPA 70 Article 314; available in different sizes (volumes) and modular design configurations (gangable) that may be field assembled, one to another, to accommodate multiple devices

5. “EIMC”: Electrical Intermediate Metal Conduit – see “IMC”

6. “EMT”: Electrical Metallic Tubing type conduit, as defined in ANSI C80.3 and NFPA 70 Article 358 An unthreaded thinwall raceway, generally made of steel (ferrous) with protective coatings or aluminum (nonferrous), of circular cross section designed for the physical protection and routing of conductors and cables and for use as an equipment grounding conductor when installed utilizing appropriate fittings (per NEC Article 358) FMT: Flexible Metal Tubing type conduit, as defined in NFPA 70 Article 360

8. “Floor Box”: A box [see "Box"] used to house cable terminations, to house wiring devices, and to interface with cords/equipment; a floor box is a special purpose box installed with floors (such as cast-in-place within concrete) such that the box finish (e.g., the coverplate) is flush with the floor finish

9. “HDPE: High Density Polyethylene type conduit, as defined in NFPA 70 Article 353

10. “Innerduct”: A continuous cylindrical pipe fabricated of extruded thermoplastic, available in corrugated, smooth, or other wall types and in different sizes (to support different quantities of cables), generally to provide a separate pulling channel and physical protection for fiber, coaxial, and metallic cables in telecommunications and other networks, and used in multiple applications such as the following:

a. within conduit to compartmentalize or create ‘sub-ducts’
b. in cable tray to create an isolated pathway

c. by itself as a pathway system

11. “IMC”: Intermediate Metal Conduit type conduit, as defined in ANSI C80.6 and NFPA 70 Article 342

12. “Junction Box”: A box used to join different runs of raceway (such as conduit) or cables, or both, and to provide space for the connection and branching of the enclosed conductors; most boxes can be used solely as junction boxes as long as they are used with an appropriate cover and with appropriate (code-required) access

13. “MaxCell”: a textile subduct product (also, fabric innerduct)

14. “LFMC”: Liquidtight Flexible Metal Conduit type conduit, as defined in NFPA 70 Article 353

15. “Outlet Box”: A box [see “Box”] used to house cable terminations (connectors, modular jacks, receptacles, or similar wiring interfaces) and to interface with cords/equipment

16. “NEC”: National Electrical Code (NFPA 70)

17. “NEMA”: National Electrical Manufacturers Association

19. “Pull Box”: A box used in a conduit-based pathway system to allow access to and enclose conduit ends for placing cables and to house the interface between duct banks segments

20. “RMC”: Rigid Metal Conduit type conduit, as defined in NFPA 70 Article 344 and ANSI C80.1

21. “RNC”: Rigid Nonmetallic Conduit type conduit, as defined in NFPA 70 Article 352 and as manufactured to NEMA TC 2 specifications

22. “Textile Subduct”: A continuous enclosed assembly fabricated of polymer-coated nylon fabric used in conduit to compartmentalize or create ‘sub-ducts’, available in different sizes and ‘cell’ counts (to support different quantities of cables); an example of textile subduct includes “Maxcell”

23. “UL”: Underwriters Laboratories

1.4 SYSTEM DESCRIPTION

A. The scope of work of this section includes planning and coordination with General Contractor and other trades of inside plant conduit pathway systems, furnishing necessary materials, and labor and associated services required to install these pathway systems. The scope of work includes innerduct/subducting within conduit.

B. The drawings do not explicitly show on plans each and every conduit run needed for the project. Apply the guidelines described in this section and on the drawings to support the cabling described in Division 27 and shown on the low voltage drawings, and provide reasonably inferred standard conduits, fittings, and products required to complete the conduit installation to meet the design intent.

C. The scope of work includes conduit, boxes, and related construction materials that may not be expressly specified herein or expressly called out on the drawings, such as: 1- and 2-hole straps, nail straps, clamps and clamp backs, strut clamps, U-bolts, pipe hangers, clip-in and bolted hangers, bushings, ground bushings, service entrance cap/weatherhead, pull rope/tape, etc.

D. The scope of work includes basic construction materials that may not be explicitly specified herein or called out on the drawings, such as: concrete anchors, inserts, and/or expansion bolts; concrete fasteners; powder-actuated pins; construction channel/strut; threaded rod; wood fasteners (lag screws); beam clamps; purlin clips; stud box supports/brackets; floor-mount box supports; T-bar ceiling box support bar; channel-mount box supports; bonding pigtail; drywall ring (for ring & string); etc.

E. Conduit Systems, including Pull Boxes
1. Provide conduit systems in accordance with CEC (Chapter 3 and Article 250), UL listing information, manufacturer’s instructions, and compliant to local inspections and seismic restraint requirements. Conduit systems shall conform to ANSI/TIA-569-B standard and BICSI TDMM guidelines. Complete shall include all reasonably inferred conduits, fittings, connectors, couplers, straps, pull boxes, supports, etc., necessary for a complete installation to meet the intended application whether noted, indicated or specified in the Contract Documents or not. Duct bank routes and pull and junction box locations and elevations shown on the Drawings are diagrammatic in nature. Field verify route prior to installation.

2. Provide pull boxes as necessary to facilitate proper cable placement, including the following:
   a. no more than 180 degrees bend between placement points
   b. no more than 150-200 feet conduit length (depending on the total bend between end points)
   c. to meet AHJ requirements

3. Seismic Bracing: Provide seismic bracing to conduit system (duct banks, pull boxes, etc).

4. Seismic Joints: Provide seismic joints to conduit at building seismic joints. Seismic joint configurations shall be approved by a structural engineer licensed in the state of California.

5. Expansion Joints/Fittings: Provide expansion joints and/or fittings to conduit where necessary. Expansion joints/fittings shall be approved by a structural engineer licensed in the state of California.

6. Conduit systems shall be mechanically and electrically continuous throughout. Where EMT and associated fittings are used as part of equipment grounding system, provide a bonding type locknut where hub type fitting terminates into a threadless opening and provide compression ring type fittings for terminating and coupling.

7. Minimum Conduit Size: Refer to drawings. If not noted on the drawings, the minimum conduit size shall be 1.25”.

8. When cast in concrete floors and/or walls, adhere to structural design requirements. Unless otherwise noted on the drawings, the largest trade size conduits shall not exceed 1/3 the floor or wall thickness, and conduits shall be spaced a minimum of three conduit diameters apart.

9. Bend radii for conduit trade sizes 2” and larger shall be 10 times the conduit outside diameter (OD) and bend radii for conduit trade sizes smaller than 2” shall be 6 times the conduit OD.

10. Provide transition couplings where dissimilar conduit types are joined.

11. Conduit bodies or ‘condulets’ (LBs, etc.) are prohibited for telecommunications and audiovisual cables.

12. For type EMT conduits:
   a. Provide steel (preferred) zinc plated or die cast set screw (or compression fittings). For set screw fittings, provide single screw fittings (e.g., 1-screw connectors and 2-screw couplers) for 1.5” and smaller conduits and provide double screw fittings (e.g., 2-screw connectors and 4-screw couplers) for 51mm (2”) and larger conduits.
   b. When cast in concrete, embedded masonry, or installed in dry locations (as defined by CEC, provide compression fittings and couplings.
   c. When installed in damp locations (as defined by CEC), provide rain-tight type fittings and couplings.

13. When attaching to concrete ceilings, provide vibration and shock resistant bases.

14. Conduit Straps: Provide steel straps – for interior applications, provide straps without spacers

15. At conduits entering into building from outside, provide duct plugs per duct.
16. For unused conduits, provide a mechanical-type seal/cap for protection and to keep the conduit free from debris.

17. Provide a pull tape into each conduit/duct between pull points.
   a. Where boxes are exposed in damp or wet locations or located in hazardous areas, provide cast metal boxes with gasketed cast metal cover plates.
   b. Provide supports for pull (and junction) boxes independently of conduit system and directly to the structure above. Provide seismic bracing for pull boxes.

18. Labeling:
   a. Provide permanent labels on conduit ends and pull box lids.

19. Conduit Application
   a. At interior concealed or exposed applications, 4” and smaller, provide EMT type conduit, unless otherwise noted. EMT is the preferred conduit type.
   b. In cast-in-place concrete, RNC and EMT types will be allowed for telecommunications and other low voltage systems.
   c. IMC and RMC will be allowed for telecommunications and other low voltage systems with written approval from the Engineer.
   d. LFMC is allowed for telecommunications (and other low voltage systems) only for short spans requiring flexible connections. When used, upsize LFMC 1 full trade size (to allow for a derating of the fill capacity).
   e. FMC is not allowed for telecommunications (and other low voltage systems) without written approval from the Engineer.

F. Clearances (minimum):
   1. From fluorescent light fixtures, or other EMI sources = 6 inches
   2. From any motor, transformer = 48 inches
   3. From flue, hot water, steam line or other non-insulated heat sources = 12 inches
   4. No conduit and/or supports shall encroach into ceiling height, head room of walkways, and/or doorways.

G. Penetrations:
   1. When penetrating partitions and other construction assemblies, use approved methods.
   2. When penetrating concrete walls (including shear walls) and/or floors, scan the area to be penetrated and core openings using methods approved by the structural engineer and by the AHJ. Obtain written approval for locations and means when not using methods included in the contract documents.
   3. When penetrating fire rated assemblies, provide UL Classified and FM Approved fire rated systems in accordance with ASTM E814 (UL1479). Provide labels at both sides of the penetration. Refer to drawings for approved systems per application.
   4. When penetrating acoustic rated assemblies, provide sealant to fill gaps, cavities, etc, to fully seal penetration.

H. Innerduct / Subducting
   1. Provide innerduct/subducting within backbone conduits in accordance with CEC and the UL listing information.
   2. Refer to drawings for routes requiring innerduct/subducting and innerduct/subducting sizes and types.

I. Duct Plugs
   1. Provide duct plugs at conduit ends at building entrances.
2. Provide simplex plugs for each fiber optic cable within innerduct at each building entrance. Size the plug depending upon the inside diameter of the innerduct and the outside diameter of the cable.

J. Outlet Boxes
1. Provide outlet boxes and covers/rings (raised and/or flat) in accordance with CEC Article 314 and NEMA OS 3. Ground and bond metal outlet boxes in accordance with NEC Article 250, Parts I, IV, V, VI, VII, and X.
2. Provide support for outlet boxes. Outlet boxes for telecommunications and audiovisual may share a support bracket (such as a stud span bracket) with electrical outlet boxes.

K. Poke-Thrus
1. Coring: Refer to section 03 82 13 for concrete core drilling requirements.
2. Provide poke-thrus, covers, and related products in accordance with CEC Article 314 and NEMA OS 3. Bond metal devices to ground in accordance with applicable portions of CEC Article 250 (such as Parts I, IV, V, VI, VII, and X).
3. At poke-thrus shared with power service, provide separation means in accordance with CEC.

L. Floor Boxes
1. Provide floor boxes, covers, and related products in accordance with CEC Article 314 and NEMA OS 3. Bond metal boxes to ground in accordance with applicable portions of Article 250 (such as Parts I, IV, V, VI, VII, and X).
2. At floor boxes shared with power service, provide separation means in accordance with CEC.

1.5 SUBMITTALS
A. General: Conform to Submittal requirements as described in Section 27 00 00.
B. Quantity: Furnish quantities of each submittal as noted in Section 27 00 00.
C. Submittal Requirements Prior to the Start of Construction:
   1. Product Data: Submit product data showing manufacturer, part numbers, listings, fabrication materials, dimensions, capacities, finishes, knockout sizes and configuration, accessories, etc.
   2. Shop Drawings: Submit shop drawings consisting of the following:
      a. Conduit layout/routes, supports locations, support details
      b. Highlight proposed changes to pathways (routes, types, sizes, etc.) compared to the contract documents
      c. Clearance variations and/or requests for exceptions
      d. Seismic bracing details (also see “Seismic Calculations” below)
      e. Instances of penetrations through fire and smoke rated barriers, including calling out firestopping type/UL System, size, quantity, and other relevant information
D. Submittal Requirements at Close Out:
   1. As-Built Drawings, showing the routes, types, sizes, quantities, dimensions, etc., of pathways (backbone pathways, primary pathways, conduit – required; secondary such as hangers – not necessary)
   2. O&M Manual, including as-built drawings, parts list (essentially final approved product data submittal), repair information, and maintenance requirements
E. Substitutions
1. Requests for substitutions shall conform to the general requirements and procedure outlined in Section 27 00 00.

1.6 QUALITY ASSURANCE
   A. Comply with Quality Assurance requirements of section 27 00 00.
   B. CEC Compliance: Comply with CEC, as applicable to construction and installation of conduit and boxes.
   C. NFPA Compliance: Comply with NFPA 70B, "Recommended Practice for Electrical Equipment Maintenance" pertaining to conduit and boxes.

1.7 DELIVERY, STORAGE, AND HANDLING
   A. Comply with Delivery, Storage and Handling requirements of section 27 00 00.

1.8 WARRANTY
   A. Comply with Warranty requirements of section 27 00 00.

PART 2 - PRODUCTS

2.1 ELECTRICAL METALLIC TUBING (TYPE EMT) CONDUIT AND FITTINGS
   A. Application: Products and assembled system shall be suitable for indoor applications, in accordance with the NEC Article 358
   B. Type EMT Conduit:
      1. Type EMT conduit shall be formed of cold rolled strip steel, electrical-resistance welded continuously along the longitudinal seam, and zinc coated after welding. Type EMT conduit bore shall be smooth and free of blisters, nicks or other imperfections which could mar cables.
      2. Type EMT conduit shall be listed by a nationally recognized testing laboratory to UL 797, and shall bear (stamped or molded on conduit and fittings) the UL label. Markings shall be permanent. Type EMT conduit shall meet ANSI C80.3 specifications.
      3. Type EMT conduit shall be recognized as a bonding conductor per NEC Article 250.118
      4. Factory elbows and bends minimum bend radius shall be 48°.
      5. Manufacturers – Type EMT Conduit:
         a. Allied Tube and Conduit Co (Electrical Group) “E-Z Pull” EMT conduit
         b. Cal Conduit Products “CalBrite” EMT conduit
         c. Republic Conduit
         d. Western Tube and Conduit Corp
         e. Or equal
   C. Fittings for EMT:
      1. Fittings (connectors, couplers, straps, accessories, etc.) shall be listed by a nationally recognized testing laboratory to UL 514B, and shall bear the UL label (stamped or molded - such markings shall be permanent).
      2. Fittings shall be manufactured compliant to ANSI/NEMA FB 1.
3. Standard Set-Screw Fittings: fabricated of steel with zinc electro-plated finish. Die cast zinc / cast malleable iron fittings not acceptable. Set-screws shall be case-hardened steel with hex head and cup point to firmly seat in wall of conduit for positive grounding.

4. Compression Fittings: gland and ring compression type construction; fabricated of steel zinc plated or cast malleable iron; UL Listed as raintight and suitable for concrete

5. Manufacturers – Fittings for EMT
   a. Appleton Electric Co and/or O-Z Gedney (Emerson Electric Co)
   b. Thomas & Betts Corp
   c. Or equal

D. Deflection/Expansion Sleeve:
   1. Application: Deflection/expansion sleeve shall compensate for movement in any direction between two conduit ends and shall withstand occasional vibration transmitted to conduit by rotating equipment or vehicular traffic.
   2. Deflection/expansion sleeve shall be listed by a nationally recognized testing laboratory to UL 514B and UL 467, and shall bear the UL label (stamped or molded - such markings shall be permanent).
   3. Deflection/expansion sleeve shall be fabricated of an inner sleeve, bonding braid, a neoprene outer sleeve with internal flexible stainless steel braid and outer stainless steel bands, ended with couplings (for connection to conduits).
   4. Deflection/expansion sleeve shall accommodate 0.75 inch (19mm) deflection, expansion, contraction, or parallel misalignment in any direction, shall allow up to 30 degree angular deflections, and shall be raintight.
   5. Manufacturer – EMT Expansion/Deflection Sleeve:
      a. Cooper Crouse-Hinds XD series
      b. O-Z Gedney (Emerson Electric Co) DX series
      c. Or equal

E. Expansion Sleeve:
   1. Application: Expansion sleeve shall compensate for parallel movement between two conduits.
   2. Expansion sleeve shall comply with UL514.B and NEMA FB-1.
   3. Expansion sleeve shall be fabricated of an inner steel sleeve with an oversized outer sleeve sealed with slip bushings, configured such that the outer sleeve can move over the inner sleeve. Sleeve shall come equipped with internal or external bonding braid and be ended with couplers suitable to connect to conduit ends.
   4. Manufacturers – EMT Expansion Sleeve:
      a. Cooper Crouse-Hinds XJG-EMT series
      b. O-Z Gedney (Emerson Electric Co) TX series
      c. Or equal

2.2 PULL STRING

A. Application: For use with manual or power fishing systems for light duty cable or tape pulling applications

B. Description: round, woven, polypropylene line
   1. Packaged in storage container with easy, quick, and tangle-free dispensing
   2. UV resistant, and resistant to rot and mildew
   3. Low elongation

C. Manufacturers:
1. Ideal Industries Inc Powr-Fish® or Valu-Line™ poly pull line
2. Klein Tools #56110 poly pull line
3. Or equal

2.3 PULL BOXES

A. Application: For use indoors as cable placement point (pull box) for low voltage cabling and wiring within a conduit raceway system.

B. Compliances:
   1. Pull boxes shall meet the requirements of UL 50 and NEMA Type 1.
   2. Pull boxes shall be listed by a nationally recognized testing laboratory for the purpose.

C. Material and Finish:
   1. Thickness: 16 gauge, minimum
   2. Material: the following materials are acceptable for pull boxes
      a. Pre-galvanized steel (ASTM A653), then formed
      b. Mild steel formed, then hot-dipped galvanized (per ASTM A123)
      c. Mild steel formed, then painted (polyester or epoxy powder coat, meeting ASTM D1654)

D. Size: pull box size shall comply with CEC 314.28

E. Configuration: pull boxes shall --- Covers shall be secured by machine screws at 6 inches intervals.

F. Manufacturers:
   1. Cooper B-Line (Eaton)
   2. Hoffman (Pentair)
   3. Hubbell Wiegmann (SC Series enclosures, as an example)
   4. Or equal

2.4 STEEL OUTLET BOXES AND COVERS

A. Application: For use indoors as outlet box, backbox, and/or junction box of low voltage systems to house wiring, cabling, terminations, and connectors; may also house and support components.
   1. Outlet boxes shall permit access to conductors for maintenance
   2. Outlet boxes shall come with knock-outs or punch-outs for easy creation of holes to accept conduit connectors.

B. Compliances:
   1. Outlet boxes shall meet the requirements of CEC Article 314.
   2. Outlet boxes shall be listed by a nationally recognized testing laboratory to UL 514A for Class 2 and Class 3 power-limited circuits (such as data and signal) providing bonding without the use of bonding jumpers, for remote control circuits, and for telecommunications circuits in accordance with NEC Article 314.
   3. Outlet boxes shall be manufactured compliant to NEMA: FB-1 and OS-1.
   4. Outlet boxes shall be fire resistant and suitable for use in rated spaces (reference: UL Fire Resistance Directory / "Orange Book").

C. Material and Finish:
1. Material: hot rolled, pre-galvanized steel, minimum spangle, AISI C-1008
2. Thickness: CEC 314.40(B) / 0.0625in, minimum
3. Finish: G60 hot dip zinc galvanized (0.60 oz/sq ft), meeting ASTM A123, or pre-galvanized (continuous sheet galvanizing) meeting per ASTM A653
4. Finish Thickness: ~0.0005 inches

D. Square Box and Covers/Rings – 5"
1. Dimensions: 5 in square x 2.875 in deep
2. Volume: 64 in³
3. Outlet box shall come equipped with integrated cable management/slack support.
4. Manufacturers:
   a. Randl Industries
      1) #T-55017; “5 Square” outlet box, knockouts: one 1” + one 1-1/4” per side, one 1/2” per back
      2) #T-55018; “5 Square” outlet box, knockouts: one 1/2”, + one 3/4” + one 1” per side, one 1/2” per back
      3) #T-55019; “5 Square” outlet box, knockouts: one 1/2”, + two 1” per side, one 1/2” per back
      4) #T-55057; “5 Square” outlet box with side mounting bracket, knockouts: one 1” + one 1-1/4” on 3 sides, one 1/2” per back
      5) #T-55058; “5 Square” outlet box with side mounting bracket, knockouts: one 1/2”, + one 3/4” + one 1” on 3 sides, one 1/2” per back
      6) #T-55059; “5 Square” outlet box with side mounting bracket, knockouts: one 1/2”, + two 1” on 3 sides, one 1/2” per back
      7) #R-55000; blank cover for “5 Square” outlet box
      8) #N-54000; 4”-sq cover for “5 Square” outlet box, flat
      9) #N-54012; 4”-sq cover for “5 Square” outlet box, 1/2” raised
     10) #N-54058; 4”-sq cover for “5 Square” outlet box, 5/8” raised
     11) #N-54034; 4”-sq cover for “5 Square” outlet box, 3/4” raised
     12) #N-54010; 4”-sq cover for “5 Square” outlet box, 1” raised
     13) #N-54114; 4”-sq cover for “5 Square” outlet box, 1-1/4” raised
     14) #N-54112; 4”-sq cover for “5 Square” outlet box, 1-1/2” raised
     15) #D-51G000; one gang cover for “5 Square” outlet box, flat
     16) #D-51G012; one gang cover for “5 Square” outlet box, 1/2” raised
     17) #D-51G058; one gang cover for “5 Square” outlet box, 5/8” raised
     18) #D-51G034; one gang cover for “5 Square” outlet box, 3/4” raised
     19) #D-51G010; one gang cover for “5 Square” outlet box, 1” raised
     20) #D-51G114; one gang cover for “5 Square” outlet box, 1-1/4” raised
     21) #D-52G000; two gang cover for “5 Square” outlet box, flat
     22) #D-52G012; two gang cover for “5 Square” outlet box, 1/2” raised
     23) #D-52G058; two gang cover for “5 Square” outlet box, 5/8” raised
     24) #D-52G034; two gang cover for “5 Square” outlet box, 3/4” raised
     25) #D-52G010; two gang cover for “5 Square” outlet box, 1” raised
     26) #D-52G114; two gang cover for “5 Square” outlet box, 1-1/4” raised
   b. Or equal

2.5 BOX SUPPORT ACCESSORIES

A. Box accessories shall comply with UL standards and shall be listed by a nationally recognized testing laboratory.

B. Stud-Mount Single-Box Bracket
1. Erico #SGBS16A; stud-mount bracket, for 1-1/2” or 2-1/8”D box, fits 16” stud spacing
2. Erico #SGBS24A; stud-mount bracket, for 1-1/2" or 2-1/8"D box, fits 24" stud spacing
3. Garvin #BMB16218; stud-mount bracket, for 2-1/8"D box, fits 16" stud spacing
4. Garvin #BMB16350; stud-mount bracket, for 3-1/2"D box, fits 16" stud spacing
5. Garvin #BMB24218; stud-mount bracket, for 2-1/8"D box, fits 24" stud spacing
6. Garvin #BMB24350; stud-mount bracket, for 3-1/2"D box, fits 24" stud spacing
7. Garvin #BMB16SL; stud-mount bracket, 'sliding' position for 1-1/2" or 2-1/8" D box, fits 16" stud spacing
8. Garvin #BMB24SL; stud-mount bracket, 'sliding' position for 1-1/2" or 2-1/8" D box, fits 24" stud spacing
9. Raco #900; fixed stud-mount bracket, for 2-1/8"D box, fits 16" stud spacing
10. Raco #9006; fixed stud-mount bracket, for 2-1/8"D box, fits 24" stud spacing
11. Raco #9013; adjustable stud-mount bracket, for 2-1/8"D box, fits 10-3/8" to 18" stud spacing
12. Raco #9015; adjustable stud-mount bracket, for 2-1/8"D box, fits 15" to 26" stud spacing

C. Stud-Mount Multi-Box Bracket
1. Erico #RBS16; stud-mount bracket, 3 positions for 4S and/or 4-11/16"S box, fits 16" stud spacing
2. Erico #RBS24; stud-mount bracket, 4 positions for 4S and/or 4-11/16"S box, fits 24" stud spacing
3. Garvin #BMB4S3P; stud-mount bracket, 3 positions for 4S and/or 4-11/16"S box, fits 16" stud spacing
4. Raco #9002; stud-mount bracket, 3 positions for 4S and/or 4-11/16"S box, fits 16" stud spacing
5. Raco #9002; stud-mount bracket, 4 positions for 4S and/or 4-11/16"S box, fits 24" stud spacing

D. Floor-Mount Box Mounting Bracket
1. Erico #FMBS18; floor mount support bracket for box, puts box at 18.5" above wall footer
2. Garvin #KP4-12; floor mount support bracket for 4S and/or 4-11/16"S box, puts box at 12" above wall footer
3. Garvin #KP4-18; floor mount support bracket for 4S and/or 4-11/16"S box, puts box at 18" above wall footer
4. Garvin #KP4-24; floor mount support bracket for 4S and/or 4-11/16"S box, puts box at 24" above wall footer
5. Raco #9009; floor mount support bracket for 4S and/or 4-11/16"S box, puts box at 12" above wall footer
6. Raco #9010; floor mount support bracket for 4S and/or 4-11/16"S box, puts box at 18" above wall footer

E. T-Bar Bracket
1. Erico #510HD; bracket for outlet box, attaches to T-bar ceiling grid

F. T-Bar Support
1. Erico #4ACS; adapter/support for outlet box, attaches to T-bar ceiling grid

2.6 MULTI-SERVICE FLOOR BOXES

A. Application: For use indoors as a multi-service (telecommunications, audiovisual, power) outlet box to house wiring, cabling, termination, connectors, and receptacles installed within a cast concrete floor

B. Box Construction: Seam welded 14 gauge steel
C. Compliances:
   1. Floor boxes shall be listed by a nationally recognized testing laboratory to UL 514A for Class 2 and Class 3 power-limited circuits (such as data and signal) providing bonding without the use of bonding jumpers, and remote control) circuits and for telecommunications circuits in accordance with NFPA 70 Article 314 for use in tile, terrazzo, carpet, and wood covered floors.
   2. Floor box assemblies shall meet the scrub water exclusions requirements of UL 514A for use in tile, terrazzo, carpet, and wood covered floors.

D. Load Capacity: Floor box assembly (back box, cover, etc) shall be rated to 300 lbs (minimum) static load.

E. Features:
   1. Suitable for cast-in-place concrete applications
   2. 8 gangs, minimum
   3. Knock-outs (or punch-outs) for easy creation of holes to accept conduit connectors
   4. Permit access to conductors behind terminations (for maintenance)

F. Cover Finish: Coordinate with Architect

G. Manufacturers:
   1. FSR Inc.
      a. #FL-500P-2.25; c-i-p floor box, 2.25-in depth
      b. #FL-500P-3; c-i-p floor box, 3-in depth
      c. #FL-500P-4; c-i-p floor box, 4-in depth
      d. #FL-500P-6; c-i-p floor box, 6-in depth
      e. #FL-500P-8; c-i-p floor box, 8-in depth
      f. #FL-500P-10; c-i-p floor box, 10-in depth
   2. FSR Inc.
      a. #SF-PB; ‘SmartFit’ c-i-p floor box (round), 4-in diameter x 5.9-in depth
      b. #SF-DDP; sub-plate for 4” box – two decora openings
      c. #SF-2SDP; sub-plate for 4” box – one decora, one 5-20R electrical outlet, and two keystone ports
      d. #SF-IPSPS; sub-plate for 4” box – IPS interface (3 position) and one 5-20R electrical outlet
   3. Wiremold
      a. #RFB-11; c-i-p floor box, 6 in depth, 11 gangs
      b. #RFB-9; c-i-p floor box, 4 in depth, 9 gangs
      c. #RFB119CTCAL; cover for carpet floors, with carpet cut-out area, brushed aluminum
      d. #RFB119CTCBK; cover for carpet floors, with carpet cut-out area, painted black
      e. #RFB119CTCGY; cover for carpet floors, with carpet cut-out area, gray
      f. #RFB119BTCAL; cover for flush tile or carpet floors, brushed aluminum
      g. #RFB119BTCBK; cover for flush tile or carpet floors, painted black
      h. #RFB119BTCGY; cover for flush tile or carpet floors, gray
   4. Or equal

2.7 MULTI-SERVICE WALL BOXES FOR FLAT PANEL DISPLAYS

A. Application: indoor use as a multi-service (telecommunications, audiovisual, power) outlet box to house wiring, cabling, termination, connectors, and receptacles and serve a flat panel display
B. Listings: Wall boxes shall be listed by a nationally recognized testing laboratory to UL 514A.
C. Fabrication Material: Backbox: Seam welded 14 gauge steel; Cover: 1/16” steel, electro-painted
D. Outlet box shall feature capacity for the following:
   1. Power: 1 duplex receptacle, duplex or decora style
   2. Telecom/Network: 2 network jacks (refer to section 271513 for jack information)
   3. AV: _ positions for AAP (or equivalent) modules
   4. Conduit Connections: _ positions for 1.25-inch conduits at top, _ positions for 1.25-inch conduits at bottom, _ positions for 1.25-inch conduits at each side,
E. Manufacturers:
   1. FSR
      a. #PWB-100; in-wall multi-service box for flat panel display
      b. #PWB-200; in-wall multi-service box for flat panel display
      c. #PWB-250; in-wall multi-service box for flat panel display
      d. Refer to 27 41 16 for AV accessories
      e. Refer to 27 15 13 for telecom accessories
   2. Wiremold
      a. #EFSB2; 2-gang in-wall multi-service box for flat panel display
      b. #EFSB4; 4-gang in-wall multi-service box for flat panel display
      c. Refer to 27 41 16 for AV accessories
      d. Refer to 27 15 13 for telecom accessories
   3. Or equal
F. Application: indoor use as a multi-service (telecommunications, audiovisual, power) outlet box to house wiring, cabling, termination, connectors, and receptacles and serve a flat panel display
G. Listings: Wall boxes shall be listed by a nationally recognized testing laboratory to UL 514A.
H. Fabrication Material: Backbox: Seam welded 14 gauge steel; Cover: 1/16” steel, electro-painted
I. Outlet box shall feature capacity for the following:
   1. Power: 1 duplex receptacle, duplex or decora style
   2. Telecom/Network: 2 network jacks (refer to section 271513 for jack information)
   3. AV: _ positions for AAP (or equivalent) modules
   4. Conduit Connections: _ positions for 1.25-inch conduits at top, _ positions for 1.25-inch conduits at bottom, _ positions for 1.25-inch conduits at each side,
J. Manufacturers:
   1. Chief Manufacturing
      a. #PAC521P; in-wall multi-service box for flat panel display
      b. #PAC516; in-wall pre-wire box for flat panel display
      c. #PAC522; in-wall pre-wire box for flat panel display
      d. Refer to 27 41 16 for AV accessories
      e. Refer to 27 15 13 for telecom accessories
   2. Or equal

PART 3 - EXECUTION

3.1 GENERAL
A. Comply with the Execution requirements of Section 27 00 00.

3.2 EXAMINATION AND PREPARATION

A. Prior to installation, plan routes and locations of pathway systems and coordinate with other trades and building systems (ductwork, plumbing, electrical raceways, wall construction, ceilings, etc.). Pathway systems shall not unnecessarily cross other trade’s work, shall not prevent removal of ceiling tiles or panels, and shall not block access to mechanical or electrical equipment. Provide offsets as required to avoid obstruction of pathway systems with other trades/systems.

B. Prior to installation, examine areas to receive pathways systems to verify conditions are ready for work and to verify conformance with manufacturer and specification tolerances. Notify the Owner’s Representative in writing of conditions that would adversely affect the installation, or subsequent

3.3 INSTALLATION

A. Secure raceway/pathway systems to building structures using approved support methods and components (fasteners, anchors, clamps, hangers, etc) and complaint to the CEC.

B. Conduit Systems, including Pull Boxes
1. Run conduit in groups/banks in the most direct route possible, parallel to building lines, and at elevations that avoid unnecessary offsets. Do not route conduit through areas in which flammable material may be stored, or over or adjacent to boilers, incinerators, hot water lines, or steam lines. Completed conduit systems installation shall not encroach into the ceiling height headroom of walkways or doorways.

2. Trapeze Supported Conduit Runs
   a. Support conduit runs using "trapeze" hangers fabricated from construction channel and threaded steel rods anchored to building structures. Fasten conduit to construction channel using standard conduit clamps or equivalent.
   b. Seismically brace trapeze supports compliant to applicable codes.

3. Surface-Mounted Conduit Runs
   a. Single Conduit Runs: Support single conduit runs to building structure using construction channel with approved anchors and hardware or using 2-hole (preferred) or 1-hole conduit straps (or similar support apparatus). Where installed in damp or wet locations, support conduit to building structure using conduit clamp such that clamp backs add space between conduit and mounting substrate.
   b. Multiple Conduit Runs: Support multi-conduit runs to building structure using construction channel with approved anchors and hardware. Select anchors based on installation substrate. Fasten conduit to construction channel using standard conduit clamps or equivalent.
   c. Install vibration control apparatus as required to meet isolation requirements.

4. Install conduit free from dents, bruises or deformations. Remove and replace damaged conduits with new undamaged material.

5. Install metallic conduit so as to not be in contact with other dissimilar metal pipes (e.g., plumbing) to minimize galvanic corrosion.

6. Make bends and offsets using standard conduit bending hand tool and/or machines or use factory fittings. The use of any item not specifically designed for bending conduit is strictly prohibited.

7. When routing conduit within concrete:
a. Place conduits at a depth as required by the project’s structural engineer. In lieu of no direction, place conduits in the middle of the concrete’s depth.
b. Do not place conduits between reinforcing steel and the bottom of floor slabs.
c. Space conduits a minimum of three conduit diameters apart unless otherwise noted on the drawings.
d. Avoid crossing conduits (to minimize displacement of concrete). Obtain written approval/detail from structural engineer for crossing and for instances not adhering to general structural details.
e. Only use compression fittings. Fully wrap fittings with duct tape.

8. For conduits that turn up and protrude from finished concrete, extend conduits 25mm – 75mm (1” to 3”) above the surface of the floor, unless conditions require other extension lengths.

9. Pull Boxes: Install pull boxes and junction boxes at locations that are accessible. Install pull boxes and junction boxes at locations that are concealed, unless as noted on drawings; pull boxes and junction boxes may be exposed in electrical rooms, utility rooms, storage areas, or when installed in ‘open’ spaces (such as no ceilings). Adjust locations and installation as coordinated with construction conditions and as required for seismic bracing. Within ceiling space (e.g., above ceiling grid), do not install higher than 1m (~3’) above grid.

10. Ream conduit ends cut in the field (non-factory) to eliminate sharp edges, burrs, etc.

11. Clean completed conduits of foreign matter and/or moisture (e.g., pull a bristle mandrel through).

12. Secure pull strings/mule tapes at conduit ends or within boxes to prevent recoiling back into duct.

13. After installation of conduit system and during ongoing general construction, protect conduits and tightly cover/seal open ends.

14. Leave no unused openings in any pull or junction box. Install close-up plugs as required to seal openings.

15. Label each conduit end in a clear manner by designating the location of the other conduit end (i.e. room name, junction box number, etc.). Indicate conduit length on the label.

16. For connections to equipment subject to movement, vibration, misalignment, cramped quarters, or noise transmission, use short length (maximum of 6ft) of the FMC or LFMC conduit. For installation in exterior locations, or humidity-laden atmosphere, corrosive atmosphere, water hose or spray wash down operations, and locations subject to seepage or dripping of oil, grease or water, use LFMC. Provide a green ground wire with FMC or LFMC conduit.

17. Terminations, Connections and Joints
   a. Securely connect conduits to boxes, cabinets, wireways, etc., using conduit connectors suitable for the application and one (or two) locknuts and, where required, an insulating bushing or insulated connectors. Torque threaded items to proper tightness.
   b. Where conduits are bonded to ground, securely attach grounding bushings and route bonding jumpers in as short of a path as possible to grounding point.
   c. Where joints and/or connections cannot be made tight, use a bonding jumper to maintain electrical continuity through the connection.
   d. Where terminations are subject to vibration, use a bonding bushing or wedge to maintain electrical continuity through the connection. Where subject to vibration or dampness, use insulating bushings to protect conductors.
   e. Vibration/Movement Isolation: At connections/terminations subject to vibration, movement, misalignment, and/or noise transmission, transition duct bank conduit to a short length (maximum of 2-3 feet) of LFMC. Secure conduit to structure immediately prior to the transition.

C. Outlet Boxes / Back Boxes
1. Install boxes plumb and square. Match heights of surrounding outlets (e.g., an adjacent electrical receptacle). Adjust locations and heights as required to suit coordination requirements of construction conditions.

2. Install boxes flush with walls, ceilings and floors except where exposed work is called for on the drawings, required, or appropriate.

3. Do not make unused openings in boxes (such as knocking out fabricated knock-outs without using the opening for a conduit connector). Replace boxes containing inadvertent or unused openings.

4. Framed Walls, both Fire Rated and Non-Rated
   a. Install outlet boxes and covers/raised rings during rough-in such that the finished condition is flush with wall finishes.
   b. Do not install outlet boxes back-to-back (outlet boxes facing opposite sides of a wall). At framed walls not fire rated, install boxes with at least 6” separation. At fire rated framed walls, install boxes with at least 24” and 1 framing stud separation.
   c. Patch/repair openings in wall (plaster, drywall, and/or plasterboard) around boxes and/or raised rings to eliminate visible gaps after outlet gets finished, in accordance with CEC 314.21.

5. Ceilings
   a. At ceilings, install boxes, supports (such as T-bar support bracket), and cover/ring such that the finished condition is flush with ceiling finishes, except where noted otherwise and where conditions prevent a flush installation
   b. At non-accessible ceilings, install service conduit continuous to an accessible location

6. Concrete Cast-In-Place Walls and Floors
   a. Set boxes in place within forms (for walls) and casting volume (for floors) such that the finished condition is flush with wall and floor finishes. Ensure proper concrete cover, according to structural requirements.

7. Masonry Walls
   a. Adjust position of outlet boxes to suit masonry course lines. Coordinate cutting of masonry walls to achieve neat openings for boxes.

D. Wall Boxes for Flat Panel Displays
   1. Install boxes plumb and square. Install boxes and covers/raised rings during rough-in such that the finished condition is flush with wall finishes. Patch openings around covers/raised rings to eliminate visible gaps after outlet gets finished.
   2. Confirm heights of each box. Coordinate with heights of associated services (e.g., electrical receptacle). Adjust locations and heights as required to coordinate with construction conditions.
   3. Do not make unused openings in boxes (such as knocking out fabricated knock-outs without using the opening for a conduit connector). Replace boxes containing inadvertent or unused openings.
   4. Do not install boxes back-to-back in a framed wall (boxes facing opposite sides of a wall), unless noted so on the drawings. At framed walls not fire rated, install boxes with at least 6” separation. At fire rated framed walls, install boxes with at least 24” and 1 framing stud separation.

E. Floor Boxes
   1. Install floor boxes square, plumb, level, and flush with structural floor. Align box with adjacent surfaces.
      a. Tolerance: 1/16"
2. For floor boxes with combined power and communications circuits, install metal dividers for separation of circuits.
3. Install covers to suit finish conditions. Coordinate floor finishes (such as carpet) with other trades.

F. Poke-Thrus
1. Install poke-thrus flush with structural floor.
2. Install covers to suit finish conditions. Coordinate floor finishes (such as carpet) with other trades.

3.4 PROTECTION
A. Protect installed products until completion of project.
B. Touch-up, repair or replace damaged products before Substantial Completion.

3.5 FINAL INSPECTION AND CERTIFICATION
A. Punch the Work of this Section compliant to the requirements of Section 27 00 00.
B. Comply with system acceptance and certification requirements of Section 27 00 00.

END OF SECTION
SECTION 27 05 36 COMMUNICATIONS BUILDING PATHWAYS – CABLE TRAYS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes: Cable tray systems as pathways within buildings to support low voltage systems
B. Related Sections
   1. Comply with the Related Sections paragraph of Section 27 00 00.
   2. Section 27 05 26, “Communications Grounding and Bonding”
   3. Section 27 11 00, “Communication Rooms”

1.2 REFERENCES

A. Comply with the References requirements of Section 27 00 00.
B. In addition to those codes, standards, etc., listed in 27 00 00, products (including fabrication process) and installation shall comply with the latest edition of the following applicable specifications and standards:
   1. ASTM International
      c. ASTM A 525, “General Requirements for Steel Sheet, Zinc-Coated Galvanized by the Hot-Dip Process”
      e. ASTM A 591, “Specifications for Electrodepositing Coatings of Zinc on steel wire or sheets”
      g. ASTM A 653, “Specification for Steel Sheet, Zinc-Coated (Galvanized) by the Hot Dip Process”
      h. ASTM B 633, “Specification for Electrodeposited Coatings of Zinc on Iron and Steel”
      i. ASTM D 769, “Standard Specification for Black Oxide Coatings”
   2. International Electrotechnical Commission (IEC)
      a. IEC 61537, “Cable Tray Systems and Cable Ladder Systems for Cable Management”
   3. National Electrical Manufacturer Association (NEMA)
      a. NEMA VE 1 (also CAN/CSA C22.2 No. 126.1-09), “Metal Cable Tray Systems”
      b. NEMA VE 2, “Cable Tray Installation Guidelines”
   4. National Fire Protection Agency (NFPA)
      a. NFPA 70B, “Recommended Practice for Electrical Equipment Maintenance”
      b. NFPA 70E, “Standard For Electrical Safety In The Workplace”
   5. Underwriters Laboratories (UL)
a. UL 467, “Grounding and Bonding Equipment”

1.3 DEFINITIONS

A. Definitions of Section 27 00 00 apply to this Section.
B. In addition to those Definitions of Section 27 00 00, the following list of terms as used in this Section defined as follows:

1. “Cable Tray” and “Cable Tray System”: A unit or assembly of units or sections and associated fittings forming a structural system used to securely fasten or support cables and raceways.

2. “Wire Mesh Cable Tray”: A cable support and management system fabricated of continuous, rigid, welded steel wire mesh; available in many sizes with attachment hardware suitimg multiple installation methods; falls under NFPA 70’s definition as cable tray.

1.4 SYSTEM DESCRIPTION

A. Work Covered Under Other Sections:

1. Backbone Conduits/Duct Banks: Conduits, supports, pull boxes, and pull strings
2. Sleeves: Sleeves (pre-fabricated systems and/or EMT conduits) and supports

B. Wire Mesh Cable Tray Systems:

1. Provide a complete cable tray system in accordance with CEC Article 392 and Article 250 (for Grounding and Bonding), NEMA VE 1, NEMA VE 2, manufacturer’s instructions, and compliant to local inspections and seismic restraint requirements, UL listing requirements, NFPA 70E, NECA’s “Standards of Installation” pertaining to general electrical installation practices, and recognized industry practices. Cable tray system shall conform to ANSI/TIA-569-B standard and BICSI TDMM guidelines. Complete shall include straight sections, connectors/splices, bonding straps, supports, etc., necessary for a complete installation. Routes shown on the Drawings are diagrammatic in nature. Field verify route prior to installation.

2. Supports: Provide supports at each connection point (junction of 2 or more straight sections), direction transitions, at the end of each run, and at other locations necessary to attain a fully supported and seismically braced cable tray system using a structurally-approved anchoring system and in accordance with NEMA VE 2.

a. Allowable Support Methods:
   1) Trapeze (NEMA VE 2, Figure 4.1G)
   2) Single hanger clip (NEMA VE 2, Figure 4.2E)
   3) Wall cantilever (NEMA VE 2, Figures 4.7A and 4.7B)
   4) Wall vertical (NEMA VE 2, Figure 4.9D)

b. Disallowable Support Methods:
   1) Center hung (NEMA VE 2, Figure 4.3A)

3. Seismic Bracing: Provide seismic bracing to supports and tray system.

4. Splices: Provide UL classified splice systems by the same manufacturer as the straight sections.

a. Allowable Splice Methods: washer splice, splice plate, splice bar, wing splice (all splice methods shall be UL Classified)

5. Bend Radius: Cable tray system shall maintain a 12” (minimum) bend radius throughout.
6. Provide radius shields at each bend/corner of "T" type intersections and cross intersections.

7. Vertical Offsets: At vertical offsets 36 inch or less, provide a cable dropout on the higher-level tray section. At vertical offsets greater than 36 inches, provide a section of tray installed vertically between the upper and lower tray levels.

8. Bonding and Grounding
   a. Cable tray shall be electrically continuous maintaining minimum metal area requirements per NFPA 70 Table 392.7 (for use as an equipment grounding conductor). Where straight sections or field fittings have been modified during installation such that wires have been removed, provide bonding straps or other approved accessories to maintain minimum continuous area per electrical code.
   b. Provide external bonding strap at connections, expansion joints, sleeves, crossovers, and at other locations where system continuity is interrupted.
   c. Bond cable tray system to approved ground, as per CEC Article 250, using approved connection means.

9. Dropouts:
   a. Provide dropouts as shown on the drawings.
   b. In locations that require 18" wide or 24" wide dropouts, combine one 12" wide dropout with one 6" wide dropout to create an 18" wide dropout, or two 12" wide dropouts to create a 24" wide dropout.

10. Provide blind ends where tray termination is exposed (e.g., not at a wall).

C. Cable Tray Systems:

1. Provide a complete cable tray system in accordance with CEC Article 392 and Article 250 (for Grounding and Bonding), NEMA VE 1, NEMA VE 2, NEMA FG 1, manufacturer’s instructions, and compliant to local inspections and seismic restraint requirements, UL listing requirements, NFPA 70E, NECA’s “Standards of Installation” pertaining to general electrical installation practices, and recognized industry practices. Cable tray system shall conform to ANSI/TIA-569-B standard and BICSI TDMM guidelines. Complete shall include straight sections, fittings, connectors/splices, bonding straps, supports, etc., necessary for a complete installation. Routes shown on the Drawings are diagrammatic in nature. Field verify route prior to installation.

2. Supports: Provide supports at each connection point, direction transitions, at fittings, at the end of each run, and at other locations necessary to attain a fully supported and seismically braced cable tray system using a structurally-approved anchoring system and in accordance with NEMA VE 2.

   a. Allowable Support Methods:
      1) Trapeze (NEMA VE 2, 4.2.1.2)
      2) Hanger rod clamp (NEMA VE 2, 4.2.1.2)
      3) Wall cantilever (NEMA VE 2, 4.2.2)
      4) Wall vertical (NEMA VE 2, 4.2.4)

   b. Disallowable Support Methods:
      1) Center hung (NEMA VE 2, 4.2.1.3)

3. Seismic Bracing: Provide seismic bracing to supports and tray system.

4. Splices: Provide UL classified splice systems by the same manufacturer as the straight sections.

5. Expansion Connections: Provide expansion connectors where required per NEMA VE 1 and/or NEMA VE 2 and per manufacturer’s instructions.

6. Bend Radius: Cable tray system shall maintain a 12" (minimum) bend radius throughout.
7. Vertical Offsets: At vertical offsets 36 inch or less, provide a cable dropout on the higher level tray section. At vertical offsets greater than 36 inches, provide a section of tray installed vertically between the upper and lower tray levels.

8. Bonding and Grounding
   a. Cable tray shall be electrically continuous maintaining minimum metal area requirements per CEC Table 392.7 (for use as an equipment grounding conductor).
   b. Bond cable tray system to approved ground, as per CEC Article 250, using approved connection means.

9. Provide blind ends where tray termination is exposed (e.g., not at a wall).

D. Clearances (minimum):
   1. Installation heights and clearances between cable tray and building structures: Refer to Drawings
   2. Side and top access clearance: Refer to Drawings
   3. From fluorescent light fixtures, or other EMI sources: Refer to Drawings
   4. From any motor, transformer: Refer to Drawings
   5. From flue, hot water, steam line or other non-insulated heat sources: Refer to Drawings

E. Penetrations:
   1. Penetrate partitions and other construction assemblies, including fire rated assemblies, smoke barriers, smoke partitions, acoustic rated assemblies, etc., using approved methods.
   2. When penetrating concrete walls (including shear walls) and/or floors, scan the area to be penetrated and core openings using methods approved by the structural engineer and by the AHJ. Obtain written approval for locations and means when not using methods included in the contract documents.
   3. When penetrating fire rated assemblies, provide UL Classified and FM Approved fire rated systems in accordance with ASTM E814 (UL1479). Provide labels at both sides of the penetration. Refer to drawings for approved systems per application.
   4. When penetrating acoustic rated assemblies, provide solid bottom type cable tray with a solid cover extending 18 inches from the finished surface of the wall on both sides. Provide sealant to fill gaps, cavities, etc, to fully seal penetration.

1.5 SUBMITTALS

A. General: Conform to Submittal requirements as described in Section 27 00 00.
B. Quantity: Furnish quantities of each submittal as noted in Section 27 00 00.
C. Submittal Requirements Prior to the Start of Construction:
   1. Product Data: Submit product data showing manufacturers, part numbers, dimensions, fabrications materials, fabrication details, finishes, capacities, and accessories; also include certifications (factory-certified test reports of specified products, complying with IEC 61537, CEC, and NEMA VE 1)
      a. Submittal should include manufacturer's certification indicating ISO 9001 quality certified
   2. Shop Drawings: Submit shop drawings consisting of the following:
      a. Cable tray layout/routes, supports locations, support details
      b. Highlight proposed changes to pathways (routes, types, sizes, etc.) compared to the contract documents
      c. Clearance variations and/or requests for exceptions
d. Seismic bracing details (also see “Seismic Calculations” below)
e. Instances of penetrations through fire and smoke rated barriers, including calling out firestopping type/UL System, size, quantity, and other relevant information

D. Submittal Requirements at Close Out:
1. As-Built Drawings, showing the routes, dimensions, types, sizes, quantities, etc. (minimum)
2. O&M Manual, including as-builds, parts list, repair information, and maintenance requirements

E. Substitutions
1. Requests for substitutions shall conform to the general requirements and procedure outlined in Section 27 00 00.

1.6 QUALITY ASSURANCE
A. Comply with Quality Assurance requirements of section 27 00 00.
B. Manufacturer shall make available test reports witnessed by an independent testing laboratory of the “worst case” loading conditions and performed in accordance with the latest revision of NEMA VE 1
C. Materials and installation shall comply with CEC – construction and installation of cable tray and cable channel systems per Article 318, bonding per Article 250, and other articles as applicable per instance.
D. Installation shall comply with NFPA 70B, “Recommended Practice for Electrical Equipment Maintenance”.

1.7 DELIVERY, STORAGE, AND HANDLING
A. Comply with Delivery, Storage and Handling requirements of section 27 00 00.

1.8 WARRANTY
A. Comply with Warranty requirements of section 27 00 00.

PART 2 - PRODUCTS

2.1 CABLE TRAY – WIRE MESH TYPE
A. Application: Suitable for the support and management of communications cables overhead.
B. Tray shall be manufactured in accordance with NEMA VE1.
C. Material: Straight sections shall be fabricated from high strength steel wires and formed into a 2-inch by 2-inch (or 2-inch by 4-inch) wire mesh pattern with welded wire intersections. Wires shall meet the minimum mechanical properties of ASTM A510 Longitudinal wires shall be straight (with no bends). Wires diameter should be approximately 0.16” (4mm). Wire ends shall be rounded during manufacturing (for safety of cables and installers) or T-welded to the top wire along sides (flanges).
D. Finish: Electro-plate SC2 yellow zinc chromate, in accordance with ASTM B633.
E. Finishes:
1. **Electro-Plated Zinc Galvanizing:** Straight sections shall be made from steel meeting the minimum mechanical properties of ASTM A 510, Grade 1008 and shall be electro-plated zinc in accordance with ASTM B633, Type III, SC-1.

F. Splicing assemblies shall be the bolted-type using serrated flange locknuts. Hardware shall have yellow zinc chromate finish, in accordance with ASTM B633.

G. Size: Refer to Drawings for sizes.

H. Manufacturers:
   1. Chalfant Manufacturing wire mesh cable tray system
   2. Chatsworth Products “OnTrac” series wire mesh cable tray
   3. Cooper B-Line “Flextray” series wire mesh cable tray
   4. Legrand Cablofil wire mesh cable tray
   5. Mono-Systems “Mono-Mesh” wire mesh cable tray
   6. WBT
   7. Or equal

**PART 3 - EXECUTION**

3.1 **GENERAL**

A. Comply with the Execution requirements of Section 270000.

B. Install cable tray systems in accordance with manufacturers’ instructions, with NEMA VE2 and with recognized industry practices. Install cable tray systems compliant to requirements of CEC, applicable portions of NFPA 70B, and to NECA’s “Standards of Installation” pertaining to general electrical installation practices.

3.2 **PREPARATION**

A. Plan routes and locations of pathway systems and coordinate with other trades/systems (ductwork, plumbing, electrical raceways, wall construction, ceilings, etc.). Pathway systems shall not unnecessarily cross other trade’s work, shall not prevent removal of ceiling tiles or panels, and shall not block access to mechanical or electrical equipment. Provide offsets as required to avoid obstruction of pathway systems with other trades.

B. Prior to installation, examine areas to receive pathways systems to verify conditions are ready for work and to verify conformance with manufacturer and specification tolerances. Notify the Owner’s Representative in writing of conditions that would adversely affect the installation, or subsequent utilization, of the system. Proceed with installation when unsatisfactory conditions are corrected.

3.3 **INSTALLATION**

A. Do not anchor supports from ductwork, piping, or other equipment hangers.

B. Ensure no other trades/building systems conflict with cable tray systems and clearances. Other building infrastructure, such as columns, pipes, valves, etc., shall not route inside or through cable tray. Either relocate/alter other building infrastructure (preferred) or, if other building infrastructure cannot be altered, adjust the cable tray route to avoid conflicts other building infrastructure.

C. Install cable trays parallel or at right angles to the centerlines of columns and beams.

D. Round edges and smooth surfaces to eliminate sharp edges and spurs that could damage (cut, puncture, etc) cable jackets.
E. Thoroughly clean surfaces receiving connections for bonding.

F. Clearances: Ensure clearance and access requirements to cable tray – above, below, and side – as shown on the drawings are met. Coordinate with other trades to avoid other building infrastructure encroaching on access/clearance.

G. Fabricate fittings (tee, cross, reducers, and 90-degree turns) in the field according to the manufacturer’s instructions and to ensure the pathway system remains UL listed. Fabricate fittings by cutting wires with a cutting device approved by the manufacturer. Cut wires in a manner that minimizes sharp edges and projections to prevent damage to cables (such as cut outer jacket) or harm to installation personnel. Provide corner connectors that provide a radius on the inside corner of bends for horizontal 90 degree bends, tees, and crosses. Bends shall have a minimum of a 12-inch bend radius.

H. At transition to and/or interface with conduit, align end of cable tray directly underneath the conduits.

I. Bonding and Grounding
   1. Bond system per “System Description” requirements.

J. Protection: Protect installed system until completion of project. Touch-up, repair or replace damaged products before punch walk.

3.4 PRE-FUNCTIONAL TESTING

A. After installing cable tray systems, perform the following pre-functional testing.

B. Visually inspect the completed cable tray system for intrusion of items such as pipe, hangers, or other equipment. If found, notify Engineer (explain in detail the conflict and suggest means to eliminate the conflict). Adjust cable tray as approved to eliminate spatial conflict and to ensure clearance.

C. Visually inspect the completed cable tray system for mechanical continuity at each cable tray joint, fitting, junction, attachment to supports (e.g., hold-down clips), etc. Check the hardware for missing or damaged bolts, bolt heads, or nuts – if found, replace with specified hardware. Check bolted connections between sections for corrosion. Clean and retorque in suspect areas.

D. Visually inspect seismic bracing. Ensure each instance complies with approved methods and is complete (anchors, stiffeners, hardware, etc). Check the hardware for missing or damaged bolts, bolt heads, or nuts – if found, replace with specified hardware. Check bolted connections between sections for corrosion. Clean and retorque in suspect areas.

E. Visually inspect the completed cable tray system for vibration. If excessive vibration is found, provide vibration isolation apparatus as needed to eliminate vibration.

F. Visually inspect the completed cable tray system for thermal expansion and contraction conditions. If thermal expansion is identified, provide expansion fittings and other apparatus necessary to eliminate (or mitigate) expansion (and/or contraction).

G. Visually inspect the completed cable tray system for electrical continuity at each cable tray joint and each ground connection. Ensure adequacy of cable tray grounding. Verify that takeoff raceways are bonded to cable tray.

H. Visually inspect the completed cable tray system for sharp edges and corners. If found, grind or file edges and corners to smooth.

I. Visually inspect the completed cable tray system for deflections and protuberances; correct any not within specifications

J. Clean cable tray system: Remove deposits of dust, scrap materials, trash of any description, and any blockage of tray ventilation.

K. Record results of visual inspections. Submit pre-functional report to Engineer.

3.5 TESTING
A. Test cable tray systems in accordance with NFPA 70B Chapter 21 for electrical continuity and connection to approved ground. Measure ground resistance; verify cable tray is bonded to approved ground with a total resistance less than 5 ohms. Adjust bonding as needed to meet this requirement.

3.6 PROTECTION

A. Protect installed products until completion of project.

1. Repair damage to galvanized finishes with zinc-rich paint recommended by cable tray manufacturer.

2. Repair damage to paint finishes with matching touchup coating recommended by cable tray manufacturer.

3. Install temporary protection for cables in open trays to protect exposed cables from falling objects or debris during construction. Temporary protection for cables and cable tray can be constructed of wood or metal materials until the risk of damage is over.

B. Touch-up, repair or replace damaged products before Substantial Completion.

3.7 FINAL INSPECTION AND CERTIFICATION

A. Punch the work of this section compliant to the requirements of Section 27 00 00.

B. Comply with system acceptance and certification requirements of Section 27 00 00.

END OF SECTION
SECTION 27 08 11 COMMUNICATIONS TWISTED PAIR TESTING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes: Testing of Communications Twisted Pair Cabling (both Backbone and Horizontal Cabling subsystems).
B. Related Sections
   1. Comply with the Related Sections paragraph of Section 27 00 00.
   2. Section 27 13 13 - Communication Backbone ISP Twisted Pair Cabling
   3. Section 27 13 14 - Communication Backbone OSP Twisted Pair Cabling
   4. Section 27 15 13 - Communication Horizontal Twisted Pair Cabling

1.2 REFERENCES

A. Comply with the References requirements of Section 27 00 00.
B. In addition to the References of Section 27 00 00, the following references apply to this specification:
   1. ANSI/TIA-1152, “Requirements for Field Test Instruments and Measurements for Balanced Twisted-Pair Cabling”

1.3 DEFINITIONS

A. Refer to Definitions of Section 270000, Section 27 13 13, Section 27 13 14, and Section 27 15 13.
B. In addition to those Definitions of Section 27 00 00, the following list of terms as used in this specification defined as follows:
   1. “CAT3”: Shall mean Category 3 cabling, per ANSI/TIA-568-C.2
   2. “CAT5E”: Shall mean Enhanced Category 5 cabling, per ANSI/TIA-568-C.2
   3. “CAT6”: Shall mean Category 6 cabling, per ANSI/TIA-568-C.2
   4. “CAT6A”: Shall mean Augmented Category 6 cabling, per ANSI/TIA-568-C.2
   5. “Channel”: Shall mean a testing configuration which includes the Permanent Link and the line cord (at the workstation), the equipment cord, and, if a full crossconnection is implemented, a patch cord and the crossconnect termination/connecting apparatus.
   6. “Connect”: Shall mean install all required patch cords, equipment cords, cross-connect wire, etc. to complete an electrical or optical circuit.
   7. “Cord”: Shall mean a length of cordage having connectors at each end. The term “Cord” is synonymous with the term “Jumper” and “Lead”.
   8. “Permanent Link”: Shall mean the ‘permanent’ portion of the Horizontal cabling to each outlet with the test cords de-embedded from the measurements; this includes cable, consolidation point (if used), termination/connecting apparatus in the IDF and the connector at the outlet.
   9. “System Cord”: Shall mean the cord used in the operating transmission circuit.
   10. “Test Cord”: Shall mean the cord certified for use in testing, as described in this section.

1.4 SYSTEM DESCRIPTION
A. Refer to Section 270000, Section 27 13 13, Section 27 13 14, and Section 27 15 13 for additional system description information.

B. Work Provided Under Other Sections

1. Backbone twisted pair cabling
2. Horizontal twisted pair cabling

C. Base Bid Work

1. Testing of a completed communication infrastructure cabling system, which includes:

   a. Submittals
   b. Testing of the twisted pair cabling as follows:

   **Table 270811-1.1: Tests For UTP Cabling**

   c. Record Documents, including test results.

1.5 SUBMITTALS

A. Comply with the Submittal requirements of Section 27 00 00.

B. Submittal Requirements at Start Of Construction:

2. Product Submittal, including cut sheets of testing equipment to be used (note all software/ firmware versions as applicable).
3. Schedule Submittal, consisting of proposed schedule of work. This schedule may be combined with the schedule developed for Division 27.

C. Submittal Requirements at Closeout:

1. Record Documents:

   a. Submit one hard copy and one soft copy of test reports, including all tested parameters. This may be combined with the reports of Section 27 08 21.
   b. Submit one hard copy of warranty certificate.

2. Format – Hard Copy:

   a. Prints of test reports, on 8.5”x 11” paper, color or black & white, one cabling link per page
   b. Assemble prints into a 3-ring binder
   c. Clearly label the cover of each test report binder with the following information:

      1) Client Name
      2) Project Name and Address
      3) Binder Name (e.g., “Test Reports for Horizontal Cabling System”)
      4) Date of Submittal – date format: month day, year (e.g., “January 1, 2020”)  
      5) Contractor Name

   d. Include a Table Of Contents at the beginning that lists the contents
   e. Organize the test reports by Backbone Cabling / Horizontal Cabling, by building, by floor, and by IDF.
   f. Sort reports in ascending cable ID order
g. Include tabbed separators for improved navigation through the manual

3. Format – Soft Copy:
   a. “Burn” onto one CD-ROM test report files as native data format (for example, an *.FLW file from a Fluke tester); if not possible to submit in native format, then issue test results as an exported Microsoft Excel compatible format.
   b. Include onto CD-ROM ‘Viewer’ software necessary to view, sort, filter, and print individual and summary test results from test results native format.
   c. Clearly label the CD-ROM with the following information:
      1) Client Name
      2) Project Name and Address
      3) CD-ROM Name (e.g., “Test Reports for Horizontal Cabling System”)
      4) Date of Submittal – date format: month day, year (e.g., “January 1, 2020”)
      5) Contractor Name

1.6 QUALITY ASSURANCE
   A. Comply with the Quality Assurance requirements of Section 27 00 00.
   B. Under no circumstances shall any cable’s and/or conductor’s test results be substituted for another’s. If an instance of falsification is confirmed, the Contractor is liable for a complete retest of the cabling system at no additional cost to the Owner. This includes the retaining the services of a neutral party to observe all retesting.

1.7 WARRANTY
   A. Warrant the validity of the test results.

PART 2 - PRODUCTS

2.1 BACKBONE TWISTED PAIR CABLING TESTER
   A. Areas of Test Measurement (minimum): Wire Map (continuity, opens, shorts, crossed pairs, split pairs): Siemon #MT-5000 test unit, with 25-pair adapter, or equal.

2.2 CATEGORY 6A HORIZONTAL CABLE TESTER
   A. Equipment shall be independently verified to meet ANSI/TIA-1152 requirements, including Level IIIe minimum accuracy. Equipment shall meet ISO/IEC Class C, D, E, and F.
   B. Test Standards (minimum): ANSI/TIA-568-C.2 Category 6A; ISO/IEC 11801 Class C and D; ISO/IEC 11801-2000 Class C and D, 1000Base-T, 100Base-TX; IEEE 802.3 10Base-T; ANSI TP-PMD; IEEE 802.5
   C. Areas of Test Measurement (minimum): test areas listed under ANSI/TIA568-C.2, 6.3
   D. Equipment:
      1. Fluke Networks
         a. #DTX-1800; “CableAnalyzer” test kit (main unit, remote unit, CAT6A permanent link adapters, CAT6A channel adapters, accessories), loaded with the latest firmware version.
         b. “LinkWare” reporting and latest version of documentation software
2.3 CATEGORY 3 HORIZONTAL CABLE TESTER

A. Test standards (minimum): TIA Category 3 per TIA TIA/EIA-568B; ISO/IEC 11801 Class C; ISO/IEC 11801-2000 Class C, 100Base-TX; IEEE 802.3 10Base-T; IEEE 802.5

B. Equipment shall be independently verified to meet ANSI/TIA-1152 requirements, including Level II minimum accuracy. Equipment shall meet ISO/IEC Class C.

C. Test Standards (minimum): ANSI/TIA-568-C.2 Category 3; ISO/IEC 11801 Class C; ISO/IEC 11801-2000 Class C, 100Base-TX; IEEE 802.3 10Base-T; ANSI TP-PMD; IEEE 802.5

D. Areas of Test Measurement (minimum): test areas listed under ANSI/TIA568-C.2, 6.3, as applicable to CAT3 cabling

E. Equipment

1. Fluke Networks
   a. #DTX-1800; "CableAnalyzer" test kit (main unit, remote unit, CAT6A permanent link adapters, CAT6A channel adapters, accessories), loaded with the latest firmware version.
   b. “LinkWare” reporting and latest version of documentation software
   c. DSP-4300 CableAnalyzer test unit, with “CableManager” reporting and documentation software (version 4.8, or higher)

2. Or equal

PART 3 - EXECUTION

3.1 SCHEDULING

A. Prepare a construction schedule based on the schedule developed in sections 27 15 13 and 27 15 23 for the testing activities. Update testing schedule when changes in the cabling schedules occur.

3.2 FIELD QUALITY CONTROL

A. Calibrate test sets and associated equipment per the manufacturers printed instructions at the beginning of each day’s testing and after each battery charge. Fully charge the test sets prior to each day’s testing to ensure proper operation.

B. Ensure test equipment and test cords are clean and undamaged during testing activities. Per the Engineer’s discretion, halt testing activity and clean testing equipment, test cords, and related apparatus.

3.3 BACKBONE TWISTED PAIR CABBING TESTING REQUIREMENTS AND PROCEDURES

A. Precautions

1. Adhere to the equipment manufacturer’s instructions during all testing.
2. Prior to any testing activity or any measurements taken, ensure the test equipment is at room temperature – approximately 70 degrees F (e.g., if necessary, bring the test equipment in from outdoors and let it set for about 15 minutes or for however long it takes to bring the test equipment to reach room temp).
3. Fully charge power sources before each day’s testing activity

B. Testing Requirements
1. Test backbone multipair cabling per “Base Bid Requirements” in Part 1 of this Section.
2. The installation will be accepted when testing has indicated availability of 100% terminated pairs.

C. Testing Procedures
1. Test continuity and wire map for all pairs.
2. Test length for 2% of pairs of each cable. Pairs shall be from different 25-pair binder groups.

D. Acceptable Test Result Measurements
1. Overall:
   a. Links which report a Fail, Fail* or Pass* for any of the individual tests shall result in an overall link Fail. All individual test results must result in a Pass to achieve an overall Pass.
   b. Any reconfiguration of a link components required as a result of a test Fail, must be re-tested for conformance.
   c. Remove and replace any cabling links failing to meet the criteria described in this specification, at no cost to the Owner, with cables that prove, in testing, to meet the minimum requirements.
2. Length
3. Wire Map: Provide continuous cable link and terminate all pairs correctly at both ends. No exceptions accepted.
4. Attenuation: The acceptable attenuation measurements for any CAT3 cabling link is that which is no greater than that listed in ANSI/EIA-568-C.2, 6.3 and as adjusted to length measurement.
5. Worst Pair-to-Pair Near End CrossTalk (NEXT) Loss: The acceptable worst pair-to-pair NEXT loss no greater than that listed in ANSI/EIA-568-C.2, 6.3 for CAT3 cabling.

E. Record Documents:
1. Permanently record test results.
2. Cable and pair identifiers of the test reports shall match the identifiers as labeled in the field – i.e., use the same ID on the cable label/termination label as what appears on the test reports.
3. Measurements shall carry a precision through no significant decimal place.
4. Each test report shall contain the following information (not necessarily in this order):
   a. Project name
   b. Cable identifier, pair number(s)
   c. Date measurement were obtained
   d. Operator (company and name)
   e. Test equipment model and serial number(s)
   f. Measurement results

3.4 HORIZONTAL CATEGORY 6A TESTING PROCEDURES

A. Precautions
1. Adhere to the equipment manufacturer's instructions during all testing.
2. Prior to any testing activity or any measurements taken, ensure the test equipment is at room temperature – approximately 70 degrees F (e.g., if necessary, bring the test equipment in from outdoors and let it set for about 15 minutes or for however long it takes to bring the test equipment to reach room temp).
3. Fully charge power sources before each day’s testing activity

B. Test Equipment Set Up

1. Set up the tester to perform a full CAT6A test, as a Permanent Link configuration.
2. If the tester has cable-specific test parameters pre-loaded, set up the tester as product-specific setting. If not, set as generic CAT6A.
3. Set the tester to save the full test results (all test points, graphs, etc.).
4. Save the test results with the associated cable link identifier.
5. Calibrate the test set per the manufacturer’s instructions.

C. Acceptable Test Result Measurements

1. Overall Test Results:
   a. The Owner shall accept only individual test results that result in a Pass.
   b. Links which report a Fail, Fail* or Pass* for any of the individual tests shall result in an overall link Fail.
   c. Any reconfiguration of link components required as a result of a test Fail, must be re-tested for conformance.
   d. Remove and replace any cabling links failing to meet the criteria described in this specification, at no cost to the Owner, with cables that prove, in testing, to meet the minimum requirements.

2. Wire Map: Correctly terminate all pairs of the cabling link at both ends. Provide only continuous pairs. No exceptions.

3. Length: Ninety-four meters is the maximum acceptable electrical length measurements for any cabling link measured under a Permanent Link configuration, including test cords.

4. Insertion Loss: The acceptable insertion loss measurements for any CAT6A cabling link is that which is no greater than that listed in ANSI/EIA-568-C.2, 6.3.

5. Worst Pair-to-Pair Near End CrossTalk (NEXT) Loss: The acceptable worst pair-to-pair NEXT loss for any CAT6A cable is that which is no greater than that listed in ANSI/EIA-568-C.2, 6.3.

6. Power Sum NEXT Loss: The acceptable power sum PS-NEXT loss for any CAT6A cable is that which is no greater than that listed in ANSI/EIA-568-C.2, 6.3.

7. Worst Pair-to-Pair ELFEXT and FEXT Loss: The acceptable worst pair-to-pair ELFEXT and loss for any CAT6A cable is that which is no greater than that listed in ANSI/EIA-568-C.2, 6.3.

8. Power Sum ELFEXT and FEXT Loss: The acceptable PS-ELFEXT and loss for any CAT6A cable is that which is no greater than that listed in ANSI/EIA-568-C.2, 6.3.

9. Alien Near End CrossTalk (ANEXT) Loss: The acceptable ANEXT loss for any CAT6A cable is that which is no greater than that listed in ANSI/EIA-568-C.2, 6.3.

10. Alien Far End CrossTalk (AFEXT) Loss: The acceptable AFEXT loss for any CAT6A cable is that which is no greater than that listed in ANSI/EIA-568-C.2, 6.3.

11. Return Loss: The acceptable return loss measurements for any CAT6A cable is that which is no greater than that listed in ANSI/EIA-568-C.2, 6.3.

12. Propagation Delay and Delay Skew: The acceptable propagation delay and delay skew measurements for any CAT6A cable is that which is no greater than that listed in ANSI/EIA-568-C.2, 6.3.

D. Record Documents:

1. Permanently record test results.
2. Export all of the numerical test results to a single spreadsheet in Microsoft Excel® 2003 (*.xls) or 2007 (*.xlsx) file format.
3. Submit test results at the conclusion of the testing to the Engineer for approval. Engineer will check these test reports for a format acceptable to the Owner, or Owner’s Representative.
4. For each Horizontal CAT6A test, record the following information:
   a. Project name and address
   b. Testing Company's and Operator's name
   c. Date of measurement
   d. Test equipment, including the following:
      1) Manufacturer, model, and serial number
      2) Date and time of last calibration
   e. Identification number of cable
   f. Overall test result

END OF SECTION
SECTION 27 08 21 COMMUNICATIONS FIBER OPTIC TESTING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes: Testing of Telecommunications Backbone and Horizontal Fiber Optic Cabling.
B. Related Sections
   1. Comply with the Related Sections paragraph of Section 270000.
   2. Section 27 13 23 - Communication Backbone ISP Fiber Optic Cabling
   3. Section 27 13 24 - Communication Backbone OSP Fiber Optic Cabling
   4. Section 27 15 23 - Communication Horizontal Fiber Optic Cabling

1.2 REFERENCES

A. Comply with the References requirements of Section 27 00 00.
B. In addition, the following standards are referenced to this Section:
   1. TIA/EIA-526-14A (OFSTP-14), "Optical Power Loss Measurements of Installed Multimode Fiber Cable Plant"
   2. TIA/EIA-526-7 (OFSTP-7), "Measurement of Optical Power Loss of Installed Singlemode Fiber Cable Plant"
   3. EIA/TIA-455-77 (FOTP-77), "Procedures To Qualify A Higher-Order Mode Filter For Measurements On Singlemode Fibers"
   4. EIA/TIA-455-78A (FOTP-78), "Spectral-Attenuation Cutback Measurement for Singlemode Optical Fibers"
   5. EIA-455-95 (FOTP-95), "Absolute Optical Power Test for Optical Fibers and Cables"
   8. BICSI Telecommunication Distribution Methods Manual (TDMM)

1.3 DEFINITIONS

A. Refer to Definitions of Section 270000, Section 27 13 23, and Section 27 13 24.
B. In addition to those Definitions of Section 270000, the following list of terms as used in this specification defined as follows:
   1. "Adapter" (associated with fiber connectivity): Shall mean a connecting device that joins 2 fiber connectors, either like or unlike
   2. "Connect": Shall mean install all required test cords, patch cords, system cords, etc. to complete an optical circuit
   3. "CPR": Coupled Power Ratio (according to TIA/EIA-526-14A Annex A
   4. "Cord": Shall mean a length of cordage having connectors at each end; the term "Cord" is synonymous with the term "Jumper"
   5. "Jumper": See "Cord"
   6. "OTDR": Shall mean Optical Time Domain Reflectometer
7. “Passive Link Segment”: Shall mean the cable, connectors, couplings, and splices between two fiber optic termination units
8. “System Cord”: Shall mean the cord used in the operating electrical or optical circuit.
9. “Test Cord”: Shall mean the cord certified for use in testing, as described in this section

1.4 SYSTEM DESCRIPTION

A. Refer to Section 27 00 00, Section 27 13 23, Section 27 13 24, and Section 27 15 23 for addition system description information.
B. Work Provided Under Other Sections
   1. Backbone fiber optic cabling
C. Base Bid Work
   1. Submittals: pre-testing and post-testing
   2. Testing of completed fiber optic passive link segment(s) per the following table:

<table>
<thead>
<tr>
<th>Subsystem</th>
<th>Type</th>
<th>Test</th>
<th>Direction</th>
<th>Wavelength</th>
</tr>
</thead>
<tbody>
<tr>
<td>Backbone</td>
<td>Multimode</td>
<td>Optical Power Loss</td>

<td>1310nm and 1550nm</td>
</tr>
</tbody>
</table>

3. Record Documents, including test results

1.5 SUBMITTALS

A. Comply with the Submittal requirements of Section 27 00 00.
B. Submittal Requirements at Start Of Construction:
   2. Pre-Testing Loss Calculations Submittal: Calculate the loss of each segment. The cable length may be based on the footage markings printed on the cable jacket. Include a brief description of each segment.
   3. Product Submittal, including cut sheets of testing equipment and the following information (this data must match the test reports):
      a. Manufacturer and model number
      b. Serial number
      c. Date of last factory calibration
      d. Software/ firmware versions (as applicable)
   4. Schedule Submittal, consisting of proposed schedule of work (this schedule may be combined with the schedule developed for Division 27)
C. Submittal Requirements at Closeout:
   1. Submit test results and reports in a format acceptable to the Owner, or Owner’s Representative, or Engineer before system acceptance.
2. Submit one soft copy and one hard copy of test reports, including all tested parameters. This may be combined with the reports of Section 27 08 11.
3. Submit one hard copy of warranty certificate from the manufacturer and the Contractor
4. Each test report (per strand per cable link) shall include the following information:
   a. Project/Client name, and project address
   b. Date of test
   c. Contractor (Company) and Technician’s name
   d. Test equipment, including Serial Numbers (*must match pre-testing submittal*)
   e. Test procedure (e.g., OFSTP-14A) and method (e.g., Method B)
   f. Light source’s launch category (including CPR) and spectral width
   g. Wavelength
   h. Cable identifier, fiber number, and fiber type (e.g., “multimode”)
   i. Measurement direction, including end locations
   j. Optical loss measurement
5. Cable and fiber identifiers of the test reports shall match the identifiers as labeled in the field – i.e., the ID stored with the test result shall be the same ID as on the cable label/fiber port label.
6. Format – Soft Copy:
   a. “Burn” onto one CD-ROM test report files as native data format (for example, an *.FLW file from a Fluke tester). If not possible to submit in native format, then issue test results as an exported Microsoft Excel compatible format.
   b. Include onto CD-ROM (or separate CD-ROM) ‘Viewer’ software necessary to view, sort, filter, and print individual and summary test results from test results native format.
   c. Clearly label the CD-ROM with the following information:
      1) Owner Name
      2) Project Name and Address
      3) CD-ROM Name (e.g., “Test Reports for Backbone Cabling System”)  
      4) Date of Submittal – date format: <month> <day>, <year> (e.g., “January 1, 2010”)  
      5) Contractor Name
7. Format – Hard Copy of Optical Loss Testing:
   a. Prints of test reports, on 8.5”x11” paper, color or black & white, one cabling link per page
   b. Assemble prints into a 3-ring binder
   c. Clearly label the cover of each test reports binder with the following information:
      1) Owner Name
      2) Project Name and Address
      3) Binder Name (e.g., “Test Reports for Backbone Cabling System”)  
      4) Date of Submittal – date format: monthday, year (e.g., “January 1, 2020”)  
      5) Contractor Name
   d. Include a Table Of Contents at the beginning that lists the contents
   e. Organize the test reports by Backbone Cabling / Horizontal Cabling, by building, by floor, and by IDF.
   f. Sort reports in ascending cable ID order
   g. Include tabbed separators for improved navigation through the manual
8. Format – Hard Copy of Characterization:
   a. Use feet for the units for distance measurements (i.e., the “X” axis of the graph) shown on the print of the test measurements.
b. Print reports such that strands of a given cabling link have matching axis scales; the x-axis shall be the same report-to-report and as well as the y-axis shall match report-to-report.

c. The trace of the printed test report shall show the launch cord.

d. Each test report shall contain the following information (not necessarily in this order):
   1) Owner Name
   2) Project Name and Address
   3) Cable identifier, fiber/strand number, and fiber type (e.g., “multimode”)
   4) Operator (company and name)
   5) Date measurements were obtained
   6) Measurement direction
   7) Set up parameters (such as wavelength, pulse width, refractive index, event threshold)
   8) Test equipment model and serial number(s)
   9) OTDR trace
   10) Length of fiber
   11) Overall link loss
   12) Contractor Name

e. For each cabling link, include either a schematic graphic or a brief narrative accurately describing the test set up. The description shall include test/launch cord (with length), expected events (connectors, slices, etc.) with expected distances, etc. This information will eliminate many questions the Engineer will have while reviewing the reports.

1.6 QUALITY ASSURANCE

A. Comply with the Quality Assurance requirements of Section 27 00 00.
B. Testing equipment shall be fully functional and in proper working order. Testing equipment shall be factory calibrated within the manufacturer’s published calibration period. Testing equipment must have loaded the latest firmware / operating software.
C. Under no circumstances shall any cable’s and/or optical conductor’s test results be substituted for another’s. If an instance of falsification is confirmed, the Contractor will be liable for a complete retest of the cabling system at no additional cost to the Owner. This includes the retaining the services of a neutral party to observe all retesting.

1.7 WARRANTY

A. Warrant the validity of the test results. Issue such warranty in writing.

PART 2 - PRODUCTS

2.1 FIBER OPTIC LIGHT SOURCE

A. Light source used for testing multimode fibers shall confirm to TIA/EIA-526-14A, 3.1. Light source used for testing singlemode fibers shall confirm to TIA-526-7, 3.1.1.
B. Light source’s modal launch condition shall be Category 1.
C. Light source’s connection interfaces shall be factory installed. Field-configurable connection interface will not be allowed.
D. Light source’s output wavelength and power shall be constant/unchanged after setting.
E. Light source shall be factory calibrated (date of last factory calibration must be documented).

F. Equipment:
1. Corning Cable Systems
   a. #OS-403RD; dual wavelength (850 / 1300) light source for multimode
   b. #OS-404RXD; dual wavelength (1310 / 1550) light source for singlemode

2. Exfo
   a. #FOT-930; OLTS test set
   b. #FOT-600 OLTS test set (#23BL Source + #602X Meter)
   c. #FOT-300; OLTS test set

3. Fluke Networks
   a. #DTX-1800; “DTX CableAnalyze” Test Kit – or bundled kit
   b. #DTX-MFM2 Fiber Module, for Multimode Fiber
   c. #DTX-GFM2 Gigabit Fiber Module, for Multimode Fiber
   d. #DTX-SFM2 Fiber Module, for Singlemode Fiber
   e. “SimpliFiber” Test Kit

2.2 FIBER OPTIC POWER METER

A. Power meters used for testing multimode fibers shall conform to TIA/EIA-526-14A, 3.2. Power meters used for testing singlemode fibers shall conform to TIA/EIA-526-7, 3.1.2.

B. Power meter shall be capable of measuring both relative and absolute power, and shall feature data storage (of measurements).

C. Power meter used shall have the following performance:
   1. Dynamic range of 0dBm to -50dBm, minimum
   2. Accuracy of ±0.2dB

D. Power meter shall be factory calibrated (date of last factory calibration must be documented).

E. Equipment:
1. Corning Cable Systems
   a. #OTS-610; power meter with data storage
   b. #OTS-400 series power meter (legacy product series)

2. Exfo
   a. #FOT-930; OLTS test set
   b. #FOT-600 OLTS test set (#23BL Source + #602X Meter)
   c. #FOT-300; OLTS test set

3. Fluke Networks
   a. #DTX-1800; “DTX CableAnalyze” Test Kit – or bundled kit
   b. #DTX-MFM2 Fiber Module, for Multimode Fiber
   c. #DTX-GFM2 Gigabit Fiber Module, for Multimode Fiber
   d. #DTX-SFM2 Fiber Module, for Singlemode Fiber
   e. “SimpliFiber” Test Kit

2.3 FIBER OPTIC MANDREL

A. For 50/125 μm fiber: 22 mm mandrel diameter for jacketed (3.0 mm) fiber.

B. Equipment:
1. Fluke Networks  
   a. #NF-MANDREL-50; red mandrel for jacketed 50/125 um fiber

2.4 FIBER OPTIC OTDR

A. Multimode Source Module:  
   - Wavelength  
     | Dynamic Range | Attenuation Deadzone | Reflective Deadzone | Loss Resolution | Distance Accuracy |
     | 850nm          | 24dB                 | 6.5mt               | 3.0mt          | 0.001dB         | 0.1mt           |
     | 1300nm         | 27dB                 | 7.0mt               | 3.0mt          | 0.001dB         | 0.1mt           |

B. Singlemode Source Module:  
   - Wavelength  
     | Dynamic Range | Attenuation Deadzone | Reflective Deadzone | Loss Resolution | Distance Accuracy |
     | 1310nm         | 40dB                 | 6.0mt               | 3.5mt          | 0.001dB         | 0.1mt           |
     | 1550nm         | 28dB                 | 12.0mt              | 3.5mt          | 0.001dB         | 0.1mt           |

C. Equipment:  
   1. Corning Cable Systems  
      a. #OV-1000; OTDR ‘mainframe’  
      b. #400-MD26; multimode module for OV-1000 OTDR  
      c. #400-SD34; singlemode module for OV-1000 OTDR  
      d. #2001HR; for multimode & singlemode systems (legacy product series)  
      e. #340 OTDR Plus Multitester II (legacy product series)  
      f. #MiniOTDR+; for multimode & singlemode systems (legacy product series)  
   2. Exfo  
      a. #FTB-500 platform OTDR  
      b. #FTB-200 platform compact OTDR  
   3. Fluke Networks  
      a. #OF-500; “OptiFiber” OTDR mainframe – or bundled kit  
      b. #OFTM-5610B; Multimode module for OptiFiber OTDR  
      c. #OFTM-5730; Singlemode module for OptiFiber OTDR  
      d. #OFTM-5610B; Multimode module for OptiFiber OTDR  

D. Reader Software: Windows-based software capable of reading stored traces and is fully functional with the testing equipment.

2.5 FIBER OPTIC TEST CORDS

A. Multimode Fiber Optic Test Cord  
   1. Multimode test cords shall conform to TIA-526-14A, 3.3.  
   2. The fiber of the multimode test cord(s) shall have the core diameter to that of the multimode fiber optic passive link under test.  
   3. Connectors of the test cords shall be compatible with (the same type as) the connector types of the light source and the power meter, and with the cabling plant.  
   4. The connectors shall exhibit ≤ 0.5dB loss per connection @ both 850nm and 1300nm, as measured per FOTP-171 D2.  
   5. Test cord length for Optical Power Loss testing: 1m - 5m.
B. Singlemode Fiber Optic Test Cord
   1. Singlemode test cords shall comply to 526-14A, 3.1.3.
   2. The fiber of the singlemode test cord(s) shall have the mode field diameter nominally equal to that of the singlemode fiber optic passive link.
   3. Connectors of the test cords shall be compatible (the same type) with the connector types of the light source and the power meter, and with the cabling plant.
   4. The connectors shall exhibit ≤ 0.5dB loss per connection @ both 1310nm and 1550nm, as measured per FOTP-171 D3. The connectors shall inhibit Fresnel reflections (i.e., have a “PC” finish).
   5. Test cord length for Optical Power Loss testing: 1m - 5m.

PART 3 - EXECUTION

3.1 FIELD QUALITY CONTROL

A. Prior to the start of testing, set up a meeting with the Engineer to witness testing procedures. The Engineer will, at their discretion, come to the site and witness the technician's actual testing procedures. The Engineer may give verbal comments to correct the technician's procedures to meet these requirements, followed up with a written observation report.

B. Calibrate test sets and associated equipment per the manufacturers printed instructions at the beginning of each day's testing and after each battery charge. Fully charge the test sets prior to each day's testing to ensure proper operation.

C. Use undamaged test equipment and test cords. Clean connectors and adapters (with a lint-free wipe and 90% (or higher) isopropyl alcohol) prior to and during testing activities. Per the Engineer's discretion, halt testing activity and clean testing equipment, test cords, and related apparatus.

D. Permanently record test results.

3.2 OPTICAL POWER LOSS TESTING REQUIREMENTS AND PROCEDURES

A. Safety: Use test equipment containing a laser or LED in accordance with ANSI Z136.2.

B. Test fiber optic passive links per "Base Bid Work" under System Description in Part 1 of this Section. Follow the procedures in the following order.

C. Precautions
   1. Adhere to the precautions described in TIA-526-14A, 5.1.
   2. Adhere to the equipment manufacturer's instructions during all testing.
   3. Prior to any testing activity or any measurements taken:
      a. Ensure test equipment is at room temperature – approximately 72 degrees F (if necessary, bring the test equipment in from outdoors and let it set until the test equipment reaches room temp).
      b. Power on the light source and power meter for at least 5 minutes prior to obtaining measurements.
      c. Clean connectors and adapters with a lint-free wipe and 90% (or higher) isopropyl alcohol.
   4. Do not power off the light source or the power meter during testing activity.
   5. Do not remove Test Cord #1 from the light source at any time (unless the testing is complete or the equipment is being put away for the evening).
   6. Do not bend the test cords smaller than 20 times the cord diameter (this may induce loss into the cord reducing the accuracy of the measurement).
D. Test Cord Performance Verification

1. Connect Test Cord #1 to the light source and to the power meter.
2. Set this value into the power meter as the reference power ($P_{ref}$).
3. Disconnect Test Cord #1 from the power meter. Do not disconnect Test Cord #1 from the light source.
4. Connect the ‘open’ end of Test Cord #1 to an adapter (of matching connector type). Connect one end of Test Cord #2 to that adapter and the other end of Test Cord #2 to the power meter.
5. The value displayed on the power meter represents the test cord #2 connection loss.
6. Flip the ends of Test Cord #2 so that the end connected to the power meter is now connected to the adapter (attached to test cord #1), and the end connected to the adapter is now connected to the power meter.
7. The value displayed on the power meter represents the test cord #2 connection loss on the opposite end.
8. Both connection loss measurements must be less than or equal to the value found in Table 270812-3.1 (below). Replace cord if measure losses exceed table values.

Table 270821-3.1: Acceptable Test Cord Connection Attenuation

<table>
<thead>
<tr>
<th></th>
<th>ST or SC Connection</th>
<th>LC and other Mini-Connector</th>
</tr>
</thead>
<tbody>
<tr>
<td>Multimode (50)</td>
<td>0.50 dB Max</td>
<td>0.20 dB Max</td>
</tr>
<tr>
<td>Singlemode</td>
<td>0.55 dB Max</td>
<td>0.30 dB Max</td>
</tr>
</tbody>
</table>

9. Repeat this test procedure from the beginning reversing the test cords in order to verify the performance of test cord #1.

E. Test Equipment Set Up

1. Follow the test equipment manufacturer’s initial adjustment and set up instructions.
2. Set the power meter to Relative Power Measurement Mode.
3. Set the meter to display power levels in dBm.
4. Set the light source and power meter to the same wavelength.

F. Multimode Passive Link Insertion Loss Testing Procedures

1. Only use a light source that exhibits a Category 1 modal launch condition. Confirm the light source’s modal launch condition following the procedures described in TIA-526-14A, Annex A.
2. Test Method:
   a. For ‘permanent’ links, perform the optical power loss testing of multimode fibers according to TIA-526-14A test method B “One Jumper Reference”.
   b. For ‘channel’ links, perform optical power loss testing of multimode fibers according to TIA-526-14A test method C “Three Jumper Reference” and include the system cords as part of the cable plant.

G. Singlemode Passive Link Insertion Loss Testing Procedures

1. Only use test jumpers that comply with the requirements TIA-526-7, 3.1.3.
2. Test Method:
   a. For ‘permanent’ links, perform the optical power loss testing of singlemode fibers according to TIA-526-7 test method A.1 “One Jumper-Cable Measurement”.
   b. For ‘channel’ links, perform optical power loss testing of singlemode fibers according to TIA-526-7 test method A.3 “Three Jumper-Cable Measurement” and include the system cords as part of the cable plant.
H. Acceptable Measurement Values
   1. The measured loss shall not exceed the calculated loss of the pre-testing submittals.

I. Record Test Measurements:
   1. Permanently record all test data per strand, including the following (minimum):
      a. Project name
      b. Cable identifier, fiber number, and fiber type (e.g., “multimode”)
      c. Testing company name
      d. Testing technician’s name
      e. Date measurements were obtained
      f. Measurement direction
      g. Wavelength
      h. Loss measurement
      i. Test equipment model and serial number(s)
   2. If the test set (light source and power meter) does not have data storage capability, then utilize the forms provided in Part 4 of this Section (or similar) as test reports.
   3. Measurements shall carry a precision through one significant decimal place, minimum.

3.3 CHARACTERIZATION TESTING REQUIREMENTS AND PROCEDURES

A. Safety: Use test equipment containing a laser or LED in accordance with ANSI Z136.2.

B. Test fiber optic passive links per “Base Bid Work” in Part 1 of this Section.

C. Precautions
   1. Adhere to the equipment manufacturer’s instructions during testing.
   2. Prior to testing activity or measurements taken, complete the following activities:
      a. Ensure the test equipment is at room temperature – approximately 70 degrees F (e.g., if necessary, bring the test equipment in from outdoors and let it set for about 15 minutes or for however long it takes to bring the test equipment to reach room temp).
      b. Turn the light source and power meter power on for at least 5 minutes.
      c. Clean test/launch cords’ and system cords’ connectors and the cabling system adapters with a lint-free wipe and 90% (or higher) isopropyl alcohol.
   3. Do not power off OTDR’s light source during testing activity.
   4. Do not remove launch cord from the OTDR’s light source at any time (unless the testing is complete or the equipment is being put away for the evening, or during trouble shooting).
   5. Do not bend the launch cord smaller than 20 times the cord diameter during testing activities (this may induce loss into the cord reducing the accuracy of the measurement).

D. Characterization Testing Procedures
   1. Equipment settings / measurement parameters:
      a. Index of Refraction: match cable-under-test fiber parameters; default settings as follows:
         Multimode Corning 50/125 Infinicor 1.481 @ 850nm 1.476 @ 1300nm
         Singlemode Corning SMF-28e+ 1.4670 @ 1310nm 1.4677 @ 1550nm
b. Pulse Width:
   Multimode 50/125  4 ns for cable lengths up to 300 meters
   20 ns for cable lengths between 300 meters and 2,000 meters
   Singlemode 10 ns for cable lengths up to 2,000 meters
   50 ns for cable lengths between 2,000 meters and 10,000 meters

c. Backscatter: multimode: -67dB @ 850nm, -74dB @ 1300nm; singlemode: -74dB @ 1310nm and 1550nm
d. Event Threshold: 0.05dB.
e. Reflection Threshold: multimode: -45dB, singlemode: -60dB.
f. Fiber Break/End-Of-Fiber: 3dB

2. Set the distance units (i.e., the "X" axis of the graph) to feet.
3. Waveform: The waveform shall be real-time and normal density.
4. Obtain measurements using a 'launch' cord connected to the test instrument and the cable-under-test.
   a. The fiber of the launch cord shall match the fiber of the cable-under-test in physical and performance parameters (such as type, core/cladding size, index of refraction, refractive profile). The fiber of the launch cord should match the fiber of the cable-under-test in manufacturer and product.
   b. The launch cord length shall be between 25 and 100 meters.

E. Record Test Measurements:
   1. Permanently record all test data per strand, including the following (minimum):
      a. Project name
      b. Contractor name
      c. Testing technician’s name
      d. Date measurements were obtained
      e. Cable identifier, strand number, and fiber type (e.g., “multimode”)
      f. Wavelength
      g. Measurement direction
      h. Full data set
      i. Curve
      j. Test equipment model and serial number(s)
   2. Measurements shall carry a precision through one significant decimal place, minimum.

SECTION 27 11 00 COMMUNICATIONS EQUIPMENT ROOMS

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes: Buildout / fit-up of communications equipment rooms.
B. Related Divisions and Sections
   1. Comply with the Related Sections paragraph of Section 27 00 00.
   2. Review Seismic Calculation requirements, specifically in Section 27 00 00, Article 1.05.
   3. Drawings, general provisions of the Agreement, and Division 01 apply to this Section.
   4. Consult other Divisions, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.

1.2 REFERENCES

A. Comply with the References requirements of Section 27 00 00.
B. In addition to those codes, standards, etc., list in Section 27 00 00, comply with the latest edition of the following applicable specifications and standards except as otherwise shown or specified:
   1. EIA/ECA-310-E, “Cabinets, Racks, Panels, and Associated Equipment”
   2. NFPA National Fire Protection Association (NFPA) 255 - Standard Method of Test of Surface Burning Characteristics of Building Materials

1.3 DEFINITIONS

A. Definitions as described in Section 27 00 00 shall apply to this section.
B. In addition to those Definitions of Section 27 00 00, the following list of terms as used in this specification defined as follows:
   1. “UPS”: Uninterruptible Power Supply – a system that provides conditioned power with batteries acting as a continuous power source for equipment during a utility power interruption

1.4 SYSTEM DESCRIPTION

A. General: Communications rooms shall fall into one of the following space titles:
   1. Building Distribution Facility
   2. Intermediate Distribution Facility

B. Room Functions:
   1. Building Distribution Facility (BDF) will serve the following functions:
a. House interbuilding twisted pair from the AA building and fiber optic from the Library backbone cabling, and house intrabuilding twisted pair and fiber optic backbone cabling to IDFs within the same building
b. House voice backbone crossconnect field and data backbone crossconnect field
c. House network equipment (i.e. distribution switches) serving the same building
d. Houses horizontal termination field, both voice and data, of devices served from this room (refer to floor plans for area served)
e. House network equipment (i.e. access switch) serving users of the room’s service area

2. Intermediate Distribution Facilities (IDF) will serve the following functions:
   a. House intrabuilding twisted pair and fiber optic backbone cabling from BDF
   b. House horizontal termination field – both voice and data – of outlets served from this room (refer to floor plans for area served)
   c. House network equipment (i.e. access switch) serving users of the room’s service area

C. Work Covered Under Other Sections
   1. Plywood backboards
   2. Bonding
   3. Grounding busbars
   4. Power and cooling
   5. Conduit, device boxes, and sleeves

D. Base Bid Work
   1. The Work under this section includes materials, accessories, fasteners, etc., and the labor and associated services required for the buildout / fit-up of telecommunications equipment rooms, and includes coordination through the General Contractor with other trades
   2. In general, the Work includes the following:
      a. Submittals
      b. Plywood backboards
      c. Rack bays (equipment racks, vertical management sections, anchoring)
      d. Cable, wire and patch cord management
      e. Overhead and vertical cable support
      f. IT Cabinets
      g. UPSs
      h. Seismic bracing
      i. Identification tags and labeling
      j. Record Documents
      k. Warranty

E. Coordination Requirements
   1. Electrical: Coordinate layout with electrical contractor to ensure proper placement of lighting, sequencing of power service to rack bay, and other issues related to electrical trade.
   2. Owner: Coordinate room-ready requirements and schedule with Owner (to allow Owner to plan and execute installation of OFOI telecommunications/network equipment). The contractor can’t bring up certain systems without the network so TRs need to be completed before those systems are brought up. TRs should be built-out with functioning lights, power, security, and climate control to be considered “ready”. 
1.5 SUBMITTALS
   A. Comply with the Submittal requirements of Section 27 00 00.
   B. Quantity: Furnish quantities of each submittal as noted in Section 27 00 00.
   C. Submittal Requirements at Start of Construction:
      1. Product Data Submittal
      2. Shop Drawings Submittal: Consisting of any proposed changes to room plans.
      3. Sample Submittal: Submit sample of equipment rack label.
      4. Schedule Submittal: Submit proposed schedule of work (this schedule may be combined with the schedule developed for Division 27).
   D. Submittal Requirements at Close Out:
      1. As-Built Drawings Submittal
   E. Substitutions
      1. Requests for substitutions shall conform to the general requirements and procedure outlined in Section 27 00 00.

1.6 QUALITY ASSURANCE
   A. Comply with Quality Assurance requirements of Section 27 00 00.

1.7 DELIVERY, STORAGE, AND HANDLING
   A. Comply with Delivery, Storage and Handling requirements of Section 27 00 00.

1.8 WARRANTY
   A. Warrant Work to perform as described within this Section for a period of 1 year. Correct deficiencies within 24 hours of notification.

PART 2 - PRODUCTS

2.1 SHEET HARDWOOD / PLYWOOD (AS BACKBOARD)
   A. A HP Grade A Type II (graded in accordance with AWI Premium)
   B. Materials shall comply with performance requirements in AWPA C27.
   C. The backboard must be 8’ x 4’ virgin plywood sheets, free from defects, and be fire rated.
   D. Fire-Retardant Treatment Processes: Plywood shall be chemically treated and pressure impregnated, capable of providing a maximum flame spread classification of 26-75 and a smoke density no greater than 450, in accordance with ASTM E 84.

2.2 FASTENERS, FOR PLYWOOD
   A. Bolts:
1. Bolts shall be steel and shall comply with ASTM A 307, Grade A (ASTM F 568M, Property Class 4.6).
2. Hex nuts and flat washers shall comply with ASTM A 563 (ASTM F 563M).

B. Concrete Anchors:
1. Expansion anchor bolt and sleeve assemblies shall have a capability to sustain, without failure, a load equal to 6 times the load imposed when installed in concrete as determined by testing per ASTM E 488 conducted by a qualified independent testing inspecting agency.
2. Materials:
   a. Carbon-steel components, zinc plated to comply with ASTM B 633 Class Fe/Zn 5
   b. Galvanized machine screws or bolts with standard expansion-shield type concrete anchors
3. Manufacturers:
   a. Phillips Drill Co. “Red Head” masonry anchors
   b. Wej-It Expansion Products Inc. “Wej-It” concrete anchors
   c. Or equal

2.3 EQUIPMENT RACK – 4-CHANNEL TYPE

A. Application: Suitable for the support of termination apparatus, cable and cord management apparatus, network equipment, and other similar equipment, within a telecommunications room.
B. Material: High strength, lightweight 6061-T6 aluminum, extrusion construction.
C. Channel:
   1. Size: 3” deep, with flanges on each side (“double sided”)
   2. Flange: 1.265” wide by 0.25” thick, with mounting holes
   4. Threading: #12-24 rolled, compatible with EIA-310
   5. RMU Markings: The RMU markings shall be permanently stamped on the ‘outside’ of both flanges on both channels.

D. Assembled Rack: Rack shall be complete with four mounting channels, two base angles (3.5” high by 6” deep by .375” thick), two top angles (1.5” high by 1.5” deep by .375” thick), a bottom ‘center pan’, and a top ‘center pan’. Assembled rack shall be <7’-0” high (overall)> <8’-0” high (overall)> by 19” mounting width (20.25” wide overall), 28” from front mounting plane to back mounting plane, and shall contain <45> <51> EIA mounting spaces (1.75”). Racks must have adequate spacing in front and back to be serviceable. Contractors should confirm placement with campus rep before permanent installation.
E. Load Rating: 1,000 lbs, when evenly distributed for the height of the rack.
F. Finish: Black, powder coat
G. Manufacturer:
   1. CPI
      a. #50120-703; 7’-0”H x 19” x 29”D 4-channel rack, 45 RMU, black
   2. Cooper B-Line
      a. #SB8301908430FB; 7’-0”H x 19” x 30”D 4-channel rack, 45 RMU, black
   3. Or equal
2.4 EQUIPMENT RACK – 2-CHANNEL TYPE

A. Application: Suitable for the support of termination apparatus, cable and cord management apparatus, network equipment, and other similar equipment, within a telecommunications room.
B. Material: High strength, lightweight 6061-T6 aluminum, extrusion construction.
C. Channel:
   1. Size: 3” deep, with flanges on each side (“double sided”)
   2. Flange: 1.265” wide by 0.25” thick, with mounting holes
   4. Threading: #12-24 rolled, compatible with EIA-310
   5. RMU Markings: The RMU markings shall be permanently stamped on the ‘outside’ of both flanges on both channels.
D. Assembled Rack: Rack shall be complete with two mounting channels, two base angles (3.5” high by 6” deep by .375” thick), two top angles (1.5” high by 1.5” deep by .375” thick), and hardware. Assembled rack shall be 7’-0” high (overall by 19” mounting width (20.25” wide overall) and shall contain 45 EIA mounting spaces (1.75”). Racks must have adequate spacing in front and back to be serviceable. Contractors should confirm placement with campus rep before permanent installation.
E. Load Rating: 1,500 lbs when evenly distributed for the height of the rack.
F. Finish: Black, powder coat
G. Manufacturer:
   1. CPI
      a. #46353-703; 7’-0”H x 19” 2-channel equipment rack, 45 RMU, black
      b. #55053-703; 7’-0”H x 19” equipment rack, black
   2. Cooper B-Line
      a. #SB556084XUF; 7’-0”H x 19” equipment rack, black
   3. Or equal

2.5 SEISMIC GUSSET, FOR 2-CHANNEL EQUIPMENT RACK

A. Application: Seismic gusset kit for stiffening and stabilization of critical joints in equipment racks.
B. Manufacturer:
   1. CPI
      a. #11592-701; gusset kit, black
   2. Cooper B-Line
      a. #SB556 GUSSET KIT FB; gusset kit, black
   3. Or equal

2.6 VERTICAL MANAGEMENT SECTIONS

A. Application: Suitable for cable routing, cord routing, and cord slack storage vertically (between the top and bottom) within a rack bay.
B. The vertical management section shall be double-sided (i.e., the management section having covered cable guides on the front and flip-retainers on the rear).
C. Size & Capacity: Refer to the Drawings for sizes and configurations.
D. Mounting: The vertical management section having matching bolt holes for attachment to the rack.
E. Color: black (guides and cover).
F. Manufacturer:
   1. CPI
      a. #11729-703; vertical management section, 7’-0” x 6”, double sided, black
      b. #30162-703; 7’-0”H x 6"W, “CCS” double sided, black
      c. #40095-703; 7’-0”H x 6"W, “MCS-EFX” double sided, extended depth, black
   2. Cooper / B-Line
      a. #SB57166D084FB; 7’-0”H x 6"W, double sided, black
      b. #SB86086D084FB; 7’-0”H x 6"W, double sided, black
   3. Panduit
      a. #WMPVHC45E; vertical manager, 7’ x 6.7"W x 13.8”D, double sided, black
   4. Or equal

2.7 HORIZONTAL MANAGEMENT PANEL

A. Application: Suitable for installation into equipment rack for horizontal cord management. The horizontal management panel shall match (and fully integrate with) the vertical management sections.
B. The horizontal management panel shall be single-sided.
C. Size: 1U or 2U high (refer to Drawings) by 19” mounting wide.
D. Color: black (guides and cover).
E. Manufacturer:
   1. CPI
      a. #30139-719; horizontal management panel, single sided, 1U, black
      b. #30130-719; horizontal management panel, single sided, 2U, black
   2. Cooper / B-Line
      a. #SB87019S1FB; horizontal management panel, single sided, 1U, black
      b. #SB87019S2FB; horizontal management panel, single sided, 2U, black
   3. Panduit
      a. #NCMH2; horizontal cable manager with removable hinged front cover, double sided, 2U
      b. #NCMHF1; horizontal cable manager, single sided, 1U
   4. Or equal

2.8 CABLE RUNWAY

A. Cable Runway Straight Sections
   1. Application: Suitable for the support & management of telecommunications (and other low voltage) cables, either overhead or mounted vertically on a wall, within Telecommunications Room. Also overhead equipment rack bracing.
3. Material (both stringer and rung): Steel tube, rectangular, 1-1/2" by 3/8" by 0.65" wall thickness.
4. Size: 9' 11-1/2" straight sections; width: refer to Drawings.
5. Manufacturers:
   a. CPI
      1) #10250-718; 18"W cable runway, black
   b. Cooper / B-Line
      1) #SB17U18BFB; 18"W cable runway, black
   c. Or equal

B. Cable Runway Sweep Fittings
1. Application: Suitable for the support & management of telecommunications cables, overhead.
2. Material (both stringer and rung): Steel tube, rectangular, 1-1/2" by 3/8" by 0.65" wall thickness.
3. Manufacturer:
   a. CPI
      1) #10822-718; horizontal sweep fitting for 18" wide cable runway, black
      2) #10723-718; vertical outside sweep fitting for 18" wide cable runway, black
      3) #10724-718; vertical inside sweep fitting for 18" wide cable runway, black
   b. Cooper / B-Line
      1) #SB131890HB12FB; horizontal sweep fitting for 18" wide cable runway, black
      2) #SB131890VO12FB; vertical outside sweep fitting for 18" wide cable runway, black
      3) #SB131890VI12FB; vertical inside sweep fitting for 18" wide cable runway, black
   c. Or equal

C. Cable Runway Installation Accessories
1. Application: Installation accessories for use with cable runway.
2. Refer to Drawings for additional information and instances for installation.
3. Manufacturer:
   a. CPI
      1) #11301-001; butt splice kit
      2) #10487-001; swivel butt splice kit
      3) #11313-001; 45-degree junction kit
      4) #11314-001; 90-degree junction kit
      5) #11302-001; junction splice ("T") kit
      6) #10488-001; swivel junction splice ("T") kit
      7) #10608-001; vertical wall bracket kit
      8) #10642-001; end caps
      9) #11421-718; wall angle support kit for 18" wide cable runway, black
     10) #11312-718; triangle support kit for 12" and 18" wide cable runway, black
     11) #11770-718; end closing kit for 18" wide cable runway, black
     12) #10595-718; rack-to-runway attachment kit, for 18" wide runway, black
   b. Cooper / B-Line
      1) #SB6699¾x10½; grounding strap
      2) #SB2107BZ; butt splice kit, black
2.9 LABEL PLATES, FOR EQUIPMENT RACKS

A. Label plate shall be suitable to affix onto top angle of equipment rack or onto the top front of a frame/cabinet.
B. Label plate shall be ‘engrave-able’ stock melamine plastic laminate substrate.
C. Size (minimum): 1/2-inch high by 6 inches long by 1/16-inch thick.
D. Color: Black.
E. Lettering shall be white, engraved, 1/8-inch high.

PART 3 - EXECUTION

3.1 GENERAL

A. Comply with the Execution requirements of Section 27 00 00.

3.2 EXAMINATION AND PREPARATION

A. Prior to installation, verify equipment rooms are suitable for the construction scope of this section. Schedule work to prevent damage caused by other trades during the course of that other construction.
B. Prepare surfaces, such as floors, for permanent installation of products, such as racks.

3.3 INSTALLATION

A. Plywood Backboards
   1. General
      a. Complete installation work in a neat, high quality manner and conform to all applicable federal, state and local codes, and all telephone standards.
      b. Replace or repair work completed by others that is defaced or destroyed by Work associated with installation of the plywood backboards. Contractor shall pay for the full cost of this repair/replacement.
c. Obtain written authorization from the General Contractor at least one week in advance of any drilling that may produce dust or particles in the air such as seismic anchorage into concrete sub-floor (so, for example, the Fire Protection System may be deactivated during such drilling).

2. Preparation
   a. Condition wood materials to average prevailing humidity conditions in installation areas prior to installing.
   b. Discard all units of material with defects that impair quality of carpentry and that are too small to use with minimum number of joints or optimum joint arrangement.

3. Plywood
   a. Install plywood in accordance with WIC Custom or Premium Quality Standard, as scheduled. Ensure work complies with applicable codes and recognized standards.
   b. Install plywood as indicated on Drawings to the dimensions shown. In lieu of no dimensions, install plywood from +0'-6" to +8'-6" above the finished floor.
   c. Install plywood plumb, level, true, and straight with no distortions. Shim as required using concealed shims.
   d. Trim plywood around electrical and telecommunications outlets.
   e. Install plywood such that the fire rating stamp is visible.
   f. Install plywood on all walls of TR not just ones designed to receive equipment.
   g. Install plywood to a tolerance of 1/8 inch in 8 feet for plumb and level; and with 1/16 inch maximum offset in flush adjoining, 1/8 inch maximum offsets in revealed adjoining surfaces.

4. Fasteners
   a. Install plywood using bolts, concrete anchors, or other fasteners suitable for the purpose.
   b. Provide nails, screws, anchors and other anchoring devices of the type, size, material, and finish required for application/mounting substrate.
   c. Do not use aluminum fasteners.
   d. Countersink fastener heads on exposed carpentry work and fill holes with wood filler.

5. Painting
   a. Paint plywood backboards with a low-gloss, white (or similar bright color) paint.
   b. Mask the plywood’s fire rated symbol/stamp from the paint such that the symbol/stamp is still visible after painting.

6. Cleaning, Finishing, and Protection
   a. Cleaning: Clean finish carpentry work on exposed and semi-exposed surfaces. Touch-up shop-applied finishes to restore damaged or soiled areas.
   b. Protection: Protect and maintain protection to ensure work will be without damage or deteriorating at time of acceptance.

B. Rack Bays

1. Equipment Racks
   a. Provide parts and accessories required to complete each rack. Completely assemble racks, according to manufacturer’s instructions.
   b. Anchoring/Bracing
      1) Use concrete anchors approved by structural engineer.
      2) Anchor racks to the structural floor at four points.
3) Brace racks overhead to overhead cable support where shown on the Drawings.

4) If required for seismic bracing, provide bracing devices (e.g., brackets, threaded rod with strut, etc.) attached to the wall or structure above using appropriate fasteners.

5) Racks must have adequate spacing in front and back to be serviceable. Contractors should confirm placement with campus rep before permanent installation.

2. Vertical Management Sections
   a. Provide vertical management sections as shown on Drawings. If not shown, provide a default of one vertical management section between each rack and at either end of the bay.
   b. Bolt vertical management sections to the equipment racks at the points designed by the manufacturer and per the manufacturer’s installation instructions.

3. Tolerances:
   a. Equipment Rack: Verify dimensions to establish proper clearances as follows:
      1) Front: 40” clearance from channel’s front mounting flange.
      2) Back: 57” clearance from channel’s back mounting flange.
   b. Provide the correct amount of space between each rack for proper installation (according to manufacturer’s written instructions) of the vertical management sections.

4. Horizontal Management Panels
   a. Provide horizontal management panels as shown on Drawings. If not shown, provide one management panel above each patch panel and one below the bottom patch panel in each rack bay where patch panels occur.
   b. Provide fasteners and parts required to complete the installation.

5. Accessories
   a. Provide rack mounting screws – 1 bag of screws per rack, as come packaged with the rack product. Attach the screws directly to the rack (visible for the punch walk). This shall constitute turn-over to the Owner.

C. Overhead Cable Support
   1. Provide support devices (e.g., brackets and threaded rod with strut) for overhead cable management system; install per the manufacturer’s instructions and fastened to the wall or ceiling using appropriate fasteners.
   2. Provide parts required for complete installation (e.g., mounting brackets, splice kits, hardware, etc.).
   3. Tolerances
      a. Install overhead cable support centered over the equipment rack, or as shown on the Drawings.
   4. Interface with Other Work: Coordinate the installation of the overhead cable support with other trades. Trapeze supports and ‘hanger rods’ (“all-thread”), for example, may be shared to lower overall construction cost.

D. Vertical Cable Support
   1. Provide cable runway installed vertically at the locations as shown on the Drawings for use to support cables routing vertically within telecommunications rooms.
2. Provide parts required for complete installation (e.g., vertical mounting brackets, bolts, etc.).
3. When using cable runway, install the runway such that the rungs are facing outward (the greater distance from the rung to the stringer edge is facing inward).

3.4 LABELING

A. General Requirements: Labeling and identifier assignment shall conform to ANSI/TIA-606-B and as approved by Owner before installation.
B. Equipment Rack Label Requirements: Provide one label plate per rack and IT cabinet. Permanently affix label plate and position as shown on the Drawings; if not shown on the Drawings, center the label plate on the rack’s front top angle or the cabinet’s top front frame.
C. Identifier Assignment
   1. Equipment Racks and IT Cabinets
      a. Prefix: “RACK” or “CABINET”
      b. First field: the room’s identifier; for example: “TR2.1”.
      c. Second field: the rack number (sequential numeral); for example: “01”.
      d. Example; “RACK TR2.1-01”

3.5 FINAL INSPECTION AND CERTIFICATION

A. Punch the Work of this Section compliant to the requirements of Section 27 00 00.
B. Comply with system acceptance and certification requirements of Section 27 00 00.

END OF SECTION
 SECTION 27 13 13 COMMUNICATIONS BACKBONE ISP TWISTED PAIR CABLING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes: Backbone ISP (inside plant/indoor) twisted pair cabling.
B. Related Sections
   1. Comply with the Related Sections requirements of Section 27 00 00.
   2. Section 27 05 26, “Communications Grounding and Bonding”
   3. Section 27 08 11, “Communications Twisted Pair Testing”

1.2 REFERENCES

A. Comply with References requirements of Section 27 00 00.
B. In addition to the codes and standards listed in Section 27 00 00, comply with the latest edition of the following applicable specifications and standards except as otherwise shown or specified:
   1. National Fire Protection Agency (NFPA)
   2. Underwriters Laboratories (UL): Applicable listing and ratings, including but not limited to the following standards:
      a. UL 444, “Communications Cables”
      b. UL 497, “Protectors for Paired-Conductor Communication Circuits”
      c. UL 497A, “Secondary Protectors for Communications Circuits”
      d. UL 497B, “Protectors for Data Communications and Fire-Alarm Circuits”
      e. UL 497C, “Protectors for Coaxial Communications Circuits”
      f. UL 1581, “Reference Standard for Electrical Wires, Cables, and Flexible Cords”
      g. UL 1666, “Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts”
      h. UL 1863, “Communications-Circuit Accessories”
   3. Insulated Cable Engineers Association (ICEA)
      a. ANSI/ICEA S-90-661-2008, “Category 3, 5, and 5e Individually Unshielded Twisted Pair Indoor Cable for Use In General Purpose and LAN Communication Wiring Systems”
   4. Telcordia
      a. GR-111, “Generic Requirements for Thermoplastic Insulated Riser Cable”

1.3 DEFINITIONS
A. Refer to Section 27 00 00 for Definitions.
B. In addition to those Definitions of Section 27 00 00, the following list of terms as used in this specification defined as follows:

1. “ALVYN”: sheath type consisting of corrugated polymer-coated aluminum shield with and adhered flame retardant jacket
2. “ARMM”: Bell system cable type (shielded riser)
3. “CMP”: Communications Media Plenum [NEC plenum rating]
4. “CMR”: Communications Media Riser [NEC riser/non-plenum rating]
5. “ISP”: Inside Plant [cabling]
6. “PE”: Polyethylene
7. “PIC”: Plastic Insulated Conductor
8. “PVC”: Polyvinyl Chloride
9. “PVDF”: Polyvinylidene fluoride

1.4 SYSTEM DESCRIPTION

A. Work Covered Under Other Sections

1. Pathways: The communications pathways (backbone conduits, riser sleeves, basketway, cable tray, etc.) work will be covered under another Section. Refer to the Drawings for size/capacity and route information.
2. Rooms: Build out (e.g., backboards, overhead and vertical cable runway, etc.) of the rooms (BDF, IDFs) will be covered under another Section. Refer to the Drawings for build out information.

B. Base Bid Work

1. Provide engineering, labor, materials, apparatus, tools, equipment, and transportation required to make a complete working telecommunications backbone twisted pair cabling system installation described in these specifications and shown on related Drawings.
2. The Drawings are diagrammatic in nature, and require shop drawings to complete the detailed design of the telecommunications infrastructure.
3. Consider backbone cabling shown on the Drawings as base bid work, unless otherwise noted. This includes terminations at both ends.
4. In general, the base bid work includes:
   a. Submittals
   b. Backbone inside plant (riser) twisted pair (copper) cables and termination apparatus
   c. Bonding (cable shield, termination apparatus, etc)
   d. Cable management
   e. Crossconnects
   f. Cable identification tags and system labeling
   g. Record Documents
   h. Warranty

1.5 SUBMITTALS

A. Comply with Submittal procedural, quantity, and format requirements of Section 27 00 00.
B. Submittal Requirements Prior To Start Of Construction:

1. Product Data Submittal, indicating conformance with NEC, UL, TIA/EIA listings, certifications and specifications.
2. Schedule Submittal, consisting of proposed schedule of work. This schedule may be combined with the schedule developed for Division 27.
3. Shop Drawings Submittal, consisting of proposed changes to cable routing, or termination locations/configurations.

C. Submittal Requirements at Closeout:
   1. As-Built Drawings
   2. Crossconnection records/cut sheets
   3. O & M Manuals

D. Substitutions
   1. Requests for substitutions shall conform to the general requirements and procedure outlined in Section 27 00 00.

1.6 QUALITY ASSURANCE
   A. Comply with Quality Assurance requirements of Section 27 00 00.
   B. Contractor Qualifications
      1. In addition to the Contractor Qualifications requirements of Section 27 00 00, the Contractor shall be manufacturer certified to install the proposed and submitted cabling system and to provide an extended warranty. Provide satisfactory evidence of certification in the form of a current letter or certificate from the manufacturer as part of the bid submission.

1.7 DELIVERY, STORAGE, AND HANDLING
   A. Comply with Delivery, Storage and Handling requirements of Section 27 00 00.

1.8 WARRANTY
   A. The telecommunications cabling system, as specified in this section, shall carry a 15-year (minimum) extended system warranty. This extended warranty shall cover parts and labor for the duration of the extended warranty. This extended warranty shall also cover electrical performance of cabling system to the specific category per ANSI/TIA/EIA-568-B performance criteria for backbone cabling.

PART 2 - PRODUCTS

2.1 MANUFACTURERS
   A. CommScope SYSTIMAX (substitutions allowed)

2.2 UNSHIELDED TWISTED PAIR CABLES – NON-PLENUM
   A. Application:
1. Cable suitable for indoor installation, between floors in vertical riser system, under access flooring, and through overhead ceiling space (in cable tray, conduit, & hangers).
2. Each and every cable run shall be a continuous single cable, homogenous in nature. Splices are not permitted anywhere.
3. Twisted pair PIC type, air core cable.

B. Conductors:
1. Annealed solid copper, 24 AWG
2. Fully insulated, consisting of a flame-retardant PVC or other thermoplastic.
3. Conductors twisted into pairs are stranded into 25-pair bundles and into units.

C. Core & Sheath:
1. Cable sheath shall consist of an overall flame-retardant PVC, or equivalent, jacket.
2. NEC rated as CMR and UL listed as such.

D. Performance:
1. Electrical performance of the twisted pairs and overall cable that complies with TIA/EIA-568-A requirements for Category 3 UTP cabling.

E. Manufacturers:
1. CommScope SYSTIMAX
   a. #1010 025AGY R1000 (106824329); 25 pair, 24 AWG, gray, CMR rated
2. BerkTek
   a. #10032396; 25 pair, 24 AWG, gray, CMR rated
3. General Cable
   a. #2133033; 25 pair, 24 AWG, gray, CMR rated

2.3 TERMINATION APPARATUS – “110 BLOCK” TYPE

A. Application:
1. Termination apparatus shall be “110 block” type.
2. Termination apparatus shall be suitable for installation within a telecommunication facility for the termination of the backbone twisted pair cables specified within this Section.
3. Termination apparatus shall be vertically oriented and suitable for wall-mount and/or rack-mount installations.
4. Termination should be in the TR racks in rj-45 patch panels. The 75 pair cable should connect to the AA building. Label pairs using campus pair count.
5. Termination apparatus, accompanied by the quantity of management panels, shall provide for both horizontal and vertical routing of cords and crossconnect wires, as shown on the drawings.

B. Manufacturer:
1. CommScope SYSTIMAX
   a. #110PA2-300FT; 110 Block kit, 300 pair, 5-pair based
   b. #188D3; vertical management panel for 300-pr block
2. **Panduit**
   a. P110KT3005Y; 110 Block kit, 300 pair, 5-pair based
   b. P110VCM300; vertical management panel for 300-Pr kit
   c. P110TB300Y; rack mounting bracket for 300-Pr kit
   d. P110TB900Y; rack mounting bracket for 300-Pr kit
   e. P110VCM; horizontal management panel

2.4 **TERMINATION APPARATUS – CAT5E PATCH PANEL, PUNCH DOWN TYPE**

A. **Application:** Patch panels shall be suitable for installation within a TR for the termination of the horizontal cables specified herein. Panels shall be horizontally oriented for a rack-mounted configuration. Panels shall be capable of supporting, organizing, labeling and patching/crossconnecting between the horizontal termination field and the equipment termination field.

B. **Patch panel shall have punch down type termination (general 110-type), and shall be compatible with the specified horizontal cables both electrically and physically.**

C. **Mechanical Performance:** Each port shall be an 8-position modular jack, compliant to ANSI/TIA-568.

D. **Electrical Performance:** Each port shall meet or exceed TIA-568 standard series and ISO/IEC 11801 requirements for CAT5E U/UTP cabling through the cable termination and patch cord connection.

E. **Manufacturer, or equal:**
   1. Belden “IBDN System 1200” “HD” Patch Panels. CAT5E
      a. AX103258; “HD” flat patch panel, 1U, 110 termination, 24 CAT5E ports
   2. CommScope SYSTIMAX “PowerSUM” Series
      a. 1100-U-PS-24; flat patch panel “PowerSUM”, 24 CAT5E ports
      b. 1100A-U-PS-24; angled patch panel “PowerSUM”, 24 CAT5E ports
   3. Leviton 110-Style Patch Panels
      a. 5G596-L24; flat patch panel, 1U, top lensed labeling, 24 CAT5E ports
      b. 5G596-U24; flat patch panel, 1U, top labeling, 24 CAT5E ports
   4. Panduit
      a. DP245E88TGY; “DP5e” flat patch panel, 24 CAT5E ports
      b. DPA245E88TGY; “DP5e” angled patch panel, 24 CAT5E ports

2.5 **CROSSCONNECT WIRE**

A. Crossconnect wire shall be suitable for installation within a telecommunication facility and fully compatible with the termination apparatus specified within this Section.
B. Crossconnect wire shall be manufactured from a single, continuous length of insulated wire, homogenous in nature. Splices are not permitted anywhere. Factory splices of insulated conductors are expressly prohibited.

C. Conductors:
   1. Conductors: 24 AWG solid copper
   2. Insulation: fully insulated conductors with a flame retardant thermoplastic (such as PVC, or equivalent)
   3. Twisted Pairs: Two insulated conductors “twisted” into a “pair” (twisted pair), individually color-coded.

D. Manufacturer:
   1. Belden B-Plus Crossconnect Wire
      a. #22208250; crossconnect wire, 1 pair, Wh/Bi
      b. #22208253; crossconnect wire, 1 pair, Wh/Bi, spool
      c. #22208260; crossconnect wire, 2 pair, Wh/Bi/Wh/Or
      d. #22208266; crossconnect wire, 3 pair, Wh/Bi/Wh/Or/Wh/Gr
      e. #22208270; crossconnect wire, 4 pair, Wh/Bi/Wh/Or/Wh/Gr/Wh/Br
   2. CommScope SYSTIMAX
      a. #CCW-F 1/24 S1000; crossconnect wire, 1 pair, Whi-Red / Red-Whi
      b. #CCW-F 1/24 S1000; crossconnect wire, 1 pair, Whi-Blu / Blu-Whi
   3. General
      a. #7023864; crossconnect wire, 1 pair, Red-Whi / Whi-Red
      b. #2114385; crossconnect wire, 1 pair, Red-Yel / Yel-Red
      c. #2114200; crossconnect wire, 1 pair, Red-Grn / Grn-Red
      d. #2114369; crossconnect wire, 1 pair, Red-Blu / Blu-Red
      e. #7023708; crossconnect wire, 1 pair, Red-Blk / Blk-Red
      f. #7041916; crossconnect wire, 1 pair, Blk-Yel / Yel-Blk
      g. #7023733; crossconnect wire, 1 pair, Org-Whi / Whi-Org
      h. #7023781; crossconnect wire, 1 pair, Grn-Whi / Whi-Grn
      i. #7036759; crossconnect wire, 1 pair, Blk-Whi / Whi-Blk
      j. #7023716; crossconnect wire, 2 pair, Blk-Whi/Whi-Blk // Org-Whi/Whi-Org
      k. #2114363; crossconnect wire, 1 pair, Whi-Org / Org-Whi
      l. #2114364; crossconnect wire, 1 pair, Whi-Grn / Grn-Whi
   4. Superior Essex
      a. #12-101-13; crossconnect wire, 1 pair, Red-Whi
      b. #12-102-13; crossconnect wire, 1 pair, Red-Yel
      c. #12-103-13; crossconnect wire, 1 pair, Whi-Blu
      d. #12-104-13; crossconnect wire, 1 pair, Vic-Blu
      e. #102-105-13; crossconnect wire, 1 pair, Blk-Whi
   5. Or equal

2.6 LABELS

A. Labels shall be machine printable with a laser printer, ink jet printer, thermal transfer printer, or hand-held printer.

B. Labels for Cables
   1. Labels shall be adhesive-backed and have a self-laminating feature
2. Labels shall fit the backbone cables listed above (i.e., shall fully wrap around the cable’s jacket).
3. Printable area should be 1 inch wide x 0.5 inch high, or larger
4. Printable area color shall be white
5. Manufacturer:
   a. Panduit
      1) #S200X400YAJ; labels for 25 to 100 pair cables [0.32” (8.09mm) - 0.95” (24.26mm) dia.]
      2) #S200X650YAJ; labels for 100 to 400 pair cables [0.48” (12.13mm) – 1.59” (40.43mm) dia.]
   b. Or equal

C. Termination Apparatus Labels
1. Labels shall be adhesive backed
2. Printable area color shall be white for backbone termination field and gray for ’2nd level’ backbone termination field
3. Manufacturer:
   a. CommScope SYSTIMAX
      1) #110WA2-4500L; 5-pair marked label inserts, white
   b. Panduit
      1) #DSL110; label inserts, white
   c. Or equal

PART 3 - EXECUTION

3.1 GENERAL
   A. Comply with the Execution requirements of Section 27 00 00.

3.2 EXAMINATION AND PREPARATION
   A. Rooms: Prior to installation, verify equipment rooms are suitable to accept the backbone twisted pair cables and terminations.
   B. Pathways: Prior to installation verify that pathways and supporting devices, provided under other sections, are properly installed, and that temporary supports, devices, etc., have been removed. Verify dimensions of pathways, including length (for example, “True Tape” the conduits).
   C. Cable Integrity: Prior to installation, verify the twisted pair cable is fully operational – both cable sheath and twisted pair conductors. Documentation of pre-installation testing is not a close out requirement, and is the responsibility of the Contractor.

3.3 INSTALLATION
   A. Backbone Cable Installation and Routing
      1. Cable runs shall have continuous sheath continuity, homogenous in nature. Splices are not permitted anywhere.
2. Maximum cable length of 500 meters from the termination within the MDF to the termination in Telecommunications Room.

3. Placement
   a. Place cables within designated pathways.
   b. Maintain a minimum bend radius of 6 times the cable diameter during and after installation.
   c. Maintain pulling tension within manufacturer’s limits.
   d. Place and suspend cables in a manner to protect them from physical interference or damage. Place cables with no kinks, twists, or impact damage to the sheath. Replace cables if damaged during installation.
   e. Place a pull rope along with cables where run in conduit and spare capacity still exists in the conduit. Tie off ends of the pull rope.

4. Routing
   a. When routing horizontally within telecommunications rooms, utilize the overhead cable support. When routing vertically within telecommunications rooms, utilize the vertical cable support and provide cable ties every 24 inches on center using.
   b. Route cables a minimum of 6” away from power sources to reduce interference from EMI.

5. Termination
   a. Provide 15 feet cable slack loop at each end of the run. Store slack in overhead cable support or as noted on Drawings.
   b. Properly relieve strain from cables at termination points per manufacturer’s instructions.
   c. Terminate twisted pairs onto the termination apparatus in accordance with manufacturer’s latest instructions and TIA/EIA-568-B standard installation practices.
   d. Bond cable shield – refer to section 27 05 26 for additional information. Provide shield bonding connector and either bonding braid or TBC to either termination apparatus ground block or directly to busbar.
   e. Perform post-installation testing as described in section 27 08 11.

B. Termination Apparatus
   1. Provide accessories required for a complete installation.
   2. Terminate cables and twisted pairs in accordance with manufacturer’s latest installation requirements and TIA-568 series standard installation practices. Terminate cable pairs onto the termination apparatus. Terminate twisted pairs compliant to TIA-568 series standards and wired per 1.04 System Description.
   3. Install the termination apparatus to the dimensions shown on the Drawings. If the dimensions are not shown, install the termination apparatus such that the bottom row of terminations is no lower than 24 inches (+/- 3”) AFF and the top row of terminations is no higher than 60 inches (+/- 3”) AFF.
   4. Mount termination apparatus plumb and square.
   5. Bond termination apparatus to grounding point (busbar) – refer to section 27 05 26 for additional information.

C. Patch Panels and Horizontal Management Panels
   1. Quantity: Provide patch panels to support termination of cables. Provide horizontal management panels based on the quantity of patch panels.
   2. Install and assemble discrete port patch panels and horizontal management panels according to the manufacturer’s instructions.
3. Install the patch panels and the horizontal management panels as shown on the contract drawings. If configuration is not shown, install the patch panels in association with the horizontal management panels such that a management panel is mounted above and below given patch panel.

D. Crossconnects
   1. In the BDF, provide one 1-pair crossconnect to length from the equipment field to the backbone field based on the records from the IDF crossconnections.
   2. Utilize the horizontal and vertical management components to properly route the crossconnect wire.
   3. Color:
      a. For digital handsets, provide: White-Blue / Blue-White
      b. For analog handsets, provide: White-Red / Red-White
   4. Splices in crossconnect wire are prohibited.

3.4 LABELING

A. General Requirements
   1. Labeling and identifier assignment and the label colors shall conform to the TIA/EIA-606-A Administration Standard and as approved by Owner or Owner’s Representative before installation.
   2. Provide permanent and machine-generated labels; hand written labels will not be accepted.

B. Cable Labels
   1. Label Format:
      a. Label type shall be wrap-around self-laminating.
      b. Label color shall be white background with clear laminating window.
      c. Text color shall be black; text height shall be 1/8" high, minimum, or #12 font size.
   2. Provide labels on both ends of cables. Fully wrap label around the cable jacket. Install labels no more than 4 inches from the edge of the cable jacket. Install labels such that they are visible by a technician from a normal stance.

C. Termination Apparatus Labels
   1. Use labels included in the product packaging. For substitutions, request approval by the Engineer.
   2. Label color shall be white for respective field type, per TIA/EIA-606-A.
   3. Text color shall be black, 3/32" high, minimum, or #10 font size.

D. Identifier Assignment
   1. General: Separate label fields of the identifier with a hyphen.
   2. Backbone ISP Twisted Pair Cables
      a. Refer to drawings.
   3. Termination Positions at the 110 Termination Blocks
      a. The first field shall identify the origination / destination room; for example “TO IDF2.2”.
      b. The second field shall identify the pair count range; for example, “0401-0450”
c. Identifier Example: “TO IDF2.2 0401 - 0450”.

3.5 FINAL INSPECTION AND CERTIFICATION

A. Punch the Work of this Section compliant to the requirements of Section 27 00 00.
B. Remove and replace with new, at no cost to the Owner, cables or conductors failing to meet the indicated standards and not passing the testing requirements of Section 27 08 11. The Owner, or Owner’s Representative, will not accept the installation until testing has indicated a 100% availability of all cables and conductors or the Owner or Owner’s Representative has approved any deviation from this requirement.
C. Comply with system acceptance and certification requirements of Section 27 00 00.

END OF SECTION
SECTION 27 13 14 COMMUNICATIONS BACKBONE OSP TWISTED PAIR CABLING

PART 1 - GENERAL

1.1 SUMMARY
A. Section Includes: Backbone OSP (outside plant) twisted pair cabling.
B. Related Sections
   1. Comply with the Related Sections requirements of Section 27 00 00.
   2. Section 27 08 11, “Communications Twisted Pair Testing”

1.2 REFERENCES
A. Comply with References requirements of Section 27 00 00.
B. In addition to the codes and standards listed in Section 27 00 00, comply with the latest edition of the following applicable specifications and standards except as otherwise shown or specified:
   1. Underwriters Laboratories (UL): Applicable listing and ratings, including but not limited to the following standards:
      a. UL 497, “Protectors for Paired-Conductor Communication Circuits”
      b. UL 497A, “Secondary Protectors for Communications Circuits”
      c. UL 497B, “Protectors for Data Communications and Fire-Alarm Circuits”
      d. UL 497C, “Protectors for Coaxial Communications Circuits”
      e. UL 1863, “Communications-Circuit Accessories”
      f. UL 1863, “Communications-Circuit Accessories”
   2. Insulated Cable Engineers Association (ICEA)
   3. Telcordia
      a. GR-421-CORE Issue 2, “Generic Requirements for Metallic Telecommunications Cables”

1.3 DEFINITIONS
A. Refer to Section 27 00 00 for Definitions.
B. In addition, define the following list of terms as used in this specification as follows:
   1. “BEP”: Building Entrance Protection [systems]
   2. “CMP”: Communications Media Plenum [NEC plenum rating]
   3. “CMR”: Communications Media Riser [NEC riser/non-plenum rating]
   4. “HDPE”: High Density Polyethylene
   5. “ISP”: Inside Plant [cabling]
   6. “LDPE”: Light Density Polyethylene
   7. “OSP”: Outside Plant [cabling]
   8. “PE”: Polyethylene
9. “PIC”: Plastic Insulated Conductor
10. “PVC”: Polyvinyl Chloride

1.4 SYSTEM DESCRIPTION

A. Work Provided Under Other Sections
   1. Telecommunications Pathways
      a. Pathways (underground conduits, maintenance holes, pull boxes, pull ropes, etc.) will be provided under other Sections.
      b. Refer to the Drawings for size/capacity and route information.
   2. Telecommunications Rooms
      a. Buildout (e.g., backboards, overhead and vertical cable runway, etc.) of the telecommunications rooms (BDFs, IDF) work will be covered under another Section.
      b. Refer to the Drawings for buildout information.

B. Base Bid Work
   1. Provide engineering, labor, materials, apparatus, tools, equipment, and transportation required to make a complete working telecommunications backbone twisted pair cabling system installation described in these specifications and shown on related Drawings.
   2. The Drawings are diagrammatic in nature, and require shop drawings to complete the detailed design of the communications infrastructure.
   3. Consider Backbone cabling as shown on Drawings as base bid work, unless otherwise noted. This includes terminations at both ends.
   4. In general, the base bid work includes:
      a. Submittals
      b. Backbone outside plant (interbuilding) twisted pair (copper) cables and terminations
      c. Building entrance protection and terminal
      d. Splicing apparatus
      e. Cable management
      f. Crossconnects
      g. Cable identification tags and system labeling
      h. Record Documents
      i. Warranty

1.5 SUBMITTALS

A. Comply with Submittal procedural, quantity, and format requirements of Section 270000.
B. Submittal Requirements Prior To Start Of Construction:
   1. Product Data Submittal, indicating conformance with NEC, UL, TIA/EIA listings, certifications and specifications.
   2. Sample Submittal, consisting of the following components:
   3. Schedule Submittal, consisting of proposed schedule of Work. This schedule may be combined with the schedule developed for other Sections within Division 27.
   4. Shop Drawings Submittal, consisting of proposed changes to cable routing, or termination locations/configurations.

C. Submittal Requirements at Closeout:
1. As-Built Drawings.
2. Crossconnection records/cut sheets.
3. O & M Manuals.

1.6 QUALITY ASSURANCE

A. Comply with Quality Assurance requirements of Section 270000.
B. Contractor Qualifications
   1. In addition to the Contractor Qualifications requirements of Section 270000, the Contractor shall be manufacturer certified to install the proposed and submitted cabling system and to provide an extended warranty. Provide satisfactory evidence of certification in the form of a current letter or certificate from the manufacturer as part of the bid submission.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Comply with Delivery, Storage and Handling requirements of Section 27 00 00.

1.8 WARRANTY

A. The communications cabling system, as specified in this Section, shall carry a 15-year (minimum) extended system warranty. This extended warranty shall cover parts and labor for the duration of the extended warranty. This extended warranty shall also cover electrical performance of cabling system to the specific category per ANSI/TIA-568-C performance criteria for backbone cabling.

PART 2 - PRODUCTS

2.1 UNDERGROUND CABLES – DUCT/CONDUIT

A. Application:
   1. Cable shall be suitable for underground conduit installations.
   2. Each and every cable run shall be a continuous single cable, homogenous in nature. Splices are not permitted anywhere.
   3. Cable type shall be PIC twisted pair, filled core, with an “ALPETH” sheath and compatible with Bell System type “ANAA” or RDUP type “PE89-AL”.

B. Conductors:
   1. Solid, annealed copper, 22 AWG
   2. Fully insulated conductors consisting of an inner layer of expanded polyolefin, covered with an outer layer (skin) of solid polyolefin
   3. Conductors twisted into pairs. Twisted pairs are stranded into 25-pair bundles and into units (and super units, if required by pair count)
   4. Color Coding: Twisted pairs and units (super units, if necessary) individually color-coded to industry standards (ANSI/ICEA Publication S-80-576, and EIA-230)

C. Core & Sheath:
   1. Cable core shall have a tape applied longitudinally (wrapped around its entirety)
a. Tape Material: non-hydroscopic dielectric (polypropylene) film, or equivalent

2. Cable core and sheath flooded (interstices between the pairs and under the core tape) with filling compound to protect against moisture penetration
   a. Filling compound: 80°C ETPR compound, or equivalent

3. Sheath Type: “ALPETH”. Sheath consists of a shield and an outer jacket
   a. Shield: Corrugated bare 8 mil aluminum tape applied longitudinally over the core wrap
   b. Outer Jacket: PE, black, with UV inhibitors, bonded to shield

D. Standards Compliance:
   1. Telcordia GR-421-CORE Issue 2
   2. RoHS-compliant

E. Manufacturers:
   1. General Cable
   2. Superior Essex

2.2 SPlice Closures AND ACCESSORIES

A. Splice Closure – Building Entrance Type
   1. Application: Splice closure system shall be suitable for indoor installation within an entrance facility for splicing between OSP and ISP cable.
   2. Closure:
      a. Re-enterable
      b. Through-splice or butt-splice configurations will be accepted.
      c. Solid sleeve, or split sleeve acceptable.
      d. End caps shall accept eight single collared or having multiple holes.
   3. Manufacturer:
      a. 3M Telecom Systems
         1) #5-26; solid closure, up to 600 pair,
         2) #5DS-26; split closure, up to 600 pair
         3) #C5-100-6; end caps (to be sized to cable entry and exits)
         4) #4460; shield bond connector for cables 100-pair or larger
         5) #4460-D; shield bond connector for cables 100-pair or smaller
         6) #25T ground braid or #25T ground braid with eyelets

2.3 BUILDING ENTRANCE PROTECTION

A. BEP Terminal – Swivel Stub Input, Swivel Stub Output
   1. Application: BEP terminal shall be suitable for indoor installation, within a telecom room (such as an Entrance Facility or 'MPOE'). BEP terminals shall provide termination of the backbone twisted pair cables specified within this Section, shall protect premises equipment against induced voltages and stray currents, and shall accept '5-pin' protector modules specified within this Section.
   2. Configuration: BEP terminal shall be designed for a wall-mounted configuration, and shall have the capacity to accept 100-pair incoming and outgoing pairs.
4. Manufacturer:
   a. Circa
      1) #1900A1-100; 100-pair BEP terminal with swivel stub input and output

2.4 LABELS
   A. Labels shall be machine printable with a laser printer, ink jet printer, thermal transfer printer, or hand-held printer.
   B. Labels for Cables
      1. Labels shall be adhesive-backed and have a self-laminating feature
      2. Labels shall fit the backbone cables listed above (i.e., shall fully wrap around the cable’s jacket).
      3. Printable area should be 1 inch wide x 0.5 inch high, or larger
      4. Printable area color shall be white
      5. Manufacturer:
         a. Panduit
            1) #S200X400YAJ; labels for 25 to 100 pair cables [0.32” (8.09mm) - 0.95” (24.26mm) dia.]
            2) #S200X650YAJ; labels for 100 to 400 pair cables [0.48” (12.13mm) – 1.59” (40.43mm) dia.]
         b. Or equal

2.5 DUCT PLUGS
   A. Plug shall create a watertight seal.
   B. Manufacturer:
      1. Tyco
         a. #40S136S; simplex plug for 4-inch conduit, cable OD 1.19-1.36
         b. #40S196SB; simplex plug for 4-inch conduit, cable OD 1.38-1.96
         c. #40S256SB; simplex plug for 4-inch conduit, cable OD 1.92-2.56
         d. #40S291SB; simplex plug for 4-inch conduit, cable OD 2.56-2.91
         e. #40S327SB; simplex plug for 4-inch conduit, cable OD 2.91-3.27
         f. #40B167S; “triplex” plug for 4-inch conduit, with 3 ports
         g. #40Q136S; “quadplex” plug for 4-inch conduit with 4 ports
      2. Carlon
         a. #MATPG3; “triplex” duct plug for 4-inch conduit, with 3 ports (1.53”-1.67”)
      3. Or equal

PART 3 - EXECUTION

3.1 GENERAL
   A. Comply with the Execution requirements of Section 27 00 00.
3.2 EXAMINATION AND PREPARATION

A. Rooms: Prior to installation, verify equipment rooms are suitable to accept the backbone twisted pair cables and terminations.

B. Pathways: Prior to installation verify that pathways and supporting devices, provided under other sections, are properly installed, and that temporary supports, devices, etc., have been removed. Verify dimensions of pathways, including length (for example, “True Tape” the conduits).

C. Cable Integrity: Prior to installation, verify the twisted pair cable is fully operational – both cable sheath and twisted pair conductors. Documentation of pre-installation testing is not a close out requirement, and is the responsibility of the Contractor.

3.3 INSTALLATION

A. OSP Interbuilding Backbone Cable

1. Cable runs shall have continuous sheath continuity, homogenous in nature, between either termination points or designated splices points. Only splices as noted on the Construction Documents are permitted.

2. Maximum cable length of 1,500 meters between termination points.

3. Placement

a. Place cables within designated pathways.
b. Maintain a minimum bend radius of 6 times the cable diameter during installation.
c. Maintain pulling tension within manufacturer’s limits. Only use UL approved cable-pulling compounds when necessary to reduce pulling tensions.
d. Protect cable during installation. Place and suspend cables in a manner to protect them from physical interference or damage. Place cables with no kinks, twists, or impact damage to the sheath. Replace cable if damaged during installation.
e. Neatly dress and organize cables in the cable routing facilities, and fastened to support devices via tie wraps.
f. Place a pull rope along with cables where run in conduit and spare capacity still exists in the conduit. Tie off ends of the pull rope.

4. Routing:

a. When routing horizontally within telecommunications rooms, utilize the overhead cable support; route backbone cables to avoid crossing over horizontal cabling or horizontal cabling crossing backbone cabling. When routing vertically within telecommunications rooms, utilize the vertical cable support and provide cable ties every 24 inches on center using.
b. Route cables a minimum of 6” away from power sources to reduce interference from EMI.

5. Duct Plugs

a. Provide duct plugs into each duct port in maintenance holes/pullboxes and building entrances.

6. Termination

a. Provide 15 feet cable slack loop at each end of the run. Store slack in overhead cable support or as noted on Drawings.
b. Properly strain relieve cables at designated points per manufacturer’s instructions.
c. Terminate copper pairs at both ends on the specified BEP. Perform terminations in accordance with manufacturer’s instructions and ANSI/TIA-568-C standard installation practices.

7. Labeling
a. Provide labels on each end of the cable, no more than 4" from where the cable enters the specified splice closure.
b. Place labels such that they are visible by a technician from a normal stance.

B. Building Entrance Splicing Systems
1. Provide entrance splice system as shown on the Drawings, including closure, end caps, splice modules, grounding components, and accessories required for a complete installation. Install splice closure and splice modules per manufacturer’s instructions using tools intended for the purpose.
2. Size enclosure based on splice bundle diameter, and size ends caps based on largest cable.
3. Include required accessories, such as collars, grommets, bushings, bonding connectors, etc. for a complete installation.
4. Thoroughly clean and separate binder groups prior to installing splice modules.
5. Apply sealant (such as B-sealant) to the end of the cable where the pairs exit the cable sheath – this to prevent water-blocking gel from leaking out the cable’s sheath.
6. Provide labels on each splice module and binder group in splice closure.
7. Grounding and Bonding
   a. Bond splice enclosure and cable shield to closet busbar using bonding conductor per manufacturer’s instructions and/or TIA-607 requirements.
   b. Provide 6 AWG bonding conductor up to 25 feet in length; if longer than 25 feet, size bonding conductor as 1000 circular mils per foot.
8. Fill unused end cap entry holes with appropriate plug (intended for purpose).
9. Attach splice enclosure to vertical cable runway on wall with metal straps

C. Building Entrance Protection
1. Provide BEP system as shown on the Drawings, including terminals, modules, and accessories required for a complete installation. Install BEP per manufacturer’s instructions.
2. Install BEP terminals plumb and square, and at height shown on Drawings. If no height is shown, install such that bottom row is at 24" AFF (+/- 3”).
3. Grounding and Bonding
   a. Bond BEP terminal to TMGB in accordance with NEC Article 800, and follow the installation requirements described in Article 800.
   b. Provide 6 AWG bonding conductor up to 25 feet in length; if longer than 25 feet, size bonding conductor as 1000 circular mils per foot.
4. Labeling
   a. Provide and permanently affix label on the terminal’s cover.
   b. Provide label in the label holder at the terminal’s “outgoing” connection.
5. Provide quantity of protector modules to completely populate terminals.

D. Termination Apparatus
1. Install the termination apparatus such that the bottom row of terminations is at a height as shown on the Drawings. If no height is shown, install bottom at 24” AFF (+/- 3”).
2. Provide accessories required for a complete installation.
3. Mount blocks plumb and square.

E. Crossconnects
1. In the MDF, provide one 1-pair crossconnect to length from the equipment field to the backbone field based on the records from the IDF crossconnections.
2. Utilize the horizontal and vertical management components to properly route the crossconnect wire.

3. Color:
   a. For digital handsets, provide: White-Blue / Blue-White
   b. For analog handsets, provide: White-Red / Red-White.

4. Splices in crossconnect wire are prohibited.

3.4 LABELING

A. General Requirements
   1. Labeling and identifier assignment and the label colors shall conform to the TIA/EIA-606-A Administration Standard and as approved by Owner or Owner’s Representative before installation.
   2. Provide permanent and machine-generated labels; hand written labels will not be accepted.

B. Cable Labels
   1. Label Format:
      a. Label type shall be wrap-around self-laminating.
      b. Label color shall be white background with clear laminating window.
      c. Text color shall be black; text height shall be 1/8” high, minimum, or #12 font size.
   2. Provide labels on both ends of cables. Fully wrap label around the cable jacket. Install labels no more than 4 inches from the edge of the cable jacket. Install labels such that they are visible by a technician from a normal stance.

C. Protection and Termination Apparatus Labels
   a. Use labels included in the product packaging. Request approval by the Engineer for substitutions.
   b. Label color shall be brown for respective field type, per TIA/EIA-606-A.
   c. Text color shall be black, 3/32” high, minimum, or #10 font size.

D. Identifier Assignment
   1. General: Separate label fields of the identifier with a hyphen.
   2. Cables
      a. The first field shall identify the cable type: "CBT" (for Cable, Backbone, Twisted pair).
      b. The second field shall identify the originating termination room identifier as shown on the plans; e.g., “MDF1.1”.
      c. The third field shall identify the ending termination room identifier as shown on the plans; e.g., “BDF2.1”.
      d. The fourth field shall identify the beginning and ending pair counts.
      e. Identifier Example: “CBT-MDF1.1-BDF2.1-0401-0600”
   3. Termination Positions on the BEP Terminal Cover
      a. The first field shall identify the opposite end’s room; for example “TO BDF2.1”.
      b. The second field shall identify the pair count range; for example, “0401-0500”
      c. Identifier Example: “TO BDF2.1 0401 - 0500”
3.5 FINAL INSPECTION AND CERTIFICATION

A. Punch the Work of this Section compliant to the requirements of Section 27 00 00.
B. Remove and replace with new, at no cost to the Owner, cables or conductors failing to meet the indicated standards and not passing the testing requirements of Section 27 08 11. The Owner, or Owner’s Representative, will not accept the installation until testing has indicated a 100% availability of all cables and conductors or the Owner or Owner’s Representative has approved any deviation from this requirement.
C. Comply with system acceptance and certification requirements of Section 27 00 00.

END OF SECTION
PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes: Backbone ISP (indoor) fiber optic cabling.
B. Related Sections
   1. Comply with the Related Sections paragraph of Section 27 00 00.
   2. 27 08 21 Communication Fiber Optic Testing

1.2 REFERENCES

A. Comply with References requirements of Section 27 00 00.
B. In addition to the codes and standards listed in Section 27 00 00, comply with the latest edition of the following applicable specifications and standards except as otherwise shown or specified:
   1. National Fire Protection Agency (NFPA)
   2. Underwriters Laboratories (UL): Applicable listing and ratings, including but not limited to the following standards:
      a. UL 1659, “Metal-Clad Cables”
      b. UL 1651, “Optical Fiber Cable”
      c. UL 1666, “Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts”
   3. Insulated Cable Engineers Association (ICEA)
      b. ANSI/ICEA S-87-640-1999, “Fiber Optic Outside Plant Communications Cable”
   4. Telcordia
      a. GR-20-CORE, Issue 3, “Generic Requirements for Optical Fiber and Optical Fiber Cable”
      b. GR-409-CORE, Issue 2, “Generic Requirements for Indoor Fiber Optic Cable”

1.3 DEFINITIONS

A. Refer to Section 27 00 00 for Definitions.
B. In addition to those Definitions of Section 27 00 00, the following list of terms as used in this specification defined as follows:
   1. “MM”: Multimode [fiber type]
   2. “OFCP”: Optical Fiber Conductive Plenum, plenum rating
   3. “OFCR”: Optical Fiber Conductive Riser, non-plenum riser rating
   4. “OFNP”: Optical Fiber Non-conductive Plenum, plenum rating
5. “OFNR”: Optical Fiber Non-conductive Riser, non-plenum riser rating
6. “OFN”: Optical Fiber Non-conductive, general purpose indoor rating
7. “PVC”: PolyVinyl Chloride
8. “SM”: Singlemode [fiber type]

1.4 SYSTEM DESCRIPTION

A. Work Covered Under Other Sections
   1. Pathways: The communications pathways (backbone conduits, riser sleeves, wire mesh cable tray, cable tray, etc.) work will be covered under another Section. Refer to the drawings for size/capacity and route information.
   2. Rooms: Build out (e.g., backboards, overhead and vertical cable support, etc.) of the telecommunications rooms will be covered under another Section. Refer to the drawings for build out information.

B. Base Bid Work
   1. Provide engineering, labor, materials, apparatus, tools, equipment, and transportation required to make a complete working telecommunications backbone fiber optic cabling system installation described in these specifications and shown on related drawings.
   2. The drawings are diagrammatic in nature, and require shop drawings to complete the detailed design of the telecommunications infrastructure.
   3. Consider Backbone cabling, as shown on drawings, as base bid work, unless otherwise noted, including terminations at both ends.
   4. In general, the base bid work includes:
      a. Submittals
      b. Backbone inside plant (riser) fiber optic cables and terminations
      c. Bonding (cable armor, termination apparatus, etc)
      d. Innerduct
      e. Cable management
      f. Crossconnections / patching.
      g. Cable identification tags and system labeling
      h. Record Documents
      i. Warranty

1.5 SUBMITTALS

A. Comply with Submittal procedural, quantity, and format requirements of Section 270000.
B. Submittal Requirements Prior To Start Of Construction:
   1. Product Data Submittal, indicating conformance with NEC, UL, TIA/EIA listings, certifications and specifications.
   2. Sample Submittal, consisting of the following components:
   3. Schedule Submittal, consisting of proposed schedule of work. This schedule may be combined with the schedule developed for Division 27.
   4. Shop Drawings Submittal, consisting of proposed changes to cable routing, or termination locations/configurations
C. Submittal Requirements at Closeout:
   1. Copy of the manufacturer’s printed reel documentation, including the following.
      a. Manufacturer’s reel number
      b. Manufacturer’s traceable batch number
c. Length of the fiber cable on the reel

d. Maximum attenuation

e. Minimum bandwidth

2. As-Built Drawings
3. Crossconnection records/cut sheets
4. O&M Manuals

D. Substitutions
1. Requests for substitutions shall conform to the general requirements and procedure outlined in Section 27 00 00.

1.6 QUALITY ASSURANCE

A. Comply with Quality Assurance requirements of Section 27 00 00.

B. Contractor Qualifications
1. In addition to the Contractor Qualifications requirements of Section 27 00 00, the Contractor shall be manufacturer certified to install the proposed and submitted cabling system and to provide an extended warranty. Provide satisfactory evidence of certification in the form of a current letter or certificate from the manufacturer as part of the bid submission.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Comply with Delivery, Storage and Handling requirements of Section 27 00 00.

1.8 WARRANTY

A. The backbone fiber optic cabling system, as specified in this section, shall carry a 15-year (minimum) extended system warranty. This extended warranty shall cover parts and labor for the duration of the extended warranty. This extended warranty shall also cover optical performance of cabling system.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Corning Cable Systems (substitutions allowed)

2.2 FIBER OPTIC CABLE – NON-PLENUM RATED [REUSE EXISTING FIBER CABLE LEFT FROM THE LIBRARY BUILDING].

A. Application:
1. Cable shall be suitable for indoor installation, between floors in vertical riser system, under access flooring, and through overhead ceiling space (in basketway, cable tray, conduit, and/or hangers).
2. Optical transmission performance shall not be significantly affected by environmental fluctuations, installation, or aging.
3. Materials shall not evolve hydrogen in quantities that will increase light attenuation.

B. Multimode 50/125 μm fiber strands shall meet or exceed the following geometry criteria:
   1. Cabling to meet TIA-492-AAAD standard as specified by CCCC Infrastructure standard 2.6.
   2. Core diameter = 50 μm, ±3.0 μm
   3. Cladding diameter = 125 μm, ±1.0 μm
   4. Core/Cladding Concentricity = ≤ 3 μm
   5. Minimum Tensile Strength = 100,000 psi

C. Multimode 50/125 μm fiber strands shall meet or exceed the following performance criteria:
   1. Cabling to meet TIA-492-AAAD standard as specified by CCCC Infrastructure standard 2.6.
   2. Attenuation = 3.0 dB/km at 850 nm and 1.0 dB/km at 1300 nm wavelengths, maximum
   3. Overfilled Bandwidth = 1,500 MHz•km at 850 nm and 500 MHz•km at 1300 nm wavelengths, minimum
   4. Effective Modal Bandwidth = 2,000 MHz•km at 850 nm and 500 MHz•km at 1300 nm wavelengths, minimum

D. Singlemode fiber strands shall meet or exceed the following geometry criteria:
   1. Cabling to meet ITU-T G.652C and D as specified by CCCC Infrastructure standard 2.6.
   2. Core diameter = 8.3 μm
   3. Mode field diameter = 8.8 μm, ±0.5 μm
   4. Cladding diameter = 125 μm, ±1.0 μm
   5. Core/Cladding Concentricity = ≤ 0.8 μm
   6. Minimum Tensile Strength = 100,000 psi

E. Singlemode fiber strands shall meet or exceed the following performance criteria:
   1. Attenuation = 0.7 dB/km at 1310 nm and 0.7 dB/km at 1550 nm wavelengths, maximum
   2. Cutoff wavelength = 1260 nm
   3. Dispersion = 3.5 ps/nm•km at 1285-1330 nm and 18 ps/nm•km at 1550 nm
   4. Singlemode fiber shall meet the specifications of the following:

F. Primary Coating:
   1. Each fiber shall be completely covered with a “primary coating” (acrylate material).
   2. Coating diameter = 250 μm, ±5 μm

G. Buffering:
   1. Each coated fiber shall be fully covered with a material extruded over and directly onto the coating. This shall be the tight buffer. Tight buffer diameter = 900 μm, ±5 μm. Material = PVC, or equivalent flame retardant thermoplastic.

H. Cable Sheath:
1. **Strength Element**: The cable shall have an internal strength element such as aramid yarn (e.g., Kevlar).
2. **Outer Jacket**: The cable shall have a seamless outer jacket (material = PVC, or equivalent) applied to and completely covering the internal components (fiber strands, strength element, other).
3. **Tensile Strength**: The cable shall have a 150-lb, minimum, rated load.
4. **Flame Rating**: NEC (Article 770) rated as OFNR cable, and UL listed as such.

I. **Manufacturer**:
   1. Corning Cable Systems
   2. Or equal

### 2.3 FIBER OPTIC PATCH CORDS

A. **Application**
   1. Fiber optic patch cords shall be suitable for indoor installation within a telecommunications room within and/or between fiber patch panels.
   2. Cord shall be assembled from a single, continuous length of cordage, homogenous in nature; Splices are not permitted.

B. **Cordage – Multimode 50/125um**
   1. **Conductors**: Two 50/125um multimode tight-buffered fibers.
   2. **Strength Element**: Aramid yarn (Kevlar).
   3. **Jacket**: Flame-retardant PVC, or equivalent, in a ‘zipcord’ configuration.
   4. **NEC**: rated as OFN (or higher), and UL listed as such.

C. **Cordage – Singlemode**
   1. **Conductors**: Two singlemode tight-buffered fibers.
   2. **Strength Element**: Aramid yarn (Kevlar).
   3. **Jacket**: Flame-retardant PVC, or equivalent, in a ‘zipcord’ configuration.
   4. **NEC**: rated as OFN (or higher), and UL listed as such.

D. **Connectors**
   1. Multimode patch cords shall be either terminated via duplex LC connectors at both ends or terminated via duplex LC connectors to connect with the cable plant and via the connector type as required for connection to equipment.
   2. Singlemode patch cords shall be either terminated via duplex LC Ultra PC connectors at both ends or terminated via duplex LC-UPC connectors to connect with the cable plant and via the connector type as required for connection to equipment.

E. **Connector Loss**
   1. Multimode: \( \leq 0.5\text{dB} \) per mated pair at both 850nm and 1300nm.
   2. Singlemode: \( 0.5\text{dB} \) per mated pair at both 1310nm and 1550nm.

F. **Manufacturer**:
   1. Corning Cable Systems
   2. Or equal

### 2.4 TERMINATION APPARATUS – FIBER OPTIC PATCH PANELS
A. Application:
   1. Fiber optic patch panels shall be an enclosed housing for protecting, storing and organizing the termination of fiber cable(s) and fiber strands, shall provide means to strain relieve and support of the specified cables, shall contain facilities to store fiber slack, and shall provide patch cord management.
   2. Fiber optic patch panels shall be passive physical equipment and apparatus used in terminating, interconnecting, and cross-connecting fiber optic cabling, shall possess a minimum fire resistant rating of UL94V-1, and shall conform to existing OSHA Health and Safety Laws.
   3. Fiber optic patch panels shall be rack-mountable.

B. Fiber optic patch panels shall come equipped with safety labels such as laser identification or warning labels as required by system considerations.

C. Manufacturer:
   1. Corning Cable Systems
      a. #CCH-04U; “Connector Closet Housing” type patch panel, 4U, holds 12 adapter modules
      b. #CCH-03U; “Connector Closet Housing” type patch panel, 3U, holds 6 adapter modules
      c. #CCH-02U; “Connector Closet Housing” type patch panel, 2U, holds 4 adapter modules
      d. #CCH-01U; “Connector Closet Housing” type patch panel, 1U, holds 2 adapter modules
      e. #WCH-02P; “Wall-Mount Closet Housing” type patch panel, holds 2 adapter modules
      f. #WCH-04P; “Wall-Mount Closet Housing” type patch panel, holds 2 adapter modules
      g. #CCH-CP12-E4; Adapter Module e/w 6 duplex MM LC aqua adapters
      h. #CCH-CP12-A8; Adapter Module e/w 6 duplex MM LC beige adapters
      i. #CCH-CP12-A9; Adapter Module e/w 6 duplex SM LC blue adapters
      j. #CCH-CP06-E6; Adapter Module e/w 6 MM SC aqua adapters
      k. #CCH-CP12-E7; Adapter Module e/w 6 duplex MM SC aqua adapters
      l. #CCH-CP06-56; Adapter Module e/w 6 MM SC beige adapters
      m. #CCH-CP06-59; Adapter Module e/w 6 SM SC blue adapters
      n. #CCH-CP06-G5; Adapter Module e/w 6 MM ST aqua adapters
      o. #CCH-CP06-15T; Adapter Module e/w 6 MM ST beige adapters
      p. #CCH-CP06-19T; Adapter Module e/w 6 SM ST blue adapters
   2. Or equal

2.5 LABELS

A. Labels shall be machine printable with a laser printer, ink jet printer, thermal transfer printer, or hand-held printer.

B. Labels for Cables
   1. Labels shall be adhesive-backed and have a self-laminating feature
   2. Labels shall fit the backbone cables listed above (i.e., shall fully wrap around the cable’s jacket).
   3. Printable area should be 1 inch wide x 0.5 inch high, or larger
   4. Printable area color shall be white
   5. Manufacturer:
      a. Panduit
1)  #S200X225YAJ; labels cables 0.24" (6.06mm) - 0.48" (12.13mm) dia.
2)  #S200X400YAJ; labels for cables 0.32" (8.09mm) - 0.95" (24.26mm) dia.
3)  #S200X650YAJ; labels for cables 0.48" (12.13mm) - 1.59" (40.43mm) dia.

b. Or equal

2.6 MISCELLANEOUS

A. Fiber Slack Storage Reel: Leviton #48900-OFR, or equal
B. Velcro Cable Ties
   1. Width: .75”.
   2. Manufacturers:
      a. Panduit
         1) #HLS-15R-0 Black, 15’ roll, cut to length.
      b. Or equal

PART 3 - EXECUTION

3.1 GENERAL

A. Comply with Execution requirements of Section 270000.

3.2 EXAMINATION AND PREPARATION

A. Pathways: Prior to installation verify pathways (conduits, etc.) and supporting devices, provided under other sections, are properly installed, and that temporary supports, devices, etc., have been removed. Verify dimensions of pathways, including length (for example, “True Tape” the conduits).
B. Rooms: Prior to installation, verify equipment rooms are ready for cables and terminations.
C. Prior to installation, verify cables and conductors are fully operational – both cable sheath and fiber strands. Pre-installation testing is the responsibility of the Contractor, though documentation of pre-installation testing is not a close out requirement.

3.3 INSTALLATION

A. Backbone Cable Installation, Routing, and Termination
   1. Cable runs shall have continuous sheath continuity, homogenous in nature. Splices are not permitted anywhere.
   2. Do not exceed 500 meters optical conductor length from the termination within the BDF to the termination in IDF.
   3. Placement
      a. Place cables within designated pathways. Place ISP cables in innerduct between points of termination throughout entire length (except at the fiber take up reel).
      b. Maintain a minimum bend radius of 20 times the cable diameter during installation, and a minimum bend radius of 10 times the cable diameter after installation.
      c. Maintain pulling tension within manufacturer's limits.
d. Place and suspend cables in a manner to protect them from physical interference or damage. Place cables with no kinks, twists, or impact damage to the sheath. Replace cables damaged during installation.

e. Do not use cable-pulling compounds for indoor installations.

f. Provide 20 to 30 feet of cable slack at each end within the Telecommunications Rooms; store slack in fiber slack storage reel mounted on the wall.

g. Place a pull rope along with cables where run in pathways and spare capacity in the pathway remains. Tie off ends of the pull rope.

4. Routing

a. When routing overhead within telecommunications rooms, neatly dress and organize cables on designated overhead cable support apparatus (for example, cable tray/runway), and fasten cables to cable support apparatus via approved straps. When routing vertically within telecommunications rooms, neatly dress and organize cables on vertical cable support apparatus (for example, vertical cable runway), and properly fasten cables to cable routing facilities via approved straps. “Properly fasten” shall consist of cable ties in a ‘crossed’ configuration per cable or cable bundle (up to three cables or innerducts) every 24 inches on center.

5. Termination

a. Properly relieve strain from cables at termination points (at/within the fiber optic termination panels) per manufacturer’s instructions.

b. Bond cable armor to grounding point (busbar) – refer to section 27 05 26 for additional information.

c. Provide breakout kits to furcate fibers from buffer tubes.

d. Terminate fiber strands via pigtail splicing at both ends using the specified fiber optic pigtail appropriate for the mode type of the fiber. Splicing type shall be fusion; mechanical splicing will not be accepted. Perform terminations in accordance with manufacturer’s instructions.

e. Provide required accessories and consumables for the complete termination of fiber strands.

f. Provide 3 feet of unsheathed fiber (tight buffer) slack within the patch panel/termination enclosure at each end of the link. Properly store fiber slack in rear of patch panel into the ‘routing rings’, per manufacturer’s instructions. Include ‘extension’ slack loop/fold in the rear of the shelf to allow for the drawer to be pulled out without putting tension on the fibers.

B. Fiber Optic Cable Termination Panel

1. Provide fully assembled termination panel in designated equipment rack; locate per drawings (if not shown, locate at the top). “Fully assembled” includes installation and mounting components and accessories such as adapter panels, coupling adapters, etc. required for operation.

2. Provide accessories required for proper installation of each termination panel, including connector panels and adapters.

3. Bond termination apparatus to grounding point (busbar) – refer to section 27 05 26 for additional information.

3.4 LABELING

A. General Requirements

1. Labeling, identifier assignment, and the label colors shall conform to the TIA/EIA-606-A Administration Standard and as approved by Owner or Owner’s Representative before installation.
2. Provide permanent and machine generated labels; hand written labels will not be accepted.

B. Cable Labels
   1. Label Format:
      a. Label type shall be wrap-around self-laminating.
      b. Label color shall be white background with clear laminating window.
      c. Text color shall be black; text height shall be 1/8" high, minimum, or #12 font size.
   2. Provide labels on both ends of cables. Fully wrap label around the cable jacket. Install labels no more than 4 inches from the edge of the cable jacket. Install labels such that they are visible by a technician from a normal stance.

C. Termination Apparatus Labels
   1. Use labels included in the product packaging. For substitutions, request approval by the Engineer.
   2. Label color shall be white for respective field type, per TIA/EIA-606-A.
   3. Text color shall be black, 3/32" high, minimum, or #10 font size.

D. Identifier Assignment
   1. General: Separate all label fields of the identifier with a hyphen.
   2. Backbone ISP Fiber Optic Cables
      a. The first field shall identify the cable type: “CBF” (for Cable, Backbone, Fiber optic).
      b. The second field shall identify the originating termination room identifier as shown on the plans; e.g., “BDF2.1”.
      c. The third field shall identify the ending termination room identifier as shown on the plans; e.g., “IDF2.2”.
      d. The fourth field shall identify the type and number of strands; for example, “Mxxx” where “M” stands for multimode and xxx stands for the ending fiber strand sequential count
      e. Identifier Example: “CBF-BDF2.1-IDF2.2-M025-M048”
   3. Termination Positions at the Termination Panels
      a. Make the first field of the identifier the destination room; for example “TO IDF2.2”.
      b. Make the second field of the identifier the strand count range; for example, “M025-M048”
      c. Identifier Example: “TO IDF2.2 M025-M048”.

3.5 FINAL INSPECTION AND CERTIFICATION

A. Punch the Work of this Section compliant to the requirements of Section 27 00 00.
B. Remove and replace with new, at no additional cost, cables with conductors failing to meet the indicated standards and not passing the testing requirements of Section 27 08 21. The Owner, or Owner’s Representative, will not accept the installation until testing has indicated a 100% availability of cables and conductors or the Owner or Owner’s Representative has approved in writing any deviation from this requirement.
C. Comply with system acceptance and certification requirements of Section 27 00 00.

END OF SECTION
SECTION 27 13 24 COMMUNICATIONS BACKBONE OSP FIBER OPTIC CABLING

PART 1 - GENERAL

1.1 SUMMARY
   A. Section Includes:
      1. Backbone outside plant (OSP) fiber optic cabling
   B. Related Sections
      1. Comply with the Related Sections paragraph of Section 270000
      2. 27 08 21 Communication Fiber Optic Testing
      3. 27 13 23 Communication Backbone ISP Fiber Optic Cabling

1.2 REFERENCES
   A. Comply with References requirements of Section 27 00 00.
   B. In addition to the codes and standards listed in Section 27 00 00, comply with the latest edition of the following applicable specifications and standards except as otherwise shown or specified:
      1. National Fire Protection Agency (NFPA)
      2. Underwriters Laboratories (UL): Applicable listing and ratings, including but not limited to the following standards:
         a. UL 1569, “Metal-Clad Cables”
         b. UL 1651, “Optical Fiber Cable”
         c. UL 1666, “Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts”
      3. Insulated Cable Engineers Association (ICEA)
         a. ANSI/ICEA S-87-640-1999, “Fiber Optic Outside Plant Communications Cable”
      4. Telcordia
         a. GR-20-CORE, Issue 3, “Generic Requirements for Optical Fiber and Optical Fiber Cable”

1.3 DEFINITIONS
   A. Refer to Section 27 00 00 for Definitions.
   B. In addition to those Definitions of Section 27 00 00, the following list of terms as used in this specification defined as follows:
      1. “HDPE”: High Density Polyethylene
      2. “LDPE”: Light Density Polyethylene
      3. “MDPE”: Medium Density Polyethylene
      4. “MM”: Multimode [fiber type]
      5. “OSP”: Outside Plant [cabling]
6. “PE”: Polyethylene
7. “SM”: Singlemode [fiber type]

1.4 SYSTEM DESCRIPTION

A. Work Covered Under Other Sections
   1. Pathways: The communications pathways (underground conduits, maintenance holes, pull boxes, innerducts, pull ropes, etc.) work will be covered under another Section. Refer to the Drawings for size/capacity and route information.
   2. Rooms: Build out (e.g., backboards, overhead and vertical cable support, etc.) of the rooms (BDFs, IDF’s) will be covered under another Section. Refer to the Drawings for build out information.

B. Base Bid Work
   1. Provide engineering, labor, materials, apparatus, tools, equipment, and transportation required to make a complete working telecommunications backbone fiber optic cabling system installation described in this Section and shown on related Drawings.
   2. The Drawings are diagrammatic in nature, and require shop drawings to complete the detailed design of the telecommunications infrastructure.
   3. Consider Backbone cabling, as shown on Drawings, as base bid work, unless otherwise noted, including terminations at both ends.
   4. In general, the base bid work includes:
      a. Submittals
      b. Backbone outside plant (OSP) fiber optic cables and terminations
      c. Bonding (cable armor, termination apparatus, etc)
      d. Innerduct
      e. Cable management
      f. Crossconnections / patching.
      g. Cable identification tags and system labeling
      h. Record Documents
      i. Warranty

1.5 SUBMITTALS

A. Comply with Submittal procedural, quantity, and format requirements of Section 270000.
B. Submittal Requirements Prior To Start Of Construction:
   1. Product Data Submittal, indicating conformance with NEC, UL, TIA/EIA listings, certifications and specifications.
   2. Sample Submittal, consisting of the following components:
      a. Cable label
   3. Schedule Submittal, consisting of proposed schedule of work. This schedule may be combined with the schedule developed for Division 27.
   4. Shop Drawings Submittal, consisting of proposed changes to cable routing, or termination locations/configurations.

C. Submittal Requirements at Closeout:
   1. Copy of the manufacturer’s printed reel documentation, including the following.
      a. Manufacturer’s reel number
      b. Manufacturer’s traceable batch number
c. Length of the fiber cable on the reel
d. Maximum attenuation
e. Minimum bandwidth

2. As-Built Drawings
3. Crossconnection records/cut sheets
4. O & M Manuals

1.6 QUALITY ASSURANCE

A. Comply with Quality Assurance requirements of Section 270000.

B. Contractor Qualifications
   1. In addition to the Contractor Qualifications requirements of Section 27 00 00, the Contractor shall be manufacturer certified to install the proposed and submitted cabling system and to provide an extended warranty. Provide satisfactory evidence of certification in the form of a current letter or certificate from the manufacturer as part of the bid submission.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Comply with Delivery, Storage and Handling requirements of Section 27 00 00.

1.8 WARRANTY

A. The communications cabling system, as specified in this Section, shall carry a 15-year (minimum) extended system warranty. This extended warranty shall cover parts and labor for the duration of the extended warranty. This extended warranty shall also cover optical performance of cabling system.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Corning Cable Systems (substitutions allowed)

2.2 SUBSTITUTIONS

A. Comply with the Substitutions requirements of Section 27 00 00.

2.3 FIBER OPTIC CABLE – UNDERGROUND DIELECTRIC

A. Application:
   1. Cable shall be suitable for outdoor installations within underground pathways system and/or within innerduct/sub-ducting.
   2. Optical transmission performance shall not be significantly affected by environmental fluctuations, installation, or aging.
   3. Materials shall not evolve hydrogen in quantities that will increase light attenuation.
B. Multimode 50/125 μm fiber strands shall meet or exceed the following geometry criteria:
   1. Cabling to meet TIA-492-AAAD standard as specified by CCCC Infrastructure standard 2.6.
   2. Core diameter = 50 μm, ±3.0 μm.
   3. Cladding diameter = 125 μm, ±1.0 μm.
   4. Core/Cladding Concentricity = ≤ 3 μm.
   5. Minimum Tensile Strength = 100,000 psi.

C. Multimode 50/125 μm fiber strands shall meet or exceed the following performance criteria:
   1. Cabling to meet TIA-492-AAAD standard as specified by CCCC Infrastructure standard 2.6.
   2. Attenuation = 3.0 dB/km at 850 nm and 1.0 dB/km at 1300 nm wavelengths, maximum.
   3. Overfilled Bandwidth = 500 MHz•km at 850 nm and 500 MHz•km at 1300 nm wavelengths, minimum.
   4. Laser Bandwidth = 2,000 MHz•km at 850 nm and 500 MHz•km at 1300 nm wavelengths, minimum.

D. Singlemode fiber strands shall meet or exceed the following geometry criteria:
   1. Cabling to meet ITU-T G.652C and D as specified by CCCC Infrastructure standard 2.6.
   2. Core diameter = 8.3 μm.
   3. Mode field diameter = 8.8 μm, ±0.5 μm.
   4. Cladding diameter = 125 μm, ±1.0 μm.
   5. Core/Cladding Concentricity = ≤ 0.8 μm.
   6. Minimum Tensile Strength = 100,000 psi.

E. Singlemode fiber strands shall meet or exceed the following performance criteria:
   1. Cabling to meet ITU-T G.652C and D as specified by CCCC Infrastructure standard 2.6.
   2. Attenuation = 0.4 dB/km at 1310 nm and 0.3 dB/km at 1550 nm wavelengths, maximum.
   3. Cutoff wavelength = 1260 nm.
   4. Dispersion = 3.5 ps/nm•km at 1285-1330 nm.
   5. Singlemode fiber shall meet the specifications of the following:

F. Buffering:
   1. Fibers shall be loosely buffered, either in a core tube or in multiple tubes around a central member.
   2. Buffer tube/tubes shall be filled with compound to protect against moisture penetration. Filling compound: “FLEXGEL”, or equivalent.

G. Sheath:
   1. Sheath shall consist of a strength member and an outer jacket, with non-metallic component dielectric sheath.
   2. Strength Member: Aramid yarn (e.g., Kevlar®), or reinforced fiberglass rods.
   3. Jacket: PE (MDPE or HDPE).
4. Rated tensile load: 600 lb. maximum rated load.
5. Operating Temperature Range: -40 to 158°F (-40 to 70°C)

H. Manufacturer:
1. Corning Cable Systems
   a. #024CW4-T4131D20; “ALTOS” gel-free sheath / outdoor cable, 24-strand 50/125μm
2. Corning Cable Systems
   a. #024SW4-T4180D20; “ALTOS” gel-free sheath / outdoor cable, 24-strand 50/125μm
3. Corning Cable Systems
   a. #024SW4-T4190D20; “ALTOS” gel-free sheath / outdoor cable, 24-strand 50/125μm
4. Corning Cable Systems
   a. #024EW4-T4101D20; “ALTOS” gel-free sheath / outdoor cable, 24-strand singlemode
5. Or equal.

2.4 SPLICING EQUIPMENT
A. Splice Closure – For Underground Vault/Pullbox
1. Splice closure shall be suitable for installation within an underground vault and/or pullbox.
2. Splice closure shall be <butt splice configuration only><through/in-line splice configuration only><branch splice configuration only><either butt, through/in-line, or branch splice configuration>.
3. Manufacturers:
   a. Corning Cable Systems
      1) #SCF-4C18-01; “Advanced Splice Closure” canister closure (butt splice configuration), 4 x 18, holds up to six 0.2” trays
      2) #SCF-4T30; “Advanced Splice Closure” in-line closure (through splice configuration), 4 x 30, holds up to six 0.2” trays
      3) #SCF-6C22-01; “Advanced Splice Closure” canister closure (butt splice configuration), 6 x 22, holds up to six 0.2” trays and one slack basket
      4) #SCF-6C22-02; “Advanced Splice Closure” canister closure (butt splice configuration), 6 x 22, holds up to twelve 0.2” trays
      5) #SCF-6T30; “Advanced Splice Closure” in-line closure (through splice configuration), 6 x 30, holds up to twelve 0.2” trays
      6) #SCF-KT-6GND; Ground kit
      7) #SCF-KT-4CBL; ‘Add-A-Cable’ kit for 4-inch closure
      8) #SCF-INSLT-BKT4; Installation bracket for 4-inch closure
      9) #SCF-KT-6CBL; ‘Add-A-Cable’ kit for 6-inch closure
     10) #SCF-INSLT-BKT; Installation bracket for 6-inch closure
     11) #M67-041; 0.2” splice tray, holds 12 bare fusion splices
     12) #M67-092; 0.2” splice tray, holds 24 bare fusion splices
     13) #M67-048; 0.2” splice tray, holds 12 heat shrink fusion splices
     14) #M67-031; 0.2” splice tray, holds 12 CamSplice mechanical splices
     15) #SCF-ST-099; 0.2” splice tray
b. 3M Telcom
   1) # 2178-LS large splice case
   2) #2522 organizer

c. PLP / Preformed Line Products:
   1) #80805105; “COYOTE” splice closure
   2) #8003509 60mm heat shrink organizer

d. Or equal.

B. Mechanical Splice Module

1. Mechanical splice module shall be suitable for installation within a splice closure either an
   underground vault/pullbox or within a building entrance facility.

2. Mechanical splice module shall accept both 250 μm primary coated (from loose buffer)
   fibers and 900 μm tight buffered fibers.

3. Mechanical splice module filled with index matching gel.

4. Performance:
   a. Maximum Insertion Loss – both multimode and singlemode: <0.3 dB.
   b. Maximum Reflection – both multimode and singlemode: <45dB.

5. Manufacturer:
   a. Corning Cable Systems
      1) #95-000-04; CamSplice mechanical splice module

B. Mechanical Splice Module

A. Application:

1. Fiber optic patch panels shall be an enclosed housing for protecting, storing and
   organizing the termination of fiber cable(s) and fiber strands, shall provide means to
   strain relieve and support of the specified cables, shall contain facilities to store fiber
   slack, and shall provide patch cord management.

2. Fiber optic patch panels shall be passive physical equipment and apparatus used in
   terminating, interconnecting, and cross-connecting fiber optic cabling, shall possess a
   minimum fire resistant rating of UL94V-1, and shall conform to existing OSHA Health and
   Safety Laws.

3. Fiber optic patch panels shall be <rack-mountable.

B. Fiber optic patch panels shall come equipped with safety labels such as laser identification or
   warning labels as required by system considerations.

C. Manufacturer:

1. Corning Cable Systems
   a. #CCH-04U; “Connector Closet Housing” type patch panel, 4U, holds 12 adapter
      modules
   b. #CCH-03U; “Connector Closet Housing” type patch panel, 3U, holds 6 adapter
      modules
   c. #CCH-02U; “Connector Closet Housing” type patch panel, 2U, holds 4 adapter
      modules
   d. #CCH-01U; “Connector Closet Housing” type patch panel, 1U, holds 2 adapter
      modules
2. Or equal.

2.6 FIBER OPTIC CONNECTORS

A. Multimode Fiber Optic Connectors – LC Type

1. Materials:
   a. Ferrule: ceramic with pre-radiused finish/face
   b. Connector Housing: Plastic

2. Connector shall have an integral strain relief feature, including a bend limiting rear boot.

3. Connector shall be installable via either epoxy or anaerobic method.

4. Manufacturer:
   a. SYSTIMAX
      1) #P1001A-Z-125 (700 007 008); LC type connector, MM, zirconia ceramic, beige boot, for 0.9 mm buffered fiber
      2) #P1001A-Z-125R (760 034 181); LC type connector, MM, pre-radius zirconia ceramic, beige boot, for 0.9 mm buffered fiber
   b. Corning Cable Systems
      1) #95-051-98-SP; LC type connector, ceramic ferrule, for 50/125 μm MM, aqua boot
   c. Panduit
      1) #FLCSMEIY; LC type connector, zirconia ceramic, MM, elec ivory

B. Singlemode Fiber Optic Connectors – LC Type

1. Materials:
   a. Ferrule: ceramic (zirconia or alumina) with pre-radiused finish/face
   b. Connector housing: plastic

2. Connector shall have an integral strain relief feature, including a bend limiting rear boot.

3. Connector shall be installable via either epoxy or anaerobic method.

4. Manufacturer:
   a. SYSTIMAX
      1) #P1101A-Z-125 (700 011 372); LC type connector, SM, zirconia ceramic, blue boot, for 0.9 mm buffered fiber
2) #P1101A-Z-125R (760 034 199); LC type connector, SM, pre-radius zirconia ceramic, blue boot, for 0.9 mm buffered fiber

b. Corning Cable Systems
1) #95-201-98-SP; LC type connector, ceramic ferrule, SM, blue boot

c. Panduit
1) #FLCSSBUY; LC type connector, zirconia ceramic, SM, blue

2.7 LABELS

A. Labels shall be machine printable with a laser printer, ink jet printer, thermal transfer printer, or hand-held printer.

B. Labels for Cables
1. Labels shall be adhesive-backed and have a self-laminating feature
2. Labels shall fit the backbone cables listed above (i.e., shall fully wrap around the cable’s jacket).
3. Printable area should be 1 inch wide x 0.5 inch high, or larger
4. Printable area color shall be white
5. Manufacturer:
   a. Panduit
      1) #S200X225YAJ; labels cables 0.24” (6.06mm) - 0.48” (12.13mm) dia.
      2) #S200X400YAJ; labels for cables 0.32” (8.09mm) - 0.95” (24.26mm) dia.
      3) #S200X650YAJ; labels for cables 0.48” (12.13mm) - 1.59” (40.43mm) dia.
   b. Or equal

2.8 MISCELLANEOUS

A. Breakout Kits
1. Application: for loose buffer cables, kit to furcate coated fibers from buffer tube in preparation for “direct connectorization” type termination.
2. Manufacturer:
   a. Corning Cable Systems
      1) #FAN-BT25-06; “Buffer Tube Fan-Out Kit”, for 6 fibers/tube, 25” tubing
      2) #FAN-BT36-06; “Buffer Tube Fan-Out Kit”, for 6 fibers/tube, 36” tubing
      3) #FAN-BT47-06; “Buffer Tube Fan-Out Kit”, for 6 fibers/tube, 47” tubing
      4) #FAN-BT25-12; “Buffer Tube Fan-Out Kit”, for 12 fibers/tube, 25” tubing
      5) #FAN-BT36-12; “Buffer Tube Fan-Out Kit”, for 12 fibers/tube, 36” tubing
      6) #FAN-BT47-12; “Buffer Tube Fan-Out Kit”, for 12 fibers/tube, 47” tubing
   b. SYSTIMAX
      1) #760 018 820; breakout kit for 6 strands per tube
      2) #760 018 838; breakout kit for 12 strands per tube
   c. Or equal

B. Fiber Slack Storage Reel: Leviton #48900-OFR, or equal

C. Velcro Cable Ties
1. Width: .75”.
2. Manufacturers:
PART 3 - EXECUTION

3.1 GENERAL

A. Comply with the Execution requirements of Section 270000.

3.2 EXAMINATION AND PREPARATION

A. Pathways: Prior to installation verify that duct banks, ducts, maintenance holes, pullboxes, and supporting devices, provided under other sections, are properly installed, and that temporary supports, devices, etc., have been removed. Verify dimensions of pathways, including length (for example, “True Tape” the conduits).

B. Rooms: Prior to installation, verify equipment rooms are ready for cables and terminations.

C. Prior to installation, verify cables and conductors are fully operational – both cable sheath and fiber strands. Pre-installation testing is the responsibility of the Contractor, though documentation of pre-installation testing is not a close out requirement.

3.3 INSTALLATION

A. Backbone Cable Installation and Routing

1. Cable runs shall have continuous sheath continuity, homogenous in nature. Splices are not permitted anywhere, unless expressly shown on the Drawings or approved in writing by the Engineer prior to installation.

2. Do not exceed 1,500 meters optical conductor length from the termination within the BDF to the termination in the IDF.

3. Placement

a. Install cables within designated pathways. Place OSP cables in innerduct between points of termination throughout entire length (except at the fiber take up reel).

b. Maintain a minimum bend radius of 20 times the cable diameter during installation, and a minimum bend radius of 10 times the cable diameter after installation.

c. Maintain pulling tension within manufacturer’s limits. Use a pulling tension meter when using mechanical assistance during installation. Record maximum pulling tension for each cable run, and submit to the Engineer for review if requested. Replace runs when manufacturer’s maximum pulling tension is exceeded.

d. Place and suspend cables in a manner to protect them from physical interference or damage. Place cables with no kinks, twists, or impact damage to the sheath. Replace cables damaged during installation.

e. Only use UL approved cable-pulling compounds when necessary to reduce pulling tensions.

f. Provide 20 to 30 feet (minimum) cable slack at each end within the Telecommunications Rooms; store slack in fiber slack storage reel mounted on the wall.

g. Place a pull rope along with cables where run in pathways (e.g., conduit) and spare capacity in the pathway remains. Tie off ends of the pull rope.
a. Neatly dress and organize cables using designated cable routing facilities, and fasten to support devices via tie wraps or Velcro-type straps.

b. When routing overhead within Telecommunications Rooms, neatly dress and organize cables on designated cable support apparatus (for example, cable tray/runway), and fasten cables to cable support apparatus via tie wraps or Velcro-type straps. When routing vertically within Telecommunications Rooms, neatly dress and organize cables on vertical cable support apparatus (for example, vertical cable runway), and properly fasten cables to cable routing facilities via tie wraps or Velcro-type straps. “Properly fasten” shall consist of cable ties in a ‘crossed’ configuration per cable or cable bundle (up to three cables or innerducts) every 24 inches on center.

5. Termination

a. Properly relieve strain from cables at termination points (at/within the fiber optic termination panels) per manufacturer’s instructions.

b. Bond cable armor to grounding point (busbar) – refer to section 270526 for additional information.

c. Provide breakout kits to furcate fibers from buffer tubes.

d. Terminate fiber strands via pigtail splicing at both ends using the specified fiber optic pigtail appropriate for the mode type of the fiber. Splicing type shall be fusion; mechanical splicing will not be accepted. Perform terminations in accordance with manufacturer’s instructions.

e. Provide required accessories and consumables for complete termination of fiber strands.

f. Provide 3 feet of unsheathed fiber (including buffer tube and broken out from the buffer tube) slack within the patch panel/termination enclosure at each end of the link. Properly store fiber slack in rear of patch panel into the ‘routing rings’, per manufacturer’s instructions.

B. Fiber Optic Cable Termination Panel

1. Provide fully assembled termination panel in designated equipment rack; locate per Drawings (if not shown, locate at the top). “Fully assembled” includes installation and mounting components and accessories such as adapter panels, coupling adapters, etc. required for operation.

2. Provide accessories required for proper installation of each termination panel, including connector panels and adapters.

3. Bond termination apparatus to grounding point (busbar) – refer to section 270526 for additional information.

3.4 LABELING

A. General Requirements

1. Labeling, identifier assignment, and the label colors shall conform to the TIA/EIA-606-A Administration Standard and as approved by Owner or Owner’s Representative before installation.

2. Provide permanent and machine generated labels; hand written labels will not be accepted.

B. Cable Labels

1. Label Format:

   a. Label type shall be wrap-around self-laminating.

   b. Label color shall be white background with clear laminating window.
c. Text color shall be black; text height shall be 1/8” high, minimum, or #12 font size.

2. Provide labels on both ends of cables. Fully wrap label around the cable jacket. Install labels no more than 4 inches from the edge of the cable jacket. Install labels such that they are visible by a technician from a normal stance.

C. Termination Apparatus Labels
   1. Use labels included in the product packaging. For substitutions, request approval by the Engineer.
   2. Label color shall be brown, white, and/or grey for respective field type, per TIA/EIA-606-A.
   3. Text color shall be black, 3/32” high, minimum, or #10 font size.

D. Identifier Assignment
   1. General: Separate all label fields of the identifier with a hyphen.
   2. Backbone OSP Fiber Optic Cables
      a. The first field shall identify the cable type: “CBF” (for Cable, Backbone, Fiber optic).
      b. The second field shall identify the originating termination room identifier as shown on the plans; e.g., “MDFA.1”.
      c. The third field shall identify the ending termination room identifier as shown on the plans; e.g., “BDF1.1”.
      d. The fourth field shall identify the type and number of strands; for example, “Mxxx” where “M” stands for multimode and xxx stands for the ending fiber strand sequential count.
      e. Identifier Example: “CBF-MDFA.1-BDF1.1-M145-M192”
   3. Termination Positions at the Termination Panels
      a. Make the first field of the identifier the destination room; for example “TO IDF2.2”.
      b. Make the second field of the identifier the strand count range; for example, “M025-M048”
      c. Identifier Example: “TO BDF1.1 M145-M192”.

3.5 FINAL INSPECTION AND CERTIFICATION

A. Punch the Work of this Section compliant to the requirements of Section 27 00 00.
B. Remove and replace with new, at no cost to the Owner, cables or conductors failing to meet the indicated standards and not passing the testing requirements of Section 27 08 21. The Owner, or Owner's Representative, will not accept the installation until testing has indicated a 100% availability of all cables and conductors or the Owner or Owner's Representative has approved any deviation from this requirement.

Comply with system acceptance and certification requirements of Section 27 00 00.END OF SECTION
SECTION 27 15 13 COMMUNICATIONS HORIZONTAL TWISTED PAIR CABLING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes: Horizontal Twisted Pair Cabling (subsystem of Telecommunications Cabling Infrastructure)
B. Related Sections
   1. Comply with the Related Sections requirements of Section 27 00 00
   2. Section 27 08 11, “Communication Twisted Pair Testing”
   3. Section 27 13 13, “Communication Backbone Twisted Pair Cabling”

1.2 REFERENCES

A. Comply with the References requirements of Section 27 00 00.
B. In addition to the codes and standards listed in Section 27 00 00, comply with the latest edition of the following applicable specifications and standards except as otherwise shown or specified:
   1. National Fire Protection Agency (NFPA)
   2. Underwriters Laboratories (UL): Applicable listing and ratings, including but not limited to the following standards:
      a. UL 444, “Communications Cables”
      b. UL 497, “Protectors for Paired-Conductor Communication Circuits”
      c. UL 1581, “Reference Standard for Electrical Wires, Cables, and Flexible Cords”
      d. UL 1666, “Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts”
      e. UL 1863, “Communications-Circuit Accessories”
      f. UL 2024A, “Optical Fiber Cable Routing Assemblies”
   3. Insulated Cable Engineers Association (ICEA):
      a. ANSI/ICEA S-90-661-2008, “Category 3, 5, and 5e Individually Unshielded Twisted Pair Indoor Cable for Use In General Purpose and LAN Communication Wiring Systems”
   4. Telcordia
      a. GR-111, “Generic Requirements for Thermoplastic Insulated Riser Cable”

1.3 DEFINITIONS
A. Refer to Section 27 00 00 for Definitions.

B. In addition, define the following list of terms as used in this specification as follows:

2. “Channel”: End to end transmission path; e.g., the entire portion of the horizontal cabling to each outlet consisting of the Permanent Link, line cord (at the workstation), patch cord, and, if a full crossconnection is implemented, the crossconnect termination/connecting apparatus and equipment cord.
3. “CMP”: Communications Media Plenum [NEC plenum rating]
4. “CMR”: Communications Media Riser [NEC riser {non-plenum} rating]
5. “FEP”: Fluorinated Ethylene Propylene
6. “FTP”: Foiled Twisted Pair
7. “PE”: Polyethylene
8. “Permanent Link”: Test configuration for a horizontal cabling link excluding patch cords, equipment cords, and line cords; e.g., the ‘permanent’ portion of the horizontal cabling to each outlet consisting of cable, consolidation point (if used), termination/connecting apparatus in the telecommunications and the connector at the outlet.
9. “PVC”: PolyVinyl Chloride
10. “UTP”: Unshielded Twisted Pair

1.4 SYSTEM DESCRIPTION

A. Work Covered Under Other Sections

1. Pathways: The communications pathways (basketway, conduits, stubs, etc.) work will be covered under another Section. Refer to the contract drawings for size/capacity and route information.
2. Rooms: Build out (e.g., backboards, overhead and vertical cable runway, etc.) of the telecommunications rooms will be covered under another Section. Refer to the contract drawings for build out information.
3. Connecting Media: Patch cords in the IDF’s between horizontal field and network equipment (e.g., access switch), patch/line cords at the work areas between outlet and user equipment (e.g., phone, computer, etc)

B. Base Bid Work

1. Provide engineering, labor, materials, apparatus, tools, equipment, and transportation required to make a complete working communications Horizontal Twisted Pair Cabling System installation described in this Section and shown on related drawings. Consider Horizontal Cabling as shown on contract drawings as base bid work, unless otherwise noted. This includes terminations at both ends.
2. In general, the base bid work includes:
   a. Submittals
   b. Horizontal cables, terminations, and outlets
   c. Cable management
   d. Patch cords and crossconnections
   e. Cable identification tags and system labeling
   f. Record Documents
   g. Warranty

C. Jack Wiring: T568A per CCCC Infrastructure standard 2.6.

1.5 SUBMITTALS
A. Comply with the Submittals article of Section 270000 for procedural, quantity, content, and format requirements.

B. Substitutions
   1. Conform to substitutions requirements and procedure in Section 270000.

C. Submittal Requirements at Start Of Construction:
   1. Product Data Submittal, indicating conformance with NEC, UL, TIA/EIA listings, certifications and specifications.
   2. Sample Submittal, consisting of the following components:
      a. Type “A” Outlet Sample – one fully configured outlet including faceplate, modular jacks, and label
      b. Cable Label Sample
   3. Schedule Submittal, consisting of proposed schedule of work. This schedule may be combined with the schedule developed for 27xxxx series Sections
   4. Shop Drawings Submittal, consisting of proposed changes to cable routing, or termination locations/configurations

D. Submittal Requirements at Closeout:
   1. As-Built Drawings
   2. Cable ID –to– Office Number Key: Submit a “cable ID-to-Office number key” as an electronic file in an MS-Excel spreadsheet file format containing a list of every cable identifier associated with the final office number
   3. Crossconnection records/cut sheets
   4. O & M Manuals

E. Posted Documentation
   1. Post one full size plot of as-built drawings, specifically the floor plans and (as applicable) reflected ceiling plans, within TRs such that show the TR’s serving area. Coordinate location with Owner.

1.6 QUALITY ASSURANCE

A. Comply with Quality Assurance requirements of Section 270000.

B. Contractor Qualifications
   1. In addition to the Contractor Qualifications requirements of Section 27 00 00, the Contractor shall be certified by the manufacturer to provide the cabling system (proposed, submitted, and approved) and to provide an extended warranty. Submit satisfactory evidence of certification in the form of a current letter or certificate from the manufacturer as part of the bid.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Comply with the Delivery, Storage and Handling requirements of Section 27 00 00.

1.8 WARRANTY
A. The horizontal cabling system, as specified in this section, shall carry a 15-year (minimum) extended system warranty. This extended warranty shall cover parts and labor for the duration of the extended warranty. This extended warranty shall also cover electrical performance of cabling system to the specific category per ANSI/TIA/EIA-568-C performance criteria for horizontal cabling.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. CommScope SYSTIMAX cabling system
B. Panduit cabling system
C. Berk-Tek (cable) and Leviton (connectivity) cabling system
D. Belden cabling system
E. Superior Essex cabling system

2.2 SUBSTITUTIONS

A. Comply with the Substitutions requirements of Section 27 00 00.

2.3 HORIZONTAL CABLE – CAT6A PLENUM (CMP) RATED

A. Application: Suitable for indoor installation, within ceiling space in primary and secondary pathways, within access/raised floor space.
B. Conductors:
   1. Insulated Conductors: 23 AWG solid copper, fully insulated with a flame retardant thermoplastic material (material = FEP, or equivalent).
C. Cable Sheath:
   1. Outer Jacket: seamless outer jacket (material = LS-PVC, or similar) applied to and completely cover the internal components (twisted pairs).
   2. Flame Rating: NEC (Article 800) rated as CMP, and UL listed as such.
D. Electrical Performance: Meet or exceed TIA/EIA-568-C.2, ISO 11801 Class E Edition 2.1, and IEEE Std. 802.3an channel requirements for supporting 10GBASE-T.

2.4 TERMINATION APPARATUS – MODULAR PATCH PANEL, CAT6A RATED

A. Application: Panels shall be suitable for installation within a telecommunication room (IDF) for the termination of the horizontal cables specified herein. Panels shall be horizontally oriented for a rack-mounted configuration. Panels shall be capable of supporting, organizing, labeling and patching/ crossconnecting between the horizontal termination field and the equipment termination field.
B. Mechanical Performance: Each port shall be an 8-position modular jack, compliant to ANSI/TIA-568-C.2 (2.5.7).
C. Electrical Performance: Each port shall meet or exceed TIA/EIA-568-C.2 6.8 and ISO/IEC 11801 requirements for CAT6A UTP cabling through the cable termination and patch cord connection.

D. Manufacturer:
   1. Belden
      a. #AX103256; CAT6A modular patch panel “10GX”, flat, 48 ports, preloaded with 48 KeyConnect jacks
   2. CommScope
      a. #M2000-2U; Modular patch panel for “GigaSPEED X10D”, 48 ports
   3. Leviton
      a. #6A586-U48; CAT6A modular patch panel “eXtreme 6A”, flat, 48 ports
   4. Ortronics
      a. #OR-PHD610U48; CAT6A modular patch panel “Clarity10G”, flat, 48 ports
   5. Panduit
      a. #DP486X88TGY; CAT6A modular patch panel “DP6 10Gig”, flat, 48 ports
   6. Or equal

2.5 MODULAR CONNECTOR / 8-POSITION JACK – CAT6A RATED

A. Application: Modular connectors (jacks) for termination of 4-pair UTP cables; modular connectors shall be compatible with the 4-pair cables specified herein this section both electrically and physically.

B. Mechanical Performance: Modular jacks shall be 8-position, compliant to ANSI/TIA-568-C.2.

C. Electrical Performance: Each jack shall meet or exceed TIA/EIA-568-C.2 and ISO/IEC 11801 requirements for CAT6A UTP cabling.

D. Manufacturer:
   1. Belden
      a. #AX104156; CAT6A 8-position “10GX KeyConnect” jack, blue
      b. #AX102282; CAT6A 8-position “10GX KeyConnect” jack, white
   2. CommScope
      a. #MGS500BH-318; CAT6A 8-position “GigaSpeed X10D” jack, blue
      b. #MGS500BH-262; CAT6A 8-position “GigaSpeed X10D” jack, white
   3. Leviton
   4. Panduit

2.6 WORK AREA OUTLETS

A. Faceplates for Standard Flush-Mount Outlets
   1. Application: Faceplates shall be suitable for indoor installation for standard 1-gang and 2-gang flush-mount devices.
   2. Faceplates shall have 2, 3, 4, or 6 ports, and shall include required accessories, such as icons, blank inserts, label windows and labels.
4. Manufacturer:
   a. Belden
   b. CommScope
   c. Leviton
   e. Ortronics

A. Labels shall be machine printable with a laser printer, ink jet printer, thermal transfer printer, or hand-held printer.

B. Labels for Horizontal Cables
   1. Adhesive backed labels and self-laminating feature.
   2. Fit the horizontal cables listed above (i.e., shall fully wrap around the cable’s jacket).
   3. Size: 2"x.05" printable area, minimum
   4. Color: Per CCCC Infrastructure Standard 2.6, Color Coding standard for patch cables and jacks:
      a. Voice - white cable and jacks
      b. Data in Administrative Areas and Offices - blue cable and jacks
      c. Data in Instructional Areas - yellow cable and jacks
      d. Emergency Speakers – orange cable and jacks
      e. Wireless Access Points - green cable and jacks
      f. Security – black cable and jacks

5. Manufacturer:
   a. Panduit
      1) #S100X150YAJ; labels for cable diameters 0.16"-0.32", white, desktop printer (laser or ink jet)
   b. Or equal

2.8 MISCELLANEOUS COMPONENTS

A. Velcro Cable Ties
   1. Width: .75".
   2. Manufacturers:
      a. Panduit “Tak-Ty” series cable ties
      b. Panduit
         1) #HLS-15R-0; black, 15’ roll, cut to length.
      c. Or Equal

B. Plenum Cable Ties
   1. Application: for use in plenum or air handling spaces
   2. Color: maroon or other distinctive non-white color
   3. Manufacturer:
      a. Panduit
         1) #PLT1M-xxxx
         2) #PLT2S-xxxx
         3) #PLT3S-xxxx
      b. Or equal.
PART 3 - EXECUTION

3.1 GENERAL

A. Comply with the Execution requirements of Section 27 00 00.

3.2 EXAMINATION AND PREPARATION

A. Rooms: Prior to installation, verify equipment rooms are suitable to accept the horizontal cables and terminations.
B. Pathways: Prior to installation verify that pathways and supporting devices, provided under other sections, are properly installed, and that temporary supports, devices, etc., have been removed. Verify dimensions of pathways, including length (for example, “True Tape” the conduits).
C. Cable Integrity: Prior to installation, verify the cable’s integrity – both sheath and conductors. Documentation of pre-installation testing is not a close out requirement, and is the responsibility of the Contractor.

3.3 INSTALLATION

A. Cable Installation and Routing
   1. Cable runs shall have continuous sheath continuity, homogenous in nature. Splices are not permitted anywhere.
   2. Place cables within designated pathways, such as cable tray, basketway, cable hangers, etc. Do no fasten (such as with cable ties) or attach cables to other building infrastructure (such as ducts, pipes, conduits, etc), other systems (such as ceiling support wires, wall studs, etc), or to the outside of conduits, cable trays, or other non-approved pathway systems.
   3. Place and suspend cables and conductors during installation and termination in a manner to protect them from physical interference or damage. Place cables with no kinks, twists, or impact damage to the sheath. Replace cables damaged during installation or termination at no additional cost.
   4. Maintain minimum cable length of 15 meters from the termination in the IDF to the termination at the user’s faceplate (permanent link).
   5. No cable length shall exceed 90 meters from the termination point in the IDF to the termination point at the work area (permanent link).
   6. Route cables at 90-degree angles, allowing for bending radius, along corridors for ease of access.
   7. Do not exceed manufacturer’s limits for pulling tension.
   8. Do not use cable-pulling compounds for indoor installations.
   9. Maintain a minimum bend radius of 6 times the cable diameter during and after installation.
   10. Route cables under building infrastructure (such as ducts, pipes, conduits, etc); Do not route cables over building infrastructure. The installation shall result in easy accessibility to the cables in the future.
   11. Place cables 6”, minimum, away from power sources to reduce interference from EMI.
   12. Place a pull string along with cables where run in pathways and spare capacity in the pathway remains. Tie off ends of the pull string (to prevent the string from falling into the conduit).
   13. Neatly dress and organize cables using designated cable routing facilities, and fasten to support devices via tie wraps or Velcro-type straps.
14. When exiting the primary pathway (such as basketway or cable tray) to the work area, exit via the top of the pathway. Secure the cables to the pathway using an approved cable tie.

B. Cable Routing and Dressing within the IDF
1. Place cables within the overhead cable support and, when routing vertically, fasten the cables onto wall-mounted vertical cable support every 24 inches on-center using cable ties.
2. At the rack bay, route cables into the back of the vertical management sections (do not route cables into the front as this space is reserved for patch cords only). Divide the cables equally between both sides of an equipment rack such that a cable does not travel past the midpoint of the rack prior to termination. Dress and cut cables to length required to reach the designated termination point with no excess cable and slack left in the horizontal cable manager, vertical cable manager, and overhead cable support.
3. Provide 10-15 feet, minimum, sheathed cable slack – length not to exceed permanent link maximum length requirement. Place the slack in the overhead cable support.

C. Termination in the IDF
1. Provide termination apparatus and accessories required for a complete installation. Install and assemble termination apparatus, accessories and associated management apparatus according to the manufacturer’s instructions.
2. Cables must terminate in a data room (TR) on the same floor
3. Properly strain relieve cables to and at termination points per manufacturer’s instructions.
4. Terminate cables and twisted pairs in accordance with manufacturer's latest installation requirements and ANSI/TIA-568-C.0 standard installation practices. Terminate cable pairs onto the termination apparatus. Terminate twisted pairs compliant to ANSI/TIA-568-C.0 and wired per 1.04 System Description.
5. Modular Patch Panels and Horizontal Management Panels
   a. Provide quantity of modular patch panels to support termination of cables served from respective IDF. Provide quantity of horizontal management panels based on the quantity of patch panels.
   b. Install and assemble modular patch panels and horizontal management panels according to the manufacturer’s instructions.
   c. Install the patch panels and the horizontal management panels as shown on the contract drawings. If configuration is not shown, install the patch panels in association with the horizontal management panels such that a management panel is mounted above and below given patch panel.

D. Cable Routing and Dressing at the Work Areas
1. Provide 2-4 feet, minimum, sheathed cable slack – length not to exceed permanent link maximum length requirement. Place the slack within ceiling space neatly on a cable hanger.

E. Termination at the Work Areas
1. Provide device components, connectors, and accessories required for a complete installation. Install and assemble connectors, jacks, adapters, termination apparatus, accessories and associated management apparatus according to the manufacturer’s instructions.
2. Provide six inches, minimum, sheathed cable slack behind each workstation outlet faceplate. Coil the slack cable inside the raceway, within the wall, or in the junction box (if used), per the cabling manufacturer's installation standards.
3. Type “A” Wall-Mount Faceplates
a. Install devices at heights shown on the contract drawings. If no heights are shown, install at 24" AFF on center (+/- 3").
b. Mount faceplates plumb, square, and at the same level as adjacent device faceplates.
c. Patch gaps around faceplates so that faceplate covers the entire opening.

4. Type “C” Furniture-Mount Faceplates
   a. Coordinate installation of faceplate adapters with the furniture contractor, including color.
   b. Mount faceplate adapters into the designated opening for telecommunications cabling.

5. Terminate cables and twisted pairs in accordance with manufacturer’s latest installation requirements and ANSI/TIA-568-C.0 standard installation practices. Terminate twisted pairs compliant to ANSI/TIA-568-C.0 and wired per 1.04 System Description.

3.4 LABELING

A. General Requirements
   1. Labeling, identifier assignment, and label colors shall conform to ANSI/TIA/EIA-606-A Administration Standard and as approved by the Owner before installation.
   2. Permanent labels with machine-generated text (hand written labels will not be accepted).

B. Label Formats
   1. Horizontal Cable Labels
      a. Text Attributes: Black, 1/8" high, minimum, or #12 font size.
      b. Install labels on both ends of cables no more than 4" from the edge of the cable jacket. Install labels such that they are visible by a technician from a normal stance.
   2. Patch Panel Labels
      a. Use modular patch panel labels included in the product packaging. Request approval by the Engineer for other labels.
      b. Use a label color for the respective field type, per TIA/EIA-606.
      c. Text Attributes: Black, 3/32" high, minimum, or #10 font size.
   3. Termination Block Labels
      a. Use labels included in the product packaging. Any deviation from this requirement must be approved in writing by the Owner.
      b. Use a label color for the respective field type, per TIA/EIA-606-A.
      c. Text Attributes: Black, 3/32" high, minimum, or #10 font size.
   4. Outlet Labels
      a. Use outlet labels included in the product packaging. Any deviation from this requirement must be approved in writing by the Owner.
      b. Label Background: White.
      c. Text Attributes: Black, 1/8" high, minimum, or #12 font size.
      d. Install label in the top label window. Leave the bottom label window blank.

C. Identifier Assignment
   1. General: Separate label fields of the identifier with a hyphen.
   2. Horizontal Cables
a. Refer to drawings.

3. Outlets
   a. Refer to drawings.

4. Individual Ports at the Outlets
   a. Refer to drawings.

5. Individual Termination Positions at Termination Blocks
   a. Refer to drawings.

6. Individual Ports at Patch Panels
   a. Coordinate colors and function requirements with owner prior to final installation.

3.5 FINAL INSPECTION AND CERTIFICATION

A. Punch the Work of this Section compliant to the requirements of Section 270000.
B. Remove cables and replace with new those failing to meet the indicated standards and not passing the testing requirements of Section 270811 with no impact to cost and schedule. The Owner, will not accept the installation until testing has indicated a 100% availability of all cables and conductors. Any deviation from this requirement must be approved in writing by the Owner.
C. Comply with system acceptance and certification requirements of Section 270000.

END OF SECTION
SECTION 272310 - INSTRUCTIONAL PLANETARIUM MEDIA SYSTEMS (IPMS)

PART 1 – GENERAL

1.1 PROJECT DESCRIPTION/WORK INCLUDED

A. Please refer to diagrammatic and schematic level drawings A.1 PL, AV1. BLOCK DRAWING, A1.CONSOLE, and TE1.PL. as well as attached specified equipment cut sheets. The selected contractor shall provide, install, train for, and support the following instructional media systems (IPMS):

1. INSET DOME PROJECTION SYSTEM. WUXGA projector produces a partial dome projection app. 8’ high x 16’ wide.

Specified Model: Panasonic PT-EZ770 with mount attached to dome tension ring

2. ULTRA-SHORT THROW PROJECTION SYSTEM. This is an Ultra Short-Throw (0.23 ratio) Projector for roll-down screen. Native Resolution is 1920 x 1080.

Specified Model: Viewsonic LS830 with wall mount PJ-WMK-304 Universal Wall Mount Kit

3. Two (2) 65” wall-mounted monitors

Specified Model: Panasonic TH-65SF2U

4. Roll-down electric screen for 52” x 92” (16:9) image

Specified Model: DA-LITE Tensioned Advantage Deluxe Electrol screen- DaMat surface -52” x 92”

5. 6 IN/4 OUT MEDIA MATRIX/ROUTING SWITCHER - for distributing six video/data sources with four outputs

Specified Model: Crestron DM-MD6X4

B. The Planetarium takes the form of multi-use domed theater and, in addition to astronomy, is also used for general instruction/lecture and visualization by various College Departments including: Science, Engineering, and Math.

C. Unless otherwise noted, a substituted component may be proposed and included, but only if approved in advance by the Planetarium Design Consultant and/or the Contra Costa College.

D. This specification shall apply to all phases of Work hereinafter specified, shown on drawing, or as required to provide a complete installation. Work required under this specification, is not limited to just the (IPMS) - refer to Architectural, Electrical, Structural, and Raceway/Structural Cabling, as well as all other drawing applicable to this project, which designate the scope of work to be accomplished. The intent of the drawings and Specifications is to provide a complete and operable planetarium system that includes all documents that are a part of the Contract.

1. Work Included. Furnish labor, material, services and skilled supervision necessary for the construction, erection, installation, connections, testing, and adjustment of all IPMS equipment specified herein, or shown or noted on drawings, and its delivery to the Owner complete in all respects ready for use.
2. The IPMS work includes installation or connection of certain materials and equipment furnished by others. Verify installation details, installation and rough-in locations from the actual equipment or from the equipment shop drawings.

E. The associated system drawings are diagrammatic and are intended to convey the scope of work, indicating intended general arrangement of equipment. Follow drawings in laying out work and verify spaces for installation of materials and equipment based on actual dimensions of equipment furnished.

1.2 RELATED DOCUMENTS AND SECTIONS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 specification sections, apply to this section.

B. Division 06 sections for the construction of a custom audiovisual console for racks, cabling, wiring, devices, controls, adapters, etc. and other material and equipment required to complete the IPMS.

C. Division 26 sections for connections to fire-alarm systems, wiring, disconnect switches, and other electrical materials required to complete the IPMS.

D. Division 27 sections for communications racks, cabling, wiring, devices, adapters, etc. and other electrical materials required to complete IPMS.

1.3 GENERAL REQUIREMENTS
A. Guarantee: Furnish a written guarantee for a period of two years from date of acceptance.

B. All of the equipment in this specification shall be furnished and installed by the Authorized Factory Installer of the equipment with the most current software and firmware package available at the time of installation. At the time of Owner Acceptance of the installation, all equipment shall include any and all updated software or hardware revisions. In addition, when the software is available in disk format, a backup copy of the most up to date revision, in disk format, shall be handed to Owner at the completion of the project.

C. Verifying Drawings and Job Conditions:
   1. Examine all project drawings and specifications to ensure full awareness of all work required under this Section.
   2. Visit the site and verify existing conditions. Where existing conditions differ from drawings, make adjustments and allowances for all necessary equipment to complete all parts of the work. Verify actual dimensions of construction contiguous with Planetarium equipment by field measurements before fabrication.
   3. Pre-installation Conferences: Conduct a minimum of one conference at the project site prior to the start of installation work. Where existing conditions differ from drawings, make adjustment and allowances for all necessary equipment to complete all parts of the work.

1.4 WORK IN COOPERATION WITH OTHER TRADES
A. Examine the drawings and specifications and determine the work to be performed by the electrical and other trades. Provide the type and amount of audiovisual systems materials and equipment necessary to place this work in proper operation, completely wired, tested and ready for u

B. Confirm Low voltage conduit, boxes and power have been provided by the division 26 00 00 contractor.

1.5 TESTING AND ADJUSTMENT
A. Upon completion of all audiovisual systems work, provide testing and demonstrating in the presence of the owner's inspector that the all audio, digital video and control parameters are as stated in the factory data sheets.

B. Promptly repair or replace all equipment and parts discovered to be in need of correction. Then retest that part of the system and all associated components to correct the error. Perform all such replacement or repair at no additional cost to the Owner.

1.6 FINAL INSPECTION AND ACCEPTANCE

A. After all requirements of the specifications and/or the drawings have been fully completed, representatives of the Owner will inspect the work. Provide competent personnel to demonstrate the operation of any item or system to the full satisfaction of each representative.

B. Final acceptance of the work will be made by the Owner after receipt of approval and recommendation of acceptance from each representative.

1.7 RECORD DRAWINGS

A. Drawings of Record: Provide and keep up-to-date, a complete record set of drawings. Keep these corrected daily and show every change from the original drawings. Keep this set of prints on the job site for use only as a record set. This shall not be construed as authorization for your firm to make changes in the layout without Owner approval in each case.

B. Upon completion of the work, obtain a set of Contract Drawings from the General Contractor and create a record set professionally using a PDF editor. Deliver this set in PDF format as indicated in Submittals – Close-Out, below.

1.8 APPROVALS, EQUALS, SUBSTITUTIONS, ALTERNATIVES, NO KNOWN EQUAL

A. Approvals: Where the words (or similar terms) “approved”, “approval”, “acceptable”, and “acceptance” are used, these refer to the requirement that acceptance by the Owner, Architect and Engineer is required.

B. Equal: Where the words (or similar terms) “equal”, “approved equal”, “equal to”, “or equal by”, “or equal” and “equivalent” are used, it shall be understood that these words are followed by the expression “in the opinion of the Owner, Architect, and Engineer.” For the purposes of specifying products, the above words shall indicate the same size, made of the same construction materials, manufactured with equivalent life expectancy, having the same aesthetic appearance/style (includes craftsmanship, physical attributes, color and finish), and the same performance.

C. Substitution: For the purposes of specifying products “substitution” shall refer to the submittal of a product not explicitly approved by the construction documents/specifications.

1. Substitutions of specified equipment shall be submitted and received by the Engineer ten days prior to the bid date for review and written approval. Regulatory Agency approval for all substitutions will be the sole responsibility of the Contractor. To receive consideration, requests for substitutions must be accompanied by documentary proof of its equality with the specified material. Documentary proof shall be in letterform and identify the specified values/materials alongside proposed equal values/materials. In addition, catalog brochures and samples, if requested, must be included in the submittal.

ONLY PRE-BID APPROVED PRODUCTS, ISSUED VIA A FORMAL BID ADDENDUM TO ALL BIDDERS, WILL BE ALLOWED ON THE PROJECT. REGARDLESS OF THE APPROVAL ON ANY SUBSTITUTION, ALL BIDS SHALL BE BASED ON THE PRODUCTS
EXACTLY AS SPECIFIED. PRICING FOR EACH APPROVED SUBSTITUTION SHALL BE INCLUDED IN THE BID SUBMITTAL AS A SEPARATE LINE ITEM.

2. The Contractor warrants that substitutions proposed for specified items will fully perform the functions required.

D. Alternates/Alternatives: For the purposes of specifying products, “alternatives/alternates” may be established to enable the Owner/Architect/Engineer to compare costs where alternative materials or methods might be used. An alternate price shall be submitted in addition to the base bid for consideration. If the alternate is deemed acceptable, written authorization will be issued.

E. No Known Equal: For the purposes of specifying products, “No Known Equal” shall mean that the Owner/Architect/Engineer is not aware of an equivalent product. The Contractor will need to submit a “Substitution” item, per the requirements listed above, if a different product is proposed to be utilized.

1.9 SUBMITTALS – PRE-CONSTRUCTION

A. Submit the shop drawing submittal as PDF files accompanied by Letter of Transmittal, which shall give a list of the number and dates of the drawings submitted.

B. Provide consecutively numbered drawings featuring the name of the project that indicate the name of the specific staff that checked and approved each drawing. Any drawings submitted without this approval will be rejected.

C. If the shop drawings show variations from the requirements of the Contract because of standard shop practice or other reasons, make specific mention of such variations in the Contractor’s letter of transmittal. If the substitution is accepted, the Contractor shall be responsible for proper adjustment that may be caused by the substitution. Submit samples upon request.

D. Only products listed as “Equal” within the contract documents, along with formally approved “Substitutions” will be reviewed. Products not conforming to these items will be rejected.

E. Shop drawings shall be submitted on the following but not limited to:

   1. System functional diagrams, including control system wiring and audio DSP processing chain
   2. Equipment locations and methods for mounting
   3. Console layout, equipment placement, etc.
   4. All other products called out on drawings that call for shop drawing submittal

1.10 SUBMITTALS – CLOSE-OUT

A. Subsequent to completing preliminary testing, provide to the Construction Manager, Owner, and Planetarium consultant, a letter/report documenting the results of the preliminary tests and the documentation detailed below. The receipt of this documentation will constitute the acknowledgment that the installation is complete, that it conforms to this specification, and that it is ready to be reviewed and tested.

B. Operation and Maintenance Manuals: Provide all manuals as PDF files on three duplicate CD-ROM disks or USB drives, named consistently with the manufacturer’s name and the model number in separate folders for the planetarium and exhibit hall. Copy the same file and folder organization to the Owner.

   1. Provide step-by-step operating instructions for the day-to-day use of the system including power activation, connection of source devices, adjustment of volume levels, selection of sources, etc. Include illustrations and references to individual equipment manuals as nec-
2. Organize the manual PDF files into folders by subsystem: audio, video, control, etc.
3. Equipment List: Include an Excel or other spreadsheet file listing all equipment including connectors and specialty hardware. Include columns for manufacturer, model, physical location, MAC address, IP address, if fixed or DHCP, VLAN, serial number, and cable label identification.

C. As-built drawings: Provide all as-built documentation as PDF files on the disks and online service mentioned above. In addition, provide a single copy each of the functional drawings, floor plans, and ceiling plans as laminated full-size drawing sets.

PART 2 - SYSTEM EQUIPMENT SPECIFICATION

2.01 PLANETARIUM INSTRUCTIONAL AND EVENT PRESENTATION SYSTEM

A. This is provision and installation of a fully integrated instructional/classroom/event video/graphic system capable of projecting computer data graphics and text in addition to distance learning recording, streaming, and video conferencing. Please refer to drawings A.1 PL, AV1. BLOCK DRAWING, A1.CONSOLE, and TE1.PL. The selected contractor shall provide, install, train for, and support the following instructional media systems (IPMS):

1. INSET DOME PROJECTION SYSTEM. WUXGA projector produces a partial dome projection app. 8' high x 16' wide.

   Specified Model: Panasonic PT-EZ770 with mount attached to dome tension ring

2. ULTRA-SHORT THROW PROJECTION SYSTEM. This is an Ultra Short-Throw (0.23 ratio) Projector for roll-down screen. Native Resolution is 1920 x 1080.

   Specified Model: Viewsonic LS830 with wall mount PJ-WMK-304 Universal Wall Mount Kit

3. Two (2) 65" wall-mounted monitors

   Specified Model: Panasonic TH-65SF2U

4. Roll-down electric screen for 52" x 92" (16:9) image

   Specified Model: DA-LITE Tensioned Advantage Deluxe Electrol screen- DaMat surface -52" x 92"

5. 6 IN/4 OUT MEDIA MATRIX/ROUTING SWITCHER - for distributing six video/data sources with four outputs

   Specified Model: Crestron DM-MD6X4

   Please see attached cut sheets for above specified equipment

B. At the lab table location, the IPMS shall have connections vis to adjacent floor box location.
C. Video input and output from source devices to displays and projectors is achieved through routing of the matrix switcher.

D. System displays:
   1. Two data projectors one if front projecting on roll-down screen and one at the rear of the theater projecting on the dome screen (see 2.0.1 numbers #1 and #2)
   2. Two 65” wall mounted LED displays see (see 2.0.1 numbers #3)
   3. Fulldome Planetarium display located in center of theater and controlled at theater control console. Coordinate with Planetarium system provider.

PART 3 - EXECUTION

3.01 GENERAL INSTALLATION DESCRIPTION

A. Install Planetarium equipment level and plumb, according to manufacturer's written instructions and drawings from Planetarium Technology Consultant. The installation, configuration and wiring of the system shall be executed in accordance with the drawings and the equipment manufacturer's installation instructions and guidelines. Should any variations in these requirements occur, the Contractor shall notify the architect before making any changes. It shall be the responsibility of the factory-authorized installer of the approved equipment to install the equipment and guarantee the system to operate as per plans and specifications.

B. Complete equipment assembly and termination where field assembly is required.

D. Install equipment with access and maintenance clearances that comply with manufacturer's written installation instructions and with requirements of authorities having jurisdiction.

3.02 GENERAL TESTING REQUIREMENTS

A. Provide all instruments for testing and demonstrating in the presence of the owner's inspector that the all Audio, Digital Video and Control parameters are as stated in the factory data sheets. Check all circuits and wiring to verify they are free of shorts and grounds.

B. VOM shall be used to test continuity and phase of all new wiring and connections with the understanding that the system will function fully as designed.

C. Control functions shall be checked for proper operation, from controlling devices to controlled devices.

D. Adjust, balance, and align equipment for optimum quality and to meet the manufacturer's published specifications. Establish and mark normal settings for each level control with permanent machine printed labeling and provide in system documentation.

E. Controls: Adjust all controls to achieve the specified performance. Provide shaft-locks or covers for all level controls, as appropriate to prevent unauthorized gain changes. Confirm that all control system operations are properly programmed and repeatable.

F. Testing Report: Provide a letter/report documenting the results of these preliminary tests, including amplifier gain/level settings, crossover filter settings, and equalization curves for review by the AV Design Consultant.
G. Verify the following before beginning actual tests and adjustments on the System:

1. All electronic devices are properly grounded.
2. All powered devices have AC power from the proper circuit. All dedicated AC power circuits are properly wired, phased, and grounded.
3. Insulation and shrink tubing are present where required. All exposed bare wire shall be clear shrink wrapped or terminated within the phoenix block. NO exposed bare wire.
4. Dust, debris, solder splatter, etc. is removed.
5. All cable is dressed, routed, and labeled; all connections are properly made and consistent with regard to polarity.

H. Cable and Fiber.

1. Test all cables as installed for shorts between conductors or to building ground and for opens.
2. Certify all data cables installed to Category 6 standards or better.
3. Document all tests and complete measurement results including wire number, date, test equipment used, operator, and test results. If any problems are detected in testing, correct the problem, and retest.

I. Video System Tests:

1. Verify performance of all video connecting cables, as specified herein. Continuity tests are not acceptable. Replace any defective cable prior to continuing testing.
2. Perform video signal parameter tests on individual items of equipment, and the work as a whole in accordance with EIA, SMPTE and AES Recommended Practices and other recognized standards as listed under REFERENCES.
3. Provide full flat panel monitor display calibration and adjustments for optimal picture quality for a single HDMI input. Provide proper aspect ratio configuration for both 16:9 and 16:10 sources. Use a test generator for all setup verification, and verify proper image configuration with the all inputs. (Contract the Owner’s Technical Representative prior to final adjustment to coordinate).
4. Projection Systems:
   a. Luminance testing consistent with performance of specified projectors and screens.
   b. Brightness, convergence per ANSI standard procedures for device.
   c. Measure nine points of illuminance per screen and calculate average value in lumens.
   d. High-bandwidth Digital Content Protection (HDCP) check
5. At spaces with HDMI transmission:
   a. Run HDCP check to ensure all devices are HDCP compliant.
   b. Test with sample source device with quantity of HDCP keys as required to operate by the system.

3.03 ACCEPTANCE TESTS

A. Acceptance Test: Owner’s Representative and/or Construction Manager will be present during acceptance testing and require assistance. Provide personnel who participated in the actual installation and preliminary testing and adjustment of the audiovisual systems. At their option, the Owner may contract and pay for a third-party consultant to perform system testing. This cost is not included in the Contractor’s contract.

Demonstrate each major component to function as specified.
B. Such tests may be performed on any piece of the system or individual equipment/device. If any test shows the equipment or system is defective or does not comply with the specifications, perform any remedies at your firm’s expense and pay the subsequent expenses of any required retesting.

3.04 TRAINING AND FIELD SUPPORT

C. Training: System Functionality
   a. Provide a minimum of one, eight-hour day of prepared and organized training sessions (separate from full dome training sessions) for the benefit of the Owner’s personnel. Demonstrate the location, wiring, operation and capabilities of each system component. Training time is to be non-contiguous, in multiple separate sessions.
   b. Develop with CCC, a training schedule to allow for training. Training shall be of sufficient duration and depth and the schedule shall allow adequate time for personnel to absorb the training.
   c. At minimum, include training on each component of the IPMS.

3.05 MISCELLANEOUS PROJECT REQUIREMENTS

A. Single Point of Contact: Provide an English-proficient, single point of contact, i.e., project manager, to speak for the Contractor and to provide the following functions:
   1. Initiate and coordinate tasks with Owner’s Project Manager, and others as specified by Owner’s Project Manager.
   2. Provide day-to-day direction and on-site supervision of Contractor personnel.
   3. Ensure conformance with all Contract provisions.
   4. Participate in weekly site project meetings as needed.
   5. This individual will remain as Project Manager for the duration of the project. The Contractor may change Project Managers only with the Owner’s Project Manager’s written approval.

B. Planning meetings and schedule: Within thirty (30) calendar days after the date of award of the Contract, an initial planning meeting will be held with the successful bidder to clarify all requirements (systems, services, distribution methods, etc.), identify responsibilities, and schedule the events that will transpire during the implementation of the project. Within one week of this initial meeting, the Contractor shall provide a written report and project schedule to clearly document the events and responsibilities associated with the project.

C. Site Cleaning: Throughout the progress of the plant construction, the Contractor shall keep the working area free from debris of all types and remove from the premises all rubbish resulting from any work done by Contractor. On a daily basis and at the completion of its work, the Contractor shall, to the extent possible, leave the premises in a clean and finished condition.

D. Safety Requirements: Contractor will utilize appropriate personnel and display warning signs, signals, flags and/or barricades at the work site to ensure adherence to safety regulations and as prudence requires.

E. Specification/Drawing Status: All specifications and drawings related to this project will be “frozen” after shop drawing approval. The Owner reserves the right to negotiate any future changes with the Contractor at any time.

F. Upon approval of shop drawings, contractor shall immediately place orders for all required materials, components, and supplies. In addition, contractor shall secure and forward written confirmations (including orders and shipping dates) direct from each manufacturer/vendor to the Owner’s Project Manager.
G. Contractor shall expedite shipment of all materials, components and supplies, as necessary to ensure the successful completion of the Project by the date required. All costs for expediting shall be included within contractor’s pricing as provided below.

H. The system cost herein shall include administration/maintenance training for at least ten Owner’s representatives with a minimum allotment of sixteen (16) hours. All training shall include written and/or video materials that shall remain the property of Owner. If materials are written, they shall be provided in quantities sufficient for each person trained; if materials are video, one copy of each will be required. The administration/maintenance training shall include, but not be limited to, the following:
   1. Review of as-built documentation, including a site demonstration.
   2. All warranty information.

3.06 DAMAGES

A. The Contractor will be held responsible for any and all damages to portions of the building caused by it, its employees or sub-contractors; including but not limited to:
   1. Damage to any portion of the building caused by the movement of tools, materials or equipment.
   2. Damage to any component of the construction of spaces.
   3. Damage to the electrical distribution system.
   4. Damage to the electrical, mechanical and/or life safety or other systems caused by inappropriate operation or connections made by the Contractor or other actions of Contractor.
   5. Damage to the materials, tools and/or equipment of the Owner, its consultants, agents and tenants.
   6. Damage to the projection dome surface
   7. Damage, interference, or outage to campus wide area or local area networks.

3.07 INSPECTIONS

A. On-going inspections shall be performed during construction by the Owner’s Project Manager. All work shall be performed in a high quality manner and the overall appearance shall be clean, neat and orderly. The following points will be examined and must be satisfactorily complied with:
   1. Are all cables properly labeled, from end-to-end?
   2. Have all terminated cables been properly tested in accordance with the specifications for the specific category as well as tested for opens, shorts, polarity reversals, transposition and presence of AC and/or DC voltage?
   3. Have the pathway guidelines been followed? Are all cable penetrations installed properly and fire stopped according to code?
   4. Has the Contractor avoided excessive cable bending?
   5. Is Cable fill correct?
   6. Are terminations compatible with applications equipment?
   7. Are connectors properly turned right side up in the Jack Panels or faceplates without cables wrapped or twisted?
   8. Is the jacket maintained right up to the termination?
   9. Are identification markings uniform, permanent and readable?

3.08 COMPLETION OF WORK

A. At the completion of the System, restore to its former condition, all aspects of the project site. On a daily basis, remove all waste and excess materials, rubbish debris, tools and equipment
resulting from or used in the services provided under this Contract. Provide all clean up, restoration, and removal noted above at no cost to Owner. If the Contractor fails in its duties under this paragraph, the Owner may upon notice to the Contractor perform the necessary clean up and deduct the costs thereof from any amounts due or to become due to the Contractor. Remove trash from work areas and bring it to the Contractor-provided dumpster.

B. Final Punch Walk: Complete a final inspection to determine if all conditions of the scope of work are completed to the owner’s satisfaction. Provide a punch list within ten days of the punch walk and present it to the Contractor for completion prior to final project sign-off by the owner. If an item is missed during the punch walk or not included on the “punch list” for any reason, it does not release the Contractor from completing the scope of work as defined in the specification or drawings.

C. Contractor shall submit complete Record Documentation as outlined in submittals section prior to project sign-off by owner.

3.09 SYSTEM AND/OR NETWORK TESTING

A. Upon completion of installation, execute all of the tests listed in this specification. Provide the Owner, written notice when all such tests have been completed to Owner’s satisfaction and Manufacturer’s specifications, Contractor shall give the Owner written notice thereof.

B. Assume responsibility of assuring that the system and network interface installed operates properly, including any required coordination with other suppliers.

3.10 FINAL ACCEPTANCE

A. The Owner or Owner’s representative may visit the site during the installation of the system to ensure that correct installation practices are being followed.

B. Notify the Owner’s representative when the systems are ready for a final job review. The review will take place within one week after notification.

C. If need for additional adjustment becomes evident during final acceptance and/or demonstration and testing, continue adjustment until the system functions fully as designed.

D. The Owner or Owner’s representative will review the installation and certification data prior to the system acceptance.

E. The Owner or Owner's representative may test some of the system's features to ensure that the certification data is correct. If a substantial discrepancy is found, the Owner reserves the right to have an independent consultant perform a certification of the entire system. If such a procedure is undertaken, the cost of the testing will be billed back to the Contractor.

F. In the event that repairs or adjustments are necessary, make these repairs at your firm’s expense. Complete all repairs within five days from the time they are disclosed to your firm.
SECTION 272315 - PLANETARIUM SOUND SYSTEM (PSS)

PART 1 – GENERAL

1.1 PROJECT DESCRIPTION/WORK INCLUDED

A. The selected contractor shall provide, install, train for and support a Planetarium 5.1 Sound System with ADA Assistive Hearing (referred to as PSS) for the CCC Planetarium as shown in schematic and diagrammatic drawings A.1 PL, AV1. BLOCK DRAWING, A1.CONSOLE, TE1.PL., and TE1.SOUND.

B. The Planetarium takes the form of multi-use domed theater and, in addition to astronomy, is also used for general instruction/lecture and visualization by various College Departments including: Science, Engineering, and Math.

C. The design is based on the following components:

Audio Speakers:

SIX (6) JBL PRX612 Powered speakers attached to dome frame

TWO (2) JBL PRX618S (subwoofers)

Digital Processor: The TesiraFORTÉ AI or Dante Compatible Cinema processor

Rack Mounted Mixer: Ashly LX-308B Line Mixer

D. Unless otherwise noted, a substituted component may be proposed and included, but only if approved in advance by the Planetarium Design Consultant and/or the Contra Costa College.

E. This specification shall apply to all phases of Work hereinafter specified, shown on drawing, or as required to provide a complete installation. Work required under this specification, is not limited to just the 5.1 Sound System - refer to Architectural, Electrical, Structural, and Raceway/Structural Cabling, as well as all other drawing applicable to this project, which designate the scope of work to be accomplished. The intent of the drawings and Specifications is to provide a complete and operable planetarium system that includes all documents that are a part of the Contract.

1. Work Included. Furnish labor, material, services and skilled supervision necessary for the construction, erection, installation, connections, testing, and adjustment of all equipment specified herein, or shown or noted on drawings, and its delivery to the Owner complete in all respects ready for use.

2. The PSS work includes installation or connection of certain materials and equipment furnished by others. Verify installation details, installation and rough-in locations from the actual equipment or from the equipment shop drawings.

F. The associated system drawings are diagrammatic and are intended to convey the scope of work, indicating intended general arrangement of equipment. Follow drawings in laying out work and verify spaces for installation of materials and equipment based on actual dimensions of equipment furnished.
1.2 RELATED DOCUMENTS AND SECTIONS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 specification sections, apply to this section.

B. Division 06 sections for the construction of a custom audiovisual console for racks, cabling, wiring, devices, controls, adapters, etc. and other material and equipment required to complete the PSS.

C. Division 26 sections for connections to fire-alarm systems, wiring, disconnect switches, and other electrical materials required to complete the PSS.

D. Division 27 sections for communications racks, cabling, wiring, devices, adapters, etc. and other electrical materials required to complete PSS.

1.3 GENERAL REQUIREMENTS
A. Guarantee: Furnish a written guarantee for a period of two years from date of acceptance.

B. Wherever a discrepancy in quantity or size of conduit, wire, equipment, devices, circuit breakers, etc., (all materials), arises on the Drawing and/or Specifications, provide and install all material and services required by the strictest condition noted on drawings and/or in specifications to ensure complete and operable systems as required by the Engineer of record.

C. Documents that your firm is a factory-authorized installer and warrantee station for the brand of equipment offered and maintain a fully-equipped service organization capable of furnishing adequate repair service to the equipment. Maintain a spare set of all major parts for the system at all times. All circuit boards, amplifiers and control sub systems shall be 100% backed up with stock at your firm’s shop.

G. All of the equipment in this specification shall be furnished and installed by the Authorized Factory Installer of the equipment. Furnish a letter from the manufacturer of all major equipment, certifying that your firm is the Authorized Installer and that the equipment has been installed according to factory intended practices.

H. All of the equipment in this specification shall be furnished and installed by the Authorized Factory Installer of the equipment with the most current software and firmware package available at the time of installation. At the time of Owner Acceptance of the installation, all equipment shall include any and all updated software or hardware revisions. In addition, when the software is available in disk format, a backup copy of the most up to date revision, in disk format, shall be handed to Owner at the completion of the project.

I. Verifying Drawings and Job Conditions:
1. Examine all project drawings and specifications to ensure full awareness of all work required under this Section.
2. Visit the site and verify existing conditions. Where existing conditions differ from drawings, make adjustments and allowances for all necessary equipment to complete all parts of the work. Verify actual dimensions of construction contiguous with Planetarium equipment by field measurements before fabrication.
3. Pre-installation Conferences: Conduct a minimum of one conference at the project site prior to the start of installation work. Where existing conditions differ from drawings, make adjustment and allowances for all necessary equipment to complete all parts of the work.
1.4 WORK IN COOPERATION WITH OTHER TRADES
A. Examine the drawings and specifications and determine the work to be performed by the electrical and other trades. Provide the type and amount of audiovisual systems materials and equipment necessary to place this work in proper operation, completely wired, tested and ready for use.

B. Confirm Low voltage conduit, boxes and power have been provided by the division 26 00 00 contractor.

1.5 TESTING AND ADJUSTMENT
A. Upon completion of all audiovisual systems work, provide testing and demonstrating in the presence of the owner's inspector that the all audio, digital video and control parameters are as stated in the factory data sheets.

B. Promptly repair or replace all equipment and parts discovered to be in need of correction. Then retest that part of the system and all associated components to correct the error. Perform all such replacement or repair at no additional cost to the Owner.

1.6 FINAL INSPECTION AND ACCEPTANCE
A. After all requirements of the specifications and/or the drawings have been fully completed, representatives of the Owner will inspect the work. Provide competent personnel to demonstrate the operation of any item or system to the full satisfaction of each representative.

B. Final acceptance of the work will be made by the Owner after receipt of approval and recommendation of acceptance from each representative.

1.7 RECORD DRAWINGS
A. Drawings of Record: Provide and keep up-to-date, a complete record set of drawings. Keep these corrected daily and show every change from the original drawings. Keep this set of prints on the job site for use only as a record set. This shall not be construed as authorization for your firm to make changes in the layout without Owner approval in each case.

B. Upon completion of the work, obtain a set of Contract Drawings from the General Contractor and create a record set professionally using a PDF editor. Deliver this set in PDF format as indicated in Submittals – Close-Out, below.

1.8 APPROVALS, EQUALS, SUBSTITUTIONS, ALTERNATIVES, NO KNOW EQUAL
A. Approvals: Where the words (or similar terms) “approved”, “approval”, “acceptable”, and “acceptance” are used, these refer to the requirement that acceptance by the Owner, Architect and Engineer is required.

B. Equal: Where the words (or similar terms) “equal”, “approved equal”, “equal to”, “or equal by”, “or equal” and “equivalent” are used, it shall be understood that these words are followed by the expression “in the opinion of the Owner, Architect, and Engineer.” For the purposes of specifying products, the above words shall indicate the same size, made of the same construction materials, manufactured with equivalent life expectancy, having the same aesthetic appearance/style (includes craftsmanship, physical attributes, color and finish), and the same performance.

C. Substitution: For the purposes of specifying products “substitution” shall refer to the submittal of a product not explicitly approved by the construction documents/specifications.

1. Substitutions of specified equipment shall be submitted and received by the Engineer ten days prior to the bid date for review and written approval. Regulatory Agency approval for all
substitutions will be the sole responsibility of the Contractor. To receive consideration, requests for substitutions must be accompanied by documentary proof of its equality with the specified material. Documentary proof shall be in letterform and identify the specified values/materials alongside proposed equal values/materials. In addition, catalog brochures and samples, if requested, must be included in the submittal.

ONLY PRE-BID APPROVED PRODUCTS, ISSUED VIA A FORMAL BID ADDENDUM TO ALL BIDDERS, WILL BE ALLOWED ON THE PROJECT. REGARDLESS OF THE APPROVAL ON ANY SUBSTITUTION, ALL BIDS SHALL BE BASED ON THE PRODUCTS EXACTLY AS SPECIFIED. PRICING FOR EACH APPROVED SUBSTITUTION SHALL BE INCLUDED IN THE BID SUBMITTAL AS A SEPARATE LINE ITEM.

2. The Contractor warrants that substitutions proposed for specified items will fully perform the functions required.

D. Alternates/Alternatives: For the purposes of specifying products, “alternatives/alternates” may be established to enable the Owner/Architect/Engineer to compare costs where alternative materials or methods might be used. An alternate price shall be submitted in addition to the base bid for consideration. If the alternate is deemed acceptable, written authorization will be issued.

E. No Known Equal: For the purposes of specifying products, “No Known Equal” shall mean that the Owner/Architect/Engineer is not aware of an equivalent product. The Contractor will need to submit a “Substitution” item, per the requirements listed above, if a different product is proposed to be utilized.

1.9 SUBMITTALS – PRE-CONSTRUCTION

A. Submit the shop drawing submittal as PDF files accompanied by Letter of Transmittal, which shall give a list of the number and dates of the drawings submitted.

B. Provide consecutively numbered drawings featuring the name of the project that indicate the name of the specific staff that checked and approved each drawing. Any drawings submitted without this approval will be rejected.

C. If the shop drawings show variations from the requirements of the Contract because of standard shop practice or other reasons, make specific mention of such variations in the Contractor’s letter of transmittal. If the substitution is accepted, the Contractor shall be responsible for proper adjustment that may be caused by the substitution. Submit samples upon request.

D. Only products listed as “Equal” within the contract documents, along with formally approved “Substitutions” will be reviewed. Products not conforming to these items will be rejected.

E. Shop drawings shall be submitted on the following but not limited to:

1. System functional diagrams, including control system wiring and audio DSP processing chain
2. Speaker locations and mounting details.
3. Single Line schematic drawings showing connections between all audio components.
4. All other products called out on drawings that call for shop drawing submittal

1.10 SUBMITTALS – CLOSE-OUT

A. Subsequent to completing preliminary testing, provide to the Construction Manager, Owner, and Planetarium consultant, a letter/report documenting the results of the preliminary tests and the documentation detailed below. The receipt of this documentation will constitute the
acknowledgment that the installation is complete, that it conforms to this specification, and that it is ready to be reviewed and tested.

B. Operation and Maintenance Manuals: Provide all manuals as PDF files on three duplicate CD-ROM disks or USB drives, named consistently with the manufacturer’s name and the model number in separate folders for the planetarium and exhibit hall. Copy the same file and folder organization to the Owner.
   1. Provide step-by-step operating instructions for the day-to-day use of the system including power activation, connection of source devices, adjustment of volume levels, selection of sources, etc. Include illustrations and references to individual equipment manuals as necessary. Hyperlink the references to the individual operation manual files included in this submission.
   2. Organize the manual PDF files into folders by subsystem: audio, mixer control, etc.
   3. Equipment List: Include an Excel or other spreadsheet file listing all equipment including connectors and specialty hardware. Include columns for manufacturer, model, physical location, speaker cable assignment, and sound source cable label identification.

C. As-built drawings: Provide all as-built documentation as PDF files on the disks and online service mentioned above. In addition, provide a single copy each of the functional drawings, floor plans, and ceiling plans as laminated full-size drawing sets.

PART 2 - PLANETARIUM SOUND SYSTEM (PSS)

2.01 5.1 AUDIO SYSTEM

Objective: To provide a spatial sound system with programmable configurations that supports programming inclusive of stereo, AND 5.1 surround, spatial sound formats and dedicated voice channel assignment for in-room reinforcement over a digital audio network.

A. The sound system should provide a minimum of 6 channels (5.1) of digital audio through a DSP/Dante Compatible Sound Processor.

B. Per drawing TE1.SOUND, the five (5) upper speakers attached to dome frame shall be Powered, 1000W, 12” two-way, bass-reflex system with 90° x 50° nominal coverage pattern. Specified Model: JBL PRX 612. Per drawing TE1.SOUND two (2) subwoofers mounted above entrance vestibule in adjacent wall.

The combined speaker systems shall provide a combined 100 dB ±3dB continuous sound level for nominal maximum loudness (measured with pink noise at the center of the theater 3-0’ AFF), from 100Hz-12KHz and a sound pressure level minimum of 100 dB ±10dB from 41Hz to 18KHz.

C. PSS will have a dedicated Public Address (PA) Single Speaker system for live presentations and announcements, that is included in the PSS design.

D. PSS audio sources include (A-Chain), but are not limited to the following:

1. Fulldome Planetarium Projection System (FPPS) – stereo and 5.1 channel source. PSS provider is to coordinate audio/video playback with FPPS provider.

2. One dual-receiver UHF wireless microphone system with headset, handheld and lavaliere element. Dual channel receiver for this feature to be located in the planetarium Console or attached to the planetarium dome screen tension ring. Specified Models: No substitution to meet Owner standards.
a. One Shure ULXD4D dual receiver with:
b. One ULXD2/SM58 handheld transmitter.
c. One ULXD1 body pack transmitter.
d. One WCM16 headset mic.
e. One WL184 lavalier mic.
f. Required frequency G50 band: 470-574 MHz.

3. One analog mixing system. The mixer shall be installed in the Planetarium Control Console Rack:
   Specified Model: Ashly LX-308B Line Mixer

4. DSP digital processor (Dante Compatible) will provide channel routing, equalization, limiting, frequency crossovers and all other processing. Installed in the Planetarium Control Console Rack:
   Specified Model: The TesiraFORTÉ AI or USL JSD-100

E. Eight (8) Speaker System (B-Chain).
   a. 6 (six) two-way self-powered speakers with 12 inch LF driver and 1.5" HF drivers with maximum dispersion of 90° x 50° attached to projection dome as shown in drawing TE1.SOUND. Maximum weight unmounted: 40 pounds. Mounts are to be either obtained by the Dome Manufacturer or approved by the Dome Manufacturer with written confirmation that mounts, if properly installed, do not nullify the dome manufacturer’s warranty. The Electrical Power for these speakers are to switched on/off at the wall behind the Control Console. Vendor is coordinate with the electrical contractor.
   Specified Model: JBL PRX 612M

   b. 2 (two) self-powered subwoofer speakers mounted and secured to the top level above the light lock/foyer as shown in drawing TE1.SOUND.
   Specified Model: JBL PRX 618S

2.02 ASSISTIVE LISTENING SYSTEM

A. System must meet current California ADA specifications. 2010 ADA compliance specs are used here as reference.
   Specified Model: See below.
   1. Listen Technologies LT-800-072-01 Transmitter with rack mount kit. Mount this feature in audio rack in Operator's Console.
   2. Listen Tech LR-4200-072-P1. Intelligent DSP RF Receiver Package
   3. Five Intelligent DSP RF Receivers (72 MHz).
   4. Five LA-430 Intelligent Ear Phone/Neck Loop Lanyard.
   5. Five LA-401 Intelligent Ear Speaker.
   6. Five LA-365 Rechargeable Li-ion Battery
7. One LA-381-01 Intelligent 12-Unit Charging Tray  
    One LA-304 Assistive Listening Notification Signage Kit.

2.03 TRAINING AND FIELD SUPPORT

Training: System Functionality
   a. Provide a minimum of one, eight-hour day of prepared and organized training sessions (separate from full dome training sessions) for the benefit of the Owner’s personnel. Demonstrate the location, wiring, operation and capabilities of each system component. Training time is to be non-contiguous, in multiple separate sessions.
   b. Develop with CCC, a training schedule to allow for training. Training shall be of sufficient duration and depth and the schedule shall allow adequate time for personnel to absorb the training.
   c. At minimum, include training on each component of the PSS.

END OF SECTION
SECTION 27 41 13 ARCHITECTURALLY INTEGRATED PROJECTION SCREENS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes:
   1. Roll-up, electrically operated projection screens

B. Related Sections:
   1. Section 055000 - Metal Fabrications: Metal fasteners and other support components for suspending projection screens.
   2. Section 061000 - Rough Carpentry: Wood blocking for installation of projection screens.
   3. Section 092900 - Gypsum Board Assemblies: Suspended gypsum board ceilings to contain recessed projection screens.
   4. Section 095100 - Acoustical Ceilings: Suspended acoustical panel ceilings to adjoin recessed projection screens.
   5. Division 26: Electrical supply, conduit, and wiring for motorized projection screens.

1.2 SUBMITTALS

A. See section 270000 for submittal requirements
B. Bidder is responsible for coordination with all affected trades for the integration of substituted products.

1.3 QUALITY ASSURANCE

A. Source limitation: Obtain projection screens from a single manufacturer as a complete unit including necessary mounting hardware, motor, controls, limit switches, and accessories.
B. Motorized projection screens shall bear UL label and be certified for use in the United States by Underwriters Laboratory (UL), Inc.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Deliver projection screens when building is enclosed, other construction within spaces where screens will be installed is substantially complete, and installation of screens is ready to begin.
B. Deliver products in manufacturer's original, unopened, undamaged containers with labels intact.
PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Da-Lite Screen Company, 3100 North Detroit Street, Post Office Box 137 Warsaw, IN 46581-0137, (800) 622-3737

B. Manufacturers of equivalent products submitted and approved in accordance with Section 01630 - Product Substitution Procedures.

2.2 MOTORIZED PROJECTION SCREENS

A. Motorized Projection Screen Schedule

<table>
<thead>
<tr>
<th>Room</th>
<th>Viewing Area (H x W)</th>
<th>Comments</th>
<th>Enclosure (H x W x D)</th>
</tr>
</thead>
<tbody>
<tr>
<td>72 OCC Classroom</td>
<td>65&quot; x 104&quot;</td>
<td>Matte white material. Supply screen with additional black drop at top as necessary to ensure bottom of image is no higher than 48&quot; AFF, UON.</td>
<td>6.38&quot; x 115.75&quot; x 7.75&quot;</td>
</tr>
</tbody>
</table>

B. Type: Recessed, plenum-rated, electrically-operated, retractable projection screen with rigid metal roller housing screen motor and screen tensioning system; Tensioned Advantage Electrol as manufactured by Da-Lite Screen Company, Inc. or approved equivalent from another authorized vendor.

C. Unless otherwise noted, provide a low-voltage interface integrated within the projection screen enclosure.
   1. Low-voltage interface shall provide connection points for Contractor-installed field wiring.

D. Method of installation: Recessed in ceiling.

E. Screen case: Extruded aluminum with steel end brackets designed to receive mounting hardware.
   1. Ceiling flange: Case is to be provided with a bottom flange to accommodate adjacent ceiling finish.
   2. Case access door: A door shall be provided at the bottom of the case to permit access to the roller.
   3. Finish: White, powder coating unless otherwise noted.

F. Tensioning system: Tab guide cable system shall be provided to maintain even lateral tension and to hold viewing surface flat.

G. Integral junction box: Projection screen housing shall contain connector for connection to motorized roller/viewing surface assembly. Housing can be installed and wired to electrical supply during construction. Motorized roller assembly shall be installed later after construction is substantially complete.

H. The screen fabric shall be permanently attached to the roller. The bottom of the screen shall be weighted.

I. MOTOR
   1. Type: 110-120 VAC, 60 HZ, 3-wire, instantly reversible, lifetime lubricated, and equipped with internal thermal overload protector, electric brake, and pre-set accessible limit switches
2. Integrated in-screen roller on vibration insulators

J. CONTROLS

1. Low voltage control: Unless otherwise noted, provide single-gang Decora-type control with pushbuttons or membrane switches for up, down and stop functions and with an electrical interface providing contact closure connections for interface with projection screens and remote control systems.

2. In rooms with two screens, label the switch operating the screen to the class’s left, “LEFT” and the switch for the right screen, “RIGHT.”

2.3 MANUALLY-OPERATED PROJECTION SCREENS

A. Manually-Operated Projection Screen Schedule

</table>

1. Classroom/Lab Type A:
   a. 40 OCC Classroom
   b. 36 OCC Classrooms (111, 112, and 113)
   c. Anatomy Lab
   d. Physio Lab
   e. Microbio Lab
   f. Gen Bio Lab
   g. O-Chem Lab
   h. General Chemistry Lab
   i. Biotech Lab
   j. Intro Chem Lab

2. Classroom/Lab Type B:
   a. 50 OCC Classroom
   b. Computer Lab

B. Type: Manually operated, retractable projection screen with rigid steel spring roller; Model C with CSR Projection Screen as manufactured by Da-Lite Screen Company, Inc. or equivalent from another authorized vendor

C. Method of Installation: Wall Mounted using 6-inch wall brackets. Ensure that the screen clears whiteboards and does not swing when retracting.

D. Screen Case
   1. Flat-backed steel case with end caps concealing roller ends.
   2. Case Finish: powder coated white.
      a. Include a powder-coated weight at bottom of screen with pull bail.
2.4 VIEWING SURFACE

A. Material: Flame retardant, mildew resistant, smooth, white fabric that can be rolled and can be cleaned with a mild soap and water solution. Da-Mat if a Da-Lite screen, otherwise the specified manufacturer’s equivalent.

B. Joints: Viewing surface shall contain no seams.

C. Provide with black masking borders.

PART 3 - EXECUTION

3.1 PREPARATION

A. Coordinate layout and installation of projection screens with ceiling construction and related components penetrating or above ceilings such as lighting fixtures, mechanical equipment, ductwork, and fire-suppression system.

B. Coordinate requirements for blocking, structural supports, and bracing to ensure adequate means for installation of screens.

C. Coordinate requirements for power supply conduit, and wiring required for projection screen motors and controls.

D. Coordinate installation of recessed mounted screens with construction of suspended acoustical panel where appropriate. Where acoustical ceiling panels are to be adhered to screen case closure, provide and coordinate required tolerances and weight restrictions.

E. Prior to installation, verify type and location of power supply.

3.2 INSTALLATION

A. Install projection screens and controls at locations and heights indicated on Drawings.

B. Comply with screen manufacturer's written instructions and shop drawings.

C. Install screen housing and make electrical connections prior to installation of suspended ceiling system. After interior construction is essentially complete, install viewing surface and drive assembly in housing.

D. Install screens securely to supporting substrate so that screens are level and back of case is plumb and does not swing during operation.

E. Provide required brackets, hanger rods, and fasteners.

F. Adjust limit switches to position bottom of projection screen image areas at 48” AFF or as otherwise noted.

G. Adjust tensioning lines to eliminate ripples and other non-flat areas of fabric.

H. Install projector screens so that the screen is not obstructed as it raises or lowers by any object mounted beneath it on the same wall.

3.3 TESTING AND DEMONSTRATION

A. Test motorized projection screens to verify that screen, controls, limit switches, closure, and other operating components are functional. Ensure that screen is level and viewing surface plumb when extended. Correct deficiencies.

B. Demonstrate operation of screen to Owner's designated representatives.

3.4 PROTECTING
A. Protect projection screens after installation from damage from construction operations. If damage occurs, remove and replace damaged components or entire unit as required to provide units in their original, undamaged condition.

END OF SECTION
SECTION 27 41 16 INTEGRATED AUDIOVISUAL SYSTEMS

PART 1 - GENERAL

1.1 SUMMARY

A. Section includes: Audiovisual systems – presentation systems, control systems, and interface with other systems. Refer to 1.04 System Description for more information.

B. Base bid work

1. Provide equipment and materials, whether specifically mentioned herein or not, needed for a complete and operating audiovisual systems to satisfy the requirements of this section and related drawings. This specification lists major equipment but not every wire, connector, extender, converter, fastener, etc., needed to complete the work.

2. Equipment racks:
   a. Floor-standing racks: Provide floor-standing equipment racks as shown on the drawings, including frame, side panels, top panels, and front and back doors, anchorage and seismic bracing as required.
   b. Provide standard or custom rack shelves and mount adapters for equipment installed in equipment racks as needed to properly mount equipment, power supplies, accessories, components, and the like. Provide cable management to properly route and mind wires, cables, and cords.
   c. Provide power receptacle strips in quantities needed to supply power to the equipment within the rack.
   d. Within racks greater than 18 RUs, provide one work light in the front and one in the back of each rack.
   e. Provide spare rack mounting screws. Determine based on rack mount units (RUs) – one spare screw per two RU installed, minimum.
   f. Provide bonding for racks, cabinets, equipment, equipment support and cable/wire management to an approved grounding point.

3. Cooling provisions
   a. Provide cooling provisions (means to move heat out of enclosed spaces to prevent temperatures from exceeding equipment manufacturers' specified maximums). Ensure equipment operates within manufacturer’s cooling guidelines. Provide only code-compliant cooling provisions (e.g., exhausting from one space to another).
   b. In racks, enclosures, millwork, cabinets, and other spaces where equipment will be installed and prone to heat buildup, provide thermostatically-controlled active cooling devices to create adequate airflow through the enclosed space. Examples of active cooling devices include vent fans. At a minimum, ensure airflow by installing active cooling devices or systems such as fans.

4. Labeling: Provide labeling for audiovisual system components. The components include, but are not limited to, the following:
   a. Equipment racks and equipment enclosures
   b. Rack-mounted equipment and devices: Provide a label on the back of each piece of equipment. If a serial number (of a given piece of equipment) is not visible in a final installed condition, provide a label on the equipment on a visible location duplicating the serial number.
   c. Wall-mounted equipment and devices: Provide an equipment label on the back of each piece of equipment. If a serial number (of a given piece of equipment) is not visible in a final installed condition, provide a label on the equipment on a visible location duplicating the serial number.
d. Provide an equipment plate for each piece of equipment.

e. Provide a label for each control that is not inherently labeled, such as those in racks and user spaces.

e. Wires and cables: Provide a cable label at each end of each piece of wire, cable and cord.

g. Handheld, lavalier, wireless, and other microphones and associated equipment (such as receivers)

h. User interface devices/plates

5. Coordination requirements

a. Coordinate with the construction team at large to ensure that equipment and other system components will be installed properly, and that there will be no compromises due to, among other aspects, spatial conflicts or power service incompatibilities.

b. Coordinate with the electrical contractor for power requirements and service connection to the System’s equipment.

c. Coordinate with the telecom contractor and other trades/contractors (as needed) placement of cables and wires when sharing pathways (such as cable tray) with other low voltage systems. Do not place cables and wires into pathways provided by others without permission.

d. Coordinate with the Owner for network configurations and/or settings required for the System’s proper or correct operation.

C. Related divisions and sections: Consult other divisions, determine the extent and character of related work. Coordinate the work of this section with, at least but not limited to, the following divisions and sections:

1. Division 0 (for Bidding Requirements, Contract Forms, and Conditions of Contract) and Division 1 (for General Requirements) – provisions listed or specified therein apply to work under this section.

2. Section 270000, “Communications Basic Requirements”
4. Section 062000, “Finish Carpentry”
5. Division 26, “Electrical Systems”
7. Section 271513, “Communications Horizontal Cabling”
8. Section 270811, “Communications Twisted Pair Testing”

D. Products installed but not furnished under this section

1. Owner-furnished, contractor-installed (OFCI) equipment
E. Products furnished and installed under another sections
1. Rough-in (device boxes, conduits, and related accessories)
2. Electrical service (e.g., 120 VAC); refer to division 26
3. Telecommunication cabling; refer to Section 271513
4. Telecommunication pathways; refer to Section 270528 and/or 270532.

F. Room types
1. The audiovisual systems design and documentation are based on standard room types.
2. Each room to receive audiovisual systems is shown on the drawings with a type designation.
3. Refer to the drawings for the quantities of each type of room and for specific audiovisual interface information per room.
4. 72 OCC (occupant) Classroom
5. Biotech Lab
6. Meeting Room
7. General Classroom
   a. 50 OCC Classroom
   b. 40 OCC Classroom
   c. 36 OCC Classroom (Room 111, 112, and 113)
8. General Lab
   a. Anatomy Lab
   b. Physio Lab
   c. Microbio Lab
   d. Computer Lab
   e. Gen Bio Lab
   f. O-Chem Lab
   g. General Chemistry Lab
   h. Intro Chem Lab
   i. Engineering Lab
   j. Physics Lab

1.2 REFERENCES

A. Comply with the References requirements of Section 270000.
B. In additional to the references listed in Section 270000, perform work in accordance with applicable requirements of governing codes, rules and regulations including the following minimum standards, whether statutory or not:
1. National Fire Protection Agency (NFPA)
   a. NFPA 262, “Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces”
2. Underwriters Laboratories (UL)
   a. UL 969, “Marking and Labeling Systems”
   b. UL 1419, "Professional Video and Audio Equipment"
   c. UL 60065, “Audio, Video and Similar Electronic Apparatus – Safety Requirements”
3. InfoComm
   a. InfoComm 1M, “Audio Coverage Uniformity in Enclosed Listener Areas”
   c. InfoComm 3M, “Projected Image System Contrast Ratio”
   d. InfoComm F501 01, “Cable Labeling for Audiovisual Systems”

4. “Sound Systems Engineering”, 3rd Ed., Davis and Davis

5. Electronic Components Industry Association (ECIA)
   a. EIA/ECA-310, “Cabinets, Racks, Panels, and Associated Equipment”

1.3 DEFINITIONS

A. The definitions in Section 270000 apply to this section.
B. In addition to those definitions in Section 270000 and Division 01, the following terms used in this specification are defined as follows:

1. “ACEG”: alternating current equipment ground (an example of this is a ground bus within an electrical panel)
2. “Approved Grounding Point”: an approved grounding point is one that satisfies the applicable electrical code and provides a low impedance path to earth. Examples include the following though may manifest in different means: a telecommunications grounding busbar (such as for bonding an equipment rack within a telecom room), the ACEG of the electrical panel serving the equipment requiring bonding to ground (such as for bonding a credenza rack within a conference room), or the ground conductor of a branch circuit (such as for bonding a single piece of equipment).
3. “A/R”: Indicates that the quantity of an item is as required to meet the design criteria indicated in the audiovisual drawings and specifications.
4. “A/S”: Indicates that the quantity of an item is as shown on the drawings.
5. “Audience Area”: the portion of a presentation space intended to be occupied by an audience. An audience area includes the primary seating and standing spaces and may include the adjacent circulation spaces. An audience area generally excludes spaces reserved for presenters.
6. “Custom” indicates systems or components the Contractor fabricates based on these specifications and drawings
7. “EDID”: Extended display identification data
8. “HDCP”: High-bandwidth digital content protection
9. “HDMI”: High-definition multimedia interface
10. “OFE”: Owner-furnished Equipment
11. “Or equal” indicates an item that is equal in function and performance to the specified device or system
12. “RU”: rack unit, as defined in EIA/ECA-310
13. “Shall” denotes a mandatory requirement
14. “Should” denotes an advisory statement
15. “SPL”: sound pressure level
16. “THD”: total harmonic distortion
17. “Will” denotes an informative statement
18. “Project”: The scope of work defined by this specification and its related drawings
19. “Software”: Any executable programs, parameter files, user interfaces, or other coded content that are required to operate, control, or maintain the audiovisual systems in this Project
20. “Custom Created Software”: Any software, parameter files, user interfaces, or other coded content created for the control or operation of the audiovisual systems in this Project.

21. “Third-party software:” Any programming developed by a party other than the AV Contractor and the Owner to be used to operate, control, or maintain the audiovisual systems in this Project.

22. “System”: The audiovisual components, cabling, and programming incorporated in the descriptions and equipment lists herein.

1.4 SYSTEM DESCRIPTION AND PERFORMANCE REQUIREMENTS

A. General

1. In circumstances where the specifications and drawings conflict, the drawings govern quantity and the specifications govern quality.

2. The contract drawings and specifications convey design intent. They are not intended to be used in lieu of shop drawings.

B. ADA compliance: Provide the following:

1. Accessible control systems

2. Assistive listening systems

C. Audio system

1. Provide echo cancellation for microphones in audio and video conferencing systems.

2. Program audio system:
   a. Frequency Response: 100 Hz to 12,000 Hz. 3 dB per octave roll off below 100Hz and above 12 kHz.
   b. Total Acoustical Harmonic Distortion: Less than 2% at 90 dBC (1 kHz reference) at four feet (1,220 mm) above finished floor in the middle of the room.

3. Distributed audio system:
   a. Frequency Response: 125 Hz to 10,000 Hz. 3 dB per octave roll-off below 125 Hz and above 10 kHz.
   b. Total Acoustical Harmonic Distortion: Less than 2% at 85 dBC (1 kHz reference) at four feet (1,220 mm) above finished floor in the middle of the room.

4. Signal to noise ratio (mixer input to amplifier output): 75 dB from 50 Hz to 15 kHz minimum.

5. Frequency response with equalizers bypassed: less than ±1 dB from 50 Hz to 12 kHz.

6. Distortion: less than 0.5% at 1 kHz at the equipment's rated input signal level.

7. Output levels (in audience areas without objectionable distortion, rattles, or buzzes, employing as test signals several different samples of recorded music and microphones applied at each system input):
   a. Program audio: not less than 95 dB
   b. Speech reinforcement: not less than 85 dB

8. Hum and Noise: inaudible (below the background noise level of the space) under normal operation observed in audience areas.

D. Video system resolutions

1. Provide system components with a minimum resolution capability of 1920 X 1080.

2. Provide systems that support the following resolutions: 1,280 x 720, 1,920 x 1,080, 1,920 x 1,220, 3840 X 2160, and 4096 x 2160.
E. Direct-view display systems
   1. Provide displays that have no more than seven defective pixels per quadrant, or per manufacturer’s spec. Reject any display with a greater number of defective pixels.

F. Wireless systems
   1. Ensure that wireless AV systems do not create radio frequency interference to other systems.
   2. Demonstrate at AV acceptance testing that wireless AV systems are not adversely affected by AV-related or other radio frequency sources.

G. Control system
   1. Provide user interfaces, such as control panels, that respect ergonomics and varying levels of technical ability among users. Follow these guidelines:
      a. Avoid abbreviations
      b. Size lettering at 1/8” minimum
      c. Maintain background to lettering contrast
   2. Positive logic: Avoid conditions which may cause command synchronization conflicts (i.e., alternate action (toggling) on/off without power reset or feedback. Provide power sensors or other devices where necessary to ensure that positive logic conditions are maintained.
   3. Timing: Prevent two or more commands being sent simultaneously to the same piece of equipment.
   4. Linking: Provide linking of functions to require the fewest number of user actions to effectively control the equipment.
   5. Clearing: Ensure that each media selection clears the previous audio and visual selection (e.g., selecting COMPUTER clears the audio and video section of the previous Blu-ray disk selection).
   6. Defaults: Establish default power-up conditions for the system including device audio levels, warm-up routine, power conditions, switcher status and other default conditions as required by the Owner or Owner’s representative.
   7. Volume Memory: Provide easy-to-use memory for volume settings associated with each source device. Unless directed otherwise in this document, provide programming that maintains these settings between alternate selections during each use – through power-on and power-off.
   8. Status indication: Program buttons for both touch panels and pushbutton panels to provide clear status indication using illumination when back-lighting is available or by changing color.
   9. Failsafe: Provide program that ensures that no operation or sequence of operations causes the control system to become inoperable or interferes with further processing, correct operations or execution of commands.

1.5 ROOM TYPES

A. 72 OCC Classroom
   1. General
      a. This room type will provide a large instructional space designed for lecture-style presentations.
b. The projectors will display content selected by the user via the push-button controller.
c. The confidence monitors will duplicate any displayed source selected by the user.
d. A local confidence monitor will be located at the instructor desk.
e. Provide camera presets on control panels. Coordinate with the Owner to determine and program these presets.

2. Audio System
   a. Provide ceiling loudspeakers for program audio. Ceiling loudspeakers in the back of the classroom will be used for program audio and voice amplification.
   b. Provide ceiling-mounted microphones for instructor voice pick-up.
   c. Provide a wireless lavalier system for instructor voice pick-up.
   d. Provide an audio digital signal processor.
   e. Provide an audio amplifier with a security cover to prevent tampering.
   f. Provide an assistive listening system to meet ADA requirements.

3. Video System
   a. Provide a ceiling-mounted video projector on a fixed mounting pole.
   b. Provide projector mounts and poles.
   c. Provide a wall-mounted display and associated mount that will serve as a confidence monitor.
   d. Provide a display at the instructor’s desk that will serve as a confidence monitor.
   e. Provide a video switcher.
   f. Provide an HDMI distribution amplifier.
   g. Provide an HDBaseT distribution amplifier.
   h. Provide scaling HDBT transmitters and receivers.
   i. Provide wall-mounted PTZ cameras and associated mounts.
   j. Provide an HDMI switch to select the PTZ camera that is being sent to the lecture capture device.
   k. Provide a camera HDBaseT receiver.
   l. Provide a networked lecture capture device. Coordinate with the Owner on lecture capture device user interface.
   m. Provide a Blu-ray player in the equipment rack.
   n. Provide a document camera at the instructor position.
   o. Provide 12-foot cables with HDMI, VGA, USB, and 3.5mm audio connectors at the lectern.
   p. Provide a composite video input, including stereo audio, with user-accessible cabling, coiled neatly inside the equipment rack to support an Owner-furnished VHS player.
   q. Install an Owner-furnished PC in the equipment rack.

4. Control System
   a. Provide a lectern mounted, hard button remote control for system control.
   b. Provide a networked room controller.
   c. Controls should include but are not limited to audio volume up/down and mute, input source selections, PTZ camera presets, standard BluRay device controls and the ability to navigate media device menus.
5. Miscellaneous
   a. Provide a technology lectern with an integrated equipment rack for the audiovisual system headend.

B. Biotech Lab
   1. General
      a. Instructional space designed for lab-style presentations and interactive presentation of content throughout the space.
      b. The projector will display content as selected by the user via the push-button controller.
      c. Wall-mounted HDMI connections in the classroom will allow users to present content.
      d. A local confidence monitor will be located at the instructor desk.
      e. Provide camera presets on control panels. Coordinate with the Owner to determine and program these presets.

   2. Audio System
      a. Provide ceiling loudspeakers for program audio.
      b. Provide ceiling-mounted microphones for instructor voice pick-up.
      c. Provide a wireless lavalier system for instructor voice pick-up. Both the ceiling-mounted microphone and wireless lavalier system will be fed into the assistive listening system and lecture capture system but not through the ceiling loudspeakers.
      d. Provide a digital signal processor.
      e. Provide an audio amplifier with a security cover to prevent tampering.
      f. Provide an assistive listening system to meet ADA requirements.

   3. Video System
      a. Provide a ceiling-mounted video projector on a fixed mounting pole.
      b. Provide projector mount.
      c. Provide a display at the instructor’s desk that will serve as a confidence monitor.
      d. Provide video switcher.
      e. Provide an HDMI distribution amplifier
      f. Provide an HDMI switcher.
      g. Provide VGA to HDMI converters for the classroom computers.
      h. Provide a scaling HDBT transmitters and receivers.
      i. Provide wall-mounted PTZ cameras and associated mounts.
      j. Provide an HDMI switch to select the PTZ camera that is being sent to the lecture capture device.
      k. Provide a camera HDBaseT receiver.
      l. Provide a networked lecture capture device. Coordinate with Owner on lecture capture device user-interface.
      m. Provide a Blu-ray player in the equipment rack.
      n. Provide a document camera at the instructor position.
      o. Provide wall-mounted HDMI connections.
      p. Provide 12 ft HDMI, VGA, and 3.5mm audio connectors at the lectern.
      q. Provide a composite video input, including stereo audio, with user-accessible cabling, coiled neatly inside the equipment rack to support an Owner-furnished VHS player.
      r. Install an Owner-furnished PC in the equipment rack.
4. Control System
   a. Provide a lectern mounted, hard button remote control for system control.
   b. Provide a networked room controller.
   c. Controls should include but are not limited to audio volume up/down and mute, input source selections, PTZ camera presets, standard BluRay controls and the ability to navigate media device menus.

5. Miscellaneous
   a. Provide an equipment rack.

C. Meeting Room
1. General
   a. Space intended for scheduled and impromptu meetings, trainings, and presentations.

2. Audio System
   a. Program audio will be provided by the display.

3. Video System
   a. Provide a wall-mounted display and associated mount.
   b. Provide a video switcher.
   c. Provide scaling HDBaseT receivers.
   d. Provide an HDBaseT auto-switch. Provide 12ft VGA with audio, USB, and two HDMI cables at the table for laptop input.
   e. Provide a conferencing soundbar with camera.
   f. Provide a Blu-ray player in the equipment rack.
   g. Install an Owner-furnished PC in the equipment rack.

4. Control System
   a. Provide a wall-mounted pushbutton control panel for system control.
   b. Provide a networked room controller.
   c. Controls should include but are not limited to audio volume up/down and mute, input source selections, standard BluRay controls and the ability to navigate media device menus.

5. Miscellaneous
   a. Provide USB transmitter and receiver.
   b. Provide a credenza equipment rack.

D. General Classroom
1. General
   a. This room type applies to the following rooms: 50 OCC Classroom, 40 OCC Classroom, and 36 OCC Classroom (Room 111, 112, and 113).
   b. Instructional space designed for lecture-style presentations.
   c. The projector will display content as selected by the user via the push-button controller.
   d. The confidence monitors will duplicate any displayed source as selected by the user.
   e. A local confidence monitor will be located at the instructor desk.
   f. Provide camera presets on control panels. Coordinate with the Owner to determine and program these presets.
2. Audio System
   a. Provide ceiling loudspeakers for program audio.
   b. Provide ceiling-mounted microphones for instructor voice pick-up.
   c. Provide a wireless lavalier system for instructor voice pick-up. Both the ceiling-mounted microphone and wireless lavalier system will be fed into the assistive listening system and lecture capture system but not through the ceiling loudspeakers.
   d. Provide a digital signal processor.
   e. Provide an audio amplifier with a security cover to prevent tampering.
   f. Provide an assistive listening system as required to meet ADA guidelines.
   g. Route ceiling-mounted microphones and program audio to the assisted listening system.

3. Video System
   a. Provide a ceiling-mounted video projector on a fixed mounting pole.
   b. Provide projector mount and pole.
   c. Provide a wall-mounted display and associated mount that will serve as a confidence monitor.
   d. Provide a display at the instructor’s desk that will serve as a confidence monitor.
   e. Provide a video switcher.
   f. Provide an HDMI distribution amplifier.
   g. Provide scaling HDBaseT transmitters and receivers.
   h. Provide wall-mounted PTZ cameras and associated mounts.
   i. Provide an HDMI switch to select the PTZ camera that is being sent to the lecture capture device.
   j. Provide a camera HDBaseT receiver.
   k. Provide a networked lecture capture device. Coordinate with Owner on lecture capture device user interface.
   l. Provide a Blu-ray player in the equipment rack.
   m. Provide a document camera at the instructor position.
   n. Provide 12 ft HDMI, VGA, USB, and 3.5mm audio connectors at the lectern.
   o. Provide a composite video input, including stereo audio, with user-accessible cabling, coiled neatly inside the equipment rack to support an Owner-furnished VHS player.
   p. Install an Owner-furnished PC in the equipment rack.

4. Control System
   a. Provide a lectern-mounted, hard button remote control for system control.
   b. Provide a networked room controller.
   c. Controls should include but are not limited to audio volume up/down and mute, input source selections, PTZ camera presets, standard Blu-ray device controls and the ability to navigate media device menus.
5. Miscellaneous
   a. Provide a technology lectern with an integrated equipment rack for the audiovisual system headend.

E. General Lab

1. General
   a. This room type applies to the following rooms: Anatomy Lab, Physio Lab, Microbio Lab, Computer Lab, Gen Bio Lab, O-Chem Lab, General Chemistry, Intro Chem Lab, Engineering Lab and Physics Lab.
   b. Instructional space designed for lab-style presentations.
   c. The projector will display content as selected by the user via the push-button controller.
   d. The confidence monitors will duplicate any displayed source as selected by the user.
   e. A local confidence monitor will be located at the instructor desk.
   f. Provide camera presets on control panels. Coordinate with the Owner to determine and program these presets.

2. Audio System
   a. Provide ceiling loudspeakers for program audio.
   b. Provide ceiling-mounted microphones for instructor voice pick-up.
   c. Provide a wireless lavalier system for instructor voice pick-up. Both the ceiling-mounted microphone and wireless lavalier system will be fed into the assistive listening system and lecture capture system but not through the ceiling loudspeakers.
   d. Provide a digital signal processor.
   e. Provide an audio amplifier with a security cover to prevent tampering.
   f. Provide an assistive listening system to meet ADA requirements.

3. Video System
   a. Provide a ceiling-mounted video projector on a fixed mounting pole.
   b. Provide projector mount and pole.
   c. Provide an interactive short throw projector.
   d. Provide a wall-mounted display and associated mount that will serve as a confidence monitor.
   e. Provide a display at the instructor’s desk that will serve as a confidence monitor.
   f. Provide a video switcher.
   g. Provide an HDMI distribution amplifier.
   h. Provide scaling HDBT transmitters and receivers.
   i. Provide wall-mounted PTZ cameras and associated mounts.
   j. Provide an HDMI switch to select the PTZ camera that is being sent to the lecture capture device.
   k. Provide a camera HDBaseT receiver.
   l. Provide a networked lecture capture device. Coordinate with Owner on lecture capture device user-interface.
   m. Provide a Blu-ray player in the equipment rack.
   n. Provide a document camera at the instructor position.
   o. Provide 12 ft HDMI, VGA, USB, and 3.5mm audio connectors at the lectern. In locations where the equipment rack is remote from the lectern, provide extender for each cable on the lectern.
   p. Provide a composite video input, including stereo audio, with user-accessible cabling, coiled neatly inside the equipment rack to support an Owner-furnished VHS player.
   q. Install an Owner-furnished PC in the equipment rack.
4. Control System
   a. Provide a lectern mounted, hard button remote control for system control.
   b. Provide a networked room controller.
   c. Controls should include but are not limited to audio volume up/down and mute, input source selections, PTZ camera presets, standard media device controls and the ability to navigate media device menus.

5. Miscellaneous
   a. Provide an equipment rack.
   b. Provide a USB transmitter and receiver.

1.6 SUBMITTALS
   A. Comply with the Submittal requirements in Section 270000.
   B. Bid submittal Submit bids in accordance with project’s overall bidding requirements, and include the following requirements of this section.

1. Firm information and qualifications: Include detailed information about the firm, including but not limited to the following, in the bid:
   a. Firm’s history – how long the firm has been in business, how long the firm has offered audiovisual systems integration services, etc.
   b. Annual revenue for the three most current years
   c. Bonding capacity and bonding insurance agent contact information
   d. Three successfully completed projects of similar scope within the past 24 months. For each project, include the owner/client name, contact information (person's name, position, and telephone number or email address), project location, type of systems installed, total contract amount, date completed, and services included (e.g., engineering, installation, integration, maintenance, etc.).
   e. Industry affiliations
   f. Advanced certifications (CTS-I/D, DMC-D/E, ACE-D/I/P/RMS, XTP, etc.)
   g. Manufacturer certifications
   h. Contractor license number for the state where the work will take place
   i. Union affiliation(s)

2. Personnel and certifications: Include information on key personnel in the bid.
   a. Include résumés and certifications for personnel who will be assigned to the project including but not limited to the Project Manager, Systems Engineer, Field Installation Supervisor, Lead Control System Programmer, and other key personnel.
   b. Include résumé(s) of CTS–I (Certified Technology Specialist – Installation) certified personnel
   c. Include other relevant company-held industry, manufacturer, and educational certifications and designations for involved personnel

4. Schedule of values: Include a schedule of values in the bid. Break out the schedule of values into two areas – equipment costs and non-equipment costs.
   a. Equipment costs: List equipment costs (each piece of equipment), including required modifications and accessories.
b. Non-equipment costs: List non-equipment costs, such as the following:
   1) General and Administrative: shipping, insurance, and guarantees, etc.
   2) Fees: e-Waste/disposal, permits, etc.
   3) Engineering: design, drawings, run sheets, instruction manuals, etc.
   4) Pre-installation: fabrication, modification, assembly, rack wiring, etc.
   5) Installation: installation, coordination, supervision, testing, etc.

6) Owner training: training session(s), manuals, etc.

5. Alternates/substitutions: Refer to Section 270000 for alternate and substitution requirements. Submit bids based on the specified equipment. If the bid includes proposed alternates and/or substitutes, separate these from the costs of the equipment as specified and include for alternate equipment full technical information and cut sheets. Proposed alternate equipment will receive consideration if the differences between the specified and alternate/substituted equipment do not depart from the design intent and function of the system and are in the best interests of the Owner. If the inclusion of substituted equipment will result in a different connection configuration than that in the bid documents, include drawings that illustrate how the proposed system would be connected.

6. System enhancements: Include in the bid recommendations, if any, that will enhance the performance and/or functionality of the system, or will reduce costs without loss of performance/functionality. Recommendations that are of value to the Owner will be taken into consideration in the evaluation of the bids. Make such proposed recommendations as “alternates”, with the appropriate cost modifications shown separate and apart from the costs of the system “as specified”.

7. Exceptions: In the bid, explain exceptions, if any, to these specifications and related drawings. In the absence of exceptions, these specifications and related drawings are binding in letter and intent.

8. Guarantee compliance with requirements and regulations in effect on the job site. Explicitly state any such non-compliances or conflicts in the bid submittal. The bidder has the responsibility to investigate potential contract, union, and scheduling issues, and to notify the general contractor of such.

C. Pre-construction submittals

1. Product data: Prior to purchase and installation, submit as a PDF file, information (such as cut sheets, etc.) for equipment, components, products, etc., that will be installed as part of the work of this section.
   a. Include in the submittal, a Table of Contents, listing equipment, components, products, etc., by room, by system, and/or by other logical designation. A continuous list of all products with no reference to where the products will be installed will be rejected. Incomplete lists will be rejected.
   b. Indicate (arrow, highlight or other designator) on each product’s cut sheet the manufacturer, model/part number, accessories (as applicable), options (as applicable), color (as applicable), and other information to indicate the exact item to be installed. Where this information is not already provided on the cut sheet, manually input this information and a brief description (as applicable).
2. Substitutions [refer to Section 270000 for substitution requirements]: Submit substitution requests based on the specified equipment and including associated equipment costs separate from the costs of the equipment as specified.
   a. Proposals for alternate equipment will receive consideration if the differences between the specified and alternate/substituted equipment do not depart from the overall intent of the design and operation of the system and are in the best interests of the Owner.
   b. Include full technical information and cut sheets for the proposed substitutions.
   c. If the inclusion of substituted equipment will result in a different connection configuration than that in the bid documents, produce drawings that illustrate how the proposed system would be connected.

3. Shop drawings [refer to Section 270000 for additional shop drawing requirements]:
   Submit shop drawings prior to installation and in accordance with the Conditions of Contract and Division 1, including the following.
   a. Functional line diagrams for all systems – clearly tag each item with name, manufacturer, and manufacturer’s model number (e.g., “Program Amplifier LabGruppen LUCIA 60/2M”) and show the terminal number or input/output designation (e.g., “Mic 1-In”, or “Record Out-Left”).
   b. Provide schematic diagrams of custom circuitry such as receptacle pin numbers and component callouts; show details of custom resistive attenuation and/or combining networks, filters, or pads which may be required in the assembly; show point to point wiring drawings for control system modules and interfaces, and for switches and relays in audio, video, or control systems.
   c. Equipment rack elevations and patch panel assignments – clearly and consistently label rack elevations, patch panels, and on equipment controls.
   d. Provide pushbutton and handheld remote control panel layouts – tag each button with function and ID matching installed labels.
   e. Factory and custom panels, plates, and designation strips, showing material, finish, color and engraving (exact lettering).
   f. Custom designed consoles, tables, carts, support bases, and shelves.
   g. Equipment modifications (if any), including details of modifications that change or void manufacturers' warranties.
   h. Cable run lists – clearly show at each terminal point the type of connector to be used; include typical wiring details of each connector; note where shields are connected and where they will float to ensure the integrity of the shielding system; indicate cable types and, where appropriate, color codes; assign wire numbers and patch bay locations to every wire and patch point in the drawing.
   i. Wattage tap setting per loudspeaker.

4. Button controller submittal:
   a. Provide a PDF per system containing a page for layout of all buttons. Ensure that the PDF is unlocked so that the Engineer may annotate it.

5. Network coordination: Submit as an Excel file or cloud-based collaborative spreadsheet (such as Google Sheets) a list of equipment that will be connected to the network, including but not limited to the following (e.g., spreadsheet column headers):
   a. Item number
   b. Description
   c. Manufacturer
   d. Model/part number
   e. MAC address
   f. IP address type (DHCP or static)
   g. Power-over-Ethernet (PoE) requirements (yes or no; which PoE standard)
   h. Specific network and/or subnet configuration requirements
i. Specific QOS requirements
j. Anticipated network traffic

6. Testing equipment and procedures:
a. Submit a list of test equipment, including manufacturer, model number, and description that will be used for testing and adjustment of the installed systems.
b. Submit testing procedures to be performed during pre-functional testing and acceptance testing, including the minimum acceptable outcome for each test.

D. At the completion of the installation

1. Initial Testing and Tuning Report: After completing initial testing and tuning, checkout, settings, as-built drawings, and operational documentation, submit written notification to the Owner and Architect that initial checkout is complete. Include in this notification a completed Initial Testing and Tuning Report that satisfies the requirements of Part 3. In the Report, document the results for tests performed during initial testing and tuning. Organize the report per room, per system, and per test. Include the testing tools/equipment, manual and automated tests, testing procedures, and expected result per test. If the test equipment stores test results and has the capability to produce reports, also include these reports.

2. Wireless microphones frequencies. Submit a list of wireless microphone frequencies and associated channels used for each microphone and system.

E. Closeout Submittals

1. Acceptance Testing Report: After completing final acceptance testing, final tuning and settings, submit an Acceptance Testing Report that documents the results for tests performed during final testing and tuning. Organize the report per room, per system, and per test. Include the testing tools/equipment, manual and automated tests, testing procedures, and expected result per test. If the test equipment stores test results and has the capability to produce reports, also include these reports. Include the system’s normal settings.

2. As-built drawings [refer to Section 270000 for additional as-built drawing requirements]: Submit as-built drawings in accordance with the Conditions of Contract and Division 1, including the following.

   a. System functional line drawings for all systems; clearly tag each item with name, manufacturer, and manufacturer’s model number (e.g., “Program Amplifier Lab.Gruppen LUCIA 60/2M”) and show the terminal number or input/output designation (e.g., “Mic 1-In”, or “Record Out-Left”).
   b. Point-to-point wiring diagrams for switches and relays in audio, video, and control systems; point-to-point wiring diagram for control system modules and interfaces
   c. Schematic diagrams of custom circuitry such as receptacle pin numbers and component callouts; show details of custom resistive attenuation and/or combining networks, filters, or pads which may be required in the assembly
   d. Equipment rack elevations and patch panel assignment drawings. Clearly label the rack elevations, patch panels, and equipment controls.
   e. Cable run lists – clearly show at each terminal point the type of connector to be used; include typical wiring details of each connector; note where shields are connected and where they will float to ensure the integrity of the shielding system; indicate cable types and, where appropriate, color codes; assign wire numbers and patch bay locations to every wire and patch point in the drawing
   f. Pushbutton and handheld remote-control panel layouts, including tagging each button with function and ID that matches installed labels
   g. Factory and custom panels, plates, and designation strips, showing material, finish, color and engraving (exact lettering)
   h. Wattage tap setting per loudspeaker.
3. System Operation and Maintenance (O&M) manual:
   a. Describe typical procedures necessary to activate each system for full functionality as required under the System Description.
   b. Describe normal settings for equalizer, amplifier, signal processing, and user operated controls (as established during system check out) in tabular or pictorial form.
   c. Outline a recommended maintenance schedule with reference to the applicable pages in the manufacturer’s maintenance manuals. Where inadequate maintenance information is provided by the manufacturer, provide the information necessary for proper maintenance.
   d. Outline a recommended plan for a normal maintenance period of at least one year, including a list of necessary and recommended replacement parts.
   e. Assume the reader of this manual to be technically competent, but unfamiliar with this particular facility.
   f. Submit equipment manufacturers’ operation and maintenance manuals for each piece of equipment.

4. Programming/software:
   a. Submit the project’s control system programming and audio processor configuration files – refer to “Software License” below.

1.7 QUALITY ASSURANCE

A. Audiovisual Contractor requirements: Demonstrate that your firm meets or exceeds the following requirements:

1. Five years’ experience, minimum, with the design, engineering, assembly, installation, start-up and maintenance of audiovisual systems of similar or greater complexity to those identified in this specification
2. Provide the necessary professional design, engineering, fabrication, installation, and project management personnel to execute the work of this section, and to guarantee a complete, functional system in compliance with the design intent
3. Successfully completed in the past 24 months a minimum of three projects of similar scope
4. Current state contracting license, as required to perform the work under this section
5. Bondable to 100% of contract value
6. Be an authorized supplier and installer for equipment listed in this section
7. Maintain permanent fabrication, service and support facilities within 100 miles of the Project site.
B. Audiovisual Contractor certifications: Demonstrate that your firm has the following certifications:
   1. An InfoComm CTS-I (Certified Technology Specialist-Installation) certified employee to actively manage this project – the Engineer will verify CTS credentials at the InfoComm website.

C. Manufacturer/equipment supplier requirements: Demonstrate that your firm meets or exceeds the following:
   1. Operate their business for not less than five years

D. Subcontractor quality:
   1. Specifically identify in the bid submission, for Owner, Architect, or Engineer’s approval, all subcontractors that will be used.
   2. Regardless of any subcontract arrangement, your firm will have sole responsibility for the successful implementation of the work in this section.

1.8 PROJECT MANAGEMENT AND COORDINATION

   A. Comply with the Project Management requirements in Section 270000.
   B. Assign a project manager to this project for the entire duration. They shall oversee the design, submittals, implementation, testing, and close out – the entire process from start to finish. The project manager shall also coordinate this work of this section with other trades.

1.9 DELIVERY, STORAGE AND HANDLING

   A. Comply with Delivery, Storage and Handling requirements in Section 270000.

1.10 WARRANTY

   A. Warrant the System for a minimum of one year from the date of system acceptance by the Owner. Honor component warranties per manufacturers’ terms if greater than one year.
      1. Include service as described in 3.14 “Maintenance and Extended Service” in the warranty.
   
   B. Activate manufacturers’ equipment warranties in the Owner’s name. The warranty period shall commence on the date of System Acceptance by the Owner.
      1. In the case of contractor-modified equipment (where the manufacturer’s warranty could be voided), warrant such equipment equivalent to that of the original manufacturer.

   C. Warrant the Software and version updates – see “Software” below.
1.11 SOFTWARE LICENSE

A. Nondisclosure

1. During or after the termination of this Agreement, the Owner agrees not to disclose any proprietary information provided by the AV Contractor, to maintain such information as confidential and not use such information provided in Project documents for any purpose other than maintenance and support of in-house systems. This does not apply to any of the information that becomes generally known to the public due to publication or other legal means and through no fault of the Owner.

B. Obligations governing the Software

1. The AV Contractor shall own the copyright of any custom created software/parameter files ("Software") and hereby grants the Owner a royalty-free, non-exclusive license to use the Software for use with the audiovisual and other connected systems in this project. This license cannot be transferred.
2. The Owner shall not rent, loan or re-license rights to use the Software to any third party.
3. Any Third-party software provided or made available to the Owner by the AV Contractor, but not created by the AV Contractor, is sublicensed to the Owner through the AV Contractor. The AV Contractor agrees that such sublicense is granted with consent of the third-party at no cost to the Owner, and the Owner shall be entitled to use such software under the same terms as the AV Contractor.
4. The AV Contractor and third-party suppliers are not restricted from licensing the Software or any portion thereof to other customers.
5. At acceptance testing, provide the source code for custom created software, applications required to use the source code, descriptions of the required equipment, and instructions detailing the modification and installation of the Software to the Owner.

C. For project and custom Software, the following apply.

1. Provide the source code to the Owner either directly via file transfer or make it available through other means, such as cloud storage, an FTP site, etc. Maintain older versions within a folder structure and make them available to the Owner at the Owner's request. At the end of the warranty period, release the current and older versions of the source code to the Owner. If the AV contractor ceases to exist during the warranty period, release the source code to the Owner upon termination of the business.
2. Provide the Software in a form suitable for immediate access by the System.
3. The AV contractor grants the Owner the right to modify and to enhance the Software as furnished and licensed under the terms of this Agreement at its own risk and expense, and further agrees such modifications and enhancements developed by the Owner to be the property of the Owner. Any changes to the custom created software parameter files do not affect copyright ownership.
4. During the warranty period, if the Owner discovers that the Software is no longer functioning in the same manner as had been approved at the beginning of the warranty period, they shall document the fault in sufficient detail to allow errors to be reproduced, and they will notify the AV contractor. Within two business days of this notification, update the software, provide or post updated Software files as detailed above, demonstrate that the error has been resolved, and maintain updated Software files as detailed above.
5. Defend any suit brought against the Owner and pay any damages due to the resulting judgment from any suit brought against the Owner as it pertains to a violation of copyrights or patents of the Software or licenses. The Owner shall notify the AV contractor in writing promptly and give authority, information and assistance at the AV Contractor’s expense.
6. The AV contractor at its own expense and option shall, if able, procure for the Owner the right to continue to use the Software as licensed or to replace it with a non-infringing release. This shall not include any agreement by the AV Contractor to accept liability for patent or copyright infringement for beyond the Software as licensed and furnished for the Project. This also excludes any agreement by the AV contractor to accept liability for patent or copyright infringements for methods and processes to be carried out by using said Software except those inherent in the furnished System.

7. All contracts with Third-party software suppliers will transfer from the AV Contractor to the Owner at Project acceptance by the Owner.

8. The Owner shall apprise the AV Contractor of activities it takes with Third-party software providers during the warranty period. Included activities would include discontinuing the use of any Software component, installing updated or alternate versions of the Software, revising the configuration of affected systems.

9. The Owner can contact the AV Contractor for questions at no additional cost during the warranty period, providing:
   a. The queries are related to the audiovisual systems defined in this document.
   b. The query is asked by the Owner’s staff or authorized representative.
   c. The inquirer has attended the AV Contractor’s or the manufacturer’s training in the use of the systems defined in this document.
   d. The question is not intended as design consultation.

10. The Owner can only make copies as backup files of the Software and they are required to include the AV Contractor’s copyright notice. The Owner shall make a reasonable effort to secure this Software to prevent theft or unlicensed usage.

D. Software license terms
   1. The Software license is granted by the AV Contractor for the devices provided for the Systems. If any devices in the system fails, the license can be transferred to a replacement device on a temporary or permanent basis if the original device is to be phased out. The transference may only occur with written notification to the AV Contractor.
   2. Additional licenses or changes to the Software are subject to a supplemental agreement between the AV Contractor and the Owner.

PART 2 - PRODUCTS

2.1 GENERAL

A. Comply with the Products requirements in Section 270000.
B. Provide products, equipment and software that are the latest version of the specified model or type available at the time of procurement, providing the updated devices provide the same or better capabilities and performance required by the system design.
C. Equipment make/model numbers that specified represents minimum performance criteria for each function.
D. Substitutions: The engineer may consider substitutions for certain equipment if the Contractor demonstrates that the substitution meets or exceeds the functional requirements described in the System Description and Performance Standards. Follow the requirements of section 012500 "Substitutions" for substitution requests.
2.2 EQUIPMENT SCHEDULE

A. Quantities: Quantities are either listed herein with a number, as "A/S" (as shown), or as "A/R" (as required). If listed as A/R or the quantity is marked with an asterisk, determine quantities as required for a fully operational system. Confirm the quantity listed here against the drawings.

2.3 CABLES AND WIRES

A. Provide cables and wires that are continuous - without splices.
B. For CATEGORY-type UTP cabling (cables, termination apparatus and installation requirements), refer to section 271513.
C. Cable selection
   1. Refer to functional diagrams for signal type between equipment.
   2. Select a cable with the appropriate rating and configuration required by the applicable building code, electrical code, AHJ, and applicable codes and regulations governing the installation.
   3. For cables that will be installed in conduit within on-grade concrete, select a cable rated for underground construction.
   4. For cables that will be installed outdoors in underground conduit, aerial, and/or corrosive environments, select a cable rated for outdoor construction.
   5. For signal extenders, use extender the manufacturer’s recommended cable type and within the maximum cable run length to be used.
D. Unless otherwise called for in these specifications and drawings, the following cables are approved for the associated application or signal type. Ensure the chosen cable is appropriate for the signal type, available pathway capacity, and run length.

2.4  HDBASET CABLE

A. Manufacturer, Or Equal

1. West Penn.

2.5  CONDUCTORS, POLYOLEFIN INSULATION, X-SPLINE, OVERALL BELDFOIL SHIELD, PVC JACKET

2.6  CUSTOM REMOTE CONTROL PANELS AND INTERFACE PLATES

A. For custom remote control panels and interface plates, use 1/8 inch (3mm) thick #6061 T6 aluminum, with a brushed, anodized, black finish (or as approved by the Architect via submittals).
2.7 EQUIPMENT PLATES

A. For equipment plates, utilize 1/32" to 1/16" thick by 1/4" high aluminum with a brushed anodized black finish.
B. Provide engraved lettering 1/8" to 3/16" high.

2.8 EQUIPMENT LABELS

A. For equipment labels, utilize white, self-laminating, machine-printable, permanent adhesive-backed tape, 3/8" to 1/2" high.
B. Provide text using black 12-point Helvetica, or a visually similar, san-serif typeface.
C. Manufacturer, or equal:
   1. Brady
   2. Brother
   3. DYMO XTL or Rhino
   4. Panduit
   5. Thomas and Betts

2.9 WIRE AND CABLE LABELS

A. Use either of the following label types for wire and cable labels:
   1. Tape – machine-printable, wrap-around, self-laminating, permanent adhesive-backed tape
   2. Machine-printable, shrink-wrapped labels
B. Provide labels with a white face stock (print area).
C. Size as needed per wire/cable size.
D. Provide labels that meet UL 969 requirements.
E. Manufacturer, or equal:
   1. Brady
   2. Brother
   3. DYMO XTL or Rhino
   4. Panduit
   a. #S100X075YAJ; self-laminating cable label, white face stock 1" wide, diameters 0.08"-0.16"
   b. #S100X125YAJ; self-laminating cable label, white face stock 1" wide, diameters 0.12"-0.28"
   c. #S100X150YAJ; self-laminating cable label, white face stock 1" wide, diameters 0.16"-0.32"
   d. #S100X225YAJ; self-laminating cable label, white face stock 1" wide, diameters 0.24"-0.48"

2.10 RACK BONDING

A. Refer to Section 270526 for approved bonding products.
PART 3 - EXECUTION

3.1 GENERAL
A. Comply with the Execution requirements in Section 270000.
B. Perform work in accordance with the standards and best practices defined by the InfoComm International coursework for Installation 1: System Fabrication and Installation 2: Setup and Verification.
C. Install products per manufacturers’ instructions.
D. Install panels, equipment, boxes, etc., plumb and square.
E. Seismic safety:
   1. Mount, anchor and/or brace permanently-installed equipment to the building structure using anchors, fastenings, supports, and methods approved by structural engineer with a safety load factor of at least 1.5. Provide installations that meet the most stringent of applicable codes and regulations to minimize potential damage to personnel and equipment from foreseeable seismic events.
   2. Brace hanging audiovisual and associated equipment both to minimize sway and to prevent detachment from the overhead structure in accordance with applicable codes.
   3. Firmly secure equipment in place unless requirements of portability dictate otherwise.

3.2 EXAMINATION
A. Prior to starting the work of this section, examine areas to receive system components and pathways to receive cabling to verify conditions are ready for work of this section and to verify conformance with manufacturer and specification tolerances.
   1. Verify that pathways, including conduit, junction boxes, cable trays, ceiling enclosures, etc., are in place prior to placing cables into pathways and as required by applicable codes.
   2. Verify that rough-in (including conduit, device boxes, floor boxes, and the like) is ready to receive wiring, cabling, devices, equipment, and the like prior to installing into the rough-in.
   3. Verify that electrical power service is ready and stable prior to connecting equipment.
   4. Check ceiling types, ceiling heights, and clearances above ceilings to ensure conditions are appropriate per manufacturer’s installation requirements.
B. Proceed with installation work only after unsatisfactory conditions are corrected.
3.3 INSTALLATION

A. Floor-standing equipment racks
   1. Completely assemble equipment racks. Include parts and accessories, such as electrical power distribution devices, cable dressing accessories, and blank and vent panels, required for a complete result.
   2. Anchoring/bracing: Anchor racks to the floor at four points per approved structural details using anchors and methods approved by a structural engineer. Seismically brace racks (e.g., using brackets, threaded rod with strut, etc.) as required, attached to the wall or structure above using appropriate anchors or fasteners.
   3. Tolerances: Verify dimensions to establish proper clearances. Install racks to attain clearance of at least 36” to the nearest piece of equipment from each enclosure’s front and back doors.
   4. Power strips: Install power strips on the back interior of the rack space on the left side as viewed from the back.
   5. Lighting: Install lights on the back interior of the rack space centered within the rack, magnetically attached or fastened to the frame, and situated to illuminate the back of the rack-mounted equipment and wiring.
   6. Refer to Section 27056 for grounding and bonding requirements.

B. Displays and mounts
   1. Wall-Mounted Displays: Install mounts using fasteners approved for the mounting substrate. For framed walls, firmly engage fasteners into backing or, if no backing is present, into framing studs.
   2. Ceiling-Mounted Displays: Install mounts to structure using fasteners and mounting accessories approved for the mount and mounting substrate. Install seismic restraints as appropriate for the installation location. Conceal cabling within mounting columns where feasible.
   3. Securely install displays onto mounts. Complete final connections (power, signal, control, etc.).
   4. Install accessories onto mounts or displays using approved attachment methods that guarantee the longevity of the installation. Accessories may be attached mechanically, if allowed by the display/mount manufacturer, or by using 3M TB3571/3572 hook and loop fastener tape or an approved equal.
   5. Dress cables; ensure they are maximally concealed yet serviceable.
   6. Adjust each display and mount to attain a true, square and level installed result.

C. Projection systems
   1. Projector Supports
      a. Anchor to structure using means approved by a structural engineer.
      b. Install lateral and/or transverse bracing to poles for seismic bracing as required.
      c. Securely install mounts onto poles using compatible adapting components.
   2. Projectors
      a. Securely install projectors to mounts.
      b. Fully assemble and install projectors, lenses, and mirrors such that the final condition will be no observable movement in the image induced by motor vibration or other mechanical operations.
      c. Install accessories onto mounts or projectors using approved attachment methods that guarantee the longevity of the installation. Accessories may be attached mechanically, if allowed by the projector/mount manufacturer, or by using 3M TB3571/3572 hook and loop fastener tape or an approved equal.
3. Align projection systems so projected images fill the viewing areas of the associated projection screens and exhibit no geometric distortion.
4. Only use physical and/or optical adjustments to correct geometric distortion.
5. Only use electronic or digital correction when called for in this document package.
6. Confirm that the total averaged light output from all projectors, in lumens, is at least 85% of that specified by the projector manufacturer.
7. Confirm that the light falloff from the center of the projected image to four corners, as measured at the projected image plane, does not exceed 50%.

D. Ceiling microphones
1. Review field conditions, and coordinate with the Architect or Engineer to resolve conflicts with other trades’ devices conflicting with microphone locations.
2. Route analog microphone cabling away from other cabling types. Where this cabling must cross other cabling types, install it at a 90° angle.
3. Install microphone preamplifiers, conversion devices, and other back boxes using safety wires attached to the building structure.
4. Prior to acceptance testing, confirm microphones do not produce audible buzz and/or noise.

E. Wireless microphone systems
1. Mount antennas external to equipment racks.
2. For wireless microphone systems using multiple antennas, space them per manufacturers’ recommendations.
3. Sequentially turn on each wireless system within RF range and allow it to complete its scanning procedure. Verify correct operation.

F. Antennas
1. Use antennas designed specifically for the frequency bands they will carry.
2. For antennas extended from the attached equipment, use cabling appropriate for the frequency and distance.
3. Use extender devices (preamplifiers) and distribution amplifiers per cabling lengths and manufacturers’ recommendations.
4. Install cabling per manufacturers’ bend radius guidelines.
5. Locate and orient antennas to ensure coverage throughout the room(s). Verify this by walk-testing systems.

G. Loudspeaker tap settings
1. Where loudspeaker tap wattages are specified in the design documents, set transformers per these. Otherwise, set taps per best practices.
2. Set taps such that the total wattage of a series of loudspeakers will not exceed 75 percent of the associated amplifier’s rated wattage.
3. Record tap settings per loudspeaker for inclusion on the as-built drawings.

H. Loudspeakers, acoustical tile ceiling mounted
1. Coordinate ceiling tile work (such as cutting holes) with the ceiling contractor.
2. Unless directed otherwise, center ceiling loudspeakers to ceiling tiles and evenly space loudspeakers.
3. Cut ceiling tiles to fit loudspeaker such that no gaps are visible after the loudspeaker cover/grille is installed.
4. Install ceiling loudspeakers with safety wires attached to the building structure per applicable codes and best practices.
5. Use tile rails and other support components to ensure loudspeakers do not sag.
6. Where manufacturer labels are visible on loudspeaker grills and are rotatable, align these consistently.
7. Replace ceiling tiles damaged during loudspeaker installation work.

I. Loudspeakers, gypsum ceiling mounted
   1. Coordinate ceiling work (such as cutting holes) with the framing contractor.
   2. Unless directed otherwise, align and evenly space loudspeakers.
   3. Cut wallboard to fit loudspeaker such that no gaps are visible after the loudspeaker cover/grille is installed.
   4. Install ceiling loudspeakers with safety wires attached to the building structure per applicable codes and best practices.
   5. Where manufacturer labels are visible on loudspeaker grills and are rotatable, align these consistently.

J. Cabling and wiring – at racks
   1. Do not use electrical tape for bonding, splicing, joining, or any other purpose.
   2. As a general practice, run power cables, control cables, and other cables with higher voltage levels on the left side of an equipment rack as viewed from the back; run other cables with lower voltage levels on the opposite side. Where wiring issues or wire routing facilities preclude this configuration, it is acceptable to deviate from the directions above, if separation is maintained between signal and electrical power cables.
   3. To reduce signal contamination, group cables per the signals being carried. Maintain appropriate distances between cable groups, especially between high-current (power; loudspeaker) and low-current (microphone) groups. Form separate groups for the following cables/signal types:
      a. Power
      b. Control
      c. Analog video
      d. Digital audio and video
      e. Analog microphone audio
      f. Analog line audio
      g. Loudspeaker audio
      h. Radio frequency
   4. Within racks, install wires and cables with service loops. Provide sufficient cable to allow each piece of equipment to be removed from the front of the rack for servicing.
   5. At boxes or points of termination, install wires and cables with service loops. Provide sufficient cable to allow each piece of equipment to be removed and laid flat on a surface for servicing.
   6. At slide-out equipment racks, dress cables to allow racks to be extended to the maximum length of the rack slides. For slide-out rotating racks, provide sufficient cable to allow full extension and rotation.
   7. For cables that interface with racks, cabinets, consoles, or equipment modules, use screw-type terminal blocks, terminal strips, or connectors. Telephone-style punch-down blocks (e.g., 110 blocks) are not acceptable.
   8. Do not bend any cable or wire tighter than the manufacturer’s minimum bend radius.
   9. Install wires and cables such that the cable exerts no strain on its termination.
   10. Label wires and cables, regardless of length, using a cable label with a unique number or letter per the instructions below under “Labeling”.
   11. Cable Shield Bonding: For cables with shields, connect them using approved connectors per an approved grounding topology.
   12. Encase umbilicals connecting moveable racks and cabinets to walls and other fixed locations in braided sleeving. Where racks and cabinets are installed in view of non-technical people, coordinate sleeving colors with the Architect.
K. Cabling and wiring – overhead distribution

1. Use cabling appropriate to loudspeaker impedance, cabling distance, and installation conditions (such as plenum versus non-plenum).
2. The use of electrical tape for bonding, splicing, joining, or any other purpose is prohibited.
3. Provide cable runs between termination points that are continuous, with sheath continuity. Splices are not permitted anywhere.
4. Place cables within designated pathways, such as cable tray, cable hangers, etc. Do not fasten cables to other building infrastructure (such as ducts, pipes, etc.), other systems (such as ceiling support wires, wall studs, etc.), or to the outside of conduits, cable trays, or other non-approved pathway systems.
5. Protect cables from physical interference and damage during installation and termination. Install cables with no kinks or twists.
6. Install HDBaseT cables within manufacturers’ length recommendations.
7. Comply with manufacturers’ limits for pulling tension.
8. Do not use cable-pulling compounds for indoor installations.
9. Install cables within manufacturers’ bend radius limits. If no minimum bend radius is given, then maintain a minimum bend radius of six times the cable diameter during and after installation.
10. Route cables under building infrastructure (such as ducts, pipes, conduits, etc.); do not route cables over building infrastructure. Install cables to provide accessibility for future service.
11. Place cables 6”, minimum, away from power sources to reduce interference from EMI.
12. Connectors: Use the following connectors:

L. Terminations and Cords at Floor Boxes

1. Provide strain relief for cables. Use appropriate cable management products (such as hook and loop straps for UTP and STP cabling, and nylon cable ties for other cables) to group similar cable types.
2. Provide permanent labels on cables within 6” of terminations.
3. Provide permanent labels on receptacles within floor boxes to clearly identify terminations and services.
4. Encase umbilicals connecting moveable racks, cabinets, etc., to floor boxes in braided sleeving. Where racks and cabinets are installed in view of non-technical people, coordinate sleeving colors with the Architect.

M. Blank panels: Provide blank trim plates in floor, wall and furniture-mounted boxes at unused termination positions. Fill each module opening filled, either with a receptacle, a receptacle plate, or a module of the type the opening is intended to house.
N. Patch panels
   1. Assignments: Wire patch panels so that signal sources appear on the upper row of a row pair; and destinations appear on the lower row of a row pair. Submit variations from this approach per the requirements in Submittals.
   2. Designation strips: Utilize alphanumeric identifications and descriptive information on audio and video patch panel designation strips. Number the jack positions in each row sequentially from left to right. Letter the jack rows sequentially from top to bottom. Include the alphanumeric identification of each jack on the functional block drawings. Mount reproductions of these drawings in an appropriate location near the patch bays.

3.4 EDID MANAGEMENT

A. For each system, determine the maximum pixel resolution, frame rate, and color depth supported by all content displays, and designate this as the target resolution for the system. Omit digital signage displays from this process.
   1. Scalers: Configure video scalers as follows:
      a. Input: Emulate the EDID configuration of the native resolution of the connected display or projector for both analog and digital inputs.
      b. Output: Configure to match the native resolution of the display system and at the highest supported scan rate.

B. Determine the system’s maximum audio parameters – output channel count, LFE capabilities, etc.

C. Configure the system’s EDID management to ensure that these audio and video parameters are sent to source devices.

3.5 HDCP MANAGEMENT

A. Include HDCP support in all equipment that incorporates copy protection for the transport of copyrighted media.
   1. Installation requirements
      a. Equipment capable of passing HDCP included in this project must support the same HDCP version (i.e. HDCP 1.4 or HDCP 2.2).
   2. Exceptions
      a. HDCP may be defeated for educational institution projects per ‘fair use’ copyright terms.

3.6 NETWORK SECURITY

A. Leave no network-connected device operating with its factory-default password.

B. Obtain Owner defined password changes for all network-connected devices. Program these passwords into the devices.

C. Where available, enable two-factor authentication.

3.7 PROGRAMMING AND EQUIPMENT CONFIGURATION

A. General Programming
1. Install the most current version of manufacturers’ firmware on devices.

B. Audio Processor Programming
1. The following instructions apply to all systems including programmable audio processors and microphones.
2. Make equalization and other room tuning adjustments to obtain the flattest, and least colored result the system is capable of.
3. After tuning the system, perform other adjustments, such as dynamics, AEC, etc.

C. Control System and Button Controllers
1. Owner’s requirements
   a. Meet with the Owner and document their functional and user interface requirements (backgrounds, color scheme, screens, menus, functions, etc.).
   b. Develop programming and user interfaces based on the user requirements.
   c. Submit touch panel layouts and menu flow documentation to the Owner and Engineer per submittal schedule.
   d. Meet with the Owner and Engineer and present the control system programming and user interfaces. Obtain the Owner’s approval on these items.

2. Programming guidelines
   a. Create initial screens (splash screens) that use a version of the Owner’s logo, generated without visible scaling artifacts.
   b. Only use red for alarm indicators and other screen elements of special significance.
   c. Avoid use of technical terms, rather, use clear, everyday language. For example, instead of “System On”, use “Turn System On”; instead of “Power Down”, use “Turn Power Off”, etc.
   d. Ensure soft buttons are sized consistently and spaced evenly.
   e. Ensure spelling, punctuation, and grammar are 100% correct.
   f. Provide menus on both touch panels and control system web pages that appear and function consistently throughout the project.
   g. Ensure items with similar functions appear consistently in all menus.
   h. Provide soft button presses that display visual feedback, and if required by the Owner, audible feedback.
   i. Source selection shall be available at all times without powering on the projector and will display on the local monitor to allow previewing of material.
   j. Label button control as allowed by manufacturer. All buttons with programmed functions will be labeled. Buttons that have no function should be removed or blanked, if possible, and spare labels or blanks provided to Owner.

3. Tech menu: Provide a “tech” menu for each touch panel. Include in tech menus:
   a. Volume control for button audible feedback
   b. Screen brightness
   c. A means to change the tech screen password; obtain from the Owner’s Representative a default password for all touch panel tech menus
   d. Other technician-specific functions required for each system

4. Make IP control system devices (touch panels, controllers, processors, etc.) accessible and controllable via the network and via web access. For example, users and/or technicians shall be able to operate touch and pushbutton panel functions remotely. Coordinate with the Owner’s Representative to ensure a successful implementation of this requirement.
5. In AV-equipped rooms with an operable partition, program the AV system to use signals from the rooms' partition sensors to automate audiovisual system combine/divide functions.

D. Power control and sequencing

1. Whether explicitly listed in this specification or not, provide power control interfaces, e.g., remotely controllable PDUs, for equipment and devices that are not equipped with integrated power control. Provide power control interfaces that are fully compatible with the specified control system. Follow this directive for devices, such as audio power amplifiers, which would not be adversely affected by external power controls. Omit such power controls for devices, such as transmitters and receivers, that should not be externally power controlled.

2. Configure non-controlling items to power off or go into a standby/low power-consumption mode when systems are powered off. At minimum, program the AV system to power off the following types of devices when not in use:
   a. Audio processors
   b. Audio amplifiers
   c. Displays
   d. Projectors

3. Configure devices that detect connection to user devices to stay in standby/low power-consumption mode when audiovisual systems are turned off.
   a. Video switchers and processors

4. When turning systems on, use the following sequence for audio components.
   a. Turn on source devices.
   b. Turn on processing and routing devices.
   c. Turn on amplifiers.

5. When turning systems off, use the following sequence for audio components.
   a. Turn off amplifiers.
   b. Turn off processing and routing devices.
   c. Turn off source devices.

E. Network connection

1. Connect all network-connectable equipment and devices to the network. Program them to electronically issue notifications for preventative maintenance (e.g., replace a projector lamp).

2. Coordinate with the Owner’s Representative which devices are to provide notification (e.g., email notification) immediately at the time of a fault and which devices will provide notifications on a daily or weekly report.

3. Coordinate with the Owner’s Representative to obtain the default notification means (e.g., the email address for maintenance messages).

4. Ensure the Owner’s Representative can revise the maintenance email address via a simple method – using a single address for all networked AV devices. Document this procedure in the Operations Manual.

F. Equipment configuration:

1. Blu-ray disk players: Set color space to RGB.

2. Computer interfaces, signal extenders and transmitters with integral input switching: Program each device and related system components involved so that the analog audio input is active regardless of which video input is selected.
3.8 LABELING

A. Provide labeling identifiers that match closeout documentation (e.g., as-built drawings, O&M Manual, etc.).
B. Clean and degrease surfaces receiving nameplates and labels prior to affixing labels.
C. When creating labels for user-facing equipment and cables, use colored labels where possible. Example uses are floor boxes, table boxes, cameras, displays, and user-facing cables. Use color coding to relate labels to related components, i.e., match the text and color on each user-facing cable, its corresponding button on the button panel, and its corresponding input on the display. Example: HDMI 2 cable has a yellow label printed with “HDMI 2”, the button panel at the table box has a yellow “HDMI 2” label and the input on the display has a yellow label printed with “HDMI 2”.
D. Interface plate designation
   1. Provide wall-mounted interface plates with clearly engraved alphanumeric identification of input type (e.g., “MIC-1”, “LINE IN”, “SPEAKER”, “VIDEO”, etc.) and corresponding patch field designation.
E. Equipment enclosures
   1. Install the label on the top of the rack or cabinet, centered horizontally.
   2. Example: line 1: “AV-01”, line 2: “Audiovisual Devices”.
F. Equipment
   1. Rack-mounted equipment: Install labels in visible locations on equipment and devices on the front and back of the equipment.
   2. Field equipment: Install labels in visible locations on miscellaneous field equipment and devices.
G. Wireless transmitters and receivers
   1. Label wireless transmitters and receivers so users can clearly identify a given transmitter associated with its receiver.
   2. Use an identifier, such as a room number, that associates each transmitter with a given room or system.
   3. Example: RM.230–MIC.3–RCVR.1
H. Wire and cable
   1. Comply with the Owner’s labeling requirements. If the Owner does not have labeling requirements, conform with InfoComm F501.01.
   2. Provide labels with machine-generated text; hand-written labels will not be accepted.
   3. Provide labels with black text 1/8” high or #12 font size.
   4. Generate a unique identifier for each cable and wire using the system defined in the InfoComm F501.01 standard. Include “primary level” data elements (per F501.01); “secondary level” (per F501.01) data elements are optional.
   5. Install labels on both ends of cables no more than 4” from the edge of the cable. Install labels such that they are visible by a technician from a normal stance.
I. Batteries
   1. Label batteries with the month and year they were installed.
   2. Example: “Installed April 2017”

3.9 FIELD QUALITY CONTROL
A. Initial tests and measurements: Prior to final adjustment and scheduling acceptance testing, perform initial tests and measurements. At minimum, include the following initial tests and measurements:

1. Adjust, balance, and align equipment for optimum quality and to meet manufacturers’ published specifications.
2. Perform the test procedure provided at the end of this specification and return the completed form no less than one week prior to the initial punch walk.
3. For rack-mounted equipment with user-accessible controls, install 1/8” diameter vinyl "map dots" as indicators for nominal operating positions of rotary, slider, and other accessible controls. Provide multiple dots, adequately distinguished, for controls having more than one nominal operating position.

B. Test twisted-pair cabling per Section 270811.

C. Digital video cabling: Follow the following procedure to test each provided digital video cable.

1. HDMI: Quantum Data 780, or equal
2. DVI/SDI/HD-SDI: Quantum Data 882D, or equal
3. DisplayPort: Quantum Data 882E-DP, or equal
4. Test Procedure:
   a. Test each cable.
   b. Replace all cables that fail.

D. Audio system:

1. Loudspeaker line impedance: Measure the impedance at 63 Hz, 250 Hz, and 1 kHz and the resistance of each loudspeaker line leaving the sound equipment rack with the line disconnected from its normal driving source. For lines to full range distributed loudspeaker systems, measure impedance at 1 kHz.
2. Hum and noise level:
   a. Measure the hum and noise levels of the overall system for each microphone input channel and line level input channel.
   b. Adjust gain controls for optimum signal to noise ratio so that full amplifier output is achieved with 0 dBm at a line level input.
   c. Terminate line level inputs with resistors of 150 and 600 ohms, respectively, for these measurements.
   d. Disconnect the loudspeaker lines and terminate the power amplifier outputs with power resistors for these measurements. Use load resistors within 5% of the nominal load impedance of the amplifier under test. Use resistors with power ratings equal to or greater than the power rating of the amplifiers.
3. System frequency response:
   a. Measure audio system frequency response for the AV systems described in Part 1. Adjust systems to provide specified performance.
4. Uniformity of coverage:
   a. Using a calibrated testing device, measure octave bands using a pink noise test signal played through the loudspeaker system(s).
5. System power output and signal level adjustment:
   a. Measure the electrical distortion of the overall system for each line level input channel.
   b. Adjust gain control as for the tests specified herein.
c. Apply a 1 kHz sine wave signal from a test signal generator having less than 0.5% total harmonic distortion at the input tested, at a level required to produce full amplifier output. Note that a pad with 150-ohm output impedance is required for driving the microphone level input in accordance with the EIA standard.

d. Use a distortion analyzer to measure the output level and total harmonic distortion of the audio equipment. In the absence of a distortion analyzer, a high input-impedance measuring device such as a DMM may be used to measure the output level.

6. Loudspeaker polarity

a. Perform loudspeaker line polarity checks using a polarity tester or use DC source at one end of each line and a voltmeter at the other end. Confirm that loudspeaker lines are correctly polarized with respect to color coding.

b. Confirm loudspeaker polarity using a polarity tester.

7. Freedom from parasitic oscillation and radio frequency pickup:

a. With systems set up for each mode of operation specified in the Part 1, confirm that systems are free from spurious oscillation and radio frequency pickup, in the absence of audio input signal and when the system is driven to full output at 100 Hz.

b. Confirm these tests audibly and by using an oscilloscope having at least 5 MHZ bandwidth.

c. Apply a slow sine wave sweep from 50 Hz to 5 kHz at a level of 6 dB below rated power amplifier output to each system. Listen carefully for buzzes, rattles and objectionable distortion.

d. Correct causes of these defects unless the cause is clearly from other than the sound amplification system's equipment and installation, in which case bring the cause to the attention of the Owner and Architect.

8. Audio test signal paths: Verify operation from source inputs through system components to signal destinations.
E. Analog composite video system:
   1. Signal to noise: Operate the system using an RS-170A test signal. Measure and
document output noise levels using a composite video distortion analyzer.
   2. Differential gain: Using an RS-170A step test signal and a waveform monitor, measure
chrominance, luminance, and normal synchronizing and blanking signals. Measure
variations in chroma subcarrier amplitude at 10%, 50%, and 90% luminance.
   3. Differential phase: Operate the system as indicated above and measure chroma
subcarrier phase variations at 10%, 50%, and 90% luminance.

F. Projection systems:
   1. For each projection system, measure light intensity at the screen’s center and four
corners. Take corner measurements 5% of the image area width and height in from
image edges.
   2. Use a properly calibrated foot-candle (or lux) meter with cosine correction for the above
measurements.

G. Control systems:
   1. Verify all operational functions at each fixed control interface position.
   2. Verify all operational functions of the control system and interfaced devices.

3.10 CLEANING, PROTECTION AND REPAIR

A. Comply with the cleaning requirements of Section 270000.
B. During the installation and up to the date of final acceptance, protect finished and unfinished
work against damage and loss. In the event of such damage or loss, replace or repair such
damaged work.

3.11 SUBCONTRACTOR MANAGEMENT

A. Continuously supervise subcontractors during the installation; intermittent supervision is not
acceptable.

3.12 SYSTEM ACCEPTANCE TESTS

A. Perform system acceptance tests after completion of initial system checkout and after
submitting the Initial Testing and Tuning Report.
B. Prior to setting up a demonstration and/or punch walk with the Engineer, ensure that the
System/Systems are complete, operational, and fully functioning, and that pre-functional and
functional testing have been completed. Fees for any additional punch walks resulting from
incomplete and/or non-functioning Systems may be assessed.
C. System acceptance tests consist of the following:
   1. Take a physical inventory of equipment on site and compare it to equipment lists in the
contract documents.
   2. Demonstrate the operation of system equipment.
   3. Perform both subjective and objective tests to determine compliance with the
specifications. Provide test equipment specified for these tests.
   4. Provide final, "as built" drawings, run sheets, manuals, and other required documents, as
detailed in Part 1.
   5. Provide complete testing reports generated by subsystems that provide self-testing.
6. Perform power on/off cycles to ensure these take place with no audible and only minimally visible artifacts, pops, etc.

D. Initial Testing and Tuning Report
   1. Perform the following tests for each system unless otherwise noted in Part 1.
   2. Use additional pages as necessary to allow complete comments.
   3. Where blanks are provided in the checklist below, observe the associated value in parenthesis.

</table>

E. If further adjustment is required, or defective equipment must be repaired or replaced, tests may be suspended or continued at the option of the Owner or Owner’s representative.

1. If the need for further adjustments becomes evident during the demonstration and testing, continue work until the installation operates properly. Included in the continued work, changes to or installation of resistive pads, adjustment of loudspeaker aiming, adjustment of system processing, programming changes to the control system, convergence and/or alignment of the video projector, if these adjustments are required.

2. If acceptance of the system is delayed because of defective equipment or because the equipment does not fulfill this specification, reimburse the Owner for time and expenses for these tests during extensions of the acceptance testing period.

3.13 OWNER TRAINING

A. Provide a minimum of twenty four hours of training on the audiovisual systems specified herein at the project site (or other location designated by the Owner) by a qualified instructor (equipment manufacturer as needed) covering operation and maintenance of the systems.

B. Provide on-site AV support to the Owner during first beneficial use or special event.
3.14 MAINTENANCE AND EXTENDED SERVICE

A. Warranty Maintenance

1. On a quarterly basis during the warranty period, execute a service visit to check and adjust equipment and systems such that they maintain the original performance. Coordinate visits directly with the Owner.

2. Pre-emptive maintenance minimum requirements:
   a. Clean filters, vents, and lenses, and dust the equipment.
   b. Verify projector images fill screens appropriately and images are focused.
   c. Test and verify that all system controls operate as labelled and that the controlled devices respond accordingly.
   d. Document and photograph any conditions that may affect the continued function and long-term operation of the audiovisual system and report to owner.
   e. Document and report projector lamp life to the Owner and replace lamps as directed.

B. Provide cost for additional service levels beyond the warranty period (as defined in this section) as follows:
   1. One year, two-year, and three-year service with quarterly pre-emptive maintenance calls and same-day issue response
   2. One year, two-year, and three-year service with quarterly pre-emptive maintenance calls and 24-hour issue response
   3. One year, two-year, and three-year service with quarterly pre-emptive maintenance calls and 48-hour issue response

END OF SECTION
PART 1 - GENERAL

1.1 SUMMARY

A. This section includes general administrative and procedural requirements for Division 28 and is intended to supplement, not supersede, the requirements specified in Division 1.

B. The requirements described herein include the following:
   1. References
   2. Definitions
   3. System Description and Existing Conditions
   4. Submittals
   5. Quality Assurance
   6. Permits and Inspections
   7. Coordination
   8. Project Management and Coordination Services
   9. Product Delivery, Storage, and Handling
   10. Warranty
   11. Maintenance

C. Products furnished and installed under another Section:
   1. 120V power
   2. Conduit, junction boxes, device boxes (essentially rough-in)
   3. Door hardware
   4. Network Connections

D. Related Sections:
   1. General and Supplementary Conditions: General provisions of the Prime Contract and Divisions 00 and 01 apply to Division 27.
   2. Consult other Sections, determine the extent and character of related work, and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable installation.
   3. Section 26 05 33, “Raceway and Boxes for Electrical Systems”
   4. Section 27 05 28, “Communications Building Pathways”
   5. Section 28 05 13, “Security System Cabling”
   7. Section 28 08 00, “Security System Acceptance Testing”
   8. Section 28 13 00, “Access Control and Alarm Monitoring System”
   9. Section 28 16 00, “Intrusion Detection System”
   10. Section 28 23 00, “Video Surveillance System”
   11. Section 14 20 00, “Elevators”
   12. Division 27
   13. Earthwork: Include trenching, backfilling, boring and soil compaction as required for the installation of underground conduit, in-grade pull boxes, vaults, and bollard foundations.
   14. Selective Demolition: Nondestructive removal of materials and equipment for reuse or salvage as indicated. Also dismantling electrical materials and equipment made obsolete by these installations.
15. Concrete Work: Include forming, steel bar reinforcing, cast-in-place concrete, finishing and grouting as required for underground conduit encasement, pedestal foundations, and curbs. [Also includes saw-cutting of existing slabs and grouting of conduits in saw-cut.]

16. Miscellaneous Metal Work: Include fittings, brackets, backing, supports, rods, welding and pipe as required for support and bracing of raceways, equipment enclosures, cameras, and similar devices.

17. Miscellaneous Lumber and Framing Work: Include wood grounds, nailers, blocking, fasteners, and anchorage for support of security materials and equipment. Refer to Division 6, Rough Carpentry.

18. Moisture Protection and Smoke Barrier Penetrations: Include membrane clamps, sheet metal flashing, counter flashing, caulking and sealant as required for waterproofing of conduit penetrations and sealing penetrations in or through fire walls, floors, ceiling slabs and foundation walls. Tape and make vapor tight penetrations through vapor barriers at slabs on grade.

19. Division 8 Locking Hardware: Include interface to electronic hardware and door controllers on security related doors.

20. Access Panels and Doors: Required in walls, ceilings, and floors to provide access to security devices and equipment.

21. Painting: Include surface preparation, priming and finish coating as required for security cabinets, exposed conduit, pull and junction boxes, and devices where indicated as field painted in this Division. Refer to Division 9, Painting.

22. Elevators: Include interface to elevator floor and hall call on security related elevators.

1.2 REFERENCES

A. General

1. Codes, standards, and industry manuals/guidelines listed by reference, including revisions by issuing authority, form a part of this specification section to extent indicated. Consider such codes and/or standards a part of this Specification as though fully repeated herein.

2. Standards listed are identified by issuing authority, authority abbreviation, designation number, title or other designation established by issuing authority. Standards subsequently referenced herein are referred to by issuing authority abbreviation and standard designation.

3. Reference to codes, standards, specifications and recommendations of technical societies, trade organizations and governmental agencies shall mean that latest edition of such publications adopted and published prior to submittal of the bid unless otherwise specifically stated

B. Codes: Perform Work executed under this Section in accordance with applicable requirements of the latest edition of governing codes, rules and regulations including but not limited to the following minimum standards, whether statutory or not:

1. California Code of Regulations (CCR):
   a. Title 8, “Industrial Relations”
      1) Chapter 3.22, “California Occupational Safety and Health Regulations (CAL/OSHA)”
   b. Title 24, “California Building Standards Code”
      2) Part 2, Volumes 1 and 2, “California Building Code” (CBC)
      3) Part 3, “California Electrical Code” (CEC)
      4) Part 11, “California Green Building Standards Code” (CALGeen)”
2. National Fire Protection Agency (NFPA)
   a. NFPA 70, “National Electrical Code” (NEC)
   b. NFPA 75, “Protection Of Information Technology Equipment”

   b. Part 27, “Miscellaneous Wireless Communications Services”  
   c. Part 68, “Connection of Terminal Equipment to the Telephone Network”

4. International Code Council  

5. Other applicable national, state, and local binding building and fire codes

C. Standards: Perform Work and furnish materials and equipment in accordance with the latest editions of the following standards as applicable:

1. Underwriter’s Laboratories (UL): Applicable listing and ratings.  
   a. UL 294, “Access Control System Units”  
   b. UL 1076, “Proprietary Burglar Alarm Units and Systems”  
   c. UL 2044, “Commercial Closed-Circuit Television Equipment”

1.3 DEFINITIONS

A. The Definitions of Division 1 apply to the sections of Division 28.

B. In addition to those Definitions of Division 1, the following list of terms as used in this specification defined as follows:

1. “ACAMS”: Access Control & Alarm Monitoring System  
2. “As directed”: As directed or instructed by Owner, or their authorized representative  
3. “Cabling”: A combination of cables, wire, cords, and connecting hardware [e.g., cables, conductor terminations, connectors, outlets, patch panels, blocks, and labeling]  
4. “Connect”: To install required patch cords, equipment cords, crossconnect wire, etc. to complete an electrical or optical circuit  
5. “Engineer”: TEECOM  
6. “Furnish”: To purchase, procure, acquire, and deliver complete with related accessories  
7. “Contractor”: To be determined  
8. “IDS”: intrusion detection system  
9. “Install”: To set in place, join, unite, fasten, link, attach, set up or otherwise connect together and test before turning over to Owner, parts, items, or equipment supplied by Contractor or others. Complete installation and make ready for regular operation  
10. “Owner”: Contra Costa College  
11. “Provide”: furnish and install  
12. “Security System”: the ACAMS, IDS, VSS, and Intercom systems collectively and integrated  
14. “VAC”: volts alternating current  
15. “VDC”: volts direct current  
16. “VSS”: video surveillance system
17. “VMS”: visitor management system

1.4 SYSTEM DESCRIPTION

A. Overview
1. Contra Costa College is constructing a 3-story multi-level building.
2. Security at the new facility consists of access control and alarm monitoring (ACAMS), video surveillance (VSS), intrusion detection (IDS), and intercom systems. The ACAMS will automate opening and closing the buildings, control access through designated doors, and will restrict after-hours access to authorized cardholders, and the IDS will monitor specific spaces for intrusion.
3. The new system will connect to Owner’s exiting head end located at the district office over the Owner’s LAN/WAN.
4. The System includes integration to the Fire/Life Safety system to disconnect power to magnetic door holders and automatically close doors after hours.
5. The System includes elevator security and integration between the electronic security system and elevator controller.
6. Refer to individual sections for detailed description of systems.

B. Custom Device Requirements
1. General: Provide a high level of coordination services to ensure the proper installation and functioning of the security system. Coordinate the installation of the security system with other trades. This may include: review of other trade’s shop drawings, attendance at meetings, providing samples for mockup, and preparation & distribution of written documentation.

C. Base Bid Work
1. Access Control and Alarm Monitoring System (ACAMS)
   a. The Owner requires an access control system to automate opening and closing of the building, restrict access afterhours by cardholder privileges, and monitor specific spaces for intrusion.
   b. The ACAMS consists of card readers, control panels, power supplies, workstations, alarm monitoring devices, and interfaces to other security equipment.
   c. Refer to Section 28 13 00 for detailed description of system.
2. Intrusion Detection System (IDS)
   a. The IDS consists of keypads, control panels, duress buttons, alarm monitoring devices, and interfaces to other security equipment.
   b. The IDS will communicate with a remote, third-party central station for alarm monitoring and contact Police Services during day-time operation and dispatch of the local Police Department after hours.
   c. Refer to Section 28 16 00 for detailed description of system.
3. Video Surveillance System (VSS)
   a. The Owner requires a video surveillance to provide a photographic record of access control transactions and alarm events, some real-time monitoring of the facility, and integration with the access control and alarm monitoring system.
   b. The VSS consists of a combination of analog and IP cameras, power supplies, IP encoders, and network video recorders.
   c. Refer to Section 28 23 00 for detailed description of system.
4. The System includes integration with the Elevator conveying system to provide the following:
   a. Individual floor and/or hall call access control

5. The System includes integration with the Fire/Life-Safety system to provide the following:
   a. Automatically release locks upon fire alarm activation for doors within the path of egress
   b. Disconnect power to magnetic door holders to automatically close doors after business hours

1.5 SUBMITTALS

A. General: Refer to Division 01 for Submittal requirements applicable to this Section.

B. Required submittals include the following:
   1. Written detailed project description
   2. Project schedule as referenced in this section
   3. Product data sheets – clearly indicate by arrows or brackets precisely what is being submitted on and those optional accessories which are included and those which are excluded
   4. Estimated delivery lead times for products
   5. Voltage drop calculations demonstrating less than ten percent voltage loss to individual security devices
   6. Battery calculations showing backup support of security equipment and locks (except egress hardware with local power supplies) for 25 lock activations or 4 hours, whichever is greater

C. Complete submittals are comprised of shop drawings and product data sheets as detailed below and related sections (covering specific security systems). Incomplete or partial submittals will be rejected.

D. Shop Drawings
   1. Obtain written approval from the Engineer for the shop-drawings submittal prior to the release of materials and equipment purchase order and prior to installation.
   2. Quantity and Media: Submit shop-drawings as described in Division 1.
   3. Shop drawings shall document Contractor’s intent to execute the work and shall include the following:
      a. Title sheet and index
      b. Floor plans showing device locations, cable routing, and pathways
      c. System block diagrams
      d. Point-to-point wiring diagrams
      e. Specific wiring details and device mounting/installation details
      f. Schedules:
         1) Building/floor
         2) Unique device name/number
         3) Security controller/location
         4) Interfaces, interlocks
         5) IP address
         6) Master/substation intercom calling locations
4. Upon award of contract, request CAD release forms from TEECOM so that electronic files may be released for Contractor’s use. TEECOM will release floor plans with devices; TEECOM will not release installation details and block diagrams (Contractor shall develop their own diagrams and details for the shop drawings submittal package).

E. Format: Furnish submittal data in electronic copy including table of contents with each section bookmarked by specification section listing materials.

F. Label each submittal with the specification section number and provide a cover letter or stamp stating that the submittal has been thoroughly reviewed by Contractor and complies with the requirements of the contract documents. Failure to comply with this requirement will constitute grounds for rejection of the submittal.

G. Resubmittals: Provide a cover letter with the resubmittal that lists the action taken and revisions made to each product submittal in response to submittal review comments. Failure to include this cover letter will constitute rejection of the resubmittal package and no review will occur.

H. Drawings
   1. Prepare shop and as-built drawings using software compatible with AutoCAD and/or Revit per project standard.
   2. Drawing requirements:
      a. Sheet size: match the project’s contract drawings size and use the project’s title block
      b. Text size: minimum 3/32 inches high when plotted at full size
      c. Symbology: match the project’s contract drawings symbols
      d. Backgrounds: screen background information to allow pertinent drawing information to stand out.
      e. Line Weights: Use appropriate line weights for devices, raceways, and text to stand out against background information.
      f. Floor Plans: 1/8-inch scale floor and site plans showing the locations of devices and cable routing paths with cable types and quantity called out.

I. Contractor Qualifications: Submit the following for review and comment at the beginning of the project.
   1. Resumes of the project manager, general foreman, and lead technician(s) indicating role, years of experience, product certifications and training, listing of similar projects the individual performed the role proposed for this project along with client contact information for each.
   2. Certification letters from manufacturers of major system components stating Contractor is an authorized reseller, installer, and extended warranty provider for the specified security systems.

J. Samples
   1. Submit samples as required for proper coordination and installation of custom mounted equipment. Examples of samples that may be required include:
      a. Screen shots showing graphical floor plan maps indicating:
         1) Active functional icons
         2) Secure areas/zones
      b. Camera field of views
1.6 QUALITY ASSURANCE

A. General
1. Provide new and unused materials, equipment, and parts comprising the units specified herein of current manufacturer and of highest grade.
2. Only use products and applications listed in this Division on the project.

B. Bid Discrepancies
1. In the event of discrepancies within the contract documents, notify Engineer within 5 days prior to the bid opening to allow the issuance of an addendum.
2. If time does not permit notification or clarification of discrepancies prior to the bid opening, the following applies: The drawings govern in matters of quantity, and the specifications govern in matters of quality. In the event of conflict within the drawings involving quantities, or within the specifications involving quantities, or within the specifications involving quality, the greater quantity and higher quality apply. Note such discrepancies and clarify in the bid. We will make no additional allowances because of errors, ambiguities, or omissions, which reasonably should have been discovered during the preparation of the bid.

C. Substitutions
1. Conform to the substitutions requirements and procedures outlined in Division 01
2. Only one substitution for each product specified will be considered.
3. Where products are noted as “or equal”, a product of equivalent design, construction, and performance is considered. Include in the product data submittal: catalog cuts, product information, and pertinent test data required to substantiate that the product is in fact equivalent to that specified.
4. Only one substitution allowed for each product specified. Do not provide substituted material, processes, or equipment without written authorization from Engineer. Assumptions on the acceptability of a proposed substitution, prior to acceptance by Engineer, are at the sole risk of Contractor.
5. The burden of proof rest with Contractor that the substituted product is equivalent or better than the specified product. When Engineer accepts a substitution in writing, it is with the understanding that Contractor guarantees the substituted product, component, article, or material to be equivalent to the one specified and dimensioned to fit within the construction according to contract documents. Approved substitutions do not relieve Contractor of responsibilities for the proper execution of the Work, or from provisions of the Specifications.
6. Manufacturers’ names and model numbers used in conjunction with materials, processes or equipment included in the contract documents are used to establish standards of quality, utility and appearance. Materials, processes or equipment that, in the opinion of Engineer, are equivalent in quality, utility and appearance will be approved as substitutions to that specified when “or equal” follows the manufacturers’ names or model number(s).
7. Whenever material, process or equipment is specified in accordance with a Federal specification, an ASTM standard, an ANSI specification, UL rating or other association standard, present an affidavit from the manufacturer certifying that the product complies with the standard specification. When requested by Engineer, submit support test data to substantiate compliance at no additional cost.
8. Pay expenses, without additional charge to Owner, in connection with substitution materials, processes and equipment, including the effect of substitution on self, Subcontractor’s or other Contractor’s work.

D. Electronic Control Systems Contractor Qualifications
1. A current, active, and valid C7 or C10 license registered with the Contractors State License Board (CSLB)
2. Minimum five years of experience in installation and service of access control, video surveillance, and intrusion detection systems
3. Minimum five completed projects similar to scope and cost
4. Evidence of technicians qualified for the work in the form of current manufacturer’s training certification

E. Materials
1. Provide new materials and equipment without defects.
2. Provide only specified products and equipment, or products and equipment that have been approved in writing.

F. Regulatory Requirements
1. Work and materials to conform to the latest rules of National Board of Fire Underwriters wherever such standards have been established and to the regulations of the State Fire Marshal, OSHA and the codes of the governing local municipalities. Perform work under these specifications confirming to the most stringent of the applicable codes.
2. Provide the quality identified within these specifications and drawings when codes, standards, regulations, etc. allow Work of lesser quality or extent. The contract documents address the minimum requirements for construction.

G. Drawings
1. Layout: Follow the general layout shown on the Drawings except where other work may conflict with the Drawings.
2. Accuracy: The Drawings show a diagrammatic representation of the system within the constraints of the symbology applied.
3. Detail: The drawings do not fully represent the entire installation for the Security System. Drawings indicate the layout and location of control console(s) components, as well as location of security devices, i.e. card readers, door locks and contacts, and duress stations. The drawings do not show conduits, wire and cabling between every system component, equipment, or device.
4. Complete the details necessary for point-to-point design. This allows Contractor to achieve desired results applying their own procedures and methods. Submit shop drawings for review prior to installation.

H. Role of Engineer
1. During the construction phase of the project, Engineer will work with Contractor to provide interpretation and clarification of project contract documents, process and reply to relevant Requests for Information (RFI), and act as an interface between Contractor and Owner.
2. Owner has retained Engineer’s services to observe the work for general compliance with the contract documents.
3. In summary, Engineer will perform the following specific services during the design phase:
   a. Review product submittals and shop drawings for general compliance with the contract drawings and specifications.
   b. Review changes as they arise and confirm that the proposed solutions maintain the intended functionality of the system.
   c. Interpret field problems for Owner and translate into understandable language.
   d. Review the testing procedures to confirm compliance with industry-accepted practices.
1.7 PERMITS AND INSPECTIONS

A. Obtain and pay for permits and inspections required for the work.

B. Furnish materials and workmanship for this work in conformance with applicable legal and code requirements.

C. Perform tests required herein, or as may be reasonably required to demonstrate conformance with the Specifications or with the requirements of legal authority having jurisdiction.

D. Obtain review from compliance officials responsible for enforcement of applicable codes and regulations to establish that the work is in compliance with requirements of reference codes indicated herein.

1.8 PROJECT MANAGEMENT AND COORDINATION SERVICES

A. Provide a project manager for the duration of the project to coordinate the security system work with other trades. Coordination services, procedures and documentation responsibility include at a minimum, the items listed in this section.

B. Review of Shop Drawings prepared by Other Subcontractors:
   1. Obtain copies of shop drawings for equipment and systems provided by others that require connections or interface with the security system work. Thoroughly review those shop drawings to confirm compliance with the interface requirements.
   2. Document discrepancies or deviations:
      a. Prepare memo summarizing the discrepancy.
      b. Submit a copy of the specific shop drawing, indicating via cloud, the discrepancy.
   3. Prepare and maintain a shop drawing review log indicating the following information:
      a. Shop drawing number and brief description of the system/material
      b. Date of your review
      c. Name of the individual performing the review
      d. Indication if follow-up coordination is required

C. Scheduling: Prepare work schedules for each floor indicating the following information:
   1. Submittals
   2. Cable Installation
   3. SEC Build Out
   4. Device Installation
   5. Programming
   6. Testing
   7. Training
   8. Other tasks included under the alternate work section of these specifications

D. Job Conditions
   1. Protection: Keep conduits, junction boxes, outlet boxes and other openings closed to prevent entry of foreign matter. Cover equipment, devices, and apparatus to protect them against dirt, paint, water, chemical or mechanical damage, before and during construction period. Prior to final acceptance, restore to original condition fixture, apparatus or equipment damaged including restoration of damaged factory applied painted finishes. Protect bright finished surfaces and similar items until in service. No rust or damage will be permitted.
2. Supervision: Personally, or through an authorized and competent representative, supervise the work from beginning to completion and, within reason, keep the same foreman and workmen on the project throughout the project duration.

E. Weekly Status Reports: Prepare weekly status reports throughout the entire course of the project containing the following information:
   1. Current / up-to-date 2-week look ahead schedule
   2. Progress during prior week
   3. Work expected to be completed during the upcoming week
   4. Delivery dates for equipment
   5. Coordination status for each device requiring coordination with other subcontractors
   6. Summary of the information owed to Contractor, who is responsible for providing the information, and due date for the information

F. Weekly Meetings: Conduct or attend weekly coordination meetings with the electrical and other specialty subcontractors to coordinate the installation of the security systems.

1.9 PRODUCT DELIVERY, STORAGE, AND HANDLING

A. Delivery
   1. Do not deliver security system components to the site until protected storage space is available.
   2. Replace equipment damaged during shipping and return to manufacturer at no cost to Owner.

B. Storage
   1. Store materials in a clean, dry, ventilated space free from temperature extremes. Storage outdoors covered by rainproof material (for example, a tarp) is not acceptable.
   2. Maintain factory wrapping or provide a heavy canvas/plastic cover to protect units from dirt, water, construction debris, and traffic.
   3. Provide heat where required to prevent condensation or temperature related damage.

C. Handling
   1. Handle in accordance with manufacturer’s written instructions.
   2. Prevent internal component damage, breakage, denting and scoring. Do not install damaged equipment. Replace damaged equipment and return equipment to manufacturer.

1.10 WARRANTY

A. Provide the Security System as described in this specification with a one-year parts and service warranty at no additional cost to Owner.

B. Include in the warranty package, at a minimum, the following:
   1. Software support agreement for the ACAMS and VSS
   2. Software upgrades and patches
   3. Labor to install software upgrades and patches necessary to maintain the latest version
   4. Emergency maintenance service on regular working hour basis
   5. Service by factory trained and employed service representatives of system manufacturer
C. Maintain regular service facilities and provide a qualified technician familiar with this work at the site within four hours of receipt of a notice of malfunction including weekends and holidays. Provide material, devices equipment and personnel necessary for repairs. Install approved temporary, alternate equipment if required by Owner, complete and operational within 24 hours after notification of a malfunction, at no additional cost.

D. Conduct warranty repairs and service at the job site unless in violation of manufacturer’s warranty; in the latter event, provide substitute systems, equipment and/or devices, acceptable to Owner, for the duration of such off-site repairs. Transport warranty substitute and/or test systems, equipment, devices, material, parts and personnel to and from the job site at no additional cost.

E. Warranty period shall commence upon written final acceptance by Owner or Owner’s designated representative.

1.11 MAINTENANCE

A. Extra Materials
   1. Deliver extra materials to a secured location determined by Owner.
   2. Provide a complete bill of materials listing quantities, part numbers, and descriptions for each device for Owner to sign indicating receipt of equipment.
   3. Provide new and unused spare parts in their original packing materials upon delivery.

B. Maintenance Service
   1. For the first year of service, conduct quarterly system performance review meetings to review system operation problems and/or defects that occurred during the preceding 3 months. During these performance review meetings, perform the following:
      a. Visual checks and operational tests of the central processor, local processors, monitors, keyboards, system printers, peripheral equipment, security equipment and devices, power supplies, and electrical and mechanical controls.
      b. Clean system equipment, including interior and exterior surfaces.
      c. Perform diagnostics on equipment.
      d. Check and calibrate each device.
      e. Run system software and correct diagnosed problems.
      f. Resolve previous outstanding problems.
   2. Provide software and firmware updates issued free of charge by the manufacturer.

PART 2 - PRODUCTS

2.1 GENERAL

A. Material and equipment specified herein have been selected as the basis of acceptable quality and performance and have been coordinated to function as components of the included systems. Where a particular material, device, equipment or system is specified directly, the current manufacturer’s specification for same is a part of these specifications, as if completely elaborated herein.

B. Remove manufacturer identification marks from visible equipment. Provide materials permanently labeled with the manufacturer’s name, model and serial number.
C. Use standard, regularly manufactured, materials and equipment for this and/or other similar systems, and not custom designed especially for this project. Provide systems and components thoroughly tested and proven in actual use. Provide subsystems of one manufacturer.

2.2 EQUIPMENT ENCLOSURES AND JUNCTION ENCLOSURES

A. Application: For indoor use to house panels and equipment, and to house terminations, relays, and other components local to controlled doors and other field devices

B. Type: NEMA type 1 enclosure

C. Description:
   1. Solid steel enclosure with solid, continuous-hinged door
   2. Finish: ANSI 61 gray polyester powder paint finish inside and out
   3. Lockable / equipped with a lock kit (lock kits shall be keyed alike with other security enclosures throughout the project)
   4. Perforated back panel within enclosure (for mounting control boards, relays, terminal strips, etc.)
   5. One tamper switch per enclosure
   6. One 5” electric fan with a screen at the port per enclosure that houses electrically-powered devices/equipment

D. Size:
   1. For use as Security Equipment Enclosure: 36"L x 24"W x 6"D minimum
   2. For use as Security Junction Enclosure: 12"L x 12"W x 6"D minimum

E. Manufacturer, or equal:
   1. Eaton Cooper B-Line
      a. #36246-1PP; 36"L x 24"W x 6"D enclosure with back panel and lock kit
      b. #12126-1PP; 12"L x 12"W x 6"D enclosure with back panel and lock kit
   2. Hoffman
      a. #A36N24M; 36"L x 24"W x 6"D enclosure
      b. #A36N24MPP back panel for 36" x 24” enclosure
      c. #A12N126; 12"L x 12"W x 6"D enclosure
      d. #A12N12PP; back panel for 12" x 12” enclosure
      e. # A612AR; lock kit
   3. Wiegmann
   4. SquareD

2.3 SLOTTED WIRING DUCT

A. For indoor use inside equipment enclosures to manage/mind wiring.

B. Description:
   1. Type: Lead-free PVC with narrow finger design
   2. Color: Light gray
2.4 WIREWAYS

A. For indoor use with equipment enclosures to manage and route wiring and cabling.

B. Type: NEMA type 1 screw cover ‘gutter’ wireway and accessories

C. Description:
   1. Wireways shall have open top assembly and closure plates/end caps (to secure end of wireway sections).
   2. Finish: ANSI 61 gray polyester powder paint finish inside and out
   3. Size: 4" x 4", minimum

D. Manufacturer, or equal:
   1. Eaton Cooper B-Line #4448-G-NK; lay-in painted wireway without knockouts
   2. Hoffman #F44T148GP lay-in painted wireway without knockouts

2.5 INTERFACE RELAYS

A. Application: lock power switching and interfacing with other high-voltage powered equipment, i.e. gates, high-voltage locks, etc. (not for use at the output contacts on the access controllers since their rating is not adequate)

B. Type: Standard industry control, plug-in type with LED indicator lights to indicate when the relay is energized.

C. Contacts: Rated for 10 amps at 120VAC.

D. Coil Operating Voltage: as required, with 24VDC as first choice

E. Features:
   1. Color-coded test button
   2. Mechanical flag
   3. Snap-on label
   4. Pilot light
   5. 2mm test jacks
   6. Dual contact markings
   7. Snap-on number and letter markers
   8. Solid bus-bar socket construction

F. Relay bases shall be mountable on standard mounting rails

G. Manufacturer, or equal:
   1. Turck
   2. Idec
2.6 TAMPER RESISTANT HARDWARE

A. Tamperproof hardware shall be used in locations below 10’ exposed to the public.
B. Hardware exposed in public spaces shall be pinned-allen type.
C. Hardware used in specialty metal surfaces shall have a similar finish color.

2.7 WIRE CONNECTORS

A. Wire connectors shall be heat activated, gel filled.
B. Twist and solder/taped or wire nut connections are not acceptable.
C. Manufacturer, or equal:
   1. Dolphin
   2. 3M Terminals
   3. Fastenal Sealed Crimp and Solder connector

PART 3 - EXECUTION

3.1 EXAMINATION

A. Conditions: Verify existing conditions, which have been previously provided under other sections, are acceptable for product installation in accordance with manufacturer's instructions.
B. Pathways: Verify that pathways and supporting devices, which have been previously provided under other sections, are properly installed, and that temporary supports and devices have been removed.
C. Field Measurements: Verify dimensions of pathways, including length of pathways. For example, “True Tape” the conduits to verify cable distances.

3.2 FIELD QUALITY CONTROL

A. Staffing: Provide a qualified foreman who is in charge of the work and who is present at the job site at times work is being performed. Perform the work using skilled technicians under the direction of the foreman. Supervise the work force executing the work. Perform the installation within the restraints of the construction schedule. Do not change the supervisor during the project without prior written approval from Owner.
B. Inspection: Perform inspection after installation. Keep areas of work accessible and notify code authorities, or designated inspectors, of work completion released for inspection. Document completion, and inspection as required.

3.3 INSTALLATION

A. Perform this work in accordance with acknowledged industry and professional standards and practices and the procedures specified herein.
B. Provide a complete, operating system. Include devices specified including basic components and accessories, interconnecting wiring and other equipment and installation devices necessary for a complete system as specified.

C. System Password Management:
   1. Change default passwords.
   2. Create a base administrator account for Owner’s use/login.
   3. Install the latest security patches (for the operating system and each individual piece of equipment).
   4. Disable unused communication ports or protocols.
   5. Perform quarterly software security patch updates for the client during the warranty period.
   6. Contractor to turn over all source media including installation discs, manuals, drives, dongles, and licensing keys and codes.

D. Manufacturer's Instructions:
   1. Comply with manufacturer's product data, including product technical bulletins, product catalog installation instructions, and product carton instructions for installation.
   2. Maintain jobsite file of Material Safety Data Sheets (MSDS) for each product delivered to jobsite.

E. Boxes, Panels, and Enclosures
   1. Install boxes, panels, and enclosures square and plumb.
   2. Set flush-mounted units with the face of the cover, bezel, or escutcheon in the same plane as the surrounding finished surface.
   3. Mount boxes, panels, and trim so that there are no gaps, cracks, or obvious lines between the trim and the adjacent finished surface; ready them to receive final finish, as applicable.
   4. Install insulating terminations in signal circuit boxes, panels, wireways, or enclosures.

F. Painting
   1. Custom paint devices as indicated on the drawings.

3.4 REPAIR/RESTORATION

A. Replace or repair work completed by others that you deface or destroy, and at no cost to Owner.

B. Punch List:
   1. Inspect installed work and develop a punch list for items needing correction.
   2. Submit punch list to Engineer for review prior to performing punch walk with Engineer.

C. Re-Installation:
   1. Make changes to the system such that defects in workmanship are correct and cables and the associated termination hardware passes the minimum test requirements.
   2. Repair defects prior to system acceptance.

D. Painting: Repaint surfaces altered during installation of the security system to match previous conditions.
3.5 CLEANING

A. Remove temporary coverings and protection of adjacent work areas. Remove unused products, debris, spills, or other excess materials. Remove installation equipment.

B. Leave finished work and adjacent surfaces in neat, clean condition with no evidence of damage.

C. Repair or replace damaged installed products.

D. Legally dispose of debris in an environmentally friendly manner.

E. Clean installed products in accordance with manufacturer's instructions prior to Owner's acceptance.

END OF SECTION
SECTION 280413 - COMMON SUBMITTAL REQUIREMENTS FOR ELECTRONIC SAFETY AND SECURITY

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Supplementary administrative and procedural requirements for submitting Shop Drawings, Product Data, Samples, and other submittals specific to the work of this Division.

B. Related Requirements:
   1. Division 01 submittal requirements.

1.3 DEFINITIONS

A. Contractor: Refers to an entity in direct Contract with the Owner to furnish and/or perform any portion of the Work of the Contract.
   1. Contractor shall review and approve Product Submittals prior to forwarding them to the Architect.

B. Product Submittals: In general, Product Submittals show characteristics of the proposed construction in one of the following forms:
   1. Shop Drawings.
   2. Product Data.
   3. Samples.

C. Action Submittals: Written and graphic information and physical samples that require Architect/Engineer's responsive action. Action submittals are those submittals indicated in individual Specification Sections as "action submittals."

D. Sustainable Design Submittals: Submittals required by Section 01813 "Sustainable Design Requirements." Submit documentation for products and materials contributing to achievement of LEED rating indicated. Sustainable Design Submittals are in addition to other submittal requirements.

E. Informational Submittals: Written and graphic information and physical samples that do not require Architect/Engineer's responsive action. Submittals may be rejected for not complying with requirements. Informational submittals are those submittals indicated in individual Specification Sections as "informational submittals."

F. Submittal Review Sheet: Specific form required to accompany each submittal. Obtain Submittal Review Sheet from the SmithGroup Project Manager.
1.4 SUBMITTAL ADMINISTRATIVE REQUIREMENTS

A. Requirements specified for submittals are intended to provide efficient handling, while permitting review responsibilities to be carried out.

B. Avoidable Resubmittals: The first two reviews of each specified submittal will be processed without cost to the Contractor. After the second review, the Owner may charge the Contractor for the cost of such additional processing, unless the processing results from approved Change Orders causing revisions to previously approved submittals.

C. Coordination: Coordinate preparation and processing of submittals with performance of construction activities.
   1. Coordinate each submittal with fabrication, purchasing, testing, delivery, other submittals, and related activities that require sequential activity.
   2. Submit all submittal items required for each Specification Section concurrently unless partial submittals for portions of the Work are indicated on approved submittal schedule.
   3. Submit action submittals and informational submittals required by the same Specification Section as separate packages under separate transmittals.
   4. Coordinate transmittal of different types of submittals for related parts of the Work so processing will not be delayed because of need to review submittals concurrently for coordination.
      a. Architect and Engineer reserve the right to withhold action on a submittal requiring coordination with other submittals until related submittals are received.

D. Processing Time: Allow time for submittal review, including time for resubmittals, as follows.
   Time for review shall commence on Architect's receipt of submittal. No extension of the Contract Time will be authorized because of failure to transmit submittals enough in advance of the Work to permit processing, including resubmittals.
   1. Refer to Section 01330 for quantity of days allowed for review.
   2. When a large volume of submittal materials is scheduled, additional review time may be required. Similarly, a particular submittal may require review completion in less than the agreed normal time. Due to variations in submittal volume and processing needs, agreed review time is not intended to apply to extreme conditions.

E. Maintain at the Project Site ready access to the latest reviewed Shop Drawings and Product Data, and one set of samples.

PART 2 - PRODUCTS

2.1 SUSTAINABLE DESIGN REQUIREMENTS

A. The District requires the Contractor to implement practices and procedures to meet the project's environmental performance goals. The Contractor shall ensure that the minimum requirements related to these goals, as defined in Section 01813 "Sustainable Design Requirements" are implemented to the fullest extent possible. Specific materials and systems have been selected to this end. Substitutions, or other changes to the work proposed by the Contractor or their Subcontractors, shall not be allowed if such changes compromise the aforementioned environmental goals and LEED certification.
B. Specific material goals, beyond inherently designed facility service systems, that may impact this area of work include: use of products with third-party verified Environmental Product Declaration, use of products with Health Product Declarations, use of products from manufacturers with publicly disclosed Corporate Sustainability Reports, use of products with recycled-content materials; use of locally-purchased, manufactured and extracted materials; use of FSC certified wood; use of low-emitting materials; construction waste recycling; and the implementation of a construction indoor air quality management plan.

PART 3 - EXECUTION

3.1 CONTRACTOR’S REVIEW

A. Project Closeout and Maintenance Material Submittals: See requirements in Division 01.

B. Be responsible for quantities, weights, and dimensions to be confirmed and correlated at the site; for information that pertains solely to the fabrication processes and to the means, methods, techniques, sequences, and procedures of construction; and for coordination of the work of every trade, supplier, and subcontractor.

C. Be responsible for each submittal to be in conformance with information given and the design intent expressed in the Contract Documents.

D. Provide with each submittal specific written notice of any variation from the requirements of the Contract Documents by causing a specific notation to be made on the Submittal Review Sheet and Submittal Transmittal. Changes to the approved construction documents are subject to DSA review and approval, submitted by the Architect as a CCD per DSA IR A-6.

3.2 ARCHITECT/ENGINEER’S AND GENERAL CONTRACTOR’S ACTION

A. General: Architect will not review submittals that do not include the Submittal Review Sheet.

B. Action Submittals: Architect’s staff and consultants will review the submittal, and mark the Submittal Review Sheet with an action code. The code meanings are described below.

C. Additional codes may be provided within comments or as an electronic submittal review stamp and shall be used in help indicating return of partial submittals.

E. Review Code meanings are as follows:

1. Action Codes Permitting Use:

   a. When an action code permitting use is assigned to a submittal, it does not authorize work that does not comply with the requirements of the Contract Documents. Acceptance of the Work will depend on compliance.

   b. Code AP - Approved: The Work covered by the submittal item may proceed, provided it complies with Contract Document requirements.

   c. Code AN - Approved as Noted: The Work covered by the submittal item may proceed, provided it complies with the Architect’s notations and Contract Document requirements.
d. Code AN-R - Approved as Noted - Resubmit: Do not deliver or install the related work until the resubmittal has received Code AP or AN. However, fabrication and other off-site work covered by the submittal item may proceed, at the Contractor's risk, provided it complies with the Architect's notations and Contract Document requirements.

2. Action Code Prohibiting Use:
   a. Action Code REJ - Not Approved: The Work covered by the submittal item, including purchasing, fabrication, delivery, and other activity, shall not proceed. Revise the submittal item or prepare a new item in accordance with the Architect's notations. Resubmit the corrected or new item without delay; do not permit submittal items marked "Not Approved" to be used. Work incorporating such items will be rejected.

3. Action Code for Items Not Required:
   a. Action Code X - Not Requested by Contract Documents: The submittal item is not called for by the Contract Documents and is being returned unreviewed by the Architect except to the extent necessary to determine its status.

F. Informational Submittals: For Architect's information only. Architect will review each submittal and will not return it, or will return it if it does not comply with requirements. Architect will forward each submittal to appropriate party.

1. Action Code for Information Only:
   a. Action Code INF - Information Only - Received: The submittal item is not called for a return with a reviewed action code by the Contract Documents and is being returned un-reviewed by the Architect except to the extent necessary to determine its status.

G. Partial submittals prepared for a portion of the Work will be reviewed when use of partial submittals has received prior approval from Architect.

H. Incomplete submittals are not acceptable, will be considered non-responsive, and will be returned without review.

I. Architect will return without review or discard submittals received from sources other than the Contractor.

J. Submittals not required by the Contract Documents may be returned by the Architect without action.

1. Do not submit Material Safety Data Sheets. They will be returned without review or discarded.

3.3 SUBMITTAL TRANSMITTAL REQUIREMENTS

A. Submittal Transmittal shall be a PDF file in electronic format. It is recommended, to expedite the submittal review, the electronic form be emailed for review to the Architect as early as possible.

   1. Submittal Numbering: See below.
   2. Contact Information: Full Name, Phone Number and Email Address.

B. Submittal Definition

   1. Each submittal consists of items from only ONE Specifications section.
2. Complete Submittal: If ALL the items required by the Specifications section are listed on one Submittal Form (including continuation sheet), it is a complete submittal.

3. Partial Submittals: If it is necessary to divide the required items of a given Specifications section into two or more submittals to meet schedule or handling requirements, the separate submittals are partial submittals. All partial submittals have the same submittal number, and are differentiated by sequential P-numbers (see below).

4. All items in each submittal, whether complete or partial, will be processed together: Individual items will not be 'broken out' for special handling. Arrange submittals accordingly.

C. Submittal Numbering
   1. Number submittals as described below to assist tracking.
   2. Number each submittal in the format nnnnnn-nn.
      a. The 6-digit number is the number of the section that requires the submittal. For example, 044200.
      b. The 2-digit number is based on the numerical sequence of submittals from that section. In other words, for each section, the first submittal is 01, the second is 02, and so on. The 2-digit number does not change for partial or re-submittals, so that the submittal can be tracked.
      c. P-Number for Partial Submittals: Number each partial submittal in the pee space, beginning with P1, and increasing by one for each partial submittal of that submittal. If the submittal is a complete submittal, leave the P space blank.
      d. R-Number for Re-submittals: Number each re-submittal in the arr space, beginning with R1, and increasing by one for each re-submittal of that submittal. Do not include an R-Number for the initial submittal.
      e. Examples:

3.4 SUBMITTAL REVIEW SHEET REQUIREMENTS

A. Provide Submittal Review Sheet in PDF format. Submit as the page after the Submittal Transmittal.

B. When attached, the Submittal Review Sheet shall not obscure information contained in the submittal.

C. Do not edit any of the information contained within the Submittal Review Sheet except as follows:
   1. Submittal Number: See Submittal Numbering in Submittal Transmittal Requirements paragraph.

D. The Contractor shall submit the PDF file in a manner that will allow editing of the Submittal Review Sheet fields by SmithGroup and its consultants.

END OF SECTION
SECTION 28 05 13 SECURITY SYSTEM CABLING

PART 1 - GENERAL

1.1 SUMMARY

A. General: Furnish engineering, labor, materials, apparatus, tools, equipment, transportation, temporary construction and special or occasional services as required to make a complete working security system installation, as described in these specifications.

B. Section Includes: Cables and wires for security systems

C. Related Sections:
   1. Consult other sections; determine the extent and character of related work and properly coordinate work executed under this section with that specified elsewhere to produce a complete and operable system.
   2. Section 28 00 00, "Basic Security Requirements"
   3. Section 28 05 53, "Security System Labeling"
   4. Section 26 05 33, "Raceway and Boxes for Electrical Systems"
   5. Section 27 05 28, "Communications Building Pathways"
   6. Section 27 15 13, "Communications Horizontal Twisted Pair Cabling"

1.2 REFERENCES

A. Comply with the Reference requirements of section 28 00 00.

B. In additional to those codes, standards, etc., listed in section 28 00 00, products and work shall comply with the latest edition of the following applicable specifications and standards except as otherwise shown or specified:
   1. NFPA 262, “Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces"
   2. ANSI/UL 1666, “Test for Flame Propagation Height of Electrical and Optical-Fiber Cable Installed Vertically in Shafts”
   3. ANSI/UL 1581, “Reference Standard for Electrical Wires, Cables and Flexible Cords”

1.3 SUBMITTALS

A. Submittal Requirements at Start of Construction:
   1. Product Data: Submit product information, including manufacturer, part number, description, use/application, jacket rating, outside diameter, etc.

B. Submittal Requirements at Closeout:
   1. Include wire and cable types in As-Built Drawings
   2. Include wire and cable information in O&M Manuals
1.4 SCOPE OF WORK

A. General:
   1. Provide engineering, labor, materials, apparatus, tools, equipment, transportation, temporary construction and special or occasional services as required to make a complete working security system installation as described in these specifications.

B. Cables for Security System
   1. Provide wires and cables sized to allow for voltage drop of 12VDC and 24VDC power service from power supplies in equipment rooms to field devices.
   2. Provide cables effectively shielded for video signal cable within the same conduit to mitigate interference or signal noise.
   3. Provide plenum rated jacket (type CL2P, CL3P, or CMP) on cables installed indoors where required.
   4. Provide PVC or PE jacket, flooded cables to prevent water intrusion where installed outdoors, underground, and/or within slab-on-grade. Provide transition of outdoor/underground cables to indoor cables when entering a building.
   5. Provide surge protection when cables enter buildings from outdoors where required by CEC.

C. Cable Supports and Pathways for Security System Cabling
   1. Provide dedicated cable support for security cables when not within primary pathways (such as cable tray). Coordinate work with Division 27 – particularly for use of pathways/cable support.

PART 2 - PRODUCTS

2.1 WIRE AND CABLE

A. General
   1. Provide required wire and cable sized to allow for voltage drop on long runs and effectively shielded as required to allow the routing of 12 & 24V power and video signal cable in the same conduit without interference or signal noise.
   2. Cable installed outdoors or in underground conduit must contain a PVC or Polyethylene jacket to prevent water intrusion and compliant with the TIA-455-82B water infiltration test.
   3. Cables installed indoors to contain a plenum rated jacket (type CMP).
   4. Application: Indoor use, for ACAMS, VSS, Security Communications System, and IDS
   5. Type: multi-conductor or paired, unshielded and shielded

B. Manufacturers, or equal:
   1. West Penn

C. Access Control & Alarm Monitoring System
   1. Plenum Jacketed Cable
      a. #18/2 AWG unshielded: West Penn #25224B, door contact cable
      b. #18/4 AWG unshielded: West Penn #25244B, REX and alarm device cable
      c. #18/6 AWG shielded (overall): West Penn #253186B, card reader cable
      d. #16/2 AWG unshielded: West Penn #25225B, lock power cable
2. Water Blocked Cable
   a. #18/2 AWG unshielded with Aquaseal tape: West Penn #AQC224, door contact cable
   b. #18/4 AWG unshielded with Aquaseal tape: West Penn #AQC244, REX and alarm device cable
   c. #18/6 AWG shielded (overall) with Aquaseal tape: West Penn #AQC3186, card reader cable
   d. #16/2 AWG unshielded with Aquaseal tape: West Penn #AQC225, lock power cable
   e. #14/2 AWG unshielded with Aquaseal tape: West Penn #AQC226, lock power cable from local power booster to exit device

D. Intrusion Detection System
   1. Plenum Jacketed Cable
      a. #22/2 AWG unshielded: West Penn #25221B, door contact cable
      b. #22/4 AWG unshielded: West Penn #25241B, keypad and alarm device cable
      c. #18/2 AWG unshielded: West Penn #25224B, control panel power cable

E. Video Surveillance System
   1. Cabling for IP cameras provided by Telecommunications contractor. Refer to Section 27 15 13 – Communications Horizontal Twisted Pair Cabling.
   2. Provide minimum RG-59/U CCTV video coaxial cable between analog cameras and the monitoring equipment, with the following features:
      a. 95% percent copper braid
      b. Foam dielectric
      c. Solid copper core
      d. 75 ohm characteristic impedance
      e. Plenum jacket
   3. Plenum Jacketed Cable
      a. #RG-59 coaxial: West Penn #25815, analog camera video cable
      b. #18/2 AWG unshielded: West Penn #25224B, power cable
      c. #22/4 AWG 2 pair individually shielded (overall): West Penn #D420, RS-422 communications cable for analog PTZ cameras
   4. Water Blocked Cable
      a. #RG-59/U coaxial with Aquaseal tape: West Penn #AQC815, analog camera video cable
      b. #18/2 AWG unshielded with Aquaseal tape: West Penn #AQC224, power cable
      c. #22/4 AWG 2 pair individually shielded (overall) with Aquaseal tape: West Penn #AQC430, RS-422 communications cable for analog PTZ cameras

2.2 MISCELLANEOUS COMPONENTS

A. Cable Ties
   1. General
      a. Provide Velco-style cable ties on security cabling within telecommunications spaces and covered wireways.
b. Dress and bind cabling with cable ties every 24” minimum.
c. Width: 0.75 inches
d. Color: Black

2. Manufacturer:
   a. Panduit #HLS-15-R-0 Black, 15 feet roll, cut to length
   b. Or Equal

B. Compression Seal BNC (Bayonet Neill Concelman) Connectors

1. General
   a. Suitable for use on RG-59 coaxial cable for CCTV systems.
   b. Compression seal connection
   c. Capable of accepting cable with outside diameters between 0.195 - 0.245 inches. Twist-on or crimp-on style connectors are not permitted.

2. Manufacturer:
   a. GEM Electronics #302-10CSTP compression seal BNC connector
   b. Or Equal

PART 3 - EXECUTION

3.1 INSTALLATION

A. Horizontal Cable Installation and Routing

1. Install cables and wires continuously (splices will not be permitted without written approval from the Engineer) for the entire length of run between connections and/or terminations.
2. Place and suspend cables within designated pathways, such as cable hangers, cable tray, etc. Do not fasten or attach cables (such as with cable ties) to other building infrastructure (such as ducts, pipes, conduits, etc.), other systems (such as ceiling support wires, wall studs, etc.), or to the outside of conduits, cable trays, or other non-approved pathway systems.
3. Place and suspend cables during installation and termination in a manner to protect them from physical interference or damage. Place cables with no kinks, twists, or impact damage to the sheath. Replace cables damaged during installation or termination at no additional cost.
4. Route cables at 90-degree angles, allowing for bending radius, along corridors for ease of access.
5. Route cables under building infrastructure (such as ducts, pipes, conduits, etc.) so the installation results in easy accessibility to the cables in the future.
6. Do not exceed manufacturer's limits for pulling tension.
7. Do not use cable-pulling compounds for indoor installations.
8. Dress and secure cables without stress and/or deformation. Dress and bind cabling with cable ties every 24” minimum. Within telecommunications spaces and covered wireways, provide Velcro-style cable ties on security cabling.
9. Install shielded wiring or route in separate raceways as recommended by the manufacturer's current requirements.
10. Place cables a minimum of 6” away from power sources to reduce interference from EMI.
11. Do not run signal wire and cable in parallel to power (120VAC).
12. When connecting to screw-type barrier blocks, terminate wires with insulated crimp-type spade lugs. Size lugs properly to assure high electrical integrity, i.e., low resistance connections.

13. Follow manufacturers recommended guidelines for installation.

14. When exiting the primary pathway (such as cable tray) to the device, exit via the top of the pathway. Secure the cables to the pathway using an approved cable tie.

15. When routing cables vertically in conduit for continuous distances greater than 30 feet, secure cables as the cables exit the vertical pathways. Secure cables using screw-flange nylon cable ties or similar approved ties. Provide symmetrical clamping devices with split, circular, or other wire conforming, nonmetallic bushings for coaxial cables.

16. Within telecom rooms, route and dress cables on the overhead cable support and, when routing vertically, fasten the cables onto wall-mounted vertical cable support every 24 inches on-center using cable ties.

B. Cable Support

1. Coordinate cable support work with sections 27 05 28 and 27 05 36 for indoor pathways such as cable hangers.

2. Above ceilings, support cables at intervals no greater than 5 feet.

3. Anchor cable support system/components to structure.

4. Vertical Support on floor space, not in riser system
   a. Route cable from below suspended ceiling devices to above ceiling when possible.
   b. When routing cable in fire-rated wall assemblies, provide conduit and firestopping.
   c. When routing cable on concrete tilt up style walls from below ceiling devices to above ceiling, provide conduit – either surface or recessed (depending on wall construction).
   d. For cable routed vertically from devices with no suspended ceiling, provide conduit stub from device junction box to 14 feet, minimum, above finish floor.

5. Vertical Support in riser system
   a. In vertical riser systems, route cable within conduit.
   b. Terminate conduit at each stacked closet in a lockable junction box. Size junction box as required per conduit size and quantity – 12" x 10" x 8", minimum.
   c. Support cables within the junction box at every other floor or approximately every 24 feet utilizing cable ties equipped with eyelets designed to accept screws for fastening or approved equivalent method.
   d. Label cables in accordance with section 28 05 53, “Security System Labeling”.

END OF SECTION
PART 1 - GENERAL

1.1 SUMMARY

A. General: Furnish engineering, labor, materials, apparatus, tools, equipment, transportation, temporary construction and special or occasional services as required to make a complete working security system installation, as described in these specifications.

B. Section Includes:
   1. Labeling of wire, cable, security devices, enclosures, and raceways.

C. Related Sections:
   1. Consult other Sections, determine the extent and character of related work and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.
   2. Section 28 00 00, "Basic Security Requirements" includes general project requirements, submittal formats, warranty, and installation requirements.

1.2 SUBMITTALS

A. Product Data: Submit the following:
   1. Product information for components specified herein.
   2. List of equipment (wire, cable, devices, enclosures, and raceways) and the corresponding text for the label.

PART 2 - PRODUCTS

2.1 NAMEPLATES

A. Engraved, plastic laminated nameplates, signs, and instruction plates. Engrave stock melamine plastic laminate 1/16-inch minimum thickness for signs up to 20 square inches, or 8 inches in length; 1/8 inch thick for larger sizes. Use white letters for engraved nameplates and punch for mechanical fasteners.

2.2 WIRE AND CABLE LABELS

A. General
   1. Self-laminating adhesive laser labels.
   3. Cable size: 0.16 – 0.32” OD
   4. Color: white with black lettering
B. Manufacturer, or equal:
   1. Panduit #R100X125V1T, #R100X150V1T, and R100X225V1T wire marking labels (This is not in our current spec. I added because it's in the referenced spec. Please delete if we don't want it in our spec.)
   2. Brady #WML-211-295 and #WML-311-292 wire marking labels
   3. Or Equal

2.3 DEVICE LABELS

A. Self-laminating, type on tape, adhesive labels. Use Helvetica 12 pt text

PART 3 - EXECUTION

3.1 INSTALLATION

A. General Requirements
   1. Label the security system components. The components include, but are not limited to, the following:
      a. Equipment Enclosures
      b. Conduits
      c. Security Devices
      d. Batteries
      e. Wires and Cables
      f. Equipment Racks
      g. Terminal Blocks
      h. Relays
      i. Patch panels, and the termination positions within the patch panels.
   2. Labels shall coincide with device IDs used on the record drawings.
   3. Degrease and clean surfaces to receive nameplates and labels.
   4. Install nameplates parallel to equipment lines. Secure nameplates to equipment fronts using machine screws.

B. Equipment Cabinets
   1. Label SEC enclosures associated with the security system with a nameplate.
   2. Mount label on exterior of door, centered horizontally, and positioned one-third of the door height vertically from the top.
       Line 2: “Security Equipment Cabinet” [1/4-inch-high letters]

C. Conduits
   1. Write the destination for every conduit entering a junction box, SEC, and CEC enclosure, or wireway using a black permanent ink marker next to the conduit inside the box.
   2. Example: “To SEC-01”

D. Security Devices
   1. Label devices associated with the security system with a permanent machine generated, laminated, label. Use 12-point Helvetica text with a clear background. Use white or black lettering depending upon the color of the device.
2. Label each device in a concealed location with the system point number and address.

E. Batteries
1. Label power supply batteries with the month and year they were installed.
2. Example: “April 2020”

F. Wire and Cable
1. Identify wire and cable clearly with permanent machine-generated labels wrapped about the full circumference within 1 inch of each connection.
2. Indicate the cable ID designated on the associated field or shop drawings or run sheet, as applies.
3. Assign wire or cable designations consistently throughout a given system; i.e., each wire or cable to carry the same labeled designation over its entire run, regardless of intermediate terminations.
4. Provide labels where wire and cable first enter and exit from conduit, junction or distribution boxes; locate labels within 6 inches of the point of exit.
5. Positional labels so they are clearly visible without the need to remove wire management or other obstructions.
6. Label cables at both ends of a run and within pull and junction boxes using machine generated wrap-around labels.

3.2 CABLE LABEL FORMAT

A. Text: Helvetica font, 12 point (minimum size, unless otherwise specifically stated)

B. From Panel to Field Device
1. Line 1: Device Type and Device Number
2. Line 2: Panel ID – Port Number
3. Example: CR 001
   PANEL 2 – CR5
4. Standard Device Types
   a. CR = Card Reader
   b. K = Camera
   c. ET = Entry Telephone
   d. R = Relay Output
   e. A = Alarm Point
5. Standard Port Numbers
   a. CR = Reader
   b. M = Monitored Input
   c. R = Relay Output

C. From Door Junction Box to Card Reader
1. Line 1: Device Type and Device Number
2. Line 2: Panel ID – Port Number
3. Example: CR 001
   PANEL 4 – CR3

D. Miscellaneous Examples:
1. From Door Junction Box to Door Contact
   a. CR001
b. DC

2. From Door Junction Box to Rex Alarm
   a. CR001
   b. REX ALM

3. From Panel to Rex
   a. CR001
   b. REX PWR
   c. 12 VDC

4. From Panel to Lock
   a. CR001
   b. LCK PWR
   c. 24 VDC

E. Communications Cable
   1. Line 1: Communication Type and Direction
   2. Line 2: Panel ID
   3. Example: RS-485 TO PANEL 2

4. Typical Communication Types
   a. RS-485
   b. RS-232
   c. RS-422

END OF SECTION
SECTION 28 08 00 SECURITY SYSTEM ACCEPTANCE TESTING

PART 1 - GENERAL

1.1 SCOPE OF WORK

A. General: Furnish engineering, labor, materials, apparatus, tools, equipment, and transportation required to test a completed security system installation as described in these and the related Specifications.

B. Base Bid Work

1. Comprehensive testing for all systems installed as part of the project in two distinct phases which includes:
   a. Functional Testing
   b. Acceptance Testing

2. Produce and submit for review and approval the test results documentation for each of the two distinct phases of testing.

C. Related Sections:

1. Section 28 00 00, “Basic Security Requirements”
2. Section 28 05 13, “Security System Cabling”
4. Section 28 08 00, “Security System Acceptance Testing”
5. Section 28 13 00, “Access Control and Alarm Monitoring System”
6. Section 28 16 00, “Intrusion Detection System”
7. Section 28 23 00, “Video Surveillance System”

1.2 SUMMARY OF ACCEPTANCE TESTING ACTIVITIES

A. Overview

1. The purpose of these testing activities is to ensure the security system operates properly and per the Owner’s requirements. Security systems are very complex from both an equipment and programming standpoint and thorough testing is necessary to ensure correct operation.

2. Perform testing activities after-hours or on weekends when the system is not being actively utilized and the building is generally unoccupied. This will minimize the amount of irrelevant activity in the system activity reports that will be used as a record of the Functional Testing and Acceptance Testing test results documentation.

B. Functional Testing

1. Functional Testing represents a complete and documented test of the security systems. At a minimum, Functional Testing shall demonstrate proper operation of security system components, including: devices, sensors, switches, power supplies, controllers, input/output boards, relays, network communications, tamper switches, initiating circuits, and associated accessories and appurtenances required for system functionality.

2. Perform Functional Testing of security systems to verify correct operation prior to scheduling the Acceptance Testing.

3. Document the results of the Functional Testing and submit to the Engineer along with system activity reports for approval.
4. Functional Testing test results documentation shall be reviewed and approved prior to scheduling the Acceptance Testing.

C. Acceptance Testing

1. Acceptance Testing represents a final walk test with the Engineer and Owner to demonstrate proper operation of security system components including system integration, programming, operational capabilities, and functional performance.
2. Perform Acceptance Testing of the security systems in the presence of the Engineer and Owner to demonstrate fully functional and completely operational security systems.
3. Submit Acceptance Testing test results documentation and punch list/deficiencies corrections, prior to Owner approval of Substantial Completion and the start of the Warranty period.

1.3 SUBMITTALS

A. Functional Testing test results documentation submittal
B. Acceptance Testing test results documentation submittal
C. Operation and Maintenance (O&M) Manuals: Submit O&M Manuals for review and approval at the completion of the project consisting of the following:
   1. Warranty letter: copy of Warranty letter reflecting start and end dates, and instructions covering warranty procedures.
   2. Functional Design Manual: includes a detailed explanation of the operation of the system.
   3. Hardware Manual, which includes:
      a. Pictorial parts list and part numbers
      b. Pictorial and schematic drawings of wiring systems including devices, control panels, instrumentation, and annunciators
      c. Telephone numbers for the authorized parts and service distributors
      d. Service bulletins
   4. Software Manual, which includes:
      a. Use of system and applications software
      b. Initialization, start-up, and shut down procedures
      c. Alarm reports
   5. Operator’s Manual, which fully explains procedures and instructions for the operation of the system and includes:
      a. Computers and peripherals
      b. System start up and shut down procedures
      c. Use of system, command, and applications software
      d. Recovery and restart procedures
      e. Graphic alarm presentation
      f. Use of report generator and generation of reports
      g. Data entry operator commands
      h. Alarm messages and reprinting formats
      i. System access requirements
      j. Service maintenance call procedures
   6. Maintenance Manual, which includes:
      a. Instructions for routine maintenance listed for each component, and a multi-page summary of component’s routine maintenance requirements
      b. Detailed instructions for repair of the security system
      c. A summary of the software licenses, including license numbers, quantity of clients, summary of the software options provided, and database capabilities
d. A list of IP addresses used and with which system component they are associated, including MAC address

e. A list of gateway addresses, subnet masks, DNS servers, and host name information

7. Test Results Manual which includes the document results of tests, required under this Specification, organized by System, Floor, and Door.

8. As-Built Drawings, which includes 11”x17” prints of the as-built drawings.

D. As-Built Drawings

1. Submit As-Built Drawings for review and approval at the completion of the project.

2. As-Built Drawings shall fully and accurately represent installed systems and conditions, including: actual locations of devices and components, actual cable and terminal block numbering, and actual wire routing and wiring (wire type, gauge/size, rating, etc).

3. Record changes in the work during the course of construction on blue or black line prints. Transfer construction mark-ups to AutoCAD or Revit format drawings at the completion of the project.

4. Include the following additional information:
   a. Device addresses and IP address information
   b. Settings for each camera (lens specs, mm setting, auto shutter setting, and other available camera settings, etc.)

5. Include approved Shop Drawings.

6. Final acceptance requires the Engineer’s approval of the As-Built Drawings.

E. Owner’s acceptance, Substantial Completion, and start of the Warranty period requires all submittals above be approved and punch list deficiencies be corrected.

1.4 QUALITY ASSURANCE

A. Provide a project manager to coordinate the security system acceptance testing work with other trades.

PART 2 - PRODUCTS

2.1 NOT USED

PART 3 - EXECUTION

3.1 SCHEDULING

A. Coordinate the security system Functional Testing and Acceptance Testing acceptance testing specific activities into the overall project construction schedule.

B. Provide the Engineer and Owner with a minimum one week notice prior to scheduling Functional Testing and Acceptance Testing activities.
3.2 TESTING REQUIREMENTS

A. Site Tests

1. At a minimum, security system testing requirements shall include the following tests (where applicable to the project):
   a. Building Perimeter Test: Test doors, cameras, and devices related to securing the perimeter of the building.
   b. BDF/IDF Test: Test devices related to securing the BDF and IDF. Inspect system panels, power supplies, and other related security equipment located in these areas.
   d. Video Surveillance System Test: Test the system for correct programming, operation, and alarm camera call-up.
   e. Video Recording System Test: Test the recording system for correct programming, alarm recording, and event retrieval. Verify correct integration with the ACAMS and IDS system for alarm call-up. Test and verify the system is viewable from client workstations.
   f. Intrusion Detection System Test: Test the network connection and alarm dialer and duress stations for correct programming and operation. Verify correct arming/disarming functions from each keypad. Verify integration with ACAMS and Video Surveillance System.
   g. Video Camera Test: Review cameras for proper coverage, quality of video, focus, configuration, etc.
   h. Other Readers/Door Test: Test remaining card readers and doors not included in the above tests.
   i. Battery and UPS Load Test: Disconnect AC power to security system equipment to verify battery operation functions and system remains fully operational.
   j. Door Hardware Test: Coordinate with the Division 08 door hardware contractor to resolve electrified locking door hardware failures and door alignment or door closer problems.

B. Site Tests Preparation

1. Provide device identification numbers that differ from or were not included on the original Construction Drawings.
2. Provide a complete system point list.
3. Provide paper and toner for the printer so that an event log can be printed out and attached to the test reports as verification of test sequence and systems response.
4. During testing, provide technicians familiar with the installation to assist with the test. Stage the technicians as follows: one at the host, one at the device being tested, and one runner responsible to furnishing tools, step ladders, etc.
5. Provide radios for use by the Engineer and Owner during testing.
6. Provide pre-programmed access cards for use during testing. Provide one authorized card for each access level. Provide one card with no access authorization. Provide keys for lockset mechanical key override.
3.3 TEST PROCEDURES
A. Follow manufacturer’s written test procedures for each type of device and system.

3.4 FIELD DOCUMENTATION
A. Provide printed system documentation containing detailed wiring diagrams for each security equipment enclosure. Documentation shall include, at a minimum, layout of equipment, elevation detail, complete parts list, and complete wiring diagrams for each security system controller, input/output board, relay, and power supply.
B. Provide a printed service log for each security equipment enclosure. Service log shall include, at a minimum, columns for the following information: date of service, description of work performed, service technician(s), and service company.
C. Neatly fold the printed system documentation and service log and place it inside a clear plastic pocket affixed to the inside door of the security equipment enclosure.

3.5 TRAINING
A. Upon completion of the Acceptance Testing, provide training to the Owner’s representatives, at times convenient to them, in the function and operation as well as the service and maintenance of the security systems.
B. Utilize the production database for the training to give the users project-specific examples from which to learn.
C. Provide 16 hours, minimum, of on-site training by a factory trained representative. Maintain a sign-in sheet with names and dates of persons trained and forward to Owner upon completion of training.
D. Provide for designated Owner’s representatives to attend off-site factory certification training for all systems installed as part of the project, including:
   1. Access Control and Alarm Monitoring System
   2. Video Surveillance System
   3. Intrusion Detection System

END OF SECTION
SECTION 28 13 00 ACCESS CONTROL AND ALARM MONITORING SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes

1. ACAMS, including access control units, input/output units, and card readers
2. ACAMS power supplies
3. Alarm initiating devices, including: magnetic switch contacts and request-to-exit sensors,
4. Power supplies
5. Interface to electric door hardware and ADA door operators
6. Interface to Fire/Life-Safety system
7. Interface to elevator controls
8. Interface to VSS and other security subsystems with bi-directional communication

B. Products Installed but not Furnished under This Section

1. New electric feed-through power transfer hinges
2. Electrified locking hardware cable and termination to transfer hinge and security system

C. Products Specified but not Installed under This Section

1. Access control devices inside elevator cabs, including card readers, interface relays, and reader modules.

D. Products Furnished and Installed under Another Section

1. 120VAC power
2. Telecommunication pathways; refer to Section 27 05 28 and/or 27 05 32.
3. Network switches, with Power over Ethernet (PoE)
4. PoE Door Hardware
5. ADA door operators and push buttons
6. Fire/life-safety system interface relays
7. Electromagnetic door holders
8. Network connectivity for ACAMS devices via Owner's local/wide area network

E. Related Sections

1. Consult other Divisions, determine the extent and character of related work and properly coordinate work specified herein with that specified elsewhere to produce a fully functional and completely operational system.
2. Section 08 71 00, "Door Hardware"
3. Section 14 20 00, "Elevators"
4. Section 28 00 00, "Basic Security Requirements"
5. Section 28 05 13, "Security System Cabling"
6. Section 28 05 53, "Security System Labeling"
7. Section 28 08 00, "Security System Acceptance Testing"
8. Section 28 16 00, "Intrusion Detection System"
9. Section 28 23 00, "Video Surveillance System"
10. Section 28 16 00, "Intrusion Detection System"

1.2 REFERENCES
A. Comply with the References requirements of Section 28 00 00.
B. In addition to the codes and standards listed in Section 28 00 00, comply with the latest edition of the following applicable specifications and standards except as otherwise shown or specified:
   1. Underwriters Laboratories (UL): Applicable listing and ratings, including but not limited to the following standards:
      a. UL 497, “Protectors for Paired-Conductor Communication Circuits”

1.3 DEFINITIONS

A. Definitions as described in Section 28 00 00 shall apply to this Section.
B. In addition to those definitions in Section 28 00 00, the following list of terms as used in this specification defined as follows:
   1. “A” and “AMP”: amperes
   2. “ACAMS”: access control and alarm monitoring
   3. “IDS”: intrusion detection system
   4. “KVM”: Keyboard, Monitor, Mouse (as in KVM drawer to access a server)
   5. “LAN”: Local Area Network
   6. “NC”: Normally closed
   7. “NO”: Normally open
   8. “REX”: request to exit
   9. “SCS”: security communications system
   10. “UPS”: uninterruptable power supply
   11. “VAC”: volts alternating current
   12. “VDC”: volts direct current
   13. “VMS”: video management system
   14. “VSS”: video surveillance system

1.4 SYSTEM DESCRIPTION

A. General: Provide engineering, labor, materials, apparatus, tools, equipment, transportation, temporary construction and special or occasional services as required to make a complete working Access Control and Alarm Monitoring system installation, as described in these specifications.
B. Access Control and Alarm Monitoring System (ACAMS) Overview
   1. The ACAMS is a distributed network of control panels connected to and programmed from an existing host server and client workstations, one located at the District Office and the others at each respective campus.
   2. The ACAMS is utilized for electronically controlling access to students, delivery personnel, and staff entrances to the building(s).
   3. The ACAMS consists of an existing Software House CCURE 9000 server located at the District Office in Martinez, existing client workstations, control panels, card readers, battery powered wireless card readers with integrated locking hardware, wireless interface modules and alarm initiating devices. The host server communicates with the field panels via the Owner’s local/wide area network.
   4. Card reader doors must tie into the existing District-wide host server. Develop schedules to automate the opening and closing of the building(s), including unlocking doors, bypassing alarms, and enabling ADA actuation devices.
   5. Card readers used in classrooms and/or additional locations as identified by the college must include emergency lockdown capability for shelter in place. The lockdown capability will:
      a. Disable the exterior reader and only allow excess via mechanical key only.
b. Notify Police Services via the access control system and/or the intrusion detection system of emergency lockdown alarm event.

6. The ACAMS also provides secondary alarm monitoring and alarm partition control of the IDS control panels through software integration.

C. ACAMS Panels and Power Supplies

1. Provide ACAMS interface software license for IDS control panels and program to enable bidirectional alarm communication for alarm notification and partition arm/disarm control.
2. Provide ACAMS interface software to VSS network video recorders to enable alarm event recording and automatic call up of associated cameras upon alarm activation (forced door, door held open, etc.).
3. Provide ACAMS control panels located in the telecommunication rooms as indicated on project drawings. Coordinate exact location of control panels with local IT department. Panels support up to 16 card readers with locking control outputs and multiple general-purpose input/output modules for automation.
4. Provide proximity wireless card readers with integrated locking hardware. Wireless readers are battery powered.
5. Provide wireless interface modules. Field determine the quantity and exact locations of the wireless interface modules for full coverage of wireless card readers.
6. Provide wireless survey kit to verify wireless interface module placement.
7. Provide input and output modules in a lockable enclosure to support the project specific security system requirements.
8. Provide multi-technology card readers with optical tampers on doors deemed critical to the security of assets subject to a high possibility of theft, sensitive information, or other areas of critical nature and doors with operational requirements such as building entrances, as noted on the project drawings.
9. Provide alarm contacts and request-to-exit motion detectors for card reader-controlled doors. Include output from ACAMS to indicate alarm contact status to IDS.
10. Provide alarm contacts for non-card reader controller perimeter doors as indicated on project drawings.
11. Provide audible alarms at monitored emergency exit-only doors and special card reader doors as indicated on project drawings. Local audible alarms to sound upon alarm activation (forced door, door held open, etc.). Provide monitoring of the key switch and remote reset through the ACAMS.
12. Utilize IDS integration to monitor motion detector and duress alarms through the ACAMS workstation. Provide interface to ADA automatic/power assist door operator and corresponding actuator push plates or optical motion detection actuators.
   a. When door locked, exterior push plate/optical sensor is disabled
   b. When door unlocked, even momentarily, push plate/optical sensor is enabled.
   c. Interior push plate/optical sensor unlocks door and always triggers automatic door operator.
13. Provide 12/24VDC ACAMS device and lock power supplies as indicated on project drawings with enclosure tamper switches.
14. Provide battery backup of system components and power supplies.

D. Card Readers / Door Devices

1. Provide multi-technology card readers, including rough-in, wiring, reader, and other components for a complete system and connect to the ACAMS. Provide tamper switches per card reader wired/connected to the ACAMS input module.
2. Provide door contacts and request-to-exit motion detectors for card reader-controlled doors and connect to the ACAMS. Refer to drawings for configurations and instances.
3. Provide double pole double throw contacts on doors controlled by card readers with associated IDS alarm monitoring keypads. Wire one contact to the serving ACAMS panel and connect to the ACAMS panel as an input.

4. Provide door contacts for non-card reader-controlled doors noted on drawings (such as ground floor perimeter doors) and connect to the ACAMS. ACAMS shall monitor these doors. Program the ACAMS to alarm should the monitored doors open when not authorized.

5. PoE Integrated door hardware (where the card reader is integrated into the door hardware) is specified and installed under division 8. Division 28 contractor to coordinate functionality and program in access control system. Refer to Division 08 71 00 Door Hardware for PoE lock coordination.

6. Program PoE hardware with integrated card reader to support emergency classroom lockdown using an integrated push button. Emergency classroom lockdown locks the door and disables the integrated card reader.

E. Tamper Monitoring
1. Provide additional monitor input points for monitoring the following:
   a. Tamper switches located within each security equipment enclosure and wireway (use unsupervised inputs for this purpose).
   b. Supervision of power supplies and batteries (use unsupervised inputs for this purpose).
   c. Tamper switches located within each door junction box.

F. Provide interface to ADA automatic/power assist door operator and corresponding actuator push plates

G. Fire/Life-Safety System Interface
1. Coordinate with Fire/Life-Safety system contractor to automatically drop power from stairwell, elevator vestibule lobby, and other doors within the path of egress upon alarm activation of the Fire/Life-Safety system.

2. Coordinate with Fire/Life-Safety system contractor for scheduled release of electromagnetic door holders on designated card reader doors or scheduled unlocked doors as indicated on project drawings. Provide ACAMS output modules as necessary to interface with Fire/Life-Safety system to release electromagnetic door holders on doors that are required to close and lock on scheduled events.

3. Provide emergency door release pull stations with double pole, double throw contacts located in elevator vestibule lobbies as indicated on project drawings. First set of contacts to break power to electrified door hardware on adjacent card reader door. Second set of contacts to connect with ACAMS. Provide ACAMS input modules as necessary to monitor status of emergency door release pull stations.

H. Elevator Interface
1. Provide a card reader in the elevator cabs shown on the drawings. In-cab card readers shall activate call buttons and control access to individual floors.

2. Provide interface between ACAMS and elevator controls. Program ACAMS with elevator interface based on the Owner’s access level policy.

3. Provide coordination during installation of card reader and cable terminations with elevator contractor. Elevator contractor to provide card reader cable in elevator travelling cable, to install the card reader into the elevator cab panel, and to connect the elevator control panel to the security junction box. ACAMS contractor to provide the security junction box, including terminal blocks and associated components, and connect the security junction box to the ACAMS panel as output points.
4. Elevator contractor responsible for elevator traveler cable, connection from elevator controller to security termination junction box, and installation of card readers within the elevator cabs.

5. Provide an output from the ACAMS system to the elevator control system, wired through the security termination junction box (at the elevator control rooms). Provide interface relays between ACAMS and elevator controller.

6. Provide coordination during installation of card reader and cable terminations with elevator contractor.

I. Extra Materials

1. Furnish 10% spare parts of total installed the following (round up to the next complete device):
   a. Access controller boards
   b. Input expansion modules
   c. Output expansion modules
   d. Reader interface modules
   e. Card readers
   f. Power supply boards
   g. Relays

2. Fuses: 5 of each type of fuse

1.5 SUBMITTALS

A. Quantity: Furnish quantities of each submittal as noted in Section 280000.

B. Contractor Qualifications: Submit certification letters for the manufacturer of the ACAMS.

C. Product Data: Submit product information for components specified herein.

D. Shop Drawings: Include the following, minimum:
   1. Device placement on floor plans and RCPs
   2. Point-to-Point Diagrams: Include wiring, points of connection and interconnecting devices between the following:
      a. ACAMS control panel
      b. ACAMS card reader and input/output modules
      c. ACAMS power supplies
      d. Card Readers
      e. Door and lock position monitoring contact switches and request-to-exit sensors
      f. Interface to electrified door hardware
      g. Interface to Fire/Life-Safety system
      h. Interface to elevator controller
      i. Hardwired interfaces to IDS
      j. Cable conductors (identify conductors on the point to point diagrams with the same tag as the installed conductor)
      k. Miscellaneous control relays
   3. Block Diagram/Riser Diagram: Show ACAMS components, conduit, wire types, and sizes between them, including cabling interties between termination hardware.
   4. Schedules: Include schedules for ACAMS control panels that show each point ID with a description of the connected devices
   5. Include user interface graphics with icons and control buttons displayed.
   6. Include custom mounting details.
E. Submittal Description: Training Submittal

1. Format: PDF
2. Contents:
   a. Cover sheet, showing:
      1) Owner Name
      2) Project Name and Address
      3) Project Submittal Number
      4) Submittal Name
      5) System Name
      6) Specification Section Number (e.g., “Section 28 13 00”)
      7) Date of Submittal. Format: Month Day, Year (e.g., “January 1, 2020”)
      8) Contractor Name
   b. Table of Contents
   c. Training Schedule
   d. Training Course outline/ agenda
   e. Course materials and training manuals for the following users as applicable:
      1) System Administrator
      2) Security staff
      3) Operator, and nurse/staff.

F. Submittal Requirements at Closeout:

1. As-Built Drawings: submit as-built drawings that includes approved block diagram, riser diagram, wiring diagram, security control room layout and elevations, floor plans, and reflected ceiling plans, and site plans showing device locations.
2. O&M Manual: submit O&M Manual as a binder or soft copy (bookmarked PDF) including the following, at a minimum:
   a. Product data – approved submittals (‘cleaned up’) and electronic
   b. As-built drawings, printed to 11x17 / tabloid landscape and electronic PDF files and native files (DWG or RVT) on storage media
   c. Warranty statement and service protocol (guidelines, contact numbers, etc.)
   d. Maintenance requirements
   e. Station Matrix, printed to 11x17 / tabloid landscape and electronic PDF files and native XLSX file on storage media
   f. Include information for the network switches and ports.

1.6 WARRANTY

A. Warrant work and the system to perform as described within this Section for a period of one year from the date of system acceptance. The warranty shall cover system operation/performance, parts, and labor. During the warranty period, respond within 4 hours and correct deficiencies within 24 hours of notification.
PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Access Control and Alarm Monitoring System
   1. Software House

B. Card Readers
   1. HID

2.2 SECURITY EQUIPMENT ENCLOSURES AND DEMARCATION ENCLOSURES

A. Refer to 280000 for product requirements.

2.3 SLOTTED WIRING DUCT

A. Refer to 280000 for product requirements.

2.4 WIREWAYS

A. Refer to 280000 for product requirements.

2.5 POWER SUPPLIES/BATTERY CHARGERS

A. Power supplies shall be UL Listed and suitable for powering ACAMS controllers, reader boards, intrusion detection panels, electric locks, and field devices (such as REXs, local alarms, etc.). Power supplies shall also be suitable for continuous charging of batteries (for power back up).

B. Description / Features:
   1. Input: 120 VAC, hard-wired
   2. Output: sixteen 12 VDC and/or 24 VDC, 10 A continuous current, PTC Class 2 rated power limited
   3. Fire alarm disconnect, individually selectable per output
   4. Short circuit and thermal overload protection
   5. Fail Safe and/or Fail Secure power outputs, individually selectable per output
   6. LEDs indicate outputs triggered
   7. Integrated charger for sealed lead acid or gel type batteries
   8. Enclosure with integrated tamper switch
   9. Monitor loss of input power and alarm in the Access Control System
   10. Manufacturers, or equal:
       a. Altronix MAXIMAL Series; 12 VDC and 24 VDC dual power supply
       b. LifeSafety Power #FPO150-C8E1; 12 VDC power supply
       c. Securitron #AQD6-8F; “AccuPower” switching power supply, 8-output
       d. Securitron #AQD6-8F8R; “AccuPower” switching power supply, 8-output with relays

2.6 BATTERIES
A. Batteries shall be UL Listed and suitable for the purpose of backing up power to security system equipment, field devices, electric locks, etc.

B. Description / Features:
   1. Voltage: 12 VDC
   2. Amps: 12 A
   3. Chemistry: SLA or VRLA
   4. Termination: Spade protected terminals

C. Manufacturer, or equal:
   1. Interstate Batteries #SLA1105 sealed lead acid 12V 12Ah battery
   2. Yuasa Battery Inc #RE12-12 sealed lead acid 12V 12Ah battery

2.7 ACCESS CONTROLLERS

A. Description / Features:
   1. An intelligent controller with integrated battery backup, database, and communication ports that supports 32 card readers
   2. Supports HID proximity, MIFARE, and DESFire card reader formats
   3. Expansion capacity/additional modules (e.g., for additional memory and/or for future feature enhancements)
   4. Supports flash upgrades for firmware updates
   5. Global input/output and anti-pass back functionality
   6. Capable of utilizing keypad commands to activate/deactivate events
   7. Monitor Inputs: Station switch, tamper, power fail, and alarm

B. Functions:
   1. Central control for attached devices
   2. Makes decisions for access
   3. Responds to monitor activity
   4. Receives input to control its decision making
   5. Reports activity to other devices

C. Mounting: within wall mounted NEMA enclosure

D. Power:
   1. Main Power Source: controller shall be powered from the associated power supply unit
   2. Battery Backup: the controller board shall have an integrated low voltage battery (such as a lithium cell) to maintain internally stored database and setup in case main power is interrupted

E. Self-Protection: Controller shall detect power input failures and tampering

F. Communications
   1. TCP/IP via 10Base-T/100Base-TX
   2. Supports multiple communication channels to which a variety of devices can connect – RS-485, RS-422, or 20mA communications to addressable modules:
      a. Input Module: Supports 16 Class A supervised input points
      b. Output Module: Supports 16 Form C dry contact relays
      c. Reader Interface Module: Supports 4 card readers with associated alarm contacts, request-to-exit devices, and lock outputs

G. Manufacturer:
1. Software House “iSTAR” series
   a. iSTAR Ultra
   b. #I8 input module
   c. #R8 output module
   d. #RM-4E four-reader interface module

2.8 MONITOR INPUT/RELAY OUTPUT BOARDS

A. Description
   1. Monitor Input: module that monitors inputs that occur over network and sends them via
      RS-485 protocol to the Controller.
   2. Relay Output: executes relay commands received from the Controller via RS-485
      protocol.
   3. Monitor Inputs: 8, minimum, four-state monitor points
   4. Relay Outputs: 8, minimum, normally opened (NO) or normally closed (NC)

B. Manufacturer, or equal:
   1. Input Module:
      a. Software House #I/8
   2. Output Module:
      a. Software House #R/8

2.9 CARD READERS

A. Description / Features:
   1. FCC and CE certified, and conform to the following ISO standards:
      a. 15693 (CSN read-only)
      b. 14443A (CSN read-only)
      c. 14443B (CSN read-only)
   2. Capable of reading the following frequencies and card formats:
      a. 125 kHz and 13.56 MHz
   3. Utilize a Wiegand protocol for communication for compatibility with standard access
      control systems.
   4. Multi-color LED and an audible sounder to indicate the status of the door
   5. For exterior locations, reader shall be fully weatherized with a rugged, polycarbonate
      enclosure, designed to withstand an operating temperature of -22 to 150 degrees
      Fahrenheit (-30 to 65 degrees Celsius) and operating humidity of 5-95% non-condensing.

B. Functions:
   1. Card reader shall continuous emit radio radiation with a continuous sensing of an access
      card.
   2. Upon reading an access cord, the card reader shall initiate a single transmission to the
      ACAMS controller.
   3. Upon receiving status from the ACAMS controller, the card reader shall change the state
      of the LED to the programmed state.
C. Manufacturer, or equal:
   1. HID multiCLASS series
      a. Wall mount: HID SE Series; multi-technology card reader
      b. Wall mount with keypad: HID SE Series with keypad; multi-technology card reader with integrated keypad
      c. Mullion style: HID SE Series mullion; multi-technology card reader

2.10 MAGNETIC CONTACT SWITCHES

A. Magnetic contact switches shall be UL 634 Listed.
B. Wood, Steel, and Hollow Metal Doors
   1. Description / Features
      a. Mounting: Recessed
      b. Switch Type: Double Pole, Double Throw
      c. Gap Distance: 0.5” maximum
   2. Manufacturer, or equal:
      a. Interlogix #1078C; 3/4" dia., closed-loop contact switch, with leads
      b. Magnasphere #MSS-19CL; 3/4" dia., open loop contact switch, with leads
      c. Magnasphere #HSS-L2C; UL 264 Level 2 high security recessed contact switch, with leads

2.11 REQUEST-TO-EXIT SENSORS

A. General
   1. Power: 12 or 24VDC, 35mA
   2. Relay Output: 2 form “C” contacts
   3. Adjustable relay latch time
   4. Programmable Fail Safe or Fail Secure Modes
   5. Programmable retrigger or non-retrigger mode
   6. Radio Frequency Interference (RFI) Immunity range from 26 to 1,000 MHz at 50 v/m

B. Manufacturer, or equal:
   1. Bosch #DS160 with TP160 trim plate
   2. Honeywell #IS320WH with IS310WHTP trim plate
   3. Interlogix #RCR-REX motion sensor REX

2.12 EMERGENCY LOCKDOWN STATION

A. General
   1. Manual push button type device, blue housing with the words: "LOCKDOWN" inscribed in white on the face
   2. Pressing the emergency button locks down exterior doors and generates alarm
   3. Wall-mounted with alarm monitored lift cover
   4. Audible alarm when cover is lifted
B. Manufacturer:
   1. Safety Technology International
      a. Stopper® Stations #SS2489LD-EN

2.13 TERMINAL BLOCKS

A. Terminal blocks/modular terminal strips shall be suitable for inside equipment enclosures/junction boxes for demarcation of elevator traveler and security cabling.
B. Provide DIN rails and other mounting accessories for a complete installation.
C. Description:
   1. Push-in style bridging system that utilizes the IDC termination method
   2. DIN rails mounting (standard 35mm)
   3. Feed through style, single level
D. Manufacturer, or equal:
   1. Phoenix Contact #QTC-1,5 terminal block and #NS-35/7,5 DIN rail
   2. ABB Entrellec feed through terminal blocks
   3. Weidmuller P-Series feed through terminal blocks

2.14 INTERFACE RELAYS

A. Refer to section 28 00 00 for relay product requirements.

PART 3 - EXECUTION

3.1 INSTALLATION

A. General
   1. Install equipment per manufacturer’s instructions.
   2. Install devices, stations, etc., square and plumb. Set flush-mounted units so that the face of the cover, bezel, or escutcheon matches the surrounding finished surface.
   3. Install so that there are no gaps, cracks, or obvious lines between the trim and the adjacent finished surface.
   4. Install to heights shown on drawings. Heights shall comply with applicable ADA requirements.
   5. Provide supervisory and end of line resistors as required.
B. ACAMS Control Panels (Reader Board, Input/Output Boards)
   1. Install security equipment enclosures and wireway per approved shop drawings.
   2. Ensure cuts, knock-outs, punches, etc. have no sharp edges.
   3. Install power supplies and associated hardware in same location.
C. Wireless Interface Module
   1. Field determine best location for wireless card reader interface module. Locate module above accessible ceiling, whenever possible to avoid damage to units.
   2. Connect wireless interface module to ACAMS panel using the RS-485 data bus.
D. Remote Reader Modules
1. Locate remote reader module in accessible ceiling space unless otherwise noted on the project drawings.
2. Power remove reader modules from power supply located at centralized security hub.

E. Card Readers
1. Install card reader to the rough-in, not directly to dry wall.
2. Connect readers directly to reader boards. Do not daisy chain readers together.
3. Cable Requirements:
   a. 6-conductor 22 AWG stranded shielded cable for signal.
   b. 1-pair 22AWG stranded shielded cable for device power.
4. Wire the card reader’s multi-color LED to indicate the following status of the door.
   a. Red = the door is secure (locked).
   b. Green = the door is unsecured (unlocked).
   c. Yellow = the card reader is not functioning (off-line/trouble), is processing a read request, or has denied access.
5. Wire/program the card reader to produce an audible beep tone to indicate to the user:
   a. The card was read and/or access was denied.
   b. Door is being held open and needs to be closed.
6. Enable optical tamper using configuration card. Wire the card reader’s optical tamper to spare input on the ACAMS reader module and jumper ground wire from door contact to provide a normally closed circuit.

F. Four-State End-of-Line (EOL) Supervision
1. Provide designated resistors at device end of line per manufacturer’s EOL recommendation to provide four-state supervision of security device and cabling.
2. Provide EOL supervision for alarm contacts, local alarm sounders, REXs, motion detectors, glass break detectors, help/duress buttons, and other designated security devices connected to the ACAMS and IDS.
3. Program ACAMS with the following states of supervision:
   a. Contact closed = Secure
   b. Contact open = Alarm
   c. Short circuit = Line fault
   d. Open circuit = Line fault
4. All NO/NC circuits shall be wired NC.

G. Elevator Card Readers and Interface with Elevator
1. Coordinate with the elevator contractor the installation of the card reader inside the cab.
2. Furnish card readers to elevator contractor for their installation in the cab.
3. Coordinate with elevator contractor to connect ACAMS output relays to elevator controller.
4. Install the elevator demarcation junction box as near as possible, but not within, the elevator machine room while remaining accessible. Install terminal blocks/modular terminal strips, DIN rails, and other accessories inside the elevator demarcation junction box. Route security wiring to terminal blocks and terminate on one side – the other side shall remain available for wiring from the elevator machine room.
H. Door Hardware
   1. Setup and conduct a door hardware coordination meeting.
   2. Coordinate the installation and termination of the security cable with the installation of the electric door hardware and transfer hinge.
   3. Route power to electrically controlled locks on Life-Safety doors through fire alarm output to automatically unlock the door upon activation of Fire/Life-Safety system. Connect fire alarm output to the disconnect relay on the associated 24VDC lock power supply.
   4. Coordinate the installation and termination of the patch cord from the network drop with the installation of the PoE door hardware and PoE transfer hinge. Refer to Specification 271513 for patch cord requirements.
   5. Provide cable and terminate wires to delayed egress devices for monitoring activation of delayed egress by the ACAMS system.

I. Door Contacts
   1. Install on protected (secured) side of door.
   2. Install 6" from latch side of 3 door.

J. Request-To Exit Motion Detectors
   1. Install motion detector on the secured (protected) side of door. Install so that its detection pattern is not obstructed by exit signs, light fixtures or other objects that would interfere with proper operation.
   2. Adjust relay hold time and pattern to properly detect valid exit and allow shunting of door contact.
   3. Adjust detection sensitivity to pulse.
   4. Mask detector lens to provide a confined detection area limited to the door handle or push bar.
   5. Run wire inside structural tube steel frame into back of conduit body for cage locations.

K. Low voltage transformers
   1. Install low voltage transformer in security junction box to prevent tampering. Coordinate with Division 26 for location of outlet in junction box.

3.2 PROGRAMMING

A. Prior to the completion of construction, schedule a meeting with the Owner to determine the programming criteria. Document the results of the meeting and perform necessary programming to achieve the Owner’s requests. During the meeting, discuss the following:
   1. Door and device names
   2. Access card levels and door groupings
   3. Alarm priority levels
   4. Schedules and time codes
   5. Holidays and holiday types (priorities)
   6. Action/responses from individual input points
   7. Standard and custom (expanded) reports
   8. Defining alarm messages and standard response messages applicable to site
   9. Routing of alarm points to and operator’s workstations, printers, and history files
   10. Owner’s graphics – develop sample graphic complete with icons and text. Alarms to appear on building floor plans depicting the nature and location of alarms. Review and revise graphic layout as required by Owner.
   11. System database backup procedures
   12. Video integration camera call-up
B. Document the results of the meeting and perform necessary programming to achieve the Owner’s requests.

C. Program and setup the system such that no additional programming other than entering new access cards is required. Include setup of available features of the software.

D. Import Owner’s cardholder database.

E. Using CAD drawing files of floor plans, perform the following relative to system graphics:
   1. Delete non-applicable drawing layers and details to arrive at simple floor plans of the building as built.
   2. Convert drawings to a graphic file format compatible with the Owner’s access control and alarm monitoring system.
   3. Load drawing files into the system.
   4. Apply new and predefined icons and other points on each graphic to indicate point and control status.
   5. Link graphic images/icons to represent reader, monitor, alarm initiating devices, and control points.
   6. Program device icons on plans with functionality.
   7. Create camera call-up events.
   8. The point names shown on the as-built drawings shall match the system point schedule.

F. Program ACAMS such that alarm events generate email notification to offsite addresses via the Internet. Also, as required by the Owner, program ACAMS such that alarm events generate pages.

G. Program customized client workstation log-ins (restrict functions by user privileges).

H. Program routing of monitor and control points. Route activations and restore messages to one or more of the following locations as directed by the Owner’s Representative:
   1. One or more system workstations
   2. One or more system printers
   3. One or more alphanumeric pagers
   4. History files in addition to the above
   5. History files only

I. Program the system such that reliance on a remote host for routine building operations, such as scheduled door commands and conditional events, are minimized to the greatest extent possible and decisions are made at the local building controller.

J. System Operation, Alarm and Reporting Function: Program door control panel tamper switches to immediately report as a separate “tamper” point to the system resulting in an alarm condition displayed in both text and graphic form on the applicable workstation(s) and an alarm message transmitted to the appropriate pager(s).

K. Program the system in a manner that minimizes the amount of time required for the users to make updates and maintain the system on a daily basis especially updates that impact card holder record updates. Nested programs, such as reader groupings used in access codes, shall be used to the greatest extent possible such that single actions are required to update an entire card data population. If there is a question regarding the appropriate approach to programming, given the flexibility of most systems, contact the Engineer prior to any initial programming.

L. Perform 2 full system back-ups at completion of initial programming and deliver one copy to owner with letter of Transmittal explaining information included in back-up and brief description of recovery procedures. Label the second removable storage device and store onsite. Perform back-ups on a regular bases through the remainder of the project.

M. Customize menus with the assistance of the factory to “gray-out” features not used on project (such as elevator control).

N. Perform field software changes after the initial programming session to “fine tune” operating parameters and sequence of operations based on revised operating requirements.

O. Password management – refer to Section 28 00 00.
3.3 EXTRA MATERIALS

A. Furnish extra materials to Owner. Produce a transmittal with an itemized list including quantities, recipient, and receipt date. Submit copy of Owner-signed transmittal with project closeout documents.
B. Place fuses inside each equipment/panel and power supply enclosure.
C. Turn over keys (equipment enclosures, low voltage power supplies, security junction boxes, rack cabinets, etc.) to the Owner. Produce a transmittal with an itemized list of keys, recipient, and receipt date. Submit copy of Owner-signed transmittal with project closeout documents.

3.4 TRAINING

A. Combine training on the ACAMS with training on the IDS (Section 28 16 00) and the VSS (Section 28 23 00).

3.5 TESTING

A. Test ACAMS in accordance with Section 28 08 00.

END OF SECTION
SECTION 28 16 00 INTRUSION DETECTION SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

A. General: Furnish engineering, labor, materials, apparatus, tools, equipment, transportation, temporary construction, and special or occasional services required to make a complete working intrusion detection system installation as described in these specifications.

B. Section includes:
   1. Intrusion Detection System, including digital communicator, keypad, and alarm devices.
   2. Door contacts, glass break detectors, motion sensors
   3. Duress alarm signal from ACAMS
   4. Interfaces and connections between intrusion detection subsystems to allow communication with one another

C. Products furnished and installed under another section:
   1. 120V power
   2. Network connectivity for IDS Panel via Owner’s local/wide area network
   3. Door alarm contacts
   4. Phone line

D. Related sections:
   1. Section 28 00 00 – Basic Security Requirements: for submittal format, warranty, general product requirements, and installation requirements
   2. Section 28 13 00 – ACAMS: for interface requirement to the IDS
   3. Section 28 05 13 – Security System Cabling: for cable requirements
   4. Section 28 05 53 – Security System Labeling: for device labeling requirements
   5. Section 28 08 00 – Security System Acceptance Testing: for testing requirements

1.2 SYSTEM DESCRIPTION

A. Overview
   1. The IDS is comprised of multiple areas that can be armed and disarmed independently of each other.
   2. The IDS is utilized for after hours monitoring of the Fireside, Classroom, and Student Activities Buildings, including the Bookstore, and 24 hour monitoring of the duress buttons.
   3. Activation of the IDS dials a remote, third party central station to first contact Police Services on campus then dispatch the San Pablo Police Department.
   4. The IDS integrates with the ACAMS through software to send alarm information for secondary monitoring with the ACAMS.

B. Intrusion Detection System
   1. Provide an IDS control panel with integrated UL listed digital communicator located in the Fireside, Classroom, and Student Activities Buildings telecommunication rooms as indicated on project drawings. Panels support up to 8 areas and 64 zones by use of addressable input/output point modules.
   2. Provide LCD command keypads as indicated on project drawings. Keypads allow for system arming and disarming by authorized users.
   3. Provide wireless back up alarm communicator.
4. Provide alarm contacts for non-card reader controller perimeter doors as indicated on project drawings.
5. Provide under counter duress buttons as indicated on project drawings. Program duress alarm inputs as 24 hours zones.
6. Provide motion sensors as indicated on project drawings.
7. Utilize double pole double throw alarm contacts from the ACAMS card reader doors as indicated on project drawings.
8. Provide 12VDC auxiliary power supply to support the field devices indicated on project drawings.
9. Provide battery backup of IDS components and power supplies for a minimum of 24 hours in the event of a power failure or emergency.

C. Interface with ACAMS
   1. Connect ACAMS alarm contact double-pole-double-throw contact to the IDS control panel. Provide expansion modules as necessary to support the security devices shown on the project drawings.
   2. Utilize existing ACAMS and IDS integration software license as required.
   3. Integrate IDS with ACAMS for alarm monitoring and alarm partition arming/disarming through existing ACAMS workstation(s).

D. Tamper Monitoring
   1. Provide additional monitor input points for monitoring the following:
      a. Tamper switches located within each security equipment enclosure and wireway (use unsupervised inputs for this purpose).
      b. Supervision of power supplies and batteries (use unsupervised inputs for this purpose).

1.3 SUBMITTALS

A. Product Data: Submit product information for the intrusion detection systems, including:
   1. IDS control panel
   2. Keypads
   3. Cellular backup communicator
   4. Duress buttons
   5. Motion sensors
   6. Alarm contacts
   7. Power supplies
   8. Calculations for backup batteries

B. Shop Drawings: Submit shop drawings containing the following:
   1. Device placement on floor plans
   2. Point-to-Point Wiring Diagrams: Include wiring, points of connect, and interconnecting devices between the following:
      a. IDS control panel
      b. IDS expansion modules and relays
      c. Keypads
      d. Motion sensors
      e. Alarm contacts
      f. Local audible alarms
      g. Power supplies
      h. Cable conductors (identify conductors on the point-to-point diagrams with the same tag as the installed conductor)
   3. Schedules: Provide schedules for the IDS control panel that show each alarm zone, applicable area or partition, and a description of the connected device.
   4. Custom mounting details
1.4 EXTRA MATERIALS

A. Provide 10%, of the total installed, spare parts for the following: (Round up to the next complete device)
   1. Fuses
   2. Motion sensors
   3. Duress buttons

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Intrusion Detection System
   1. DSC, to integrate with Software House ACAMS headend

2.2 IDS CONTROL PANELS

A. General
   1. Integrated UL listed digital communicator with phone line monitor (loop or ground start)
   2. Supports up to 64 alarm zones and 8 programmable areas or partitions
   3. Capable of utilizing multiple telephone numbers, primary and duplicate paths with main and alternate destinations
   4. Capable of utilizing a dual phone line switcher to monitor 2 phone lines
   5. Capable of sending daily automatic test and status reports
   6. Supports supervised expansion and relay output modules
   7. Supports RS-232 connectivity to third party devices for automation
   8. Capable of utilizing a TCP/IP converter for Ethernet connectivity

B. Manufacturer
   1. DSC PowerSeries #PC1864 8-64 zone control panel
      a. Accessories
         1) DSC #PC5200 Power Supply Module
         2) DSC #PC5204 Power Supply Module
      b. Expansion modules
         1) DSC # PC5100 Addressable Xone Expander
         2) DSC # PC5108 8-Hardwire Xone Expander
         3) DSC # PC 5208 Programmable Output Module
         4) DSC #TL250GS Internet Alarm Communicator
      c. Wireless back-up communication device
         1) DSC #GS3060; Universal Wireless Alarm Communicator

2.3 IDS KEYPADS

A. General
   1. 32-character display
   2. Keys light on entry or key press
   3. Back lighted multi-key touch pad
   4. User controlled brightness and loudness

B. Provide the ability to display for each detection point:
   1. Alarm
   2. Trouble
   3. Supervisory
   4. Faulted
   5. Custom text
C. System wide displays include:
   1. Local system test
   2. Sensor reset
   3. Event log

D. Manufacturer
   1. DSC #PK5500 64-Zone LCD Full-Message Keypad

2.4 MAGNETIC CONTACT SWITCH

A. Steel Doors:
   1. Mounting: Recessed
   2. Contacts: Single Pole, Single Throw
   3. Gap Distance: 0.5"
   4. Manufacturer:
      a. Sentrol #1078 closed-loop, 1" diameter
      b. GRI #180RS-12 closed loop, 1" diameter
      c. Or equal

2.5 GLASS BREAK SENSOR

1. Ceiling Mount
   a. DSC #DG-50AU
   b. Bosch DS1101i Series
   b. Or Equal

2.6 DURESS BUTTONS

B. Under-Counter
   1. General
      a. Actuating lever, housing, and cover plate made of ABS fire-retardant plastic
      b. Latching circuit with integrated LED
      c. Contact: Normally Open or Normally Closed electrical loop, SPDT
      d. Operating Voltage: 12VDC
   2. Manufacturer
      a. GE Security #3040 panic switch
      b. Or Equal

2.7 MOTION SENSORS

C. General
   1. Type: Passive infrared (PIR) detector with Fresnel type lens
   2. Operating Voltage: 10-14VDC
   3. Range: 35’ x 35’ minimum
   4. Integrated tamper switch

D. Manufacturer
   1. Wall mount
      a. Bosch # ISC-BPR2 blue line PIR detector
      b. Or Equal
   2. Ceiling Mount
      a. Bosch # DS938Z panoramic PIR detector
      b. DSC # BV-500 PIR detector
      c. Or Equal
2.8 IDS POWER SUPPLIES

E. General
1. Provides a 120VAC to 12/24VDC output, fully supervised power supply to power IDS field devices.
2. Utilizes 16 PTC Class 2 rated power limited outputs.
3. Short circuit and thermal overload protection.
4. Integrated charger for sealed lead acid or gel type batteries.
5. Capable of providing 6 amp supply current.

F. Manufacturer
1. Altronix # AL600ULXPD16CB multi-output power supply/charger
2. Or Equal

PART 3 - EXECUTION

3.1 INSTALLATION

A. General
1. Follow manufacturers recommended guidelines for installation.

B. Components
1. IDS Control Panel
   a. Place control panel and associated expansion boards in large NEMA Type-1 enclosure with ACAMS equipment.
   b. Utilize ACAMS power supplies to power control panel and associated expansion boards. Do not use plug-in transformers.
   c. Provide standoff brackets to mount control boards to perforated panel within enclosure.
   d. Place power supply and associated hardware in same location.
   e. Install supervisory and end-of-line resistors for security field devices.
   f. Coordinate installation of phone jack and network connection in IDS control panel enclosure for communications to the contracted central station and integration with ACAMS.
2. Keypads
   a. Mount keypads as indicated on project drawings.
   b. Place one keypad adjacent to or on the IDS control panel enclosure for local service and programming.
3. Duress Buttons
   a. Mount duress buttons under work desks as indicated on the project drawings.
   b. Coordinate with architect and casework contractor to field determine exact placement prior to installation.
4. Motion Sensors and Glass Breaks
   a. Mount motion detectors as indicated on project drawings. Verify current location to maximize coverage prior to installation.
   b. Install detectors so that detection pattern is not obstructed by objects that would interfere with proper operation.

3.2 PROGRAMMING

A. Prior to the completion of construction, schedule a meeting with the Owner to determine the following programming criteria:
1. Zone or alarm point descriptions
2. User authority levels to arm/disarm areas or alarm partitions
3. Auto arm/disarm schedules
4. Interface requirements with ACAMS
5. Central station response from individual alarm points
6. Central station password and call list information

B. Document the results of the meeting and perform necessary programming to achieve the Owner’s requests. Program and setup the system such that no additional programming other than entering new access codes is required.

3.3 TESTING

A. Commission the Intrusion Detection System in accordance with Section 28 08 00.

END OF SECTION
SECTION 28 23 00 VIDEO SURVEILLANCE SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes
   1. Video Surveillance System (complete system)
   2. Video Management System (software)
   3. Fixed cameras, lenses, mounts, and housings
   4. Panoramic cameras, lenses, mounts, and housings
   5. Power Supplies

B. Products Furnished But Not Installed Under This Section
   1. None

C. Products Installed But Not Furnished Under This Section
   1. None

D. Products Specified But Not Installed Under This Section
   1. None

E. Products Furnished And Installed Under Another Section
   1. 120VAC power
   2. Telecommunication cabling between telecom room and cameras; refer to Section 27 15 13.
   3. Network switches, with Power over Ethernet (PoE)

F. Related Sections
   1. Consult other Divisions, determine the extent and character of related work and properly coordinate work specified herein with that specified elsewhere to produce a complete and operable system.
   2. Section 27 15 13, “Communications Horizontal Cabling”
   3. Section 27 13 23, “Communications Backbone Fiber Optic Cabling”
   4. Section 28 00 00, “Basic Security Requirements”
   5. Section 28 08 00, “Security System Acceptance Testing”
   6. Section 28 05 13, “Security System Cabling”
   7. Section 28 05 53, “Security System Labeling”
   8. Section 28 13 00, “Access Control and Alarm Monitoring System”
   9. Section 28 16 00, “Intrusion Detection System”

1.2 REFERENCES

A. Comply with the References requirements of Section 28 00 00.
B. In addition to the codes and standards listed in Section 28 00 00, comply with the latest edition of the following applicable specifications and standards except as otherwise shown or specified:
   1. Underwriters Laboratories (UL): Applicable listing and ratings, including but not limited to the following standards:
1.3 DEFINITIONS

A. Definitions as described in Section 28 00 00 shall apply to this Section.

B. In addition to those definitions in Section 28 00 00, the following list of terms as used in this specification defined as follows:

1. “A” and “AMP”: amperes
2. “ACAMS”: access control and alarm monitoring
3. “CCD”: charge-coupled device
4. “CMOS”: complementary metal oxide semiconductor
5. “DSP”: digital signal processing
6. “FC”: foot candles
7. “FPS”: frames per second
8. “IDS”: intrusion detection system
9. “KVM”: keyboard, video, mouse switch
10. “NAS”: network-attached storage
11. “NVR”: network video recorder
12. “PoE”: Power over Ethernet
13. “PTZ”: pan-tilt-zoom
14. “RAID”: redundant array of independent disks
15. “SAN”: storage area network
16. “VAC”: volts alternating current
17. “VDC”: volts direct current
18. “VMS”: video management system
19. “VSS”: video surveillance system

1.4 SYSTEM DESCRIPTION

A. General: Provide engineering, labor, materials, apparatus, tools, equipment, transportation, temporary construction, and special or occasional services as required to make a complete working video surveillance system, as described in this specification.

B. Video Surveillance System (VSS) Overview

1. The VSS is an enterprise-wide system generally comprised of fixed and panoramic cameras (with associated mounting apparatus, housings, cabling, etc.), video management system (software), and network video recorder and storage (provided by owner), that provides live video feeds for real-time surveillance and monitoring, recorded video for forensic analysis, and (in some cases) intrusion detection through video analytics.

2. The VSS serves as the video component of the facility’s overall security and safety program. Camera deployment and their respective field-of-views are strategically determined to coincide with points of security and access control as well as surveillance of open and high-security spaces.

3. The VSS interconnects and integrates with the ACAMS, IDS, and security/emergency communications system such that alarms/events generated within the other systems (generally carried through the ACAMS) cause VSS and the VMS to behave in a programmed manner.
   a. Program active icons in graphic user interface map in the ACAMS to allow camera call up based on the selection of icon.

C. Video Surveillance System (VSS) Scope
1. Server (to host VMS software): The Owner will provide a server for the VMS software package.
2. Video Storage hardware / Network Video Recorder (NVR): The Owner will provide a server store video.
3. Video Management System Software: Provide VMS software package, including loading the VMS package onto the VMS server and integrating the software onto the network and integrating the video storage hardware into the VMS. Coordinate with the Owner’s IT department for network integration and other IP-related requirements. Provide VMS licenses in a quantity sufficient to support the project’s cameras and client workstations plus 20% (minimum, round up to nearest whole number).
4. Program the software system to meet the project requirements including programming recording input points, video call up, and other aspects of the system. Provide software interface to the ACAMS, IDS, and security/emergency communications system for alarm call up of cameras on predefined alarm events.
5. Provide cameras as shown on the drawings. Provide outdoor housing and mounts for exterior cameras.
6. Provide power supplies to supply power to cameras. Do not combine with ACAMS power supplies.

D. Tamper Monitoring: Provide one tamper switch within each PTZ dome enclosure to monitor the enclosure, including wiring, connection to ACAMS panel; and programming this tamper switch into ACAMS system as monitor input point.

E. Surge Protection: Regardless of who provides the cabling to outdoor cameras, ensure that the connection infrastructure for outdoor cameras receive proper protection against transient voltages. Installations shall comply with CEC 800.47, CEC800.50 and CEC 800.90.

F. Extra Materials
1. Furnish 10% spare parts of total installed the following (round up to the next complete device):
   a. Fixed cameras
   b. Power Supplies (specifically for VSS)
   c. Relays

1.5 SUBMITTALS

A. Contractor Qualifications: Submit certifications for the manufacturers of the video surveillance equipment.
B. Product Data: Submit product information for components specified herein.
C. Shop Drawings:
   1. Device placement on floor plans.
   2. Point-to-Point Diagrams: Include wiring, points of connection and interconnecting devices between the following:
      a. Video surveillance system, monitors, and recording equipment
      b. Devices connected to the system
      c. Miscellaneous control relays
      d. Conductors (identify conductors on the point-to-point diagrams with the same tag as the installed conductor)
   3. Camera Matrix: Submit as an Excel-compatible spreadsheet a matrix that includes each camera. The matrix, using the same ID as shown on the as-built drawings, shall include the following column headers, at a minimum:
      a. Device
      b. Device Identifier
c. Location
d. MAC Address
e. IP Address
f. IDF Room
g. Network Switch
h. Switch Port

4. Block Diagram/Riser Diagram: Show the video surveillance system components, conduit, wire types, and sizes between them, including cabling interties between termination hardware.
5. User interface graphics with icons and control buttons displayed.
6. Custom mounting details

D. Submittal Requirements at Closeout:
1. As-Built Drawings (this may be combined with the ACAMS as-built drawings): submit as-built drawings that includes block diagram, riser diagram, wiring diagram, and reflected ceiling plans, floor plans and site plans showing camera locations (tagged with a unique ID per camera).
2. Camera Matrix: submit as an Excel-compatible spreadsheet a matrix that includes each camera. The matrix, using the same ID as shown on the as-built drawings, shall include the following column headers, at a minimum:
   a. Camera Type
   b. Camera ID (shall match the as-built plans)
   c. Camera manufacturer and model (shall match the approved product data submittal)
   d. Camera lens manufacturer and model (shall match the approved product data submittal)
   e. Location
   f. MAC Address
g. IP Address
h. IDF Room
i. Network Switch
j. Switch Port
k. Maintenance requirements

3. O&M Manuals: submit O&M Manual as a binder or soft copy (bookmarked PDF) including the following, at a minimum:
   a. Product data – approved submittals ('cleaned up') and electronic
   b. As-built drawings, printed to 11x17 / tabloid landscape and electronic PDF files and native files (DWG or RVT) on storage media
   c. Warranty statement and service protocol (guidelines, contact numbers, etc.)
   d. Maintenance requirements
   e. Station Matrix, printed to 11x17 / tabloid landscape and electronic PDF files and native XLSX file on storage media
   f. Network switches and ports configuration information

1.6 WARRANTY

A. Warrant the system for a period of one year from the date of system acceptance. The warranty shall cover system operation/performance, parts, and labor. Correct deficiencies within 24 hours of notification.
PART 2 - PRODUCTS

2.1 CAMERAS

A. Fixed IP Corner Mount Camera
   1. Type: Color, vandal-resistant
   2. Power: PoE
   3. Image: 1/3-inch format, unless otherwise noted
   4. Lens Mount: Accept a "CS" mount auto or manual-iris lens
   5. Resolution: 1080p HD
   6. Minimum Light Level: 0.3 fc imager illumination at full video, unless otherwise noted
   7. Lens: 1.8mm, unless otherwise noted
   8. Frame Rate: 25fps at H.264
   9. Manufacturer, or equal:
      a. Axis #P9106-V

B. Fixed IP Interior Dome Camera
   1. Type: Color, vandal-resistant
   2. Power: PoE
   3. Image: 1/3-inch format, unless otherwise noted
   4. Lens Mount: Accept a "CS" mount auto or manual-iris lens
   5. Resolution: 1080p HD
   6. Minimum Light Level: 0.1 fc imager illumination at full video, unless otherwise noted
   7. Lens: 3 to 9mm, unless otherwise noted
   8. Frame Rate: 30fps at H.264
   9. Manufacturer, or equal:
      a. Axis #P3375-V
      b. Axis #T91D61
      c. Axis #T94K01D

C. Fixed IP Exterior Dome Camera
   1. Type: Color, vandal-resistant
   2. Power: PoE
   3. Image: 1/3-inch format, unless otherwise noted
   4. Lens Mount: Accept a "CS" mount auto or manual-iris lens
   5. Resolution: 1080p HD
   6. Minimum Light Level: 0.1 fc imager illumination at full video, unless otherwise noted
   7. Lens: 3 to 9 mm, unless otherwise noted
   8. Frame Rate: 30fps at H.264
   9. Manufacturer, or equal:
      a. Axis #P3375-VE
      b. Axis #T91D61
      c. Axis #T94M02D

D. Interior 360-Degree Camera
   1. Video Compression format: H.264, MPEG-4, MJPEG
   2. Power over Ethernet + (IEEE 802.3at)
   3. Resolution: 10240 x 1920 – 8 Megapixel
4. Frame Rate: 15 fps at 2MP (H.264)
5. Sensor: Four 1/2.8” progressive scan CMOS sensors
6. Vandal Resistant Dome
7. Type: Day/Night
8. Camera Manufacturer:
   a. Axis #P3707-PE
9. Accessories, or equal:
   a. Axis #T91D61
   b. Axis #T94M02D

E. Exterior 360-Degree Camera
1. Video Compression format: H.264, MPEG-4, MJPEG
2. Power over Ethernet (IEEE 802.3af, Class 3)
3. Resolution: 10240 x 1920 – 20 Megapixel
4. Frame Rate: 3.5fps at H.264
5. Sensor: Four 1/2-1/2” progressive scan CMOS sensors
6. Vandal Resistant Dome
7. Type: Day/Night
8. Manufacturer, or equal:
   a. Hanwha #PNM-9000VQ
9. Accessories, or equal:
   a. Hanwha #SBP-276HM
   b. Hanwha #SBP-390WM1
   c. Hanwha #SBP-300KM

F. Exterior 360-Degree Camera with IR
10. Video Compression format: H.264, MPEG-4, MJPEG
11. Power over Ethernet (IEEE 802.3af, Class 3)
12. Resolution: 4x2560x1440 – 15 Megapixel
13. Frame Rate: 3.5fps at H.264
14. Sensor: Four 1/2-1/2” progressive scan CMOS sensors
15. Vandal Resistant Dome
16. Type: Day/Night
17. Manufacturer, or equal:
   a. AXIS P3719-PLE
18. Accessories, or equal:
   a. T94N01D Pendant Kit
   b. T94N01L Recessed Mount

G. PTZ Network Camera
19. Video Compression format: H.264, MPEG-4, MJPEG
20. Power over Ethernet (IEEE 802.3af, Class 3)
21. Resolution: 1920 x 1080 – 2MP
22. Frame Rate: 30fps at H.264
23. Sensor: 4.44 Optical 32x lens
24. Type: Day/Night ICR
25. Manufacturer:
   a. Hanwha #PNM-9320VQP
26. Accessories, or equal:
a. SBP-300LM  
b. SBP-300CM  
c. SBP-300WM

2.2 VIDEO MANAGEMENT SOFTWARE

A. NVR Video Management Software
   1. Video surveillance software must have software integration with ACAMS. Hard-wired input/output alarms is not acceptable.
   2. Include software licenses:
      a. Camera licenses to support devices shown on project drawings
      b. Client workstation licenses to support a minimum of 5 concurrent users
      c. Internet Explorer client browser license
   3. Manufacturer:
      a. Salient Systems Complete View Enterprise (to match existing standard)

2.3 POWER SUPPLIES/BATTERY CHARGERS

A. VSS System Power Supplies
   1. 120 VAC input to 24 VAC output, continuous current, fully supervised power supplies for power to cameras.
   2. Provide a separate fused connection to power supply per camera.
   3. Exterior PTZ Camera, or equal:
      a. AXIS #5000-001 24VAC Outdoor power supply

2.4 LINE PROTECTORS

A. For use on data cables serving exterior cameras.
B. Manufacturer, or equal:
   1. Transectr #1101-994
   2. DITEK

2.5 IP VIDEO ENCODER

A. General
   1. Video Compression: Motion JPEG, MPEG-4 Part 2 (ISO/IEC 14496-3), Profiles: ASP and SP
   2. Resolution: 4CIF, 2CIFExp, 2CIF, QCIF
   3. Frame Rate: Up to 30/25 per channel
   4. Pan/Tilt/Zoom control
   5. Alarm and event management
   6. Channels: 4 minimum

B. Blade Video Server
   1. Hot-swappable
   2. Built-in, universal power supply
   3. Security: IP address filtering and HTTPS encryption
4. Manufacturer, or equal:
   a. Axis #243Q blade video server

C. Video Server Rack Enclosure
   1. High density rack-mount solution
   2. Capable of storing a minimum of 3 interchangeable and hot-swappable blade video servers
   3. Manufacturer, or equal:
      a. Axis #29 1U video server rack

PART 3 - EXECUTION

3.1 PRE-CONSTRUCTION PLANNING

A. Prior to the completion of construction, schedule a meeting with the Owner and the Engineer to determine the system programming requirements, such as the following:
   1. Camera naming/numbering
   2. Field of view per camera
   3. Settings for contrast, wide dynamic range, and auto-iris
   4. Camera call-up and recording features, including video motion detection

B. Camera Locations
   1. Prior to installation, coordinate/confirm camera locations. As needed, perform a field walk with the Owner. Obtain Owner signoff of camera locations and field of view per camera prior to installation.
   2. Prior to rough-in construction, coordinate rough-in locations and requirements per camera.

3.2 INSTALLATION

A. Cameras
   1. Field determine exact placement of cameras to ensure complete coverage.
   2. Field determine fixed camera lens size to ensure complete coverage.
   3. Provide outdoor housing and mounts for exterior cameras.
   4. For exterior cameras, provide LiquidTight flexible metallic conduit from junction box to camera housing and connect from below.
   5. Provide 25-foot cable loop at PTZ location for relocating unit if required post installation
   6. Coordinate Network Data Drop with Telecom contractor for each IP Camera.
   7. Coordinate camera IP address with District IT staff.

B. VSS Power supplies
   1. Do not combine with Access Control & Alarm Monitoring System power supplies.

C. Network Video Recorder Storage
1. Coordinate installation of additional camera licenses and programming of cameras on owner provided network video server with District ITS

D. Surge Protection
1. Provide surge protection for video, power, and control cable on exterior cameras.
2. Provide protective device at the camera and encoder/encoder device.

3.3 PROGRAMMING

A. Network Video Recorder
1. Connect the servers/storage to the Owner’s LAN/WAN to allow remote viewing from authorized workstations utilizing the VMS client viewing software. Configure the cameras and servers at the following initial requirements:
   a. Codec: H.264
   b. Resolution: 1080p (minimum)
   c. Storage: 30 Days (minimum)
   d. Recording: Motion
   e. Frame Rate: 15 fps

B. Document the results of the meeting and perform necessary programming to achieve the Owner’s requests.
C. Setup and program the system such that no additional programming required.
D. Use the camera naming convention agreed upon at in the programming meeting when programming point names into the system.
E. Perform two full system back-ups at completion of initial programming and deliver one copy to the Owner with a letter of transmittal explaining information included in back-up and brief description of recovery procedures. Perform back-ups on a regular bases through the remainder of the project.

3.4 TESTING

A. Test the video surveillance system in accordance with Section 28 08 00.

3.5 SYSTEM OPERATION CONFIRMATION

A. At 30 days after substantial completion, perform field review of video surveillance system software with the Owner to "fine tune" configuration settings for resolutions, recording, and frame rate to meet the storage and operational requirements.

END OF SECTION
SECTION 283100 - ANALOG ADDRESSABLE FIRE ALARM AND DETECTION SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:

1. Fire alarm system operation.
2. Fire alarm equipment.
3. Fire alarm wiring.

B. Provide an integrated, analog addressable, monitoring and control system for a complete fire alarm system as described herein. The system includes, but is not limited to, control units, power supplies, digital alarm communicating transmitter, remote annunciators, initiating devices, notification appliances, and outputs for specified fire life safety and control functions. The system also includes batteries, relays, fire alarm termination cabinets, conduit, wiring, and other equipment for a complete and operating system.

C. Unit Prices: Provide unit pricing for the following pieces of equipment. The unit pricing will include complete installation of devices listed with 40 feet of cable, conduit, if required, connections, programming, battery capacity, and the like.

1. Addition of manual pull station.
2. Addition of rate-or-rise or fixed temperature heat detector.
3. Addition of photoelectric or ionization smoke detector.
4. Duct mounted ionization or photoelectric smoke detector.
5. Magnetic door holder.
6. Speaker.
7. Audible/visible notification appliance.
8. Visible notification appliance.
9. Addressable relay with complete connection to item to be controlled or monitored.

1.2 SYSTEM DESCRIPTION

A. System Supervision: Provide electrically supervised, microprocessor-based system, with analog/addressable supervised two-wire Class B signaling line circuit and Class B notification circuit. Occurrence of single ground or open condition in initiating device, notification appliance, or signaling line circuit places circuit in "trouble" mode. Component or power supply failure places system in "trouble" mode. Fire sprinkler activation or duct-mounted smoke detector activation puts system in "supervisory" mode. Occurrence of single ground or open condition on alarm initiating circuit or on signaling circuit does not disable that circuit or control panel from transmitting "alarm." Each circuit includes individual supervisory and alarm function and is to be so arranged that a fault condition in circuits will not affect the proper operation of other circuits.

B. Alarm Sequence of Operation: Activation of a manual fire alarm box, automatic fire detector, or fire extinguishing system causes system to enter "alarm" mode including the following operations:

1. Provide local English language annunciation of device location, address and condition, and audible and visual alarm signal at control panel and remote annunciators.
2. Provide manual "acknowledge" function at control panel and remote annunciators to silence audible alarm signal, visual signal remains displayed until initiating alarm is cleared.
3. Transmit “alarm” signal to off-premises equipment, i.e., to the local fire department or Owner's selected vendor. Provide necessary connections to digital alarm communicator transmitter.
4. Activate fire alarm notification appliances.
5. Transmit signal to fire/smoke dampers.
6. Transmit signal to initiate shutdown of air handling equipment.
7. Transmit signal to release fire doors.
8. Transmit signals to elevator control equipment to initiate elevator recall and shunt trip.
9. Transmit signal to building access/security system.

C. Supervisory Sequence of Operation: Fire sprinkler tamper switch activation or duct-mounted smoke detector activation causes system to enter “supervisory” mode including the following operations:
1. Provide local English language annunciation of device location, address and condition, and audible and visual supervisory signal at control panel and remote annunciators.
2. Provide manual "acknowledge" function at control panel and remote annunciators to silence audible supervisory signal, visual signal remains displayed until initiating supervisory is cleared.
3. Transmit "supervisory" signal to off-premises equipment.

D. Trouble Sequence of Operation: System trouble, including single ground or open of supervised circuit, or power or system failure, causes system to enter “trouble” mode including the following operations:
1. Provide local English language annunciation of device location, address and condition, and audible and visual trouble signal at control panel and remote annunciators.
2. Provide manual "acknowledge" function at control panel and remote annunciators to silence audible trouble signal, visual signal remains displayed until initiating trouble is cleared.
3. Transmit "trouble" signal to off-premises equipment.

E. System Reset: Key-accessible control function returns the system to normal, non-alarm state, if initiating circuits have cleared. Reset to be located on both the main fire alarm control panel and the remote annunciators.

F. Lamp Test: Manual "lamp test" function causes the annunciation lamps to illuminate at fire alarm control and remote annunciator panels. Provide "lamp test" function at each annunciator panel.

G. Addressing: Provide each initiating device with its own discrete analog address.

H. Power Requirements:
1. The control panel receives 120VAC via a dedicated circuit per NFPA requirements.
2. Loss of normal and emergency power automatically causes the system to transfer to battery power. Indicate battery power operation by a yellow lamp and audible annunciation at the control panel and remote annunciator panels. Upon return of 120VAC power, unit recharges batteries to full capacity and maintains battery on float charge.
3. Provide storage batteries of sufficient capacity to operate the fire alarm system under normal supervisory condition for 24 hours and operate alarm signals for 15 minutes at the end of the standby period. Provide trickle charge adequate capacity to maintain the battery fully charged with automatic rate charge. Provide batteries in a locking cabinet manufactured for the purpose. Do not install cabinets or equipment below the battery cabinet. Do not locate battery and charging system cabinets in ceiling space.

1.3 SUBMITTALS

A. Submit shop drawings and product data in accordance with Division 01.
B. A maximum of two submittal reviews will be performed by the Engineer. Compensate additional time and material to the Engineer based on their published fees for additional reviews.

C. Equipment submittals must include the following:
   1. Complete descriptive data (cut sheets) including UL listing, FM approval (for the specified application) for system components.
   2. Provide Shop drawings to include the following:
      a. A symbol key with device catalog number, description, dimensions, back box size and mounting requirements.
      b. Detailed riser diagram.
      c. Device address and notification appliance circuit number with end-of-line device.
      d. Battery calculations for each battery backed fire alarm control unit.
      e. Voltage drop calculations for each notification appliance circuit, indicating conductor run length and size. 10 percent voltage drop maximum.
      f. Complete sequence of operation.
      g. Point to point wiring indicating the quantity and gauge of the conductors and size of conduit/raceway used.
      h. Wiring connection diagrams for components being connected to the system and interfaces to associated equipment.

D. Submit manufacturer's installation instructions.

E. Submit complete product data sheets and shop drawings to local AHJ, for approval, prior to construction.

F. Submit, prior to final acceptance, a letter confirming that inspections have been completed and the system is installed and functioning in accordance with the Specifications. Include manufacturer representative's certification of installation and letter of warranty.

G. Operation and Maintenance Manuals: Provide manuals containing cut sheets, manufacturer's operation and maintenance manual, troubleshooting guide, operating instructions, spare parts list, program printout, and data file on CD-ROM, 1 year warranty agreement including parts and labor, and professional Record Drawings. Warranty period begins upon the date of final acceptance.

1.4 QUALITY ASSURANCE

A. Requirements of Regulatory Agencies:
   1. Installation subject to inspection and approval of federal, state and local authorities.
   2. Equipment: UL listed FM approved.
   3. Contact AHJ prior to bid and provide required fire alarm and detection devices and components as required by adopted codes as interpreted by AHJ.

B. Reference Standards:
   8. UL 864 Listing.
PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Furnish equipment specified in this Section by one manufacturer: Siemens XLS, XLSV or approved equal.

2.2 MATERIALS

A. Control panel:
   1. Multiprocessor Based: Configurable as an analog/addressable, point identified system.
   2. System will be capable of displaying the analog value of each smoke detector, the address and condition of fire alarm monitoring points.
   3. CPU continuously monitors the communications and data processing cycles of the microprocessor. On CPU failure the system generates an audible and visual trouble signal on the control panel and remote annunciators.
   4. House the CPU in the fire alarm cabinet with sufficient space to allow maximum system expansion and to enclose the alphanumeric display.
   5. Retain basic life safety software in field programmable non-volatile memory. Provide the CPU with a capacity of a minimum of 100 addressable points.
   6. The system is multichanneled. Each channel operates independently. Faults on one channel not impede operation of the other.
   7. Equip the CPU with software to provide a control-by-event feature, whereby the receipt of an alarm point is programmed to operate the control points within the system. Provide control-by-event actions for life safety functions in a programmable non-volatile memory. CPU software programming for control of systems defined in this Section is installed as a part of this Section. Reprogram the support system prior to acceptance, if required by Owner.
   8. System is capable of addressing and operating smoke detectors, manual pull stations, open contact devices and addressable auxiliary control relays on the same communication loop.
   9. Program Software:
      a. The field configuration program provides the programmable operating instructions for the system. Store the resident program in non-volatile memory.
      b. Perform the programming at the location of the fire alarm control panel. Program the system without shutting the system down. Programming is done off line. Update and maintain a hard copy and a CD-ROM copy of the program at the site. Make system programming software available to Owner, at an additional cost, allowing the user to reprogram system points, add system points, add or change point descriptions and update the data file.
      c. Programmed control point activation includes selective control of HVAC, door holder release, elevator recall, system equipment monitoring, and fire safety and auxiliary functions.
      d. Devices meet criterion specified under materials.
      e. Verification and display of sensitivity of each addressable smoke detector can be read using the operating software. Replace devices with readings outside of the allowed value at time of system check out.
   10. Control Panel Display Modules: Provide keyboard display module 80-character backlit LCD. Each alarm/trouble condition appears in English language with the description and location of the alarm/supervisory/trouble. The alarm/supervisory/trouble may be acknowledged, silenced and the system reset from the control panel or the remote annunciator(s).
   11. Power Supply: Provide power supply(s), adequate to serve control panel modules, remote annunciators, addressable devices, notification appliances, and other connected devices.
   12. Digital Alarm Communicator Transmitter (DACT): Electrically supervised, capable of transmitting alarm, supervisory and trouble signals over telephone lines to off-premises receiver. Signal transmitter interfaces fully with receiver station of local fire department or
Owner's selected vendor. Verify requirements and provide call sequence and message as directed by Owner and the AHJ.

13. Auxiliary Relays: Provide sufficient SPDT auxiliary relay contacts for each function in this portion of the Specifications and for equipment interconnections required under electrical and mechanical specifications.

14. Auxiliary Switches: Provide auxiliary equipment control switches with labeled status indicating lights for each switch.

B. Emergency Voice/Alarm Communications System Panel.

1. UL 864 listed.
2. Provide the fire protective signaling system circuits in accordance with Style Y for Notification Appliance Circuits (NAC). Open condition in circuit will cause trouble indication at control panel.
3. LED indicators for power trouble, ground trouble, and signal trouble in each NAC. Also, LED indicators for manual evacuation status, clear status, and "ready to talk" status for manual microphone paging.
4. Selectable audio tones (at least four different tone patterns) and voice message generation via digital recorded messages (either Owner supplied, from professionally recorded tapes or a manufacturer provided library).
5. Operator controls at panel include manual evacuation (alarm signal from momentary switch activation), manual clear from momentary switch activation, local microphone manual paging, remote microphone manual paging option.
6. Capable of receiving alarm signal from host panel notification appliance circuit.
7. Includes audio amplifier with a minimum capacity of 50 watt.
8. Built-in spoken diagnostic system testing program, permitting testing of individual speakers by one unassisted person.

C. Addressable Initiating Devices:

2. Fixed Temperature Heat Detectors: Rated 135F or 190F as noted on Drawings or required by space use. Provide off white low profile detectors.
3. Rate-of-Rise and Fixed Temperature Heat Detectors: Responding to 15F temperature rise per minute and to 135F fixed temperature as noted on Drawings or required by space use. Provide off white low profile detectors.
5. Ionization Type Analog Detector: Analog/addressable dual chamber 360 degree smoke entry, visual latching operation indicator, insect screen, panel adjustable sensitivity, test switch, tamper resistant and solid state voltage regulation.
6. Duct-Mounted Analog Smoke Detectors: Analog addressable, combination of ionization and photoelectric types, auxiliary relay contacts rated at 5 amps each at 120VAC. Duct sampling tubes extending width of duct, visual indication of detector actuation, direct housing mount. Detector powered from control panel, power on indicator light. Detector rated for air velocity, humidity, and temperature of duct. Provide with a remote LED/test switch.
7. Flame Detector: Encapsulated solid state electronic circuitry with auxiliary contacts. Visual alarm light, 3 second time delay, open area ultra violet 6 second response to 12-inch diameter hydrocarbon fire when viewed head-on from 30 feet. No response to sunlight or artificial light sources. Provide each detector with an addressable module.
8. Addressable Control Module: Signaling line circuit interface module that connects to notification appliance circuits and provides system control outputs. Module powered from control panel.
9. Addressable Monitor Module: Signaling line circuit interface module that connects to initiating devices and initiating device circuits. Module powered from control panel.

10. Remote Switches: Provide remote control/indication and test switches for system or equipment testing or control accompanied by English language labeled indicator lamps, i.e. for duct-mounted smoke detectors, projected beam type smoke detector, and the like.

11. Water Flow and Pressure Alarm Switches: Verify requirements, locations, and quantities with sprinkler design. Switches are provided by Division 15, wired by Division 16, unless specifically noted otherwise. Provide each switch with an addressable module.

12. Supervisory Pressure and Tamper Switches: Verify requirements, locations, and quantities with sprinkler design. Switches are provided by Division 15, wired by Division 16, unless specifically noted otherwise. Provide each switch with an addressable module.

13. Projected Beam Type Smoke Detector: Infrared emitter and receiver, adjustable reception threshold, micro processor self adjusting compensation for optic contamination, acrylic anti fog infrared filter, green power indicating LED, red alarm LED, and yellow trouble LED. Voltage and RF suppression, compensating circuitry for vibration and temporary obscuration. Auxiliary contacts. Provide each detector with an addressable module and a remote LED/test switch.

14. Wire Guards: Chrome steel guard. Provide where device is subject to abuse and where required by AHJ. Submit original, color, data cut sheets for approval by Architect.

15. Single/Multiple Station Smoke Alarm: 120VAC photoelectric smoke alarm/detector with 9VDC battery backup as an auxiliary power source in the event of an electrical failure. Include 90dB piezo solid-state, nonlatching horn. Temporal 3 evacuation sounding device. Tandem connection up to 12 units. Three-position test switch.

16. Single/Multiple Station Smoke Alarm with Strobe: 120VAC photoelectric smoke alarm/detector with 9VDC battery backup. Include 90dB piezo solid-state, nonlatching horn and 177 candela strobe. Add Alternate: Coordinate with Campus for Temporal 3 evacuation sounding device. Tandem connection up to six units. Three-position test switch.

D. Annunciators:

1. Alphanumeric Remote Annunciator with Controls: Back lit LCD alphanumeric annunciator 80 characters long. Provide under locking cover a test switch, alarm and trouble buzzer, buzzer silence switch and buzzer silence message and reset switch, flush mount with finished cover, vandal-resistant UV stabilized Lexan (or approved) overlay and required modules, control panel, etc., to drive annunciator. Self-contained, suitable for wet location where located exterior. Verify location with AHJ before installation.

2. Provide framed floor plan of facility adjacent to the annunciator panel identifying room names/numbers, device/addresses or fire zone number and listing as utilized on the annunciator panel, as required by local AHJ. Check with the local fire department for size and approved mounting location.

E. Door Hold-Opens/Closers, Elevator Recall, Fire/Smoke Damper Control, and Fire Safety and Auxiliary Functions:

1. Magnetic door holders. Provide smoke detection and addressable control relays to release magnetic hold open devices. Verify requirements and quantities prior to bidding.
   a. Magnetic hold open/closers installed by door hardware supplier. Division 16 provides power and control conduit, wiring, boxes and terminations to power devices and interface devices to fire alarm system.
   b. Hold door open until signaled by addressable relay module. When actuated, the device will release door to close. Doors release automatically on power failure.

2. Provide elevator recall smoke detectors, addressable control relays, and connection to elevator equipment per NFPA 72 and as required by the AHJ.

3. Provide elevator shunt trip heat detectors, addressable control relays, addressable monitor relay for shunt trip power, and connection to elevator equipment per NFPA 72 and as required by the AHJ.
4. Provide fire/smoke damper control/monitoring. Provide required smoke detectors, relays, wiring, and the like. Provide spot type smoke detector(s), listed for releasing service, and install within 5 feet of the dampers per the CBC or as required by the AHJ. Verify requirements, locations and quantities with Division 15 prior to bidding.

F. Notification Appliances:
   1. Speakers: Flush wall mount, white finish. Insect-proof 4-inch multitap to 1/4, 1/2, 1, and 2 watts with back box and trim grill. State of California fire marshal listed Provide speaker capable of transmitting tone or voice. Trim finish as directed by Architect. Provide with integral ADA and UL 1971 approved strobe light as required by AHJ. Candela rating as required per space used.
   2. Speaker/Strobe Appliances: Flush wall mount, white finish. Provide speaker capable of transmitting tone or voice. Provide with integral ANSI 117.1 and UL 1971 approved strobe light. Candela rating as required per space used.
   3. Audible/Visible Appliances (Horn/Strobes): Flush wall mount, white finish. Provide horn-strobes that meet the latest requirements of NFPA 72, ANSI 117.1 and UL 1971. Candela rating as required per space used.
   4. Visible Notification Appliances (Strobes): Flush wall mount, white finish. The strobes will meet or exceed the latest requirements of NFPA 72, ANSI 117.1, and UL standard 1971. Candela rating as required per space used.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Obtain approval of system design from AHJ prior to installation. Do not begin installation without approval from AHJ and submittal review comments from Engineer.

B. Terminate fire alarm conductors in control and annunciator panels on terminal strips. Connect wiring neatly and secure to cabinet with nylon cable straps. Set up termination of cabling so that sections of the system may be isolated or shorted out for servicing. Maximum of two conductors under each terminal strip connection.

C. From fire alarm controlled relays, make connection to motor controls and related equipment as required for fan system control. Provide relays UL listed for the purpose.

D. Wiring:
   1. In accordance with manufacturer's instructions, provide wiring, conduit and outlet boxes required for the erection of a complete system as described herein, as shown on Drawings, and as required by AHJ.
   2. Provide wiring to meet the requirements of national, state and local electrical codes. Provide color coded wiring as recommended and specified by the fire alarm and detection system manufacturer. Minimum signaling line circuit and initiating device circuit wire size: AWG 18. Minimum notification appliance circuit wire size: AWG 14, or as approved by the Engineer. Test wiring free from ground faults and short circuits.
   3. Provide complete conduit system for wiring. Provide Type FPL power-limited fire alarm cable. Provide Type FPL power-limited fire alarm cable when run open or in raceway. Type FPLR power-limited fire alarm cable when run is from floor to floor or in a vertical run in a shaft (install raceway where passing through a floor to a height of 7 feet above the floor) and Type FPLP power-limited cable when wiring is in ducts or plenum space.
   4. Provide final connections between equipment and the wiring system approved by manufacturer.
   5. At junction boxes and termination points, provide identification tags on wires and cables.
E. Duct-Mounted Smoke Detectors:
1. Provide duct-mounted smoke detectors on air systems with air quantities of 2000 cfm or more. Coordinate with Division 15.
2. Install duct-mounted smoke detector(s) on supply or return side of air duct. Coordinate with campus for final location.
3. Provide control wiring from duct-mounted detector auxiliary relay contacts to air handling equipment controller. Connect to controller so that when duct-mounted smoke detector is activated, the air handling equipment is shut down.
4. Provide duct-mounted smoke detectors rated for air velocity, temperature, and humidity of duct. Verify quantities, locations, and requirements with Division 15 Drawings and mechanical system installer.
5. Where duct-mounted smoke detectors are mounted in inaccessible building void spaces provide access hatch. Provide access hatch with fire rating equivalent to rating of wall, ceiling, or shaft being penetrated.

F. Fire/Smoke Dampers and Smoke Dampers:
1. Connect control and power wiring to dampers per manufacturer's instructions.
2. Verify quantities, location and requirements of dampers with Division 15 Drawings and Specifications, and mechanical system installer.
3. For each fan unit serving fire/smoke dampers and smoke/dampers with associated duct-mounted smoke detectors, provide current sensing switch with 8-amp, 250-volt rated relay contacts (Hawkeye 740 series or approved) for cutting power to fire/smoke dampers when fan unit shuts down.
4. If damper is installed within a duct, provide smoke detector within 5 feet of damper with no air inlets or outlets between the damper and detector.
5. If damper is installed within an unducted opening, provide smoke detector located within a 5-foot horizontal radius of the damper to control the damper.
6. Provide control wiring, transformers and power connections for an operable damper and detection system.

3.2 FIELD QUALITY CONTROL

A. Upon completion of the installation, subject the system to operational tests and when necessary corrections have been accomplished, advise Architect who will schedule a final inspection test with the Owner. Ensure the connections to the fire alarm system have been in service for at least 10 days of trouble/alarm free operation prior to the final inspection. Furnish instruments, labor and materials required for the tests and a qualified technician to conduct the tests. Correct deficiencies found at no cost and retest system as necessary, prior to final acceptance. Tests include the following:
1. Operation of each signal initiating device (smoke detectors, heat detectors, pull stations, fire/smoke rated doors, process and facilities control sequences).
2. Operation of each notification appliance (alarm horn and alarm strobe).
3. Operation of features of the system under normal operation.
4. Operation of supervisory features of the system.
5. Operation of features of the systems on standby power with primary power off.
6. Documentation by download of control panel memory.

B. Upon completion of the installation of fire alarm equipment, provide to Architect a signed, written statement substantially in the form as follows: "The undersigned having been engaged as the Contractor on the facility confirms that the fire alarm equipment was installed in accordance with the Drawings, Specifications, wiring diagrams, instructions, directions provided by manufacturer, and requirements of the governing authorities."
3.3 EQUIPMENT DEMONSTRATION AND PERSONNEL TRAINING

A. At the direction of Architect the equipment supplier of the system will provide factory trained representative to demonstrate the operation of the fire alarm system equipment and to instruct the Owner's personnel in its operation. Provide names and date of instruction prior to final acceptance.

3.4 OPERATION AND MAINTENANCE MANUALS

A. Provide three sets of manuals to the Architect prior to final acceptance. Provide manuals containing professional developed Record Drawings, battery type and battery calculations, spare parts list, operating procedures, troubleshooting guide, program printout, data file on CD-ROM and a 1 year warranty agreement including parts and labor. Warranty period begins upon the date of final acceptance.

END OF SECTION
SECTION 310413 - COMMON SUBMITTAL REQUIREMENTS FOR EARTHWORK

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Supplementary administrative and procedural requirements for submitting Shop Drawings, Product Data, Samples, and other submittals specific to the work of this Division.

B. Related Requirements:
   1. Division 01 submittal requirements.

1.3 DEFINITIONS

A. Contractor: Refers to an entity in direct Contract with the Owner to furnish and/or perform any portion of the Work of the Contract.
   1. Contractor shall review and approve Product Submittals prior to forwarding them to the Architect.

B. Product Submittals: In general, Product Submittals show characteristics of the proposed construction in one of the following forms:
   1. Shop Drawings.
   2. Product Data.
   3. Samples.

C. Action Submittals: Written and graphic information and physical samples that require Architect/Engineer's responsive action. Action submittals are those submittals indicated in individual Specification Sections as "action submittals."

D. Sustainable Design Submittals: Submittals required by Section 01813 "Sustainable Design Requirements." Submit documentation for products and materials contributing to achievement of LEED rating indicated. Sustainable Design Submittals are in addition to other submittal requirements.

E. Informational Submittals: Written and graphic information and physical samples that do not require Architect/Engineer's responsive action. Submittals may be rejected for not complying with requirements. Informational submittals are those submittals indicated in individual Specification Sections as "informational submittals."

F. Submittal Review Sheet: Specific form required to accompany each submittal. Obtain Submittal Review Sheet from the SmithGroup Project Manager.
1.4 SUBMITTAL ADMINISTRATIVE REQUIREMENTS

A. Requirements specified for submittals are intended to provide efficient handling, while permitting review responsibilities to be carried out.

B. Avoidable Resubmittals: The first two reviews of each specified submittal will be processed without cost to the Contractor. After the second review, the Owner may charge the Contractor for the cost of such additional processing, unless the processing results from approved Change Orders causing revisions to previously approved submittals.

C. Coordination: Coordinate preparation and processing of submittals with performance of construction activities.
   1. Coordinate each submittal with fabrication, purchasing, testing, delivery, other submittals, and related activities that require sequential activity.
   2. Submit all submittal items required for each Specification Section concurrently unless partial submittals for portions of the Work are indicated on approved submittal schedule.
   3. Submit action submittals and informational submittals required by the same Specification Section as separate packages under separate transmittals.
   4. Coordinate transmittal of different types of submittals for related parts of the Work so processing will not be delayed because of need to review submittals concurrently for coordination.
      a. Architect and Engineer reserve the right to withhold action on a submittal requiring coordination with other submittals until related submittals are received.

D. Processing Time: Allow time for submittal review, including time for resubmittals, as follows. Time for review shall commence on Architect's receipt of submittal. No extension of the Contract Time will be authorized because of failure to transmit submittals enough in advance of the Work to permit processing, including resubmittals.
   1. Refer to Section 01330 for quantity of days allowed for review.
   2. When a large volume of submittal materials is scheduled, additional review time may be required. Similarly, a particular submittal may require review completion in less than the agreed normal time. Due to variations in submittal volume and processing needs, agreed review time is not intended to apply to extreme conditions.

E. Maintain at the Project Site ready access to the latest reviewed Shop Drawings and Product Data, and one set of samples.

PART 2 - PRODUCTS

2.1 SUSTAINABLE DESIGN REQUIREMENTS

A. The District requires the Contractor to implement practices and procedures to meet the project's environmental performance goals. The Contractor shall ensure that the minimum requirements related to these goals, as defined in Section 01813 "Sustainable Design Requirements" are implemented to the fullest extent possible. Specific materials and systems have been selected to this end. Substitutions, or other changes to the work proposed by the Contractor or their Subcontractors, shall not be allowed if such changes compromise the aforementioned environmental goals and LEED certification.
B. Specific material goals, beyond inherently designed facility service systems, that may impact this area of work include: use of products with third-party verified Environmental Product Declaration, use of products with Health Product Declarations, use of products from manufacturers with publicly disclosed Corporate Sustainability Reports, use of products with recycled-content materials; use of locally-purchased, manufactured and extracted materials; use of FSC certified wood; use of low-emitting materials; construction waste recycling; and the implementation of a construction indoor air quality management plan.

PART 3 - EXECUTION

3.1 CONTRACTOR’S REVIEW

A. Project Closeout and Maintenance Material Submittals: See requirements in Division 01.

B. Be responsible for quantities, weights, and dimensions to be confirmed and correlated at the site; for information that pertains solely to the fabrication processes and to the means, methods, techniques, sequences, and procedures of construction; and for coordination of the work of every trade, supplier, and subcontractor.

C. Be responsible for each submittal to be in conformance with information given and the design intent expressed in the Contract Documents.

D. Provide with each submittal specific written notice of any variation from the requirements of the Contract Documents by causing a specific notation to be made on the Submittal Review Sheet and Submittal Transmittal. Changes to the approved construction documents are subject to DSA review and approval, submitted by the Architect as a CCD per DSA IR A-6.

3.2 ARCHITECT/ENGINEER’S AND GENERAL CONTRACTOR’S ACTION

A. General: Architect will not review submittals that do not include the Submittal Review Sheet.

B. Action Submittals: Architect’s staff and consultants will review the submittal, and mark the Submittal Review Sheet with an action code. The code meanings are described below.

C. Additional codes may be provided within comments or as an electronic submittal review stamp and shall be used in help indicating return of partial submittals.

E. Review Code meanings are as follows:

1. Action Codes Permitting Use:
   a. When an action code permitting use is assigned to a submittal, it does not authorize work that does not comply with the requirements of the Contract Documents. Acceptance of the Work will depend on compliance.
   b. Code AP - Approved: The Work covered by the submittal item may proceed, provided it complies with Contract Document requirements.
   c. Code AN - Approved as Noted: The Work covered by the submittal item may proceed, provided it complies with the Architect’s notations and Contract Document requirements.
d. Code AN-R - Approved as Noted - Resubmit: Do not deliver or install the related work until the resubmittal has received Code AP or AN. However, fabrication and other off-site work covered by the submittal item may proceed, at the Contractor's risk, provided it complies with the Architect's notations and Contract Document requirements.

2. Action Code Prohibiting Use:
   a. Action Code REJ - Not Approved: The Work covered by the submittal item, including purchasing, fabrication, delivery, and other activity, shall not proceed. Revise the submittal item or prepare a new item in accordance with the Architect's notations. Resubmit the corrected or new item without delay; do not permit submittal items marked "Not Approved" to be used. Work incorporating such items will be rejected.

3. Action Code for Items Not Required:
   a. Action Code X - Not Requested by Contract Documents: The submittal item is not called for by the Contract Documents and is being returned unreviewed by the Architect except to the extent necessary to determine its status.

F. Informational Submittals: For Architect's information only. Architect will review each submittal and will not return it, or will return it if it does not comply with requirements. Architect will forward each submittal to appropriate party.

   1. Action Code for Information Only:
      a. Action Code INF - Information Only - Received: The submittal item is not called for a return with a reviewed action code by the Contract Documents and is being returned un-reviewed by the Architect except to the extent necessary to determine its status.

G. Partial submittals prepared for a portion of the Work will be reviewed when use of partial submittals has received prior approval from Architect.

H. Incomplete submittals are not acceptable, will be considered non-responsive, and will be returned without review.

I. Architect will return without review or discard submittals received from sources other than the Contractor.

J. Submittals not required by the Contract Documents may be returned by the Architect without action.

   1. Do not submit Material Safety Data Sheets. They will be returned without review or discarded.

3.3 SUBMITTAL TRANSMITTAL REQUIREMENTS

A. Submittal Transmittal shall be a PDF file in electronic format. It is recommended, to expedite the submittal review, the electronic form be emailed for review to the Architect as early as possible.

   1. Submittal Numbering: See below.
   2. Contact Information: Full Name, Phone Number and Email Address.

B. Submittal Definition

   1. Each submittal consists of items from only ONE Specifications section.
2. **Complete Submittal:** If ALL the items required by the Specifications section are listed on one Submittal Form (including continuation sheet), it is a complete submittal.

3. **Partial Submittals:** If it is necessary to divide the required items of a given Specifications section into two or more submittals to meet schedule or handling requirements, the separate submittals are partial submittals. All partial submittals have the same submittal number, and are differentiated by sequential P-numbers (see below).

4. **All items in each submittal, whether complete or partial, will be processed together:** Individual items will not be 'broken out' for special handling. Arrange submittals accordingly.

C. **Submittal Numbering**

1. Number submittals as described below to assist tracking.

2. **Number each submittal in the format nnnnnn-nn.**

   a. **The 6-digit number is the number of the section that requires the submittal.** For example, 044200.

   b. **The 2-digit number is based on the numerical sequence of submittals from that section.** In other words, for each section, the first submittal is 01, the second is 02, and so on. The 2-digit number does not change for partial or re-submittals, so that the submittal can be tracked.

   c. **P-Number for Partial Submittals:** Number each partial submittal in the pee space, beginning with P1, and increasing by one for each partial submittal of that submittal. If the submittal is a complete submittal, leave the P space blank.

   d. **R-Number for Re-submittals:** Number each re-submittal in the arr space, beginning with R1, and increasing by one for each re-submittal of that submittal. Do not include an R-Number for the initial submittal.

   e. **Examples:**

3.4 **SUBMITTAL REVIEW SHEET REQUIREMENTS**

A. **Provide Submittal Review Sheet in PDF format.** Submit as the page after the Submittal Transmittal.

B. **When attached, the Submittal Review Sheet shall not obscure information contained in the submittal.**

C. **Do not edit any of the information contained within the Submittal Review Sheet except as follows:**

   1. **Submittal Number:** See Submittal Numbering in Submittal Transmittal Requirements paragraph.

D. **The Contractor shall submit the PDF file in a manner that will allow editing of the Submittal Review Sheet fields by SmithGroup and its consultants.**
SECTION 311001 - PLANT PROTECTION

PART 1 - GENERAL

1.1 DESCRIPTION

A. Preserve and protect existing trees, shrubs and other plant materials to remain, including protecting plants on adjoining properties during site preparation work and construction.

B. Provide tree and shrub pruning and removal in accordance with these Specifications if required by the Contract Documents.

C. Layout and review of utility and irrigation trenches that occur in the Tree Protection Root Zone.

D. Related Requirements:
   1. Section 311200, SOIL STRIPING & STOCKPILING
   2. Section 312300, EXCAVATION & FILL
   3. Section 329000, PLANTING

1.2 QUALITY ASSURANCE

A. Reference Standards:
   1. Ordinances and Regulations: All local, municipal and state laws, codes and regulations governing or relating to all portions of this work are hereby incorporated into and made a part of these Specifications. Anything contained in these Specifications shall not be construed to conflict with any of the above codes, regulations or requirements of the same. However, when these Specifications and Drawings call for or describe materials, workmanship or construction of a better quality, higher standard than is required by the above mentioned codes and regulations, the provisions of these Specifications and Drawings shall take precedence. Furnish without extra charge additional materials and labor required to comply with above rules and regulations.

B. Pre-installation Conference:
   1. Conduct conference at the project site. Contractor shall review and identify with the District's Representative the limits of Work and extent of plant materials and other improvements to be protected. Notify District's Representative of discrepancies between existing conditions and Drawings before proceeding with Work.
   2. Review methods and procedures related to temporary tree and plant protection including, but not limited to, the following:
      a. Tree-service firm's personnel, and equipment needed
      b. Arborist's responsibilities.
      c. Quality-control program.
      d. Coordination of Work and equipment movement with the locations of protection zones.
      e. Trenching by hand or with air spade within protection zones.

C. At the District's discretion, an Arborist may represent the District to review the work of the Contractor in regards to plant protection. Arborist Qualifications: ISA Certified Arborist licensed to work in the State of California.
D. Tree Service Firm Qualifications: An experienced tree service firm that has successfully completed temporary tree and plant protection work similar to that required for this Project and that will assign an experienced, qualified arborist to Project site during execution of the Work.

1.3 PROJECT CONDITIONS

A. Coordination: Coordinate this work with the work of other Sections to avoid delay and interference with other work.

B. Nuisances: Keep dirt, dust, noise and other objectionable nuisance to a minimum. Use temporary enclosures, coverings and sprinkling, and combinations thereof, as necessary to limit dust to lowest practicable level, except do not use water to the extent that it causes flooding or contaminated run-off.

C. Traffic: Conduct work to ensure minimum interference with vehicular and pedestrian traffic, and to permit unencumbered access to site and adjacent properties.
   1. Do not close or obstruct streets, sidewalks, alleys or other public passageways without permission from authorities having jurisdiction.
   2. If required by governing authorities, provide alternate routes around closed and obstructed traffic ways.

D. The following practices are prohibited within protection zones:
   1. Storage of construction materials, debris, or excavated material.
   2. Moving or parking vehicles or equipment.
   3. Foot traffic.
   4. Erection of sheds or structures.
   5. Impoundment of water.
   6. Excavation or other digging unless otherwise indicated.
   7. Attachment of signs to or wrapping materials around trees or plants unless otherwise indicated.

E. Do not direct vehicle or equipment exhaust toward protection zones.

F. Prohibit heat sources, flames, ignition sources, and smoking within or near protection zones and organic mulch.

1.4 DEFINITIONS

A. Diameter breast height (DBH): diameter of a trunk as measured at a height 54 inches above the ground line.

B. Plant-Protection Zone: Area surrounding individual trees, groups of trees, shrubs, or other vegetation to be protected during construction and indicated on Drawings.

C. Tree-Protection Zone: Area surrounding individual trees or groups of trees to be protected during construction and as identified on the drawings or otherwise by a certified arborist.

D. Vegetation: Trees, shrubs, groundcovers, grass, and other plants.

E. Structural Root Zone: A circular area with the tree trunk at the center and a radius equal to 3 times the diameter of the tree trunk measured at breast height (4.5 feet above ground line).
This zone, where most of the structural roots exist, is based upon tree failure research conducted by E.T. Smiley at the Bartlett Tree Research Laboratory. Any structural (buttress) root, which has been severed or is rotten within this zone, can no longer provide adequate support to the tree and must be considered missing.

F. Dripline: The area of the ground directly beneath the vertical projection (shadow) of the trees foliage canopy.

1.5 SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings:
   1. Include plans and locations of protection-zone fencing and signage, showing relation of equipment-movement routes and material storage locations with protection zones. Indicate extent of trenching by hand or with air spade within protection zones.
   2. Protection-Zone Signage

C. Qualification Data: For arborist and tree service firm.

D. Certification: From arborist, certifying that trees indicated to remain have been protected during construction according to recognized standards and that trees were promptly and properly treated and repaired when damaged.

E. Maintenance Recommendations: From arborist, for care and protection of trees affected by construction during and after completing the Work.

F. Survey of Existing Conditions: Provide to District a Survey of Existing Conditions. Record existing conditions, including underground utilities, etc. on As Built Drawings by use of field measurements and preconstruction photographs. Make permanent record of measurements, materials, and construction details required to make exact reproduction.

G. Tree Pruning Schedule: Written schedule detailing scope and extent of pruning of trees to remain that interfere with or are affected by construction.
   1. Species and size of tree.
   2. Location on site plan. Include unique identifier for each.
   3. Reason for pruning.
   4. Description of pruning to be performed.
   5. Description of maintenance following pruning.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Backfill Soil: Approved planting soil of suitable moisture content and granular texture for placing around tree; free of stones, roots, plants, sod, clods, clay lumps, pockets of coarse sand, concrete slurry, concrete layers or chunks, cement, plaster, building debris, and other extraneous materials harmful to plant growth.
B. Organic Mulch: Free from deleterious materials and suitable as a top dressing for trees and shrubs, consisting of one of the following:
   1. Type: Wood and bark chips
   2. Size Range: ½'-2”

C. Protection-Zone Fencing: Fencing fixed in position and meeting the following requirements:
   1. Chain-Link Protection-Zone Fencing: Galvanized-steel fencing fabricated from minimum 2-inch opening, 0.148-inch- diameter wire chain-link fabric; with pipe posts, minimum 2-3/8-inch- OD line posts, and 2-7/8-inch- OD corner and pull posts; with 1-5/8-inch- OD top and bottom rails; with tie wires, hog ring ties, and other accessories for a complete fence system.
      a. Height: 72 inches
   2. Gates: Swing access gates matching material and appearance of fencing, to allow for maintenance activities within protection zones.

D. Protection-Zone Signage: Shop-fabricated, rigid plastic or metal sheet with attachment holes prepunched and reinforced; legibly printed with nonfading lettering and as follows:
   1. Text: “Tree Protection Zone. No Heavy Equipment.”
   2. Lettering: 3-inch- high minimum, black characters on white background.

E. Tree Branch & Trunk Protection: for branches trunks exposed to, or at risk of exposure to impact by construction equipment.
   1. 2x lumber
   2. 1/2”-wide steel straps

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas in which work is to be performed. Report in writing to the District's Representative all prevailing conditions that will adversely affect the existing plant materials to remain. Do not proceed with work until a solution acceptable to the District’s Representative has been arrived at.

B. Survey of Existing Conditions: Record existing conditions, including underground utilities, etc. by use of measured drawings and preconstruction photographs.

C. Starting work constitutes acceptance of the existing conditions and the Contractor shall then, at his expense, be responsible for correcting all unsatisfactory and defective work encountered.

3.2 PREPARATION

A. Locate and clearly identify trees, shrubs, and other vegetation to remain an/or relocated. Tie a 1-inch blue vinyl tape around each tree trunk at 54 inches above the ground.
B. Protect tree root systems from damage caused by runoff or spillage of noxious materials while mixing, placing, or storing construction materials. Protect root systems from ponding, eroding, or excessive wetting caused by dewatering operations.

C. Tree-Protection Zones: Mulch areas inside tree-protection zones and other areas indicated. Do not exceed indicated thickness of mulch.
   1. Apply 4-inch uniform thickness of organic mulch unless otherwise indicated. Do not place mulch within 6 inches of tree trunks.

D. Install and maintain temporary fencing and other required protective devices and exclude construction activities from tree/shrub zones except as supervised by the Arborist / District's Representative.

E. If tree/plant protection zones cannot be protected with fencing, a four inch layer of mulch with minimum 1.25 inch thick, metal strap linked plywood shielding shall be maintained in the tree/shrub zone where heavy equipment will be operated.

3.3 PROTECTION ZONES

A. Protect trees and shrubs against cutting, breaking, skinning and bruising of bark; permit no traffic or stockpiling within drip line.

B. Do not change earth surface within drip line of trees and shrubs except as approved in writing by the Owner.

C. Do not park vehicles or store materials, supplies and construction equipment within Tree Protection Zone.

D. Verify details of protection-zone fencing before retaining last option in "Protection-Zone Fencing" Paragraph below.

E. Protection-Zone Fencing: Install protection-zone fencing along edges of protection zones before materials or equipment are brought on the site and construction operations begin in a manner that will prevent people from easily entering protected areas except by entrance gates. Construct fencing so as not to obstruct safe passage or visibility at vehicle intersections where fencing is located adjacent to pedestrian walkways or in close proximity to street intersections, drives, or other vehicular circulation.
   1. Chain-Link Fencing: Install to comply with ASTM F 567 and with manufacturer's written instructions.
   2. Posts: Set or drive posts into ground one-third the total height of the fence without concrete footings. Where a post is located on existing paving or concrete to remain, provide appropriate means of post support acceptable to District. Post may be steel driven type, or self-supporting type.
   3. Access Gates: Install where required; adjust to operate smoothly, easily, and quietly; free of binding, warp, excessive deflection, distortion, nonalignment, displacement, disruption, or malfunction throughout entire operational range. Confirm that latches and locks engage accurately and securely without forcing or binding.

F. Protection-Zone Signage: Install protection-zone signage in visibly prominent locations in a manner approved by District. Install one sign spaced approximately every 20 feet on protection-zone fencing, with signs each facing a different direction.
G. Where tree branches & trunks are exposed to, or at risk of exposure to impact by construction equipment, secure 2x lumber radially around tree branches and/or trunk to prevent damage. Secure lumber with steel strapping.

H. Maintain protection zones free of weeds and trash.

I. Maintain protection-zone fencing and signage in good condition as acceptable to District and remove when construction operations are complete and equipment has been removed from the site.
   1. Do not remove protection-zone fencing, even temporarily, to allow deliveries or equipment access through the protection zone.
   2. Temporary access is permitted subject to preapproval in writing by arborist if a root buffer effective against soil compaction is constructed as directed by arborist. Maintain root buffer so long as access is permitted.

3.4 EXCAVATION & TRENCHING

A. General: Excavate at edge of protection zones and for trenches indicated within protection zones according to requirements in Section 312300 "Excavation" unless otherwise indicated.

B. Trenching within Protection Zones: Where utility trenches are required within protection zones, excavate under or around tree roots by hand or with air spade, or tunnel under the roots by drilling, auger boring, or pipe jacking. Do not cut main lateral tree roots or taproots; cut only smaller roots that interfere with installation of utilities. Cut roots as required for root pruning. If excavating by hand, use narrow-tine spading forks to comb soil and expose roots.

C. Redirect roots in backfill areas where possible. If encountering large, main lateral roots, expose roots beyond excavation limits as required to bend and redirect them without breaking. If encountered immediately adjacent to location of new construction and redirection is not practical, cut roots approximately 3 inches (75 mm) back from new construction and as required for root pruning.

D. Do not allow exposed roots to dry out before placing permanent backfill. Provide temporary earth cover or pack with peat moss and wrap with burlap. Water and maintain in a moist condition. Temporarily support and protect roots from damage until they are permanently relocated and covered with soil.

3.5 ROOT PRUNING

A. Prune tree roots that are affected by temporary and permanent construction. Prune roots as approved by certified arborist.
   1. Generally cutting of roots two inches or greater shall be avoided. Roots one inch and greater in diameter that must be cut shall be cut cleanly and obliquely with the cut surface facing down.
   2. Exposed and pruned roots shall be covered with light well-drained soil backfill and mulch over. The area shall be kept moist.
   3. Cut roots manually by digging a trench and cutting exposed roots with sharp pruning instruments; do not break, tear, chop, or slant the cuts. Do not use a backhoe or other equipment that rips, tears, or pulls roots.
   4. Cut Ends: Do not paint cut root ends
5. Temporarily support and protect roots from damage until they are permanently redirected and covered with soil.
6. Cover exposed roots with burlap and water regularly.
7. Backfill as soon as possible according to requirements in Section 312300 "Excavation."

B. Root Pruning at Edge of Protection Zone: Prune tree roots 6 inches outside of the protection zone by cleanly cutting all roots to the depth of the required excavation.

C. Root Pruning within Protection Zone: Clear and excavate by hand or with air spade to the depth of the required excavation to minimize damage to tree root systems. If excavating by hand, use narrow-tine spading forks to comb soil to expose roots. Cleanly cut roots as close to excavation as possible.

3.6 AIR SPADING:

A. Air spading, or hand removal of soil or tunneling is required for excavation in the Tree Protection Zone of any trees for the installation of infrastructure where roots 2 inches in diameter and larger are encountered. The "critical root zone" is defined as any area around a tree in which a two inch diameter root is encountered. The Arborist / District's Representative shall define the critical root zone and the Contractor shall excavate using a pneumatic excavator (AIR-SPADE or equivalent) as follows:

B. Trenching for utility lines or other infrastructure may be done mechanically outside the Tree Protection Zone. As the equipment operator approaches the canopy radius, or for certain species up to 1.5 times the canopy radius out from the base of the tree (Oaks, Poplars, Redwoods, etc.) the operator shall be assisted by a spotter who shall inspect the excavation for roots. If a root of two inches diameter is encountered the spotter shall halt mechanical excavation and pneumatic excavation shall proceed. If no other two inch or greater diameter root is encountered in an excavation of two feet forward and two feet deep, the single two inch root may be cleanly cut proximal to (on the tree side of) any fracture or torn bark. Mechanical excavation may continue until a two inch diameter root is encountered, and the pneumatic excavation, exploration is then repeated.

C. The Contractor shall control dust and the spread of soils excavated. The air-spade operator shall moisten the soil to field capacity and to a minimum probe depth of 2.5 feet with a watering needle (hydro-spear) 48 hours prior to pneumatic excavation. The spread of excavated soil shall be contained to the area adjacent to the trench path with upright plywood sheeting.

D. These specifications shall not be considered operating instructions or a requirement to use a specific pneumatic excavation product. It is the responsibility of the Contractor to read and understand the pneumatic excavator operation instructions and safety procedures (including the proper and safe use of air compressor, hoses, excavation tools, etc.) prior to operations.

3.7 TREE PRUNING

A. Obtain specific instruction from Arborist / District's Representative for pruning of trees, shrubs, roots or disturbance of soil within spread of tree branches. The Contractor shall utilize protection measures as outlined by Arborist / District's Representative, which may include directional drilling, or hand clearing to expose the roots.
B. Provide periodic watering for all planting within Contract limit and any adjacent areas affected by the work. Maintain moisture to a minimum 6" depth, minimum.

C. Using an approved pruning saw, provide selective tree limb pruning as accepted by the District if branches interfere with new construction. Limb diameter shall be limited to 5" diameter and shall be pruned just outside the branch collar in accordance with American National Standards Institute, (ANSI 300) and International Society of Arboriculture, (ISA) standards.

D. Approved branches to be shortened must be cut just above a fork with another living branch which is plus or minus 1/2 the diameter of the removed branch as shown in the pruning figure herein. Branches to be removed which exceed 2" in diameter shall be severed with a 3-step cut to prevent bark peeling. Final cuts must not injure the branch collar or branch bark ridge of the remaining branches and trunk.
E. Prune branches that are affected by temporary and permanent construction.
1. Prune to remove only injured, broken, dying, or dead branches unless otherwise indicated. Do not prune for shape unless otherwise indicated.
2. Do not remove or reduce living branches to compensate for root loss caused by damaging or cutting root system.
3. Pruning Standards: Prune trees according to ANSI A300 (Part 1)

F. Unless otherwise directed by arborist and acceptable to District do not cut tree leaders.

G. Cut branches with sharp pruning instruments; do not break or chop.
H. Do not paint or apply sealants to wounds.
I. Provide subsequent maintenance pruning during Contract period as recommended by arborist.
J. Chip removed branches and stockpile in areas approved by District.

3.8 REGRADING
A. Lowering Grade: Where new finish grade is indicated below existing grade around trees, slope grade beyond the protection zone. Maintain existing grades within the protection zone.
B. Lowering Grade within Protection Zone: Where new finish grade is indicated below existing grade around trees, slope grade away from trees as recommended by arborist unless otherwise indicated.
   1. Root Pruning: Prune tree roots exposed by lowering the grade. Do not cut main lateral roots or taproots; cut only smaller roots. Cut roots as required for root pruning.
C. Raising Grade: Where new finish grade is indicated above existing grade around trees, slope grade beyond the protection zone. Maintain existing grades within the protection zone.
D. Minor Fill within Protection Zone: Where existing grade is 6 inches or less below elevation of finish grade, fill with backfill soil. Place backfill soil in a single uncompacted layer and hand grade to required finish elevations.

3.9 FIELD QUALITY CONTROL
A. Inspections: Engage a qualified arborist to direct plant-protection measures in the vicinity of trees, shrubs, and other vegetation indicated to remain and to prepare inspection reports.

3.10 TREE & PLANT REMOVAL & REPLACEMENT
A. Field Verification: Before removing non-designated trees, shrubs, stumps, bushes, vines, rubbish, undergrowth and deadwood as shown on the Drawings and as specified, obtain verification from Owner's Representative.
B. Repair or replace trees, shrubs, and other vegetation indicated to remain or to be relocated that are damaged by construction operations, in a manner approved by District.
   1. Submit details of proposed pruning and repairs.
   2. Perform repairs of damaged trunks, branches, and roots within 24 hours according to arborist's written instructions.
   3. Replace trees and other plants that cannot be repaired and restored to full-growth status, as determined by District.
C. Backfill and compact areas excavated and open pits and holes resulting from removal operations. Comply with requirements herein and as specified in Section 312333 "Utility Trenching and Backfilling" for backfill materials, compaction and installation methods.
D. Remove all stumps and roots in their entirety. Tree trunks shall be removed minimum depth of 2 1/2 feet below existing grade or finish grade, whichever is deeper. Stump grinding is an acceptable method of removal of roots and stumps of trees and shrubs; however, the chip
contaminated soil shall be replace with approved clean planting soil in planting areas and with approved clean fill soil in all other areas.

E. Backfill and compact voids excavated and open pits and holes resulting from removal operations. Comply with Earthwork Specification for backfill materials, compaction and installation methods. Unless required otherwise, in planting areas backfill holes with clean approved planting soil compacted to 90% relative compaction to a minus 12 inches below finish grade and 85% relative compaction for the top 12 inches, except as required elsewhere to a greater degree by Civil or Structural Engineer. In non-planting areas backfill holes with approved fill soil compacted to 95% relative compaction.

F. Remove and replace trees indicated to remain that are more than 25% dead or in an unhealthy condition before the end of the corrections period or are damaged during construction operations that District determines are incapable of restoring to normal growth pattern.

G. Plant Replacement: Contractor shall replace trees cut or severely damaged due to the Contractor’s work as follows:
   1. An ISA Certified Arborist may be retained by the District to determine the condition of trees in question as to their ability to survive in a healthy condition and in their original shape, or a pruned aesthetically pleasing shape acceptable to the District. Comply with recommendations to rehabilitate as recommended by the Arborist, or to replace in accordance with the requirements below.
   2. Trees size shall be determined by Diameter at Breast Height (DBH). Replacement of trees and shrubs shall also include providing acceptable plant installation, automatic irrigation system and a minimum maintenance period of 120 days. If plant(s) is not acceptably maintained and is not healthy and thriving at the end of the 120 day maintenance period, the Contractor shall continue the maintenance work until such time that healthy tree(s) and/or shrub(s) is achieved.
   3. Replace any damaged planting in kind using "specimen" plants as follows and at no cost to Owner:
      a. Trees up to 3” DBH: Replace with 36” box size.
      b. Trees 3” to 6” DBH: Replace with 72” box size.
      c. Trees 6” to 12” DBH: Replace with 84” box size.
      d. Trees 12” DBH and larger: Tree value shall be determined by Arborist using Council of Tree and Landscape Appraisers (CTLA) method. Replace damaged tree with largest available nursery boxed tree and cash difference between value of damaged tree and nursery stock replacement cost.
      e. Shrubs: Replace with 15-gallon can size.
   4. Plant and maintain new trees as specified

H. Excess Mulch: Rake mulched area within protection zones, being careful not to injure roots. Rake to loosen and remove mulch that exceeds a 3-inch uniform thickness to remain.

I. Soil Aeration: Where directed by arborist, aerate surface soil compacted during construction. Aerate 10 feet beyond drip line and no closer than 36 inches to tree trunk. Drill 2-inch- diameter holes a minimum of 12 inches (300 mm) deep at 24 inches o.c. Backfill holes with an equal mix of augered soil and sand.

3.11 CLEANUP AND DISPOSAL, per the District’s General Conditions.

A. Disposal: Remove excess excavated material, displaced trees, trash, and debris and legally dispose of them off Owner's property.
B. Clean excess soil may be distributed on site as accepted by District's Representative, if it does not adversely affect specified finish grades or percolation of water into planting soil.

C. Upon completion of work under this Section, remove all tools, equipment and temporary protections, enclosures and structures.

END OF SECTION
SECTION 311100 - CLEARING & GRUBBING

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes all work necessary to successfully complete demolition, clearing & grubbing to prepare site for the phasing and new construction, including the following:
   1. Protecting existing trees and vegetation to remain.
   2. Trimming tree limbs and roots.
   3. Removing trees as designated.
   4. Clearing vegetation, debris, trash and other materials within limits indicated.
   5. Grubbing of vegetation within limits indicated.
   7. Removing above-grade site improvements within limits indicated.
   8. Disconnecting, capping or sealing, and abandoning site utilities in place.
   9. Disconnecting, capping or sealing, and removing site utilities.
  10. Disposing of objectionable material off site.
  11. Clean line saw cutting of existing asphalt pavement, concrete sidewalks, concrete curb/gutter, etc., as specified herein.
  13. Protection from injury or defacement of trees and other vegetation and objects to be preserved.
      a. Removal of surface debris and deleterious materials such as rubbish.
      b. Removal and stockpile of materials for landscaping use at approved location.
      c. Disposal of unwanted materials off site.

1.2 REGULATORY REQUIREMENTS

A. No burning shall be allowed.

B. Comply with the following California Code of Regulations:
   1. Title 8: CAL/OSHA, Chapter, Subchapter 4 – Construction Safety Orders
   2. Title 24: Part 2, California Building Code, Chapter 33, Protection of Pedestrian during Construction or Demolition.
   3. Bay Area Air Quality Management District

1.3 DEFINITIONS

B. CAL-OSHA: California Occupational Safety and Health Administration.

C. Topsoil: Natural or cultivated surface-soil layer containing organic matter and sand, silt, and clay particles; friable, pervious, and black or a darker shade of brown, gray, or red than underlying subsoil; reasonably free of subsoil, clay lumps, gravel, and other objects more than 2-inches in diameter; and free of weeds, roots, and other deleterious materials.
D. Tree Protection Zone: Area surrounding individual trees or groups of trees to be protected during construction, and defined by the drip line of individual trees or the perimeter drip line of groups of trees, unless otherwise indicated.

1.4 MATERIAL OWNERSHIP

A. Except for stripped topsoil or other materials indicated to remain District’s property, cleared materials shall become Contractor’s property and shall be removed from Project site.

1.5 SUBMITTALS

A. Follow Submittal procedure outlined in Division 0 – General Conditions and Division 1 – General Requirements.

1.6 PROJECT CONDITIONS

A. Except for materials indicated to be stockpiled or to remain the District’s property, cleared materials are the Contractor’s property. Remove cleared materials from site and dispose of in lawful manner.

B. Salvageable Improvements: Carefully remove items indicated to be salvaged and store where indicated on plans or where designated by the District. Avoid damaging materials designated for salvage.

C. Unidentified Materials;

1. If unidentified materials are discovered, including hazardous materials that will require additional removal other than is required by the Contract Documents, immediately report the discovery to the District.

2. If necessary, the District will arrange for any testing or analysis of the discovered materials and will provide instructions regarding the removal and disposal of the unidentified materials.

PART 2 - PRODUCTS

2.1 SOIL MATERIALS

A. Backfill excavations resulting from demolition operations with on-site or import materials conforming to structural backfill defined in Section 31 23 33 Utility Trenching and Backfill.

1. Obtain approved borrow soil materials off-site when satisfactory soil materials are not available on-site.

PART 3 - EXECUTION

3.1 PREPARATION

A. Protect and maintain benchmarks and survey control points during construction.
B. Locate and clearly flag trees and vegetation to remain or to be relocated.

C. Protect existing site improvements to remain during construction.
   1. Restore damaged improvements to their original condition, as acceptable to the District. Prior to restoration the contractor shall notify the District of the damaged improvements.

3.2 TREE REMOVAL

A. Remove trees designated for removal prior to the construction of new improvements.

B. Perform tree removal work in a safe and proper manner, adhering to CAL-OSHA and ANSI Standards.

C. Remove or grind stumps to a minimum of 18-inches below finish subgrade. Remove surface roots to this depth within 24-inches of the tree trunk. Trees, plants and roots that are below proposed building footprint or slabs on grade shall be removed in its entirety.

3.3 RESTORATION

A. Restore damaged improvements to their original condition, as acceptable to the District.

B. Repair or replace trees and vegetation indicated to remain that are damaged by construction operations, as directed by the District.
   1. Employ a qualified arborist, licensed in jurisdiction where the Project is located, to submit details of proposed repairs and to repair damage to trees and shrubs.
   2. Replace trees that cannot be repaired and restored to full-growth status, as determined by the District. Clear and grub existing areas only to extent required by new construction and as indicated. Use methods required to complete the Work within limitations of governing regulations.

3.4 BACKFILL

A. Place and compact material in excavations and depressions remaining after site clearing in conformance with Section 312333.

3.5 DISPOSAL

A. Remove surplus soil material, unsuitable topsoil, obstructions, demolished materials, and waste materials, including trash and debris, and legally dispose of them off the District’s property.

3.6 CONSTRUCTION WASTE MANAGEMENT

A. To the greatest extent possible, separate reusable and recyclable products from contaminated waste and debris in accordance with the General Contractor’s Waste Management Plan. Place recyclable and reusable products in designated containers and protect from moisture and contamination.

END OF SECTION
SECTION 311200 - SOIL STRIPPING & STOCKPILING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Removing existing vegetation.
   2. Clearing and grubbing.
   3. Stripping and stockpiling topsoil.

B. Related Requirements:
   1. Section 311001, PLANT PROTECTION
   2. Section 312300, EXCAVATION & FILL

1.2 DEFINITIONS

A. Subsoil: Soil beneath the level of subgrade; soil beneath the topsoil layers of a naturally occurring soil profile, typified by less than 1 percent organic matter and few soil organisms.

B. Surface Soil: Soil that is present at the top layer of the existing soil profile. In undisturbed areas, surface soil is typically called "topsoil," but in disturbed areas such as urban environments, the surface soil can be subsoil.

C. Topsoil: Top layer of the soil profile consisting of existing native surface topsoil or existing in-place surface soil; the zone where plant roots grow. Its appearance is generally friable, pervious, and black or a darker shade of brown, gray, or red than underlying subsoil; reasonably free of subsoil, clay lumps, gravel, and other objects larger than 2 inches (50 mm) in diameter; and free of weeds, roots, toxic materials, or other nonsoil materials.

D. Plant-Protection Zone: Area surrounding individual trees, groups of trees, shrubs, or other vegetation to be protected during construction and indicated on Drawings.

E. Tree-Protection Zone: Area surrounding individual trees or groups of trees to be protected during construction and indicated according to requirements in Section 31 10 01 “Plant Protection.”

F. Vegetation: Trees, shrubs, groundcovers, grass, and other plants.

1.3 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site to review extent of area where topsoil is to be stripped and stockpiled

1.4 MATERIAL OWNERSHIP

A. Except for materials indicated to be stockpiled or otherwise remain District's property, cleared materials shall become Contractor's property and shall be removed from Project site.
1.5 SUBMITTALS

A. Existing Conditions: Documentation of existing trees and plantings, adjoining construction, and site improvements that establishes preconstruction conditions that might be misconstrued as damage caused by site clearing.
   1. Use sufficiently detailed photographs or video recordings.
   2. Include plans and notations to indicate specific wounds and damage conditions of each tree or other plant designated to remain.

B. Topsoil stripping and stockpiling program. Prepare a written program to systematically demonstrate the ability of personnel to properly follow procedures and handle materials and equipment during the Work. Include dimensioned diagrams for placement and protection of stockpiles.

C. Soil Stockpile Quantity Report:
   1. Provide a written report documenting the quantity, location and height of all stockpiled soil.

D. Soil Analysis Report:
   1. Provide soil analysis report for each topsoil stockpile. Soils analysis report to be performed by Waypoint Analytical, a certified soil analysis laboratory, and include agricultural suitability analysis and recommendations for amending the soil. Subsoil will not be approved as planting soil.

1.6 FIELD CONDITIONS

A. Traffic: Minimize interference with adjoining roads, streets, walks, and other adjacent occupied or used facilities during site-clearing operations.
   1. Do not close or obstruct streets, walks, or other adjacent occupied or used facilities without permission from District and authorities having jurisdiction.
   2. Provide alternate routes around closed or obstructed trafficways if required by District or authorities having jurisdiction.

B. Improvements on Adjoining Property: Authority for performing site clearing indicated on property adjoining District's property will be obtained by District before award of Contract.
   1. Do not proceed with work on adjoining property until directed by District.

C. Utility Locator Service: Notify utility locator service. Call Before You Dig for area where Project is located before site clearing.

D. Do not commence site clearing operations until temporary erosion- and sedimentation-control and plant- and tree-protection measures are in place.

E. Tree- and Plant-Protection Zones: Protect according to requirements in Section 311001 "Plant Protection."

F. Soil Stripping, Handling, and Stockpiling: Perform only when the soil is dry or slightly moist.
PART 2 - PRODUCTS

2.1 MATERIALS

A. Satisfactory Stockpiled Top Soil / Planting Soil material: Requirements for satisfactory planting soil material are specified in section 329000 “Planting”

PART 3 - EXECUTION

3.1 PREPARATION

A. Protect and maintain benchmarks and survey control points from disturbance during construction.

B. Verify that trees, shrubs, and other vegetation to remain or to be relocated have been flagged and that protection zones have been identified and enclosed according to requirements in Section 31 10 01 "Plant Protection."

C. Protect existing site improvements to remain from damage during construction.
   1. Restore damaged improvements to their original condition, as acceptable to District.

3.2 TEMPORARY EROSION AND SEDIMENTATION CONTROL

A. Provide temporary erosion- and sedimentation-control measures to prevent soil erosion and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways, according to erosion- and sedimentation-control Drawings and requirements of authorities having jurisdiction.

B. Verify that flows of water redirected from construction areas or generated by construction activity do not enter or cross protection zones.

C. Inspect, maintain, and repair erosion- and sedimentation-control measures during construction until permanent vegetation has been established.

D. Remove erosion and sedimentation controls and restore and stabilize areas disturbed during removal.

3.3 TREE AND PLANT PROTECTION

A. Protect trees and plants remaining on-site according to requirements in Section 31 10 01 "Plant Protection."

B. Repair or replace trees, shrubs, and other vegetation indicated to remain or be relocated that are damaged by construction operations according to requirements in Section 31 10 01 "Plant Protection."

3.4 EXISTING UTILITIES

A. District will arrange for shutting off utilities. Contractor is responsible for disconnecting, capping and sealing indicated utilities that serve existing structures before site clearing.
   1. Verify that utilities have been disconnected and capped before proceeding with site clearing.
B. Locate, identify, disconnect, and seal or cap utilities indicated to be removed or abandoned in place. Arrange with utility companies to shut off indicated utilities.

C. Locate, identify, and disconnect utilities indicated to be abandoned in place.

D. Interrupting Existing Utilities: Do not interrupt utilities serving facilities occupied by District or others, unless permitted under the following conditions and then only after arranging to provide temporary utility services according to requirements indicated:
   1. Notify District not less than two days in advance of proposed utility interruptions.
   2. Do not proceed with utility interruptions without District's written permission.

E. Excavate for and remove underground utilities indicated to be removed, refer to section 312300 Excavation section.

3.5 CLEARING AND GRUBBING

A. Remove obstructions, trees, shrubs, and other vegetation to permit installation of new construction.
   1. Do not remove trees, shrubs, and other vegetation indicated to remain or to be relocated.
   2. Grind down stumps and remove roots larger than 1 inch in diameter, obstructions, and debris to a depth of 18 inches below exposed subgrade.
   3. Use only hand methods or air spade for grubbing within protection zones.

B. Fill depressions caused by clearing and grubbing operations with satisfactory soil material unless further excavation or earthwork is indicated.
   1. Place fill material in horizontal layers not exceeding a loose depth of 8 inches (200 mm), and compact each layer to a density equal to adjacent original ground.

3.6 TOPSOIL STRIPPING

A. Contractor to strip and stockpile existing on-site top soil per plans and submit quantity and soil report. If stockpiled top soil is determined to be an acceptable planting soil, contractor to provide credit to owner for reduced quantity of imported planting soil. All planting areas to receive 12” of imported planting soil (refer to Section 329000).

B. Remove sod and grass before stripping topsoil.

C. Strip topsoil to depth encountered and no more than 12” in a manner to prevent intermingling with underlying subsoil or other waste materials.
   1. Remove subsoil and non-soil materials from topsoil, including clay lumps, gravel, and other objects larger than 2 inches (50 mm) in diameter; trash, debris, weeds, roots, and other waste materials.

D. Stockpile topsoil away from edge of excavations without intermixing with subsoil or other materials. Grade and shape stockpiles to drain surface water. Cover to prevent windblown dust and erosion by water.
   1. Limit height of topsoil stockpiles to 72 inches.
   2. Mechanically mix each topsoil stockpile uniformly to produce a homogeneous soil texture prior to soil testing each stockpile for agricultural suitability.
   3. Do not stockpile topsoil within protection zones.
   4. Dispose of surplus topsoil after final soil placement. Surplus topsoil is that which exceeds quantity indicated to be reused.
3.7 STOCKPILING ROCK

A. Remove from **construction area** naturally formed rocks that measure more than 1 foot across in least dimension. Do not include excavated or crushed rock.
   1. Separate or wash off non-rock materials from rocks, including soil, clay lumps, gravel, and other objects larger than 2 inches in diameter; trash, debris, weeds, roots, and other waste materials.

B. Stockpile rock **away from edge of excavations** without intermixing with other materials. Cover to prevent windblown debris from accumulating among rocks.
   1. Limit height of rock stockpiles to **36 inches**.
   2. Do not stockpile rock within protection zones.
   3. Stockpile surplus boulders larger than 24” diameter to allow later use by the District.
      Contractor to remove stockpiled rock at no cost to owner if rocks are rejected for reuse.

3.8 DISPOSAL OF SURPLUS AND WASTE MATERIALS

A. Remove surplus soil and rock material, unsuitable topsoil, obstructions, demolished materials, and waste materials including trash and debris, and legally dispose of them off District’s property.

B. Separate recyclable materials produced during site clearing from other nonrecyclable materials. Store or stockpile without intermixing with other materials and transport them to recycling facilities. Do not interfere with other Project work.

END OF SECTION
SECTION 312300 - EXCAVATION AND FILL

PART 1 - GENERAL

1.1 SUMMARY

A. This Section describes the requirements for earthwork operation, as shown on the Drawings and specified:

1. Excavation and/or embankment from existing ground to subgrade, including soil sterilant, for parking areas, walks, paths, and any other site improvements called for on the Plans.
   a. Aggregate base.
   b. Dispose off-site waste, excess or unsatisfactory material.

1.2 RELATED DOCUMENTS

A. Geotechnical Report: "Geotechnical Engineering Investigation Report, C-4016 New Allied Science Building, Contra Costa College, 2600 Mission Bell Drive, San Pablo, California." Kleinfelder Project No.: 20181569.001A, Dated: October 17, 2017, including:

1. Addendum Letters No. 1 and No. 2 dated March 2 and March 4, 2018, respectively.

B. Caltrans Standard Specifications:
   1. Section 17, Watering.
   2. Section 19, Earthwork.
   3. Section 26, Aggregate Bases.

1.3 RELATED SECTIONS

A. Section 31 11 00 – Clearing and Grubbing

1.4 REGULATORY REQUIREMENTS

A. State of California, Department of Transportation (Caltrans), Standard Specifications

B. ASTM
   1. D 1557, Test Method for Laboratory Compaction Characteristics of Soil Using Modified Effort.
   2. D1557-70 for testing in compaction.
   3. D 1586, Method for Penetration Tests and Split-Barrier Sampling of Soils.
   4. D 2487, Classification of Soils for Engineering Purposes.

D. CAL/OSHA, Title 8.

### 1.5 DEFINITIONS

A. Borrow: Approved soil material imported from off-site for use as Structural Fill or Backfill.

B. Structural Backfill: Soil materials approved by the District’s Representative and used to fill excavations resulting from removal of existing below grade facilities, including trees.

C. Structural Fill: Soil materials approved by the District’s Representative and used to raise existing grades.

D. Rock: Rock material in beds, ledges, unstratified masses, and conglomerate deposits and boulders of rock material ¾-cubic yards or more in volume that when tested by an independent geotechnical testing agency, according to ASTM D 1586, exceeds a standard penetration resistance of 100 blows/2-inches.

E. Structures: Buildings, footings, foundations, retaining walls, slabs, tanks, curbs, mechanical and electrical appurtenances, or other man made stationary features constructed above or below grade.

F. Subgrade: Surface or elevation remaining after completing excavation, or top surface of a fill or backfill immediately below base or topsoil materials.

G. Unsuitable Material: Any soil material that is not suitable for a specific use on the Project. The District’s Representative will determine if a soil material is unsuitable.

H. Utilities: onsite underground pipes, conduits, ducts and cables.

### 1.6 SUBMITTALS

A. Submittal procedure shall be as outlined in Division 1 – General Requirements.

B. Submit material certificates signed by the material producer and the Contractor, certifying that each material item complies with, or exceeds the specified requirements.

### 1.7 QUALITY ASSURANCE

A. Conform all work and materials to the recommendations or requirements of the District’s
Representative.

B. Percentage of compaction specified shall be the minimum acceptable. The percentage represents the ratio of the dry density of the compacted material to the maximum dry density of the material as determined by the procedure set forth in ASTM D 1557.

C. Excavate and backfill existing areas only to extent required by new construction and as indicated. Use methods required to complete the Work within limitations of governing regulations. Backfill as necessary to achieve rough grade elevations as indicated per plan.

D. Perform excavation, filling, compaction and related earthwork under the observation of the District’s Representative. Materials placed without approval of the District’s Representative will be presumed to be defective and, at the discretion of the District’s Representative, shall be removed and replaced at no cost to the District. Notify the District’s Representative at least 24-hours prior to commencement of earthwork and at least 48 hours prior to testing.

E. The District’s Representative will perform observations and tests required to enable him to form an opinion of the acceptability of the Project earthwork. Correct earthwork that, in the opinion of the District’s Representative, does not meet the requirements of these Technical Specifications.

F. Upon completion of the construction work, certify that all compacted fills and foundations are in place at the correct locations, and have been constructed in accordance with sound construction practice. In addition, certify that the materials used are of the types, quality and quantity required by these Technical Specifications. The Contractor shall be responsible for the stability of all fills and backfills constructed by his forces and shall replace portions that in the opinion of the District’s Representative have been displaced or are otherwise unsatisfactory due to the Contractor’s operations.

G. Do not mix or place cement treated base when the temperature is below is below 36 degrees F or when the ground is frozen.

H. Identify and protect existing utilities.

I. Finish soil grade tolerance at completion of grading:
   1. Paved areas: +0.05 feet.
   2. Other areas: ±0.10 feet.

1.8 PROJECT CONDITIONS

A. Promptly notify the District and the District’s Representative of surface or subsurface conditions differing from those disclosed in conformance with Division 1 General Requirements.

B. Protect open excavations, trenches, and the like with fences, covers and railings to maintain safe pedestrian and vehicular traffic passage.

C. Prevent erosion of freshly graded areas during construction and until such time as permanent drainage and erosion control measures have been installed.

D. Temporarily stockpile fill material in an orderly and safe manner and in a location approved by the District.
E. Provide dust and noise control in conformance with Division 1 General Requirements.

F. Environmental Requirements: When unfavorable weather conditions necessitate interrupting earthwork operation, areas shall be prepared by compaction of surface and grading to avoid collection of water. Provide adequate temporary drainage to prevent erosion. After interruption, compaction specified in last layer shall be re-established before resuming work.

PART 2 - PRODUCTS

2.1 SOIL MATERIALS

A. General: Provide borrow soil materials when sufficient satisfactory soil materials are not available from on-site excavations.

B. Obtain approval of on-site soil materials and borrow materials to be used for structural fill or structural backfill from the District’s Representative.

C. On-Site Structural Fill and Structural Backfill: Soil or soil-rock mixture from on site excavations, free from organic matter or other deleterious substances. On-site structural fill and backfill shall not contain rocks or rock fragments over 3 inches in greatest dimension.

D. Imported Structural Fill and Structural Backfill: Conform to the requirements of on-site structural fill. Material shall also be non-expansive with a plasticity index of 12 or less, has a liquid limit less than 30, and has an expansion index less than 20. Gradation should meet the criteria in the following table:

¹American Society for Testing and Materials Standards (latest edition)
²State of California, Department of Transportation, Standard Test Methods (latest edition)

2.2 SOIL STERILANT

A. Commercial chemical for weed control, registered by EPA. Provide granular, liquid or wet-able powder form.
2.3 AGGREGATE BASE

   1. Class 2, 1-1/2-inch Maximum: Section 26-1.02B.
   2. Class 2, 3/4-inch Maximum: Section 26-1.02B.
   3. Class 3: Section 26-1.02C.

PART 3 - EXECUTION

3.1 GENERAL

A. Conform to Section 19, Earthwork, Caltrans Standard Specifications as modified by the Contract Documents.

B. Placement and compaction of material by flooding, ponding, or jetting will not be permitted.

C. The use of explosives will not be permitted.

3.2 WET WEATHER CONDITIONS

A. Do not prepare subgrade, place or compact soil materials if above optimum moisture content.

B. If the District’s Representative allows work to continue during wet weather conditions, conform to supplemental recommendations provided by the District’s Representative and the project Geotechnical Report.

3.3 EXCAVATION

A. Excavate earth and rock to lines and grades shown on drawings as prepared by a licensed professional engineer and to the neat dimensions indicated on the Plans, required herein or as required to satisfactorily compact backfill.

B. Remove and dispose of large rocks, pieces of concrete and other obstructions encountered during excavation.

C. Where forming is required, excavate only as much material as necessary to permit placing and removing forms.

D. Provide supports, shoring and sheet piles required to support the sides of excavations or for protection of adjacent existing improvements. Refer to Section 31 50 00 – Temporary Excavation Support and Protection.

3.4 GRADING

A. Uniformly grade the Project to meet existing conditions.

B. Finish ditches, gutters and swales to the sections, lines and grades indicated and to permit...
proper surface drainage.

C. Round tops and bottoms of slopes as indicated or to blend with existing contours.

D. Temporary cuts shall be no steeper than one (1) horizontal to one (1) vertical.

3.5 SUBGRADE PREPARATION

A. Prepare subgrades under structures, building slabs, of other surface facilities and areas to receive structural fill. A four (4) inch layer of three quarter (3/4) inch crushed rock or slab capillary break material shall be underlain with at least sixteen (16) inches of “non-expansive” fill material for a total of 20 inches of non-expansive material. The material shall be placed beneath exterior flatwork and extend at least five (5) feet beyond the slab edges. Slab subgrade soils will also need to be properly moisture-conditioned prior to the placement of the “non-expansive” material.

1. Scarify the top twelve (12) inches of underlying subgrade soils, moisture-conditioned to at least two (2) percent above optimum moisture content, and compacted to ninety (90) percent relative compaction per ASTM D1557.

B. Prepare subgrades for walks, paved areas, curbs and gutters by scarifying surface at least twelve (12) inches in one lift below final subgrade elevations and a minimum of two (2) feet beyond edge of pavement unless specified otherwise by the District’s Representative. Uniformly moisture condition to obtain optimum moisture contents. Break clods and condition surface by harrowing or dry rolling. Remove boulders, hard ribs and solid rock. Prepare earth uniform for full depth and width of subgrade. In a similar fashion, exterior concrete flatwork should be underlain by six (6) inches of “non-expansive” material along with proper moisture conditioning of the subgrade soil.

1. Scarify the top twelve (12) inches of underlying subgrade soils, moisture-conditioned to at least two (2) percent above optimum moisture content, and compacted to ninety (90) percent relative compaction per ASTM D1557. The upper 6-inches of pavement subgrade should be compacted to ninety-five 95 percent relative compaction.

C. Protect utilities from damage during compaction of subgrades and until placement of final pavements or other surface facilities.

D. Obtain the District’s Representative’s approval of subgrades prior to placing pavement.

3.6 REUSE OF ONSITE MATERIALS

A. On-site clay soils encountered across the site are considered suitable for reuse as general engineered fill provided they are not placed within the upper two (2) feet of areas supporting improvements or permanent slopes or wall backfill unless chemically treated with sufficient high-calcium quicklime. Engineered fill consisting of native clayey soils placed deeper than two (2) feet from finished soil grades in permanent slopes or wall backfill should be compacted to between eighty-eight (88) and ninety-two (92) percent relative compaction at a moisture content at least three (3) percent above optimum. Native clayey soils supporting structural loads should be compacted to between ninety (90) and ninety-three (93) percent relative compaction at a moisture content at least two (2) percent above optimum.

B. If necessary, the native clayey soils may be placed in the upper two (2) feet of areas...
supporting improvements if they have been chemically treated. One approved chemical treatment is the use of lime at an application rate of four (4) to five (5) pounds of lime per cubic foot of soil treated or as determined by laboratory testing of soil samples obtained from on-site borrow areas prior to construction by the contractor. Final lime application rates should be determined such that a stabilized fill material with an expansion index of less than twenty (20) (based on ASTM test method D4829) is achieved. The lime-stabilized soil should be compacted to at least ninety (90) percent relative compaction at a moisture content of at least two (2) percent above optimum, based on ASTM D1557. The upper 6 inches of subgrades supporting exterior slabs or pavements should be compacted to at least ninety-three (93) percent of the maximum dry density. Lime treatment should be performed by a specialty contractor experienced in this work and should be performed in accordance with Caltrans Standard Specifications Section 24-2. Lime-treated areas can have significantly elevated pH levels (pH over ten (10)) and may not be appropriate for use in landscaped areas. If used beneath improvements, appropriate corrosion protection should be provided.

3.7 PLACEMENT OF STRUCTURAL FILL

A. Obtain the District’s Representative’s approval of surface to receive structural fill prior to placement of structural fill material.

B. Place structural fill on prepared subgrade.

C. Fills greater than five (5) feet in depth shall be compacted to ninety-five (95) percent of the maximum dry density as determined by ASTM Test Method D 1557.

D. Spread structural fill material placed in horizontal lifts less than eight (8) inches in loose thickness, and compact to between ninety (90) and ninety-three (93) percent of the maximum dry density.

E. The uppermost six (6) inches of structural fill underneath exterior slabs and pavement where vehicular traffic is expected shall be compacted to a minimum of ninety-five (95) percent of the maximum dry density.

F. Place structural fill material to suitable elevations above grade to provide for anticipated settlement and shrinkage.

G. Overbuild fill slopes, as required by the District’s Representative, to obtain required compaction. Remove excess material to lines and grades indicated. Native soils used to construct permanent slopes or backfill shoring or retaining walls deeper than 2 feet should be moisture conditioned to at least three (3) percent above optimum and compacted to between eighty-eight (88) and ninety-two (92) percent of the maximum dry density.

H. Do not drop fill on structures. Do not backfill around, against or upon concrete or masonry structures until structure has attained sufficient strength to withstand loads imposed and the horizontal structural system had been installed.

I. Permanent slopes should be constructed utilizing benching and subdrain collection pipes as indicated on the plans.
3.8 AGGREGATE BASE

A. Watering, Spreading and Compacting: Section 26-1.03, of Caltrans Standard Specifications.

3.9 COMPACTION AND TESTING

A. Do not compact by ponding, flooding or jetting.

B. Aerate material if it is too wet. Add water to material if it is too dry. Thoroughly mix lifts before compaction to ensure uniform moisture distribution.

C. Perform compaction using rollers, pneumatic or vibratory compactors or other equipment and mechanical methods approved by the District’s Representative.

D. Compaction requirements:
   1. Compact structural fills less than five (5) feet thick to ninety (90) percent compaction.
   2. Compact structural fill five (5) feet thick or greater to ninety-five (95) percent compaction.
   3. Compact the upper six (6) inches of subgrade soils beneath pavements, curbs and gutters to ninety-five (95) percent compaction. Extend compaction two (2) feet beyond pavement edges unless specified otherwise by the District’s Representative.
   4. Compact the upper six (6) inches of subgrade soils under walks, structures and areas to receive structural fill to ninety (90) percent compaction.

3.10 SOIL STERILIZATION

A. Apply soil sterilant to areas indicated, such as beneath asphalt concrete pavement, brick pavement, concreter pavement and at grade concrete slabs, including sidewalks, curbs and gutters. Also where indicated apply soil sterilant below expansion and control joints and at areas where pipes, ducts or other features penetrate slabs.

B. Apply soil sterilant uniformly and at the rates recommended by the manufacturer.

C. Apply soil sterilant to prepared subgrade, or after installation of aggregate base as recommended by the manufacturer.

3.11 DISPOSAL

A. Lawfully dispose of all unsuitable and excess or surplus material off-site at no cost to the District.

END OF SECTION
SECTION 312300 - STRUCTURAL EXCAVATION AND FILL

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. Geotechnical Report: "Geotechnical Engineering Investigation Report, C-4016 New Science Building, Contra Costa College, 2600 Mission Bell Drive, San Pablo, California". Kleinfelder Project No.: 20181569.001A, dated October 17, 2017 and Geologic and Hazard Assessment Report dated October 20, 2017 and Addendum Letters No. 1, No 2, No. 3 and No. 4 dated March 2, March 14, 2018, August 16 and December 12, 2018 respectfully are available in accordance with “Information Available to Bidders.”

1.2 SUMMARY

A. This Section Includes:
   1. Excavation for foundations and pits.
   2. Backfilling structural excavations as required.

B. Related Sections:
   1. Division 03 “Concrete” for formwork for footings.
   2. Division 31 “Earthwork” for mass excavation and/or fill for building pad.

1.3 REFERENCES

B. American Concrete Institute (ACI):
   1. ACI 301 - Specifications for Structural Concrete for Buildings, 2010.
   2. ACI 229R – Controlled Low Strength Materials, 2013.

C. California Department of Transportation’s (Caltrans):

1.4 SITE CONDITIONS

A. Notify Owner’s Representative when site conditions differ from findings of Geotechnical Investigation Report.
PART 2 – PRODUCTS

2.1 MATERIALS

A. Concrete: Concrete materials and proportions shall be in accordance with ACI 301 to produce concrete with minimum compressive strength of 2500 psi at 28 days.

B. Structural Fill: CSS Section 26, Class 2 Aggregate Base rock, 3/4” size.

C. Controlled Low Strength Material: Machine mixed, self-compacting, low-strength fill consisting of fine aggregate, cementitious materials, entrained air and water. Mix and mixing shall conform to recommendations of ACI 229 to achieve the following properties:

1. Slump: 8 to 10 inches.
2. Compressive Strength:
   a. For backfill: Minimum 150 psi to maximum 300 psi at 30 days.
   b. For fill beneath footings: Minimum 300 psi at 30 days.
3. Fresh Density: 115 to 145 pounds per cubic.
4. Subsidence: Minimal; a maximum of 1/16” per foot of thickness.

D. Pea Gravel: ASTM C 33, Size No 7.

1. Backfill material: Crushed rock of uniform gradation, 100% passing 3/4 inch sieve.

PART 3 – EXECUTION

3.1 PREPARATION

A. Take measures to prevent surface water from entering excavations.

B. Notify Geotechnical Engineer at least 48 hours prior to commencing and upon completion of excavations.

3.2 EXCAVATION

A. Accurately cut foundation excavations to dimensions and elevations shown on Drawings to tolerances of ACI 301.

B. Where sides are unstable or excavations are not accurately cut, over-excavate to permit placement and removal of formwork.

C. Shore and brace excavations as required to prevent caving and danger to persons and structures. Comply with applicable safety regulations.

D. Prepare bottoms of footing excavations to produce conditions acceptable to Owner’s Representative, based on professional opinion of Geotechnical Engineer.

1. The bottoms of excavations shall be firm, undisturbed earth, clean and free from loose material, debris and foreign matter.
2. Remove or recompact disturbed material.
3. Remove soft or unstable material to a depth satisfactory to Geotechnical Engineer.
4. Fill over-depth excavations with concrete, flowable fill, or structural fill compacted to minimum 95% relative compaction.

E. Maintain footing conditions approved by Geotechnical Engineer until concrete work is complete.
   1. In periods of wet weather, over-excavate footings and place 2-inches minimum concrete mud-slab as soon as practical after completing excavation.

F. Keep excavations free of water at all times until foundation concrete is cast.

G. Stockpile or remove excavated material from site in accordance with Division 31 Section “Earthwork”.

3.3 BACKFILLING

A. Place and compact fill in accordance with Division 31 “Earthwork”.
   1. Use pea gravel or controlled low strength material for backfill against sides of footings and pits, where adequate compaction of structural fill cannot be achieved.

B. Backfill footings after formwork is removed. Do not backfill pits until concrete has cured a minimum of 7 days.

3.4 FIELD QUALITY CONTROL

A. The Geotechnical Engineer will observe footing excavations prior to placement of reinforcement; and again, immediately prior to casting of concrete.

B. The Geotechnical Engineer will observe the placement of fill and backfill material.

END OF SECTION
SECTION 312333 - UTILITY TRENCHING AND BACKFILLING

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Excavation, bedding, and backfill of underground storm drain, sanitary sewer and water piping and associated structures.

B. The CONTRACTOR shall provide all materials, equipment, and labor necessary to perform and complete all utility earthwork as shown on the Drawings and as specified herein.

C. The work of this Section includes all utility earthwork required for construction of the project. Such earthwork shall include, but may not necessarily be limited to, the loosening, removing, loading, transporting, depositing, and compacting in its final location of all materials wet and dry, as required for the purposes of completing the work, which shall include, but not necessarily be limited to, the furnishing, placing, and removing of sheeting, shoring and bracing necessary to safely support the sides of all excavations; all pumping, ditching, draining and other required measures for the removal or exclusion of water from the excavation; the supporting of structures above and below the ground; all backfilling around structures and all backfilling of trenches and pits; the disposal of excess excavated materials; borrow of materials to make up deficiencies for fills; and all other incidental earthwork.

D. Hazardous materials shall be handled in accordance with all regulatory agency requirements. Asbestos cement pipe (ACP) exists within the project area and replacement of existing ACP is anticipated but shall be abandoned in place unless otherwise noted in the plans. The contractor shall make every attempt to protect all asbestos containing items during the execution of this contract. However, there will be instances where ACP or asbestos containing material will need to be removed, handled, cut, disturbed, or disposed of and the contractor shall comply with all local, state and federal regulations regarding construction activities near asbestos containing materials.

1.2 SECTION EXCLUDES

A. Drainage fill material and placement around subdrains.

B. Power, telecommunications, and low voltage scope of work.

1.3 RELATED DOCUMENTS

A. Geotechnical Report: “Geotechnical Engineering Investigation Report, C-4016 New Allied Science Building, Contra Costa College, 2600 Mission Bell Drive, San Pablo, California.” Kleinfelder Project No.: 20181569.001A, Dated: October 17, 2017, including:

B. Addendum Letters No. 1 and No. 2 dated March 2 and March 4, respectfully.

C. ASTM:
   1. C 33, Specification for Concrete Aggregates.
   7. D 2487, Classification of Soils for Engineering Purposes.

E. CAL/OSHA, Title 8.

1.4 RELATED SECTIONS
   A. Section 31 11 00, Clearing and Grubbing.

1.5 DEFINITIONS
   A. AC: Asphalt Concrete.
   C. Bedding: Material from bottom of trench to bottom of pipe.
   D. CDF: Controlled Density Fill.
   E. DIP: Ductile Iron Pipe.
   F. Initial Backfill: Material from bottom of pipe to 12-inches above top of pipe.
   G. PCC: Portland Cement Concrete.
   H. RCP: Reinforced Concrete Pipe.
   I. Springline of Pipe: Imaginary line on surface of pipe at a vertical distance of ½ the outside diameter measured from the top or bottom of the pipe.
J. Subsequent Backfill: Material from 12-inches above top of pipe to subgrade of surface material or subgrade of surface facility or to finish grade.

K. Trench Excavation: Removal of material encountered above subgrade elevations and within horizontal trench dimensions.
   1. Authorized Trench Over-Excavation: Excavation below trench subgrade elevations or beyond indicated horizontal trench dimensions as shown on plans or authorized by the Geotechnical Consultant.
   2. Unauthorized Trench Over-Excavation: Excavation below trench subgrade elevations or beyond indicated horizontal trench dimensions without authorization by the Geotechnical Consultant. Unauthorized excavation shall be without additional compensation.

L. Utility Structures:
   1. Storm Drain Manholes, vaults, etc.
   2. Sanitary sewer manholes, vaults, etc.
   3. Water vaults, etc.

1.6 SUBMITTALS

A. Follow Submittal procedure outlined in Division 0 – General Conditions and Division 1 – General Requirements

B. Product Data:
   1. Grading and quality characteristics showing compliance with requirements for the Work.
   2. Certify that material meets requirements of the Project.
   3. Aggregate for Structural Soil Mix.

C. Samples:
   1. If required by the Geotechnical Consultant, provide 40-pound samples of all imported trench bedding and backfill material sealed in airtight containers, tagged with source locations and suppliers of each proposed material. Do not import materials to Project without written approval of the Geotechnical Consultant.
   2. Provide materials from same source throughout work. Change of source requires approval of the Geotechnical Consultant and the District’s Representative’s.

D. Material Test Reports: Provide, from a qualified testing agency, the following test results showing compliance with the project requirements:
   1. Classification according to ASTM D 2487 of each imported trench bedding and backfill material.
   2. Laboratory compaction curve in conformance with ASTM D 1557 for each imported trench bedding and backfill material
   3. Structural Soil Mix Testing: Provide a two-gallon representative sample to laboratories for an analysis of the structural soil mix indicating the following:
      a. Particle size analysis, including the following gradients of mineral content (USDA Designated Size in mm):
         1) 3” (76mm)
         2) 2 ½” – 3” (63-76mm)
         3) 2” – 2 ½” (50-83mm)
4) 1 ½” – 2” (37-50mm)
5) 1” (25-37mm)
6) ¾” (19-25mm)
7) Fine gravel – 1/8” – ¾” (2-19mm)
8) Sand – 0.05 -2mm
9) Silt – 0.002-0.05mm
10) Clay – minus 0.002mm

b. Provide manufacturer’s analysis of the following:
   1) Loose and rodded unit weight.
   2) Bulk specific gravity and absorbance.
   3) Gravel dimension and surface texture description.
   4) Aggregate soundness and L.A. abrasion.

c. Sample Collection Procedure:
   1) Collect a minimum of eight samples to make up the composite sample.
   2) Take samples from random locations in the stockpile varying from the top to
      the bottom and around the stockpile.
   3) Take at least half the samples from the lower third of the stockpile into a clean
      bucket.
   4) Thoroughly mix material after samples are taken.
   5) Remove 2 gallon of material from bucket and fill a zip-lock plastic bag.
   6) Double bag the composite sample and label the bag with a permanent marker
      indicating the material name and date sample was taken.

1.7 QUALITY ASSURANCE

A. Provide an independent testing agency qualified according to ASTM E 329 to conduct soil
   materials and rock definition testing, as documented according to ASTM D 3740 and ASTM E
   548.

B. Conform all work and materials to the recommendations or requirements of the Geotechnical
   Report and meet the approval of the Geotechnical Consultant.

C. Percentage of compaction specified shall be the minimum acceptable. The percentage
   represents the ratio of the dry density of the compacted material to the maximum dry density of
   the material as determined by the procedure set forth in ASTM D 1557.

D. The Geotechnical Consultant will perform observations and tests required to enable him to form
   an opinion of the acceptability of the trench backfill. Correct the trench backfill that, in the
   opinion of the Geotechnical Consultant, does not meet the requirements of these Technical
   Specifications and the Geotechnical Report.

1.8 PROJECT CONDITIONS

A. Promptly notify the District’s Representative of surface or subsurface conditions differing from
   those disclosed in the Geotechnical Report. First notify the District’s Representative verbally to
   permit verification and extent of condition and then in writing. No claim for conditions differing
from those anticipated in the Contract Documents and disclosed in the Geotechnical Report will be allowed unless Contractor has notified the District’s Representative in writing of differing conditions prior to contractor starting work on affected items.

B. Protect open, trenches, and utility structure excavations with fences, covers and railings to maintain safe pedestrian and vehicular traffic passage.

C. Stockpile on-site and imported backfill material temporarily in an orderly and safe manner.

D. Provide dust and noise control in conformance with Division 1.

E. Areas to receive structural soil mix shall be inspected by the Owner’s Representative before starting work.

PART 2 - PRODUCTS

2.1 PIPE BEDDING AND INITIAL BACKFILL

A. ASTM D 2321, Class IA, IB or II.
   1. Clean and free of clay, silt or organic matter.

B. Class 2 Aggregate Base: Conform to Section 26 of Caltrans Standard Specifications, ¾-inch maximum.

2.2 SUBSEQUENT BACKFILL

A. Conform to on-site or imported structural backfill in Section 31 23 00, Excavation and Fill.

2.3 CONTROLLED DENSITY FILL (CDF) (IN TRENCHES)

A. Provide non-structural CDF, from bottom of trench to finish subgrade of subbase or base material, that can be excavated by hand and produce unconfined compressive 28-day strengths from 50-psi to a maximum of 150-psi. Provide aggregate no larger than 3/8-inch top size. The 3/8-inch aggregate shall not comprise more than 30% of the total aggregate content.

B. Cement: Conform to the standards as set forth in ASTM C-150, Type II Cement.

C. Fly Ash: Conform to the standards as set forth in ASTM C-618, for Class F pozzolan. Do not inhibit the entrainment of air with the fly ash.

D. Air Entraining Agent: Conform to the standards as set forth in ASTM C-260.
E. Aggregates need not meet the standards as set forth in ASTM C-33. Any aggregate, producing performances characteristics described herein will be accepted for consideration. The amount of material passing a #200 sieve shall not exceed 12% and no plastic fines shall be present.

F. Provide CDF that is a mixture of cement, Class F pozzolan, aggregate, air entraining agent and water. CDF shall be batched by a ready mixed concrete plant and delivered to the job site by means of transit mixing trucks.

G. The Contractor shall determine the actual mix proportions of the controlled density fill to meet job site conditions, minimum and maximum strengths, and unit weight. Entrained air content shall be a minimum of 4.0%. The actual entrained air content shall be established for each job with the materials and aggregates to be used to meet the placing and unit weight requirements. Entrained air content may be as high as 20% for fluidity requirements.

H. Mix design shall meet the Geotechnical Consultant’s approval.

2.4 CONCRETE STRUCTURE BEDDING AND BACKFILL

A. Precast Structures: Same materials to the same heights as specified for pipe bedding and backfill, or other material approved by the Geotechnical Consultant.

B. Poured-in-Place Structures:
   1. Bedding: Bedding shall meet the approval of the Geotechnical Consultant. In general, bedding is not required, pour bases against undisturbed native earth in cut areas and against engineered fill compacted to 90% relative compaction in embankment areas.
   2. Side Backfill: On-site or imported structural fill meeting the requirements given in Section 31 23 00.
   3. Structural Soil Mix: TMT Enterprises, 1996 Oakland Road, San Jose, CA 915131; (408)432-9010

2.5 AGGREGATE FOR STRUCTURAL SOIL MIX:

A. Aggregate shall be triangular.

B. Aggregate shall not be limestone or sandstone.

C. Aggregate shall pass a 3-inch screen and be retained on a 2-inch screen.

D. Aggregate dimensions shall not exceed 1.5:1.0 for any two dimensions chosen.

2.6 SOIL FOR STRUCTURAL SOIL MIX:

A. Soil shall be a “clay loam” or “clay” based on “USDA classification system” as determined by mechanical analysis and shall be of uniform composition, without admixture of subsoil.

B. Soil shall be free of stones greater than one-half inch, plants, roots, debris and other extraneous
matter larger than one inch in diameter or an excess of smaller pieces of same type materials as determined by Owner’s Representative.

C. Soil shall not contain toxic substances harmful to plant growth.

D. Soil shall be obtained from naturally well drained areas which have never been stripped of topsoil before and have a history of satisfactory vegetative growth.

E. Soil shall contain not less than 3% or more than 7% organic matter as determined by organic carbon and total nitrogen on oven-dried samples.

F. Soil shall be the product of a commercial processing facility specializing in production of Structural Soil Mixes for a minimum of 5 years.

G. Mechanical analysis:
   1. Textural Class: Based on material passing a 2 mm screen.
   2. Gravel: Less than 5%.
   3. Sand: 20 – 50%.
   4. Silt: 20 – 30%.
   5. Clay: 25- 60%.

H. Chemical analysis:
   1. pH: Between 6.5 to 7.9.
   3. Nutrient level:
      a. Fertility: The range of the essential elemental concentration in soil shall be as follows.

         Ammonium Bicarbonate/DTPA Extraction parts per million (mg/kgolram) dry weight basis.

         | Element    | Range   |
         |------------|---------|
         | Phosphorous| 10-40   |
         | Potassium  | 100-200 |
         | Iron       | 5-35    |
         | Manganese  | 0.6-6   |
         | Zinc       | 1-8     |
         | Copper     | 0.3-5   |
         | Boron      | 0.2-1   |
         | Magnesium  | 50-150  |
         | Sodium     | 0-100   |
         | Sulfur     | 25-500  |
         | Molybdenum | 0.1-2   |

      b. Toxic elements and compounds and excessive nutrients below UC guidelines and soil testing laboratory guidelines. The maximum permissible elemental concentration in the soil.

         Ammonium Bicarbonate/DTPA Extraction parts per million (mg/kgolram) dry weight basis.

         | Element  | Range   |
         |----------|---------|
         | Arsenic  | 1       |
2.7 STRUCTURAL SOIL MIX

A. Content:
   1. 4 parts structural soil aggregate.
   2. 1 part soil, treated with polymer.

B. Mixing:
   1. Mix polymer (PAM) with soil 48 hours ahead of blending with aggregate to allow for proper bonding.
   2. Cure polymer treated soil by allowing the soil to partially dry.
   3. Based upon accepted mix design, blend materials off-site in a clean area using an experienced blending operator.
   4. Uniformly blend materials so that they are evenly distributed throughout mixtures.
   5. Maintain adequate soil moisture content during mixing process.
   6. Soils and mix components shall easily shred and break down without clumping.
   7. Soil clods shall easily break down into a medium crumbly texture material.
   8. Do not blend materials that are saturated or contain excessive water.
   9. Measure and monitor amount of soils moisture at mixing site periodically during mixing process.
  10. Protect materials and mixtures from contamination prior to, during, and after mixing operations.
  11. Store mixes in stockpiles prior to shipment to site in clean areas protected from contamination from other materials.
  12. Reblend the mix if the components have separated.

2.8 FILTER FABRIC

A. Filter Fabric:
   2. Mirifi 140N (Mirifi Inc., Charlotte, NC) (Tel. 800-438-1855) or equal.

Cadmium 1
Chromium 10
Cobalt 2
Lead 30
Mercury 1
Nickel 5
Selenium 3
Silver 0.5
Vanadium 3

   c. Soluble salt: Less than 3.0 Millimho per cm in saturation extract.
   d. Boron: Less than 1 part per million in saturation extract.
   e. Sodium Absorption Ratio: Less than 4.
PART 3 - EXECUTION

3.1 TRENCHING AND EXCAVATION

A. Existing PCC or AC Areas: Cut PCC or AC to full depth at a minimum distance of 12-inches beyond the edge of the trench.

B. Excavate by hand or machine. For gravity systems begin excavation at the outlet end and proceed upstream. Excavate sides of the trench parallel and equal distant from the centerline of the pipe. Hand trim excavation. Remove loose matter.

C. Excavation Depth for Bedding: Minimum of 4-inches below bottom of pipe or as otherwise allowed or required by the Geotechnical Consultant, except that bedding is not required for nominal pipe diameters of 2-inches or less.

D. Excavation Width at Springline of Pipe:
   1. Up to a nominal pipe diameter of 24-inches: Minimum of twice the outside pipe diameter, or as otherwise allowed or required by the Geotechnical Consultant.
   2. Nominal pipe diameter of 30-inches through 36-inches: Minimum of the outside pipe diameter plus 2-feet, or as otherwise allowed or required by the Geotechnical Consultant.
   3. Nominal pipe diameter of 42-inches through 60-inches: Minimum of the outside pipe diameter plus 3-feet, or as otherwise allowed or required by the Geotechnical Consultant.

E. Over-Excavations: Backfill trenches that have been excavated below bedding design subgrade, with approved bedding material.

F. Comply with the District’s Representative’s limitations on the amount of trench that is opened or partially opened at any one time. Do not leave trenches open overnight without the approval of the District’s Representative.

G. Where forming is required, excavate only as much material as necessary to permit placing and removal of forms.

H. Bottoms of trenches will be subject to testing by Geotechnical Consultant. Correct deficiencies as directed by the Geotechnical Consultant.

I. Grade bottom of trench to provide uniform thickness of bedding material and to provide uniform bearing and support for pipe along entire length. Remove stones to avoid point bearing.

3.2 CONTROL OF WATER AND DEWATERING

A. Be solely responsible for dewatering trenches and excavations and subsequent control of ground and surface water. Provide and maintain such pumps or other equipment as may be necessary to control ground water and seepage to the satisfaction of the Geotechnical Consultant and the District’s Representative until backfilling is completed.
B. Dewater during backfilling operation so that groundwater is maintained a least one foot below level of compaction effort.

C. Obtain the Geotechnical Consultant’s approval for proposed control of water and dewatering methods.

D. Reroute surface water runoff away from open trenches and excavations. Do not allow water to accumulate in trenches and excavations.

E. Maintain dewatering system in place until dewatering is no longer required.

3.3 BRACING AND SHORING

A. Conform to California and Federal OSHA requirements.

B. Place and maintain such bracing and shoring as may be required to support the sides of the excavations for the proper protection of workmen; to facilitate the work; to prevent damage to the pipes and appurtenances being constructed; and to prevent damage to adjacent structures or facilities. Remove all bracing and shoring upon completion of the work.

C. Be solely responsible for all bracing and shoring and, if requested by the District’s Representative, submit details and calculations to the District’s Representative. The District’s Representative may forward the submittal to the Geotechnical Consultant, the Consulting Engineer and/or the California Division of Industrial Safety for their review. The Contractor’s submittal shall include the basic design, assumed soils conditions and estimation of forces to be resisted, together with plans and specifications of the materials and methods to be used, and shall be prepared by a civil engineer or structural engineer registered in California. No excavations in trench section or around structures shall precede a response to the submittal by the District’s Representative.

D. Be solely responsible for installing and extracting the sheathing in a manner which will not disturb the line, grade, or backfill compaction or operation of the utility being installed or adjacent utilities and facilities.

3.4 PIPE BEDDING

A. Obtain approval of bedding material from the Geotechnical Consultant.

B. Accurately shape bedding material to the line and grade called for on the Plans. Carefully place and compact bedding material to the elevation of the bottom of the pipe in layers not exceeding 8-inches in loose thickness. Compact bedding material at optimum water content to 90% relative compaction for sand and 95% relative compaction for fine gravel unless specified otherwise on the Plans or by the Geotechnical Consultant. Compact by pneumatic tampers or other mechanical means approved by the Geotechnical Consultant. Jetting or ponding of bedding material will not be permitted.
C. Upon completion of bedding operations, and prior to the installation of pipe, notify the Geotechnical Consultant, who will inspect the bedding layer. Do not commence pipe laying until the Geotechnical Consultant has approved the bedding.

3.5 BACKFILLING

A. Obtain approval of backfill material from Geotechnical Consultant.

B. Bring initial backfill up simultaneously on both sides of the pipe, so as to prevent any displacement of the pipe from its true alignment. Carefully place and compact initial backfill material to an elevation of 12-inches above the top of the pipe in layers not exceeding 8-inches in loose thickness. Compact initial backfill material at optimum water content to 90% relative compaction for sand and 95% relative compaction for fine gravel unless specified otherwise on the Plans or by the Geotechnical Consultant. Compact by pneumatic tampers or other mechanical means approved by the Geotechnical Consultant. Jetting or ponding of initial backfill material will not be permitted.

C. Bring subsequent backfill to subgrade or finish grade as indicated. Carefully place and compact subsequent backfill material to the proper elevation in layers not exceeding 8-inches in loose thickness. Compact subsequent backfill material at optimum water content to 90% relative compaction, except in areas subject to vehicular traffic shall be compacted to at least 95% relative compaction, unless specified otherwise on the Plans or by the Geotechnical Consultant. Compact by pneumatic tampers or other mechanical means approved by the Geotechnical Consultant. Jetting or ponding of subsequent backfill material will not be permitted.

D. Do not use compaction equipment or methods that produce horizontal or vertical earth pressures which may cause excessive pipe displacement or damage the pipe.

E. Utility backfill shall be inspected and tested by the Geotechnical Consultant during placement. Cooperate with the Geotechnical Consultant and provide working space for such tests in operations. Backfill not compacted in accordance with these specifications shall be re-compacted or removed as necessary and replaced to meet the specified requirements, to the satisfaction of the Geotechnical Consultant and the District’s Representative prior to proceeding with the Project.

3.6 STRUCTURAL SOIL MIX INSTALLATION

A. Place mix carefully to avoid damage or displacement of other materials such as paving, drain rock, geotextile fabric and irrigation piping.

B. Do not mix subgrade soils on construction materials with mix.

C. Remove soil mix contaminated with subgrade soil, construction materials or debris.

D. Maintain mix in a moist, but not saturated, condition to prevent segregation of mix during placement.
E. Install mix in 6 inch lifts in locations indicated on the Drawings.

F. Compact lifts to 95 percent compaction in compliance with Geotechnical Investigation Report. Schedule the Geotechnical Engineer to perform nuclear density field tests after each lift of mix to confirm compaction.

G. Install final lift of mix to elevations indicated on the Drawings.

3.7 CLEANUP

A. Upon completion of utility earthwork all lines, manholes catch basins, inlets, water meter boxes and other structures shall be thoroughly cleaned of dirt, rubbish, debris and obstructions of any kind to the satisfaction of the District’s Representative.

END OF SECTION
SECTION 312500 - EROSION AND SEDIMENTATION CONTROL

PART 1 - GENERAL

1.1 SUMMARY

A. This Section describes the requirements for providing and installing temporary erosion and sedimentation control structures as specified.

1.2 SUBMITTALS

A. Follow Submittal procedure outlined in Division 0 – General Conditions and Division 1 – General Requirements.

1.3 REGULATORY REQUIREMENTS:

B. State Water Resources Control Board (SWRCB) standards.

PART 2 - PRODUCTS

2.1 Furnish and install the products as specified in the Storm Water Pollution and Prevention Plan and as required by the SWRCB required to eliminate potential erosion and sedimentation during construction works. Products which shall be installed, but are not limited to, are the following:

A. Siltation fences

B. Outlet structure, basins, ditches

C. Filter fabric, and/or mesh

D. Hydroseeding

E. Wattle and/or Gravel bags

PART 3 - EXECUTION

3.1 GENERAL

A. A Storm Water Pollution Prevention Plan (SWPPP) in accordance with the SWRCB application is to be prepared by the Engineer or the Contractor. The Contractor shall review the BMP’s selected
for the Project in the approved SWPPP, then prepare erosion and sediment control plans that are site specific that show the application of these approved BMPs. These site and increment specific erosion and sediment control plans shall be included in each increment package.

B. Erosion and sedimentation control measures are to be installed in areas only to extent required by new construction and as indicated or as directed by governing regulations.

C. The Contractor shall provide inspection and repair of established SWPPP applications and prepare maintenance reports of erosion control measures in accordance with approved SWPPP.

END OF SECTION
SECTION 315000 - TEMPORARY EXCAVATION SUPPORT AND PROTECTION

PART 1 - GENERAL

1.1 SUMMARY

A. This Section includes temporary excavation support and protection systems.

B. Temporary excavation support performance: Design, furnish, install, monitor, and maintain temporary excavation support and protection system capable of supporting temporary excavation sidewalls and of resisting soil, which will require a back drainage system as to eliminate hydrostatic pressures, and superimposed and construction loads.

1. Delegated Design: Design temporary excavation support and protection system, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

2. Prevent surface water from entering temporary excavations by grading, dikes, or other means.

3. Install temporary excavation support and protection systems without damaging existing buildings, structures, and site improvements adjacent to temporary excavation.

1.2 RELATED SECTIONS

A. Section 31 23 19: Dewatering

1.3 REGULATORY REQUIREMENTS

A. Geotechnical Report: “Geotechnical Engineering Investigation Report, C-4016 New Allied Science Building, Contra Costa College, 2600 Mission Bell Drive, San Pablo, California.” Kleinfelder Project No.: 20181569.001A, Dated: October 17, 2017, including:

B. Addendum Letters No. 1 and No. 2 dated March 2 and March 4, 2018, respectively.

C. Addendum Letter No 3 dated August 8, 2018.

1.4 SUBMITTALS

A. Shop Drawings: For temporary excavation support and protection system.

B. Delegated-Design Submittal: For temporary excavation support and protection system indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

C. Other Informational Submittals:

1. Record Drawings: Identifying and locating capped utilities and other subsurface structural, electrical, or mechanical conditions.
a. Note locations and capping depth of wells and well points.

1.5 QUALITY ASSURANCE

A. Preinstallation Conference: Conduct conference at Project site.
   1. Review methods and procedures related to temporary excavation support and protection system including, but not limited to, the following:
      a. Geotechnical report and addendums.
      b. Existing utilities and subsurface conditions.
      c. Proposed temporary excavations.
      d. Proposed equipment.
      e. Monitoring of temporary excavation support and protection system.
      f. Working area location and stability.
      g. Coordination with waterproofing.
      h. Abandonment or removal of temporary excavation support and protection system.

1.6 PROJECT CONDITIONS

A. Interruption of Existing Utilities: Do not interrupt any utility serving facilities occupied by the College or others unless permitted under Division 1.

B. Project-Site Information: A geotechnical report has been prepared for this Project and is available for information only. The opinions expressed in this report are those of geotechnical engineer and represent interpretations of subsoil conditions, tests, and results of analyses conducted by geotechnical engineer.
   1. Make additional test borings and conduct other exploratory operations necessary for temporary excavation support and protection.
   2. The geotechnical report and addendums are referenced elsewhere in the Project Manual.

C. Survey Work: Engage a land surveyor or professional engineer with a California license to survey adjacent existing buildings, structures, and site improvements; establish exact elevations at fixed points to act as benchmarks. Clearly identify benchmarks and record existing elevations.
   1. During installation of temporary excavation support and protection systems, regularly resurvey benchmarks, maintaining an accurate log of surveyed elevations and positions for comparison with original elevations and positions. Promptly notify Architect if changes in elevations or positions occur or if cracks, sags, or other damage is evident in adjacent construction.

PART 2 - PRODUCTS

2.1 MATERIALS

A. General: Furnish and install the following as specified herein and required to eliminate potential erosion and sedimentation during construction works.
   1. Structural steel: ASTM A 36/A 36M, ASTM A 690/A 690M, or ASTM A 992/A 992M.
   2. Steel sheet piling with continuous interlocks: ASTM A 328/A 328M, ASTM A 572/A 572M,
or ASTM A 690/A 690M; with continuous interlocks
3. Wood Lagging: Preservative treated lumber, mixed hardwood, nominal rough thickness of size and strength required for application
4. Cast-in-Place Concrete: ACI 301, of compressive strength required for application.
5. Reinforcing Bars: ASTM A 615/A 615M, Grade 60 (Grade 420), deformed.
6. Tiebacks: Steel bars, ASTM A 722/A 722M.
7. Tiebacks: Steel strand, ASTM A 416/A 416M.

2.2 LEED REQUIREMENTS
A. Provide documentation necessary to satisfy the LEED requirements for Construction Activity Pollution Prevention Plan which will be part of the SWPPP.

PART 3 - EXECUTION

3.1 PREPARATION
A. Contractor to engage surveyor or engineer to survey adjacent existing structures and site improvements before and regularly during installation of temporary excavation support and protection system.
B. Protect structures, utilities, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards that could develop during temporary excavation support and protection system operations.
   1. Shore, support, and protect utilities encountered.
C. Install temporary excavation support and protection systems to ensure minimum interference with roads, streets, walks, and other adjacent occupied and used facilities.
   1. Do not close or obstruct streets, walks, or other adjacent occupied or used facilities without permission from the College and authorities having jurisdiction. Provide alternate routes around closed or obstructed traffic ways if required by authorities having jurisdiction.
D. Contractor shall protect in place the existing roadways, sidewalks and structures adjacent to the project area.
E. Locate temporary excavation support and protection systems clear of permanent construction so that forming and finishing of concrete surfaces are not impeded.
F. Monitor temporary excavation support and protection systems daily during temporary excavation progress and for as long as temporary excavation remains open. Promptly correct bulges, breakage, or other evidence of movement to ensure that temporary excavation support and protection systems remain stable.
G. Promptly repair damages to adjacent facilities caused by installing temporary excavation support and protection systems.

3.2 SOLDIER PILES AND LAGGING
A. Install steel soldier piles before starting temporary excavation. Extend soldier piles below
temporary excavation grade level to depths adequate to prevent lateral movement. Space soldier piles at regular intervals not to exceed allowable flexural strength of wood lagging. Accurately align exposed faces of flanges to vary not more than tolerances as specified by a qualified professional engineer.

B. Install wood lagging within flanges of soldier piles as temporary excavation proceeds. Trim temporary excavation as required to install lagging. Fill voids behind lagging with soil, and compact.

C. Install wales horizontally at locations indicated on Drawings as prepared by a qualified professional engineer and secure to soldier piles.

3.3 SHEET PILING

A. Before starting temporary excavation, install one-piece sheet piling lengths and tightly interlock to form a continuous barrier. Accurately place the piling, using templates and guide frames unless otherwise recommended in writing by the sheet piling manufacturer. Limit vertical offset of adjacent sheet piling to tolerances as specified by a qualified professional engineer Accurately align exposed faces of sheet piling to vary not more than tolerances as specified by a qualified professional engineer. Cut tops of sheet piling to uniform elevation at top of temporary excavation.

3.4 BRACING

A. Bracing: Locate bracing to clear columns, floor framing construction, and other permanent work. If necessary to move brace, install new bracing before removing original brace.
1. Do not place bracing where it will be cast into or included in permanent concrete work unless otherwise approved by Architect.
2. Install internal bracing, if required, to prevent spreading or distortion of braced frames.
3. Maintain bracing until structural elements are supported by other bracing or until permanent construction is able to withstand lateral earth and a backdrainage system is in place as to eliminate hydrostatic pressures.

3.5 REMOVAL AND REPAIRS

A. Remove temporary excavation support and protection systems when construction has progressed sufficiently to support temporary excavation and bear soil and a backdrainage system is in place as to eliminate hydrostatic pressures. Remove in stages to avoid disturbing underlying soils or damaging structures, pavements, facilities, and utilities.
1. Remove temporary excavation support and protection systems to a minimum depth of 48 inches (1200 mm) below overlaying construction and abandon remainder.
2. Fill voids immediately with approved backfill compacted to density specified in Section 31 23 00 Excavation and Fill.*
3. Repair or replace, as approved by the College, adjacent work damaged or displaced by removing temporary excavation support and protection systems.

B. Leave temporary excavation support and protection systems permanently in place as directed by the Architect.
3.6 DISPOSAL
   A. Lawfully dispose of all unsuitable and excess or surplus material off-site at no cost to the College.

3.7 CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
   A. General: Comply with General Contractor’s Waste Management Plan and Division 1.
   B. To the greatest extent possible, separate reusable and recyclable products from contaminated waste and debris in accordance with the General Contractor's Waste Management Plan. Place recyclable and reusable products in designated containers and protect from moisture and contamination.

END OF SECTION
SECTION 316800 - FOUNDATION TIEDOWN ANCHORS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes:

1. Permanent tiedown anchors used to provide resistance to seismic uplift forces, including drilling, grouting, stressing, load testing and lock-off.

1.3 SYSTEM REQUIREMENTS

A. Contractor design responsibility: Contractor shall determine the bond length, borehole diameter and grouting method to achieve the performance requirements, subject to the minimum requirements of the Contract Documents.

B. Performance requirements:

2. Each tiedown anchor shall be capable of sustaining an Ultimate Load (UL) as designated on Drawings, when performance tested in accordance with Part 3 of this Section.

C. Minimum requirements:

1. Contractor shall not be permitted to adjust the location and number of tiedown anchors or change the anchor bar size or type from that designated in the Contract Documents.

2. Minimum borehole diameter shall be as designated on Drawings.

3. Free-stressing length designated on Drawings is a minimum requirement. Free-stressing length shall not exceed specified minimum by more than five feet unless approved by Owner's Representative, considering affect on anchor elongation.

4. Minimum length of bonded zone shall be as designated on Drawings.

5. Provide the minimum total anchor length designated on Drawings to achieve the required load capacity of anchor groups, where indicated.

D. Performance Verification: All tiedown anchors shall be tested in accordance with Part 3 of this Section.
1. Contractor shall complete the initial performance testing program prior to installation of additional anchors.

1.4 REFERENCES

A. Standards listed below apply where designation is cited in this Section. Where the applicable year of adoption or revision is not listed below, the latest edition applies.

B. ASTM: Standards of the American Society for Testing and Materials (ASTM) apply where cited in this Section.

C. PTI: Post-Tensioning Institute’s “Recommendations for Prestressed Rock and Soil Anchors”, 2014 (PTI DC35.1-14)

1.5 DEFINITIONS

A. Alignment Load (AL): A nominal load applied to an anchor during testing to keep the testing equipment positioned correctly.

B. Design Load (DL): As designated on Drawings. The Design Load is the maximum anchor load determined using allowable stress load combinations.

C. Free-stressing length: The length of the anchor bar that is not bonded to the surrounding ground or grout during stressing, measured from the bearing plate.

D. Lock-off load: The prestressing force after transferring the load from the jack to the foundation, as specified on the Drawings.

E. Ultimate Load (UL): The maximum load to which performance test anchors are subjected, equal to the maximum load determined based on load combinations for strength design using overstrength factors and not exceeding .8 x the specified minimum tensile strength of the tiedown anchor. Anchors designated for performance testing shall be subjected to UL as designated on the Drawings.

F. Proof Load (PL): The maximum load to which production anchors are subjected, equal to 133% of DL.

G. Tiedown: A system used to transfer tensile loads to soil or rock that includes the anchor bar, anchorage, corrosion protection, sheathings, centralizers, and grout.

1.6 SUBMITTALS

A. Submittal procedures and administrative provisions are established by Division 01 Section "Submittals".

B. Qualifications: Project lists for the Anchor Installer.

C. Design calculations: Provide test load, nominal borehole diameter, bond length and free-stressing length for each tiedown. Indicate basis for determination of bond length. Identify minimum and maximum anchor deformation under Maximum Test Load.
1. Calculations shall bear the seal and signature of a Civil Engineer registered in the State of California.

D. Fabrication drawings: Indicate bar size and material. Provide detailed drawing of factory installed corrosion protection and sheath systems, including end terminations. Provide detailed drawing of anchor zone, including all anchorage components. Indicate location and type of centering devices.

E. Installation and monitoring procedures: Provide detailed written procedure to be followed for installing anchors, including description of equipment and methods to be used. Describe procedures for monitoring grout quality, volume of grout, and grouting pressure during installation. Include form proposed for preparation of standard daily log.

F. Load testing procedures: Describe procedures to be employed for load testing.
   1. Submit certified calibration charts for each test jack, pressure gauge, master gauge, and load cell to be used.

G. Mill test reports: Submit test reports certifying compliance with specified standards to Testing Agency for record purposes.
   1. Anchor bars.
   2. Cement.

H. Mix design for grout.

1.7 QUALITY ASSURANCE

A. Installer qualifications: Not less than 5 successfully completed projects within the preceding 5 years with similar site conditions, shaft sizes, and anchor test loads.

B. Preinstallation conference: Conduct conference at project site to comply with requirements in Division 01 Section "Project Management and Coordination."
   1. Schedule: Three weeks minimum prior to installation of tiedown anchors.
   2. Attendees: For the Contractor, include representatives of the Anchor Installer and their Professional Engineer. For the Owner, include representatives of the Geotechnical Engineer and Testing Agency.
   3. Agenda: General Contractor shall review status of submittals and discuss outstanding items and proposed schedule for work. Anchor Installer shall present procedures for installation, testing, and monitoring. Roles and responsibilities for testing, inspection and monitoring by Contractor, Geotechnical Engineer, and Testing Agency will be reviewed and coordinated. Process for response to field conditions that require modification to approved drawings will be reviewed.

C. Each anchor shall be load tested by the Contractor, with observation by the Geotechnical Engineer and Owner’s Testing Agency in accordance with "Load Testing" provisions of this Section.
   1. Jacks shall be calibrated, and load versus gauge pressure/load cell reading curves provided for each pressure gauge, for 25 percent and 75 percent of the minimum jack extension for two cycles of loading, over the full range of expected load usage. At least six (6) load increments shall be applied, and all measured points shall be shown on the calibrations.
2. Provide means to measure load application within an accuracy of plus or minus five percent (5%).

1.8 PRODUCT HANDLING AND STORAGE

A. Handle anchor bars in such a manner to ensure that bars are not bent and that corrugated PVC sheathing is not damaged. Repair damage to sheathing in accordance with the manufacturer’s recommendations.

B. Maintain anchors free of soil. Do not drag on ground. Store off ground on suitable supports.

PART 2 - PRODUCTS

2.1 TIEDOWNS

A. General: Factory fabricate tiedown anchor assemblies as one continuous unit to achieve 100-year certified PTI Class I (Double Corrosion Protection) in the completed installation.

B. Acceptable products: Dywidag Threadbar® Anchors with Double Corrosion Protection, SAS Stressteel Inc. threadbars with DCP, or Williams Threadbar with Multiple Corrosion Protection III (No substitutions).

C. Anchor bar: Alloy steel threaded bars fabricated from steel conforming to ASTM A722, with a minimum tensile strength of 150,000 psi, and manufacturer’s standard threaded deformations.

D. Factory corrosion protection: Anchor bars shall be encapsulated in a corrugated plastic sheath over the full length of the anchor. The annular space between the bar and the sheath shall be completely filled with encapsulation grout. Encase corrugated sheathing in a smooth plastic sheath over the free-stressing length and tape ends.

1. Plastic sheaths: High density polyethylene (HDPE) according to ASTM D1248, Type III, or polyvinyl chloride (PVC) according to ASTM D1784, Class 13464-B.
   a. Corrugated sheath: Sheath shall have a minimum wall thickness of 1.5 mils. Inside diameter shall be 1/2-inch minimum larger than the anchor bar diameter, measured from the outside of anchor bar deformations. Outside diameter shall be 1/2-inch minimum larger than inside diameter.
   b. Smooth sheath: Tube or pipe with a minimum wall thickness of 0.10 inches. Inside diameter shall not be more than 0.25 inches larger than outside diameter of corrugated sheath. Outside diameter shall not exceed 4 inches.
   c. The materials for accessories such as end caps, grouting caps, grout tubes and sealing caps shall have properties equal to the plastic sheath.

2. Encapsulation grout: A combination of Type I or II Portland cement and potable water. Chemical admixtures that retard set or reduce bleeding may be used. Other admixtures shall be allowed only with approval of Owner’s Representative.

3. Tape: 20 mil thick by minimum 2 inch wide polyethylene tape. Same as 3M Scotchrap™ All-Weather Corrosion Protection Tape 51, or approved equal.

E. Accessories: Furnish manufacturer’s standard accessories as necessary for complete installation.
2.2 GROUT

A. A pumpable mixture of Types I or II Portland cement, water, and admixtures. Chemical additives which can control bleed or retard set may be used. Expansive additives will not be allowed. Additives, if used, shall be mixed in accordance with the manufacturer's recommendations.

1. The grout shall achieve a minimum compressive strength of 2,500 psi at 7 days and 3,500 psi at 28 days. Grout must achieve a compressive strength of 3000 psi at the time of stressing.

2. The grout shall bleed less than 2 percent when allowed to stand for 1 hour.

F. Fabrication:

1. Shop fabricate anchor bar assemblies. Field splice only as necessary and with approval of Owner's Representative.

2. Anchor bars shall be cut with an abrasive saw.

3. All of the bond length shall be free of dirt, lubricants, or other deleterious substances that may significantly affect bond or the service life of the anchor.

4. Encapsulation grouting shall be done on an inclined frame or bed by injecting the grout from the low end of the anchor.

5. Joints in the plastic sheath shall be made watertight.

5. Centralizers: PVC devices that will position the anchor bar assembly at the center of the shaft and will hold it securely in place during grout placement. The centering devices shall not interfere with grout placement. Place at 10-foot intervals along bond length.

6. Covers: Steel or plastic cover that forms a permanent watertight enclosure for the anchor head. Cover shall provide minimum 1 inch vertical clearance over top of anchor bar. Cover shall positively and securely fasten to bearing plate. Cover shall have provision for filling with corrosion inhibiting compound.

Th
3. Subject to compliance with requirements, fine aggregate (sand) and/or fly ash may be added to grout mix.

2.3 MISCELLANEOUS

A. Corrosion-inhibiting compound: Grease or wax with appropriate moisture-displacing, corrosion-inhibiting additives, and self-healing properties. The compound shall permanently stay viscous and be chemically stable and non-reactive with the prestressing steel, the sheathing material, and the anchor grout. Compound shall comply with Table 4.1 of PTI "Recommendations for Prestressed Rock and Soil Anchors"

2.4 SOURCE QUALITY CONTROL

A. Inspection and testing will be performed under provisions of Division 01 Section, “Quality”.

B. Testing Agency will:
   1. Review manufacturer's test reports for compliance with specified requirements.
   2. Verify material identification.

PART 3 - EXECUTION

3.1 PREPARATION

A. Perform field engineering and layout work including furnishing necessary centerlines, offsets, and grade stakes.

B. Notify the Geotechnical Engineer at least four working days in advance of the beginning of work or on resumption of work after stoppage. Any hole drilled or cast without continuous observation of the Geotechnical Engineer will be rejected.

3.2 INSTALLATION

A. Install tiedown anchors in accordance with approved layout drawings and installation and monitoring procedures.

B. Tolerances:
   1. Plan location: Plus or minus 3 inches.
   2. Vertical alignment: Shafts out of plumb, or differing from prescribed angle, not more than 1.5 percent of length.
   3. Where specified tolerances are exceeded, provide corrective construction to compensate for eccentricity as determined by Owner’s Representative. Corrective construction is subject to DSA review and approval as a CCD.

C. Minimum formwork: Case top 2 feet of anchor shaft with leave-in place metal, plastic or fiber tube. Formwork may remain in place. Backfill around form with clean sand upon completion of anchor.
3.3 LOAD TESTING

A. Test installed tiedowns in accordance with the procedures herein prior to installation of foundations.

B. Load testing shall be performed by Contractor, under the observation of Geotechnical Engineer.

C. Testing shall be performed in accordance with provisions of PTI “Recommendations for Prestressed Rock and Soil Anchors”, except as modified herein.

D. Testing apparatus: Apparatus for applying loads shall be in accordance with ASTM D3689.
   1. Maintain 8 feet clear distance between test anchor and cribbing.
   2. Equipment shall be calibrated in accordance with Section 8.2 of PTI “Recommendations for Prestressed Rock and Soil Anchors”.

E. Verification Load Testing (Pre-Production Testing) as required by the project Geotechnical Engineer. Test 3 sacrificial pre-production anchors.
   1. Test anchors using the Performance Test procedures and loading schedule (Table 8.1) of PTI “Recommendations for Prestressed Rock and Soil Anchors” except as modified herein. Add two additional loading steps to Table 8.1 as follows.
      a. Loading step 7. Apply load according to the following increments: AL, 0.25 DL, 0.50 DL, 0.75 DL, 1.00 DL, 1.20 DL, 1.33 DL, 1.60 DL.
      b. Loading step 8. Apply load according to the following increments: AL, 0.25 DL, 0.50 DL, 0.75 DL, 1.00 DL, 1.20 DL, 1.33 DL, 1.60 DL, UL.
   2. In the Pre-Production Testing, the anchor is incrementally loaded and unloaded. At each increment, the movement of the anchor bar is recorded. The loading at each increment.
During performance testing, the movement of the stressing end of the anchor shall be recorded at each increment of loading and at 1- and 10- minutes. If the total movement between the 1 and 10 minute readings exceeds 0.04 inches, hold the load for 50 additional minutes. The movement shall then be recorded at 15, 20, 25, 30, 45, and 60 minutes.

**F.** During Pre-Production Testing, the movement of the stressing end of the anchor shall be monitored to the nearest 0.001 inches using a free-standing dial gauge. Measurements shall be recorded at each increment of loading and at 1- and 10- minutes.

1. Plot a graph of total anchor movement at each load increment.
2. Acceptance criteria:
   a. The total elastic movement shall exceed 80% of the theoretical elastic movement of the anchor bar over the free-stressing length.
   b. The total elastic movement shall not exceed the theoretical elastic movement of the anchor bar over the free-stressing length plus one half of the bonded length.
   c. The total movement, measured during the final cycle of loading, shall not exceed the designated performance criteria.
   d. The creep rate does not exceed 0.080 inches/log cycle during the final log cycle of the test.

**G.** Test the first 2 production anchors and 2% of the remaining using Performance Test procedures.

1. The test anchor locations are shown on the structural foundation plans. Geotechnical Engineer shall review and approve locations as representative of site conditions.
2. Do not install other anchors until tests are completed and accepted by Geotechnical Engineer.

**H.** Performance test procedures:

1. Test anchors using the Performance Test procedures and loading schedule (Table 8.1) of PTI “Recommendations for Prestressed Rock and Soil Anchors” except as modified herein. Add additional loading step to Table 8.1 as follows.
   a. Loading step 7. Apply load according to the following increments: AL, 0.25 DL, 0.50 DL, 0.75 DL, 1.00 DL, 1.20 DL, 1.33 DL, 1.60 DL.

2. In the performance test, the anchor is incrementally loaded and unloaded. At each increment, the movement of the anchor bar is recorded. The loading at each increment is held just long enough to obtain movement readings, but not longer than 1 minute. The maximum load is held for a minimum of 10 minutes, with movement readings taken at 1, 2, 3, 4, 6 and 10 minutes.

3. If the total movement between the 1 and 10 minute readings exceeds 0.04 inches, hold the load for 50 additional minutes. The movement shall then be recorded at 15, 20, 25, 30, 45, and 60 minutes.

**I.** During performance testing, the movement of the stressing end of the anchor shall be monitored to the nearest 0.001 inches using a free-standing dial gauge. Measurements shall be recorded at each increment of loading and at 1- and 10- minutes.

1. Plot a graph of total anchor movement at each load increment.
2. Acceptance criteria:
   a. The total elastic movement shall exceed 80% of the theoretical elastic movement of the anchor bar over the free-stressing length.
   b. The total elastic movement shall not exceed the theoretical elastic movement of the anchor bar over the free-stressing length plus one half of the bonded length.
   c. The total movement, measured during the final cycle of loading, shall not exceed the designated performance criteria.
d. The creep rate does not exceed 0.080 inches/log cycle during the final log cycle of the test.

J. Proof tests: All remaining anchors shall be Proof Tested.
1. Test anchors using the Proof Test procedures of PTI "Recommendations for Prestressed Rock and Soil Anchors".
2. The proof test measures the movement of the anchor during one cycle of incremental loading. The loading at each increment is held just long enough to obtain movement readings, but not longer than 1 minute. The maximum load is held for a minimum of 10 minutes, with movement readings taken at 1, 2, 3, 4, 6 and 10 minutes.
3. Apply the Proof Load (PL) according to the following increments: AL, 0.25 DL, 0.50 DL, 0.75 DL, 1.00 DL, 1.20 DL, 1.33 DL.
4. Hold Maximum Test Load for 10 minutes. If the total movement between the 1- and 10-minute readings exceeds 0.04 inches, hold the load for 50 additional minutes. The movement shall then be recorded at 15, 20, 25, 30, 45, and 60 minutes.
5. Acceptance Criteria:
   a. The total movement shall exceed 80% of the theoretical elastic movement of the anchor bar over free-stressing length, when measured between 0.50 DL and MTL.
   b. The creep rate does not exceed 0.080 inches/log cycle during the final log cycle of the test.

K. When, in the professional opinion of the Geotechnical Engineer, the proof test results for an anchor show significant variation from the performance test results, the Contractor shall perform a performance test on that anchor at no additional cost to Owner.
1. Allow for additional Performance Testing of 5 percent of the total number of anchors in Contract Price.

L. Defective anchors:
1. If an anchor fails to meet the above acceptance criteria for testing, then that anchor will be rejected. All rejected anchors shall be replaced or supplemented by anchors installed at locations approved by the Owner’s Representative, as required to provide the total anchor capacity indicated on the Drawings.
2. No extension or time or additional compensation will be provided for replacing or installing additional anchors.

M. Records: The Contractor shall provide the Owner’s Representative two (2) copies of test record for each anchor within five (5) days of each test. Test records shall include the information listed below.
1. General: Project identification, anchor identification, bar size and type, bond length, free-stressing length.
2. Grouting data: Date grouted, pressure and grout volume.
3. Test results: Date tested, test type (performance or proof) and graphs of results. Note any adjustments made during test and unusual occurrences during test.

3.4 LOCK-OFF
A. Preparation: Observe placement, sealing and securing of trumpet immediately prior to placement of foundation concrete. Verify that compressible material is installed over top of shaft.
B. Upon completion of foundations, stress anchor bars to lock-off and anchor. Provide a method of anchorage which will limit the load loss to not more than five percent of the lock-off load in the transfer of loads from the jacks to the footing.

C. Fill trumpet completely with corrosion preventative compound.

D. Install and seal cover and fill completely with corrosion preventative compound.

3.5 FIELD QUALITY CONTROL

A. Inspection and testing will be performed under provisions of Division 01 Section “Quality”.

B. Geotechnical Engineer will:
   1. Continuously observe drilling for anchors paying attention to the depths of soil and rock materials encountered. Notify Contractor and Owner’s Representative when depth of materials encountered varies from expected conditions.
   2. Continuously observe tiedown anchor installation. Notify Contractor and Owner’s Representative when grout volume or pressure deviates from observations of test program.
   3. Monitor load testing and recording of results.
   4. Perform final determination of the acceptability of installed tiedown anchors; assign reduced capacity to tiedown anchors that fail to comply with specified requirements.
   5. Compile records of each tiedown anchor from Contractor’s log, Geotechnical Engineer’s observations, load testing, and as-built locations provided by the Contractor.
   6. Prepare final report.

C. Testing Agency will:
   1. Sample and test grout for compressive strength in accordance with ASTM C109.
   2. Observe final stressing, lock-off and installation of corrosion protection measures.

END OF SECTION
SECTION 320413 - COMMON SUBMITTAL REQUIREMENTS FOR EXTERIOR IMPROVEMENTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Supplementary administrative and procedural requirements for submitting Shop Drawings, Product Data, Samples, and other submittals specific to the work of this Division.

B. Related Requirements:
   1. Division 01 submittal requirements.

1.3 DEFINITIONS

A. Contractor: Refers to an entity in direct Contract with the Owner to furnish and/or perform any portion of the Work of the Contract.
   1. Contractor shall review and approve Product Submittals prior to forwarding them to the Architect.

B. Product Submittals: In general, Product Submittals show characteristics of the proposed construction in one of the following forms:
   1. Shop Drawings.
   2. Product Data.
   3. Samples.

C. Action Submittals: Written and graphic information and physical samples that require Architect/Engineer's responsive action. Action submittals are those submittals indicated in individual Specification Sections as "action submittals."

D. Sustainable Design Submittals: Submittals required by Section 01813 "Sustainable Design Requirements." Submit documentation for products and materials contributing to achievement of LEED rating indicated. Sustainable Design Submittals are in addition to other submittal requirements.

E. Informational Submittals: Written and graphic information and physical samples that do not require Architect/Engineer's responsive action. Submittals may be rejected for not complying with requirements. Informational submittals are those submittals indicated in individual Specification Sections as "informational submittals."

F. Submittal Review Sheet: Specific form required to accompany each submittal. Obtain Submittal Review Sheet from the SmithGroup Project Manager.
1.4 SUBMITTAL ADMINISTRATIVE REQUIREMENTS

A. Requirements specified for submittals are intended to provide efficient handling, while permitting review responsibilities to be carried out.

B. Avoidable Resubmittals: The first two reviews of each specified submittal will be processed without cost to the Contractor. After the second review, the Owner may charge the Contractor for the cost of such additional processing, unless the processing results from approved Change Orders causing revisions to previously approved submittals.

C. Coordination: Coordinate preparation and processing of submittals with performance of construction activities.
   1. Coordinate each submittal with fabrication, purchasing, testing, delivery, other submittals, and related activities that require sequential activity.
   2. Submit all submittal items required for each Specification Section concurrently unless partial submittals for portions of the Work are indicated on approved submittal schedule.
   3. Submit action submittals and informational submittals required by the same Specification Section as separate packages under separate transmittals.
   4. Coordinate transmittal of different types of submittals for related parts of the Work so processing will not be delayed because of need to review submittals concurrently for coordination.
      a. Architect and Engineer reserve the right to withhold action on a submittal requiring coordination with other submittals until related submittals are received.

D. Processing Time: Allow time for submittal review, including time for resubmittals, as follows. Time for review shall commence on Architect's receipt of submittal. No extension of the Contract Time will be authorized because of failure to transmit submittals enough in advance of the Work to permit processing, including resubmittals.
   1. Refer to Section 01330 for quantity of days allowed for review.
   2. When a large volume of submittal materials is scheduled, additional review time may be required. Similarly, a particular submittal may require review completion in less than the agreed normal time. Due to variations in submittal volume and processing needs, agreed review time is not intended to apply to extreme conditions.

E. Maintain at the Project Site ready access to the latest reviewed Shop Drawings and Product Data, and one set of samples.

PART 2 - PRODUCTS

2.1 SUSTAINABLE DESIGN REQUIREMENTS

A. The District requires the Contractor to implement practices and procedures to meet the project's environmental performance goals. The Contractor shall ensure that the minimum requirements related to these goals, as defined in Section 01813 "Sustainable Design Requirements" are implemented to the fullest extent possible. Specific materials and systems have been selected to this end. Substitutions, or other changes to the work proposed by the Contractor or their Subcontractors, shall not be allowed if such changes compromise the aforementioned environmental goals and LEED certification.
B. Specific material goals, beyond inherently designed facility service systems, that may impact this area of work include: use of products with third-party verified Environmental Product Declaration, use of products with Health Product Declarations, use of products from manufacturers with publicly disclosed Corporate Sustainability Reports, use of products with recycled-content materials; use of locally-purchased, manufactured and extracted materials; use of FSC certified wood; use of low-emitting materials; construction waste recycling; and the implementation of a construction indoor air quality management plan.

PART 3 - EXECUTION

3.1 CONTRACTOR'S REVIEW

A. Project Closeout and Maintenance Material Submittals: See requirements in Division 01.

B. Be responsible for quantities, weights, and dimensions to be confirmed and correlated at the site; for information that pertains solely to the fabrication processes and to the means, methods, techniques, sequences, and procedures of construction; and for coordination of the work of every trade, supplier, and subcontractor.

C. Be responsible for each submittal to be in conformance with information given and the design intent expressed in the Contract Documents.

D. Provide with each submittal specific written notice of any variation from the requirements of the Contract Documents by causing a specific notation to be made on the Submittal Review Sheet and Submittal Transmittal. Changes to the approved construction documents are subject to DSA review and approval, submitted by the Architect as a CCD per DSA IR A-6.

3.2 ARCHITECT/ENGINEER'S AND GENERAL CONTRACTOR'S ACTION

A. General: Architect will not review submittals that do not include the Submittal Review Sheet.

B. Action Submittals: Architect's staff and consultants will review the submittal, and mark the Submittal Review Sheet with an action code. The code meanings are described below.

C. Additional codes may be provided within comments or as an electronic submittal review stamp and shall be used in help indicating return of partial submittals.

E. Review Code meanings are as follows:

   1. Action Codes Permitting Use:
      a. When an action code permitting use is assigned to a submittal, it does not authorize work that does not comply with the requirements of the Contract Documents. Acceptance of the Work will depend on compliance.
      b. Code AP - Approved: The Work covered by the submittal item may proceed, provided it complies with Contract Document requirements.
      c. Code AN - Approved as Noted: The Work covered by the submittal item may proceed, provided it complies with the Architect's notations and Contract Document requirements.
d. Code AN-R - Approved as Noted - Resubmit: Do not deliver or install the related work until the resubmittal has received Code AP or AN. However, fabrication and other off-site work covered by the submittal item may proceed, at the Contractor's risk, provided it complies with the Architect's notations and Contract Document requirements.

2. Action Code Prohibiting Use:
   a. Action Code REJ - Not Approved: The Work covered by the submittal item, including purchasing, fabrication, delivery, and other activity, shall not proceed. Revise the submittal item or prepare a new item in accordance with the Architect's notations. Resubmit the corrected or new item without delay; do not permit submittal items marked "Not Approved" to be used. Work incorporating such items will be rejected.

3. Action Code for Items Not Required:
   a. Action Code X - Not Requested by Contract Documents: The submittal item is not called for by the Contract Documents and is being returned unreviewed by the Architect except to the extent necessary to determine its status.

F. Informational Submittals: For Architect's information only. Architect will review each submittal and will not return it, or will return it if it does not comply with requirements. Architect will forward each submittal to appropriate party.
   1. Action Code for Information Only:
      a. Action Code INF - Information Only - Received: The submittal item is not called for a return with a reviewed action code by the Contract Documents and is being returned un-reviewed by the Architect except to the extent necessary to determine its status.

G. Partial submittals prepared for a portion of the Work will be reviewed when use of partial submittals has received prior approval from Architect.

H. Incomplete submittals are not acceptable, will be considered non-responsive, and will be returned without review.

I. Architect will return without review or discard submittals received from sources other than the Contractor.

J. Submittals not required by the Contract Documents may be returned by the Architect without action.
   1. Do not submit Material Safety Data Sheets. They will be returned without review or discarded.

3.3 SUBMITTAL TRANSMITTAL REQUIREMENTS

A. Submittal Transmittal shall be a PDF file in electronic format. It is recommended, to expedite the submittal review, the electronic form be emailed for review to the Architect as early as possible.
   1. Submittal Numbering: See below.
   2. Contact Information: Full Name, Phone Number and Email Address.

B. Submittal Definition
   1. Each submittal consists of items from only ONE Specifications section.
2. Complete Submittal: If ALL the items required by the Specifications section are listed on one Submittal Form (including continuation sheet), it is a complete submittal.

3. Partial Submittals: If it is necessary to divide the required items of a given Specifications section into two or more submittals to meet schedule or handling requirements, the separate submittals are partial submittals. All partial submittals have the same submittal number, and are differentiated by sequential P-numbers (see below).

4. All items in each submittal, whether complete or partial, will be processed together: Individual items will not be 'broken out' for special handling. Arrange submittals accordingly.

C. Submittal Numbering

1. Number submittals as described below to assist tracking.

2. Number each submittal in the format nnnnn-nn.
   a. The 6-digit number is the number of the section that requires the submittal. For example, 044200.
   b. The 2-digit number is based on the numerical sequence of submittals from that section. In other words, for each section, the first submittal is 01, the second is 02, and so on. The 2-digit number does not change for partial or re-submittals, so that the submittal can be tracked.
   c. P-Number for Partial Submittals: Number each partial submittal in the pee space, beginning with P1, and increasing by one for each partial submittal of that submittal. If the submittal is a complete submittal, leave the P space blank.
   d. R-Number for Re-submittals: Number each re-submittal in the arr space, beginning with R1, and increasing by one for each re-submittal of that submittal. Do not include an R-Number for the initial submittal.
   e. Examples:

3.4 SUBMITTAL REVIEW SHEET REQUIREMENTS

A. Provide Submittal Review Sheet in PDF format. Submit as the page after the Submittal Transmittal.

B. When attached, the Submittal Review Sheet shall not obscure information contained in the submittal.

C. Do not edit any of the information contained within the Submittal Review Sheet except as follows:
   1. Submittal Number: See Submittal Numbering in Submittal Transmittal Requirements paragraph.

D. The Contractor shall submit the PDF file in a manner that will allow editing of the Submittal Review Sheet fields by SmithGroup and its consultants.

END OF SECTION
SECTION 320523 - PORTLAND CEMENT CONCRETE PAVING

PART 1 - GENERAL

1.0 SECTION INCLUDES

A. Materials for Portland cement concrete.
B. Aggregate and aggregate grading for Portland cement concrete.
C. Water for Portland cement concrete.
D. Admixtures for Portland cement concrete.
E. Proportioning for Portland cement concrete.
F. Mixing and transporting Portland cement concrete.
G. Formwork for cast in place Portland cement concrete.
H. Embedded materials for Portland cement concrete.
I. Steel reinforcement for Portland cement concrete.
J. Placing and finishing Portland cement concrete.
K. Curing Portland cement concrete.
L. Protecting Portland cement concrete.

1.1 RELATED SECTIONS

A. Section 311100, Clearing and Grubbing

1.2 RELATED DOCUMENTS

A. ASTM:
   1. A 82, Cold Drawn Steel Wire for Concrete Reinforcement.
   2. A 185, Steel Welded Wire Fabric, Plain for Concrete Reinforcement.
   3. A 615, Deformed and Plain Billet Steel Bars, for Concrete Reinforcement.
   7. C 618, Fly Ash and Raw or Calcined Natural Pozzolan for use as Natural Admixture in Portland Cement.

B. Caltrans Standard Specifications:
1. Section 51: Concrete Structures.
2. Section 73: Concrete Curbs and Sidewalks.
3. Section 90: Concrete.

1.3 DEFINITIONS

A. ASTM: American Society for Testing Materials

1.4 SUBMITTALS

A. Follow Submittal procedure outlined in Division 0 – General Conditions and Division 1 – General Requirements.

B. Concrete Mix Design: Have all concrete mixes designed by a testing laboratory and approved by the Consulting Engineer. Conform all mixes to the applicable building code requirement, regardless of other minimum requirements listed herein or on the drawings. Submit mix designs for review before use. Show proportions and specific gravities of cement, fine and coarse aggregate, and water and gradation of combined aggregates.

1.5 QUALITY ASSURANCE

A. Concrete shall be subject to quality assurance in accordance with Section 90 of Caltrans Standard Specifications.

1. Slump tests: Have available, at job site, equipment required to perform slump tests. Make one slump test for each cylinder sample, from same concrete batch. Allowable maximum slump shall be 4 inches for walls and 3 inches for slab on grade.

B. Certifications:

1. Provide District’s Representative at the time of delivery with certificates of compliance signed by both Contractor and Supplier containing the following statements:
   a. Materials contained comply with the requirements of the Contract Documents in all respects.
   b. Proportions and mixing comply with the design mix approved by the Consulting Engineer. Design mix shall have been field tested in accordance with the herein requirements of the Caltrans Standard Specifications and produces the required compressive strength under like conditions.
   c. Statement of type and amount of any admixtures.

2. Provide District’s Representative, at time of delivery, with certified delivery ticket stating volume of concrete delivered and time of mixing, or time of load-out in case of transit mixers.

C. Conform to the applicable provisions of Section 51, 73 and 90 of the Caltrans Standard Specification and these Technical Specifications.

1. Conform construction of Portland cement concrete surface improvements (including curbs, gutters, medians, valley gutters, walks, pads) to the requirements of Section 73 of the Caltrans Standard Specifications unless otherwise required in these Technical Specifications or shown on the Plans.

2. Conform other construction of Portland cement concrete items to the requirements of Section 51 of the Caltrans Standard Specifications unless otherwise required in these Technical Specifications or shown on the Plans.
1.6 DESIGNATION

A. Unless noted otherwise herein or on the Plans, the minimum compressive strength for portland cement concrete at 28 days for this Project shall be 3,600 psi.

PART 2 - PRODUCTS

2.1 PORTLAND CEMENT

A. General: Type II (modified) cement conforming to section 90-2.01 of the Caltrans Standard Specifications.

2.2 AGGREGATE AND AGGREGATE GRADING

A. General: Conform to the requirements of Section 90-2.02, 2.02A and 2.02B of the Caltrans Standard Specifications.

B. Aggregate Size and Gradation: Conform to the requirements of Section 90-3 of the Caltrans Standard Specifications for 1-inch maximum combined aggregate.

2.3 WATER

A. General: Conform to the requirements of section 90-2.03 of the Caltrans Standard Specifications. For mixing and curing Portland cement concrete and for washing aggregates.

2.4 EXPANSION JOINT MATERIAL

A. Material for expansion joints in Portland cement concrete improvements shall be pre-molded expansion joint fillers conforming to the requirements of ASTM Designation D 1751. Expansion joint material shall be shaped to fit the cross section of the concrete prior to being placed. Suppliers certificates showing conformance with this specification shall be delivered with each shipment of materials delivered to the job site. Unless noted otherwise herein or on the Plans expansion joint thickness shall be as follows:
   1. Curbs, Curb Ramps, Sidewalks, Driveways and Gutter Depressions: \( \frac{1}{4} \)-inch.
   2. Gutter Lining, Ditch Lining and Channel Lining: \( \frac{3}{8} \)-inch.
   3. Structures: As indicated.

2.5 REINFORCEMENT AND DOWELS

A. Bar reinforcement for concrete improvements shall be deformed steel bars of the size or sizes called for on the plans conforming to the requirements of ASTM Designation A 615 for Grade 60 bars. Size and shape for bar reinforcement shall conform to the details shown or called for on the Plans.
B. Slip dowels, where noted or called for on the plans or detail drawings shall be smooth billet-steel bars as designated and conforming to the requirements of ASTM Designation A 615 for Grade 60 bars. Ends of bars inserted in new work shall be covered with a cardboard tube sealed with cork; no grease or oil shall be used.

C. Mesh for reinforcement for concrete improvements shall be cold drawn steel wire mesh of the size and spacing called for on the plans conforming to the requirements of ASTM Designation A 82 for the material and ASTM Designation A 185 for the mesh. Size and extent of mesh reinforcement shall conform to the details shown or called for on the plans.

D. Tie wire for reinforcement shall be eighteen (18) gauge or heavier, black, annealed conforming to the requirements of ASTM Designation A 82.

E. Suppliers certificates showing conformance with this specification shall be delivered with each shipment of materials delivered to the job site.

2.6 ACCESSORY MATERIALS

A. Conform water stops and other items required to be embedded in of portland cement concrete structures to the applicable requirements of Section 51 of the Caltrans Standard Specifications unless otherwise specifically noted or called for on the Plans or detail drawings.

B. Curing Compounds:
   1. Regular Portland Cement Concrete: "Non-Pigmented Curing Compound - Chlorinated Rubber Base-Clear" conforming to the requirements contained in Section 90-7.01B, of the Caltrans Standard Specifications.
   2. Color Conditioned Decorative Portland Cement Concrete: LITHOCHROME colorwax as manufactured by the L. M. Scofield Company or approved equal.

2.7 FORMS

A. Conform to the requirements of Section 51-1.05 of the Caltrans Standard Specifications.

2.8 PRECAST CONCRETE STRUCTURES

A. Conform to the following Sections of Caltrans Standard Specifications:
   1. 51-1.02, Minor Structures.
   2. 70-1.02C, Flared End Sections.
   3. 70-1.02H, Precast Concrete Structures.
PART 3 - EXECUTION

3.1 STRUCTURAL EXCAVATION

A. Structural excavation may be either by hand, or by machine and shall be neat to the line and dimension shown or called for on the plans. Excavation shall be sufficient width to provide adequate space for working therein, and comply with CAL-OSHA requirements.

B. Where an excavation has been constructed below the design grade, refill the excavation to the bottom of the excavation grade with approved material and compact in place to 95% of the maximum dry density.

C. Remove surplus excavation material remaining upon completion of the work from the job site, or condition it to optimum moisture content and compact it as fill or backfill on the site, if the material is approved by the Geotechnical Consultant.

3.2 SOIL STERILANT

A. Furnish and apply to areas indicated in accordance with Section 31 23 00, Excavation and Fill.

3.3 BRACING AND SHORING

A. Conform to California and Federal OSHA requirements.

B. Place and maintain such bracing and shoring as may be required to support the sides of the excavations for the proper protection of workmen; to facilitate the work; to prevent damage to the facility being constructed; and to prevent damage to adjacent structures or facilities. Remove all bracing and shoring upon completion of the work.

C. Be solely responsible for all bracing and shoring and, if requested by the District’s Representative, submit details and calculations to the District’s Representative. The District’s Representative may forward the submittal to the Geotechnical Consultant, the Consulting Engineer and/or the California Division of Industrial Safety for their review. The Contractor’s submittal shall include the basic design, assumed soils conditions and estimation of forces to be resisted, together with plans and specifications of the materials and methods to be used, and shall be prepared by a civil engineer or structural engineer registered in California. No excavations related to the proposed facility shall precede a response to the submittal by the District’s Representative.

D. Be solely responsible for installing and extracting the sheathing in a manner which will not disturb the position or operation of the facility being constructed or adjacent utilities and facilities.

3.4 PLACING CONCRETE FORMS

A. Form concrete improvements with a smooth and true upper edge. Side of the form with a smooth finish shall be placed next to concrete. Construct forms rigid enough to withstand the pressure of the fresh concrete to be placed without any distortion.
B. Thoroughly clean all forms prior to placement and coat forms with approved form oil in sufficient quantity to prevent adherence of concrete prior to placing concrete.

C. Carefully set forms to the alignment and grade established and conform to the required dimensions. Rigidly hold forms in place by stakes set at satisfactory intervals. Provide sufficient clamps, spreaders and braces to insure the rigidity of the forms.

D. Provide forms for back and face of curbs, lip of gutters and edge of walks, valley gutters or other surface slabs that are equal to the full depth of the concrete as shown, noted or called for on the Plans. On curves and curb returns provide composite forms made from benders or thin planks of sufficient ply to ensure rigidity of the form.

3.5 PLACING STEEL REINFORCEMENT

A. Bars shall be free of mortar, oil, dirt, excessive mill scale and scabby rust and other coatings of any character that would destroy or reduce the bond. All bending shall be done cold, to the shapes shown on the plans. The length of lapped splices shall be as follows:
   1. Reinforcing bars shall be lapped per the schedules shown on the Drawings.
   2. Splice locations shall be made as indicated on the plans.

B. Accurately place reinforcement as shown on the plans and hold firmly and securely in position by wiring at intersections and splices, and by providing precast mortar blocks or ferrous metal chairs, spacers, metal hangers, supporting wires, and other approved devices of sufficient strength to resist crushing under applied loads. Provide supports and ties of such strength and density to permit walking on reinforcing without undue displacement.

C. Place reinforcing to provide the following minimum concrete cover:
   1. Surfaces exposed to water: 4-inches.
   2. Surfaces poured against earth: 3-inches.
   3. Formed surfaces exposed to earth or weather: 2-inches.
   4. Slabs, walls, not exposed to weather or earth: 1-inch.

D. Minimum spacing, center of parallel bars shall be two and one half (2-1/2) times the diameter of the larger sized bar. Accurately tie reinforcing securely in place prior to pouring concrete. Placing of dowels or other reinforcing in the wet concrete is not permitted.

3.6 MIXING AND TRANSPORTING PORTLAND CEMENT CONCRETE

A. Transit mix concrete in accordance with the requirements of ASTM Designation C 94. Transit mix for not less than ten (10) minutes total, not less than three (3) minutes of which shall be on the site just prior to pouring. Mix continuous with no interruptions from the time the truck is filled until the time it is emptied. Place concrete within one hour of the time water is first added unless authorized otherwise by the District's Representative.

B. Do not hand mix concrete for use in concrete structures

3.7 PLACING PORTLAND CEMENT CONCRETE

A. Thoroughly wet subgrade when concrete is placed directly on soil. Remove all standing water prior to placing concrete.
B. Do not place concrete until the subgrade and the forms have been approved.

C. Convey concrete from mixer to final location as rapidly as possible by methods that prevent separation of the ingredients. Deposit concrete as nearly as possible in final position to avoid re-handling.

D. Place and solidify concrete in forms without segregation by means of mechanical vibration or by other means as approved by the District’s Representative. Continue vibration until the material is sufficiently consolidated and absent of all voids without causing segregation of material. The use of vibrators for extensive shifting of fresh concrete will not be permitted.

E. Concrete in certain locations may be pumped into place upon prior approval by the District’s Representative. When this procedure requires redesign of the mix, such redesign shall be submitted for approval in the same manner as herein specified for approval of design mixes.

3.8 PLACING ACCESSORY MATERIALS

A. Place water stops and other items required to be embedded in or Portland cement concrete structures at locations shown or required in accordance with Section 51 of the Caltrans Standard Specifications unless otherwise specifically noted or called for on the Plans.

B. Curing Compounds:
   1. Regular Portland Cement Concrete: Apply "Non-Pigmented Curing Compound - chlorinated Rubber Base-Clear" in accordance with Section 90-7.01B, 7.01D and 7.03 of the Caltrans Standard Specifications.
   2. Color Conditioned Decorative Portland Cement Concrete: Apply LITHOCHROME color-wax, or approved equal, in accordance with the manufacturer’s instructions.

3.9 EXPANSION JOINTS

A. Construct expansion joints incorporating pre-molded joint fillers at twenty (20) foot intervals in all concrete curbs, gutters, sidewalks, median/island paving, valley gutters, driveway approaches and at the ends of all returns. At each expansion joint install one-half inch by twelve inch (1/2" x 12") smooth slip dowels in the positions shown or noted on the detail drawings.

B. Orient slip dowels at right angles to the expansion joint and hold firmly in place during the construction process by means of appropriate chairs.

3.10 WEAKENED PLANE JOINTS

A. Construct weakened plane joints in concrete curbs, gutters, sidewalks, median/island paving and valley gutters between expansion joints at ten (10) foot intervals throughout, or as otherwise indicated. Depth of joint score depth to be one-fourth (25%) the thickness of the concrete.

   1. Grooved Joints: Form weakened plane joints after initial floating by grooving and finishing each edge of joint to a radius of 1/8-inch. Repeat grooving of weakened plane joints after applying surface finishes. Eliminate groover tool marks on concrete surfaces.
   2. Sawed Joints: Form weakened plane joints with power saws equipped with shatterproof abrasive or diamond-rimmed blades. Cut 1/8-inch wide joints into concrete when cutting action will not tear, abrade or otherwise damage surface and before concrete develops random contraction cracks.
3.11 FORM REMOVAL
   A. Remove forms without damage to the concrete. Remove all shores and braces below the ground surface, before backfilling.
   B. Do not backfill against concrete until the concrete has developed sufficient strength to prevent damage.
   C. Leave forms for cast-in-place walls in place at least 72 hours after pouring.
   D. Leave edge forms in place at least 24 hours after pouring.

3.12 CONSTRUCTION
   A. Form, place and finish concrete curbs, walkways, island paving, valley gutters and driveway approaches in conformance with the applicable requirements of Section 73-1.04, 73-1.05, 72-1.05A and 73-1.06 of the Caltrans Standard Specifications as modified herein.
   B. Provide a medium broom finish to all horizontal surfaces unless otherwise shown.
   C. Construct new concrete curb, curb and gutter and valley gutters against existing asphalt concrete by removing a minimum of 12-inches of the asphalt concrete to allow placement of curb or gutter forms. Patch pavement with a 6-inch deep lift of asphalt concrete after gutter form is removed.
   D. Where monolithic curb, gutter and sidewalk is specified, separate concrete pours will not be allowed.

3.13 CONNECTING TO EXISTING CONCRETE IMPROVEMENTS
   A. New curb, gutter, or sidewalk is to connect to existing improvements to remain by saw cutting to existing sound concrete at the nearest score line, expansion joint or control joint. Drill and insert ½-inch diameter by 12-inch long dowels at 24-inches on center into existing improvements. Install pre-molded expansion joint filler at the matching joint.
   B. A cold joint to the existing curb is not acceptable.

3.14 DECORATIVE AND NON-DECORATIVE SURFACING CONSTRUCTION
   A. Decorative surfacing concrete walks or other installations shall be formed and placed as a concrete slab conforming to the details shown or noted on the Plans. Exposed aggregate concrete sidewalks shall be repaired in kind or better condition.
   B. Add lampblack or equivalent to the non-decorative surface concrete at the central mixing plant.

3.15 ACCESSIBLE PATH OF TRAVEL CONSTRUCTION FINISH
   A. Provide equivalent of medium salted finish at slopes less than 6% and slip-resistant finish at slopes 6% and greater along any accessible path of travel.
3.16 FIELD QUALITY CONTROL

A. Finish subgrade for concrete improvements shall be subject to approval prior to placement of forms.

B. No concrete shall be placed prior to approval of forms.

C. Concrete improvements constructed shall not contain areas that pond water and shall be smooth and ridge free.

D. Conform the finish grade at top of curb, flow line of gutter, and the finish cross section of concrete improvements to the design grades and cross sections.

E. Variation of concrete improvements from design grade and cross section as shown or called for on the plans shall not exceed the tolerances established in Sections 73-1.05 and/or 73-1.06 of the Caltrans Standard Specifications.

3.17 RESTORATION OF EXISTING IMPROVEMENTS

A. Replace in kind all pavement or other improvements removed or damaged due to the installation of concrete improvements.

B. Remove, landscaping or plantings damaged or disturbed due to the installation of concrete improvements. Replace in kind.

END OF SECTION
SECTION 320800 – COMMISSIONING OF IRRIGATION SYSTEMS

PART 1 - GENERAL

1.1. RELATED DOCUMENTS

A. The General Conditions, Supplementary Conditions and Division 01 are fully applicable to this Section, as if repeated herein.

1.2. RELATED WORK SPECIFIED ELSEWHERE

A. Division 01, Section 01910, General Commissioning Requirements
B. Division 22 and 32 Sections pertaining to Irrigation Systems and Controls.

1.3. REFERENCES

A. USGBC:

      a. Energy and Atmosphere Prerequisite: Fundamental Commissioning and Verification.

B. California Building Standards Commission:
   1. Title 24, Part 11, 2016, California Green Building Standards Code, Section 5.4.10.2 Commissioning.

C. ASHRAE:
   1. ASHRAE Guideline 0-2013: The Commissioning Process

1.4. DEFINITIONS

A. Basis of Design (BOD): The documentation of design criteria and assumptions for systems, components, and methods chosen to meet the Owner’s Project Requirements and applicable regulatory requirements, standards, and guidelines. The document includes narrative descriptions of the systems to be commissioned. The BOD is prepared by the Design Professionals.

B. Building Automation System (BAS): The automated building system providing control and user interaction with select building systems, such as the HVAC, domestic hot water and lighting systems. Also, often referred to as building management system (BMS), energy management system (EMS), or an energy management and control system (EMCS).

C. Commissioning (Cx): A quality-focused process to verify and document that building systems are installed and perform as intended per the OPR, BOD and design documents.

D. Commissioning Authority (CxA): An independent agent hired directly by the Owner and not otherwise associated with the Design Professionals or the General Contractor. The CxA is the
authority on commissioning results and other commissioning program elements completion, and assists the General Contractor with coordinating commissioning activities and witnesses the activities on behalf of the Owner.

E. Commissioning Issue: A condition that affects, prevents or inhibits commissioning, and must be resolved to complete the commissioning process.

F. Commissioning Issues & Recommendations Log (Cx Log): A log maintained by the CxA listing and describing all Cx issues and recommendations documented during the commissioning process, including providing the status, recommended action, contractor updates and resolution, and associated dates. All Cx issues require action, correction and closure.

G. Commissioning Report (Cx Report): The final report issued at the conclusion of the commissioning process. The report will include an executive summary abbreviating the outcome of the commissioning process and identifying all outstanding issues. The report also contains all commissioning documentation collected throughout all phases of the project.

H. Commissioning Plan (Cx Plan): A document that outlines the organization, coordination, and requirements of the commissioning process in more detail and contains project specific commissioning forms.

I. General Contractor (GC): The contractor directly contracted to the Owner with overall responsibility for the project and all commissioning activities described herein.

J. Commissioning Coordinator (CxC): Individual within the GC firm who plans, schedules, directs and coordinates all the Trade Subcontractor’s commissioning activities, and serves as the CxA’s single point of contact for all administrative, documentation and coordination functions.

K. Deferred Testing: Testing performed at a later time, due to partial occupancy, equipment, load, seasonal requirements, design or other site conditions that disallow the test from being performed prior to substantial completion.

L. Deficiency: A condition in the installation, function or performance of a component, equipment or system that is not in compliance with the contract documents and design. A deficiency will be considered a Cx issue and documented on the Cx Log.

M. Design Professional (DP): Architects, engineers and other consultants involved in the design of the project.

N. Functional Performance Test (FPT): A test of the dynamic function, operation and control of the equipment and systems to verify system performance to the fullest extent. Systems are tested under various operating modes and control sequences including failure modes. The FPTs are performed using manual (direct observation) or monitoring methods. The FPTs can include sequence of operation tests, performance tests, verification tests, integrated systems tests, and trend analysis. Functional performance tests are also often referred to as acceptance tests.

O. HVAC&R: Heating, ventilation, air conditioning and refrigeration.

P. Installation Verification (IV): Field verification and documentation of proper installation of system equipment, assemblies and components, per design documents and manufacturer requirements. The IV process is typically complete when systems are ready for startup or operation. IV is organized and documented under the System Readiness Checklist (SRC) forms.
Q. Monitoring: The recording of parameters (temperature, flow, current, status, pressure, etc.) of equipment operation, which shall be completed using data-loggers or the trending capabilities of BAS or control systems.

R. Owner’s Project Requirements (OPR): A document describing the operational and functional requirements of a project, the expectations of how the facility will be used and operated, and the equipment and system expectations and requirements, as defined by the Owner. This document provides an explanation of the ideas, concepts, goals, success criteria, and supporting information for the project.

S. Percent Sampling: Witnessing the startup, checkout or testing of a selected fraction of the total number of identical or near-identical pieces of equipment or systems.

T. Pre-Functional Checks and Tests (PFCT): These are various checks and tests performed on a piece of equipment or system before, during, or after the initial startup and operation, but prior to the FPT phase. They are performed to confirm the system equipment and individual components were installed correctly and are working properly and meeting applicable performance requirements and specifications. They are all organized and documented under the SRC forms and are to be completed prior to FPTs.

U. Startup: Initial starting or activating of equipment usually performed by the Trade Subcontractor or the Manufacturer’s authorized representative.

V. Systems Manual: A manual that provides the operating staff the information needed to understand and optimally operate the commissioned systems. It expands upon the scope of traditional operating and maintenance documents and is compiled of multiple documents such as the final BOD, single line diagrams, and as-built controls drawings and sequences of operation.

W. System Readiness Checklist (SRC): A construction checklist, typically one or two pages, listing the necessary commissioning tasks and required documentation to verify a system is ready for FPTs, or system operation if no FPTs are performed. The tasks covered in the SRC include IV, Startup and PFCT, and the Trade Subcontractor completed forms for these tasks are attached to the specific SRC. The SRC must be completed and signed by the GC prior to conducting the FPTs.

X. Trade Subcontractor: Typically, a subcontractor to the GC who provides and installs specific building components and systems and/or provides certain services.

Y. Trending: Monitoring using the BAS or a control system, to aid in functional testing and to verify system operation and performance under actual operating conditions.

Z. Warranty Phase: The phase of the project immediately after the initiation of the building equipment warranty which spans the entire length of the project warranty.

1.5. DESCRIPTION OF WORK

A. Systems and equipment to be commissioned:
   1. Landscape irrigation systems and controls.

B. The work includes the completion and documentation of formal commissioning procedures by the GC and Trade Subcontractors.
1. The GC and Trade Subcontractors shall provide the quality control for the installation, startup, checkout and testing of the systems. The commissioning process provides independent review throughout the process and qualitative functional performance testing in order to formally observe and document the quality control efforts are completed.

2. Refer to Section 01910, General Commissioning Requirements for summary description of the general commissioning process and requirements.

3. The Trade Subcontractors and the factory authorized service representatives shall be responsible for participation in the commissioning process as outlined in this specification and Section 01910, General Commissioning Requirements.

1.6. COMMISSIONING PROCESS

A. Submittal Reviews by the CxA

1. The CxA will review pertinent Trade Subcontractor submittals for the appropriate systems in the commissioning scope, concurrently with the Design Professionals and will provide review comments to the Design Professionals.

2. The GC shall provide a submittal log to the CxA for referencing the requested submittals to be reviewed by the CxA (for which the GC shall issue to the CxA concurrently with the submission to the Design Professionals). Alternatively, the GC shall include the CxA on the distribution of all Trade Subcontractor submittals issued to the Design Professionals, for systems applicable to this specification.

3. The GC shall issue the requested submittals to the CxA for review at the same time they issue the submittals to the Design Professionals.

4. The CxA will also use the information from the submittals to develop commissioning forms and test procedures.

B. Cx Plan and Form Development

1. The CxA prepares a Preliminary Cx Plan either during the project final design phase or early construction phase. The Cx Plan provides guidance in the execution of the commissioning process during construction and will contain the project specific commissioning forms.

2. Commissioning during construction begins with a kickoff meeting conducted by the CxA where the CxA reviews the commissioning process and responsibilities with the appropriate team members. The CxA presents the Preliminary Cx Plan and discusses the project specific requirements.

3. The CxA develops the SRC forms, which list the commissioning tasks and the associated IV, Startup, and PFCT documentation required for each system and equipment to be commissioned.

4. The CxA provides the SRC forms to the GC and Trade Subcontractors for review and comment.

5. The CxC shall submit to the CxA, for review and approval, the representative blank IV, Startup, and PFCT forms and plans for completing all IV, Startup, and PFCT tasks, prior to conducting any of these tasks.

a. IV forms are to provide field verification and documentation of proper installation of system equipment, assemblies and components, typically completed prior to formal Startup. Where appropriate and approved by the CxA, these forms may be combined with the Startup or PFCT forms.

   1) The IV forms are a combination of Trade Subcontractor provided forms (which may include any applicable design drawings, floor plans, details, or single line diagrams that will be field verified) and the applicable equipment IV (pre-startup) checklists contained in the Manufacturer’s installation manuals.
2) The Trade Subcontractors are to verify equipment installation per the Manufacturer’s guidelines and requirements, and thus are encouraged to use and complete any applicable equipment IV checklists contained in the Manufacturer’s installation manuals, in addition to any IV forms used by the Trade Subcontractors to verify system installation per design.

b. Startup forms consist of Manufacturer and/or Trade Subcontractor provided forms and plans used to document the completion of formal startup procedures and associated checks and verifications during the startup and initial operation. Where applicable, these forms shall include checks of the equipment internal / factory provided controls including sensors and control devices.

c. PFCT forms and plans are Trade Subcontractor provided forms and plans used to document the completion and results for the various checks and tests performed before, during, or after startup.

d. The CxA reviews the blank IV, Startup and PFCT forms and plans, and will issue any comments, which may include additions or changes to be made to the forms and plans, and/or supplemental forms may be issued by the CxA, where appropriate, to improve the forms and commissioning process.

6. The CxA will develop FPT procedures and forms, and provide the draft forms to the GC and Trade Subcontractors for review and comment.

7. The CxA will update and finalize the Cx Plan with equipment specific blank SRC, IV, PFCT and FPT forms.

C. System Readiness (Pre-Functional) Activities

1. Meetings will be conducted throughout construction with commissioning team members, as required, to plan, coordinate, and schedule commissioning activities, review documentation, and resolve Cx issues.

2. The Trade Subcontractors shall perform the IV, Startup and PFCT tasks for all systems and equipment (no sampling allowed), unless the contract or design documents allow for sampling of the pre-functional tests.

   a. In general, the GC and Trade Subcontractors should complete IV prior to Startup, but where appropriate and approved by the CxA, they can combine IV and Startup into one activity (and Startup is not performed if there are deficiencies identified from the IV).

3. The Trade Subcontractors and the CxC shall document completion of the IV, Startup and PFCT tasks on the IV, Startup, PFCT and SRC forms, and shall complete the SRC forms and attach the completed IV, Startup, and PFCT forms to the SRCs forms.

   a. The intent of the SRC forms is for the GC and Trade Subcontractors to certify that the irrigation systems, controls and instrumentation, equipment and assemblies have been installed, started, calibrated and are operating per the contract and design documents.

4. The CxA will review the completed IV, Startup, PFCT and SRC forms. The CxA will also perform various field observations and reviews, and witness a sample of the Startup and PFCT activities (some PFCT witnessing may be performed as back-checks after PFCT tasks are completed).

   a. The Trade Subcontractor shall resolve any IV and PFCT results deemed unacceptable by the CxA. And the Trade Subcontractor shall execute a new sample of the PFCT to be witnessed by the CxA. The CxA shall deem the PFCT acceptable after resolution of all issues and any witnessed sampling results in no issues.
5. The CxC shall submit all completed SRC forms to the CxA for review prior to conducting the FPTs. The CxA shall deem the SRCs acceptable after all SRC forms and supporting IV, Startup and PFCT forms are complete and any issues have been addressed.

D. Functional Performance Testing

1. FPTs are to test the dynamic function, performance and control of the equipment and systems under various modes of operation. These tests verify the correct implementation of the sequences of operation and the system performance meets the design criteria. The FPTs are performed using manual (direct observation) or monitoring methods. FPTs include the following types of tests, where applicable:

   a. Sequence of Operation Tests.
      1) Sequence of operation tests are witnessed by the CxA for each unique sequence of operation but may not necessarily be repeated across identical systems, equipment or spaces, if the contractor has verified the same programmed sequence of operation code (as tested) has been programmed across multiple identical systems, equipment or spaces, based sample verification tests witnessed by the CxA (see below).

   b. Verification Tests.
      1) Verification tests are often less detailed tests than the sequence of operation tests and are typically witnessed by the CxA at a higher sample rate. Examples of verification tests include:
         a) verifying the programmed sequence of operation code is the same as the as-tested code per the sequence of operation tests,
         b) verifying the alarm points are configured per the sequence of operation tests (without having to repeat the actual sequence tests),
         c) testing portions of the systems controls, such as irrigation zone control valve functions, or testing critical sequences, with a higher sample rate beyond the individual sequence of operation tests.

   c. Performance Tests.
      1) Performance tests are to be performed after the sequence of operation and verifications tests, and are focused on testing and verifying performance. Performance tests are typically witness by the CxA at a lower sample rate. An example is an irrigation system coverage test.

2. The CxA will develop FPT forms that contain:
   a. Specific step-by-step procedures to execute the test in a clear, sequential and repeatable format, including any control system point value or setpoint overrides required to simulate a test condition or sequence mode.
   b. The expected system response and acceptance criteria of proper performance with a Yes/No check box to allow for clearly marking whether or not proper performance of each part of the test was achieved.
   c. A section for recording actual system response, notes and comments.

3. Once the SRC forms are complete, the Trade Subcontractors shall execute the FPTs, with the FPTs witnessed by the CxA.
   a. The GC and Trade Subcontractors are responsible for ensuring all systems are installed, operating and performing per the requirements of the contract and design documents, and are ready for the FPTs.
   b. The Trade Subcontractors shall determine what level of pre-testing is appropriate in order to prepare for the CxA witnessed FPTs.
c. A percent sampling approach may be used for executing the FPTs of identical systems and equipment, to be defined in the Cx Plan and FPT forms.
d. The acceptance criteria for the FPT sampling shall be zero, meaning, any FPTs that do not pass shall require the Trade Subcontractor to resolve the issue for all applicable systems and equipment (even those specifically not in the original sample) and new sample rates selected for a re-test executed by the Trade Subcontractor and witnessed by the CxA. The CxA shall deem the FPTs acceptable after all FPTs, including re-tests, have passed and resolution of all issues completed.
e. The CxA will document the results of all FPTs on the associated FPT forms created by the CxA, unless indicated otherwise on the FPTs.

4. The Cx Plan will define any seasonal or deferred testing.

E. Cx Issues and Recommendations

1. Throughout the process, the CxA records Cx issues and recommendations on the Cx Log and distributes the Cx List to the team. The GC and Trade Subcontractors shall correct Cx issues and recheck or retest the system(s) without delay at no additional cost to the Owner. The CxA will verify the completion of the issues and recommendations, and make all amendments to the Cx Log.

F. Training Verification and Final Documentation

1. The GC shall submit a comprehensive Training Plan (with specific training agendas provided by the Trade Subcontractors) for review by the Design Professionals, CxA and Owner, prior to conducting any training. The Training Plan shall meet the specific requirements in the contract documents and specifications for each applicable system to be commissioned and the LEED Enhanced Commissioning requirements, and may include both operations and maintenance (O&M) staff training and building occupant training. The GC shall coordinate with the Owner and/or Owner’s Representatives, as needed, regarding any specific requirements for occupant training.

2. The CxA will verify completion of the training by witnessing some training sessions and receiving a copy of all training class sign-in sheets and any training materials / handouts, to be provided by the CxA or Trade Subcontractors.

3. The CxA will develop the Systems Manual (per the LEED requirements), including the current facility requirements, a preventative O&M plan and an ongoing Cx plan, with assistance from the GC and Trade Subcontractors.

4. The CxA will complete the Commissioning Report and all associated documentation for the Owner with assistance from the GC and Trade Subcontractors.

G. Post-Occupancy Warranty Phase Commissioning

1. The CxA will report any identified operational or performance issues (identified by the building O&M staff or warranty phase Cx activities) to the CxC via a Warranty Phase Cx Log for resolution by the GC and Trade Subcontractors during or prior to the end of the warranty period.

2. The Trade Subcontractors shall execute any defined seasonal or deferred FPTs, witnessed by the CxA.

3. No later than either 10 months after substation completion or two months prior to the expiration of the first 12-month warranty period of building occupancy, the CxA will return to the facility to interview facility O&M staff, walk the facility and review systems operation and trend data where applicable. Key representatives from the GC and Trade Subcontractors shall attend a site walk-through and meeting, as determined by the CxA.
1.7. COMMISSIONING TEAM

A. The Commissioning Team is responsible for performing the process and achieving successful commissioning results. The Commissioning Team is comprised of the following:

1. Owner and Owner’s Representatives
2. Commissioning Authority (CxA).
3. Design Professionals
4. General Contractor (GC)
5. GC’s Commissioning Coordinator (CxC)
6. Trade Subcontractors responsible for systems covered in this section include:
   a. Landscape Irrigation Contractor
7. Manufacturer Representatives supplying equipment, materials, components and controls for the systems to be commissioned.

1.8. RESPONSIBILITIES

A. General.

1. The Commissioning Team and all others involved in the commissioning process shall follow the Commissioning Plan, attend the commissioning kickoff meeting, and attend additional commissioning meetings as necessary.

B. Commissioning Authority (CxA)

1. See Section 01910, General Commissioning Requirements.

C. General Contractor:

1. See Section 01910, General Commissioning Requirements.

D. Trade Subcontractors – General Requirements:

1. Provide and submit for CxA review, the representative blank forms and plans for completing all IV, Startup, and PFCT tasks, including manufacturer’s installation checks and startup procedures. Electronic files are acceptable.
2. Provide any equipment and construction submittals and shop drawings, including detailed sequences of operation, and any other requested contract documentation for systems to be commissioned, as requested by the CxA. Electronic files are acceptable.
3. Attend commissioning meetings as directed by the CxA and GC’s CxC to facilitate the commissioning process.
4. Assign personnel with expertise and authority to act on behalf of the Trade Subcontractor and schedule them to participate in and perform assigned commissioning tasks.
5. Ensure that any required manufacturer factory tests are performed and provide the factory test data and results where required.
   a. Perform IV, Startup and PFCT tasks for all systems and equipment (no sampling), unless the contract or design documents allow for sampling of these tasks.
   b. Complete all IV, Startup and PFCT documentation clearly and legibly.
   c. Submit all completed IV, Startup and PFCT forms to the CxC and CxA, as part of completing the SRC forms, for review by the CxA.
7. Provide a schedule and access for the CxA to witness any equipment Startup and PFCT tasks. Notify the CxC and CxA at least 10 days in advance of Startup and PFCT tasks.
8. Ensure that any required manufacturer's representative field tests and on-site IV, startup and checkout of selected equipment are performed per the contract documents. Provide completed manufacturer documentation and commissioning forms for these activities to the CxC.

9. Address applicable Cx issues promptly. All IV, Startup and PFCT issues must be resolved before the FPTs can proceed.

10. Assist the CxA in preparing the FPT procedures, clarifying the operation and control of commissioned equipment where the specifications, control drawings or equipment documentation are not sufficient for writing detailed testing procedures.

11. Review the FPT procedures to ensure feasibility, safety and equipment protection, and provide necessary written alarm limits, setpoint changes and overrides to be used during the tests.

12. Setup any additional control system software points, global commands, overrides of any sensor values or relays, and overrides of any setpoints or schedules, to simulate certain conditions and operating modes, in order to conduct the FPTs.

13. Perform the FPTs, with the FPTs witnessed by the CxA. Provide at least 10 days advance notice to the CxC and CxA for scheduling the FPTs.

14. Prepare a training agenda for each training class for the equipment and systems to be commissioned.

15. Coordinate with the GC and Owner to schedule and plan training. Execute training of Owner's personnel per approved training agenda and schedule. Provide copies of training class sign-in sheets and materials / handouts.

16. Prepare O&M Manuals according to the Contract Documents. 

17. Assist the CxA in developing the Systems Manual, including providing as-built drawings, controls sequences, setpoints, single-line diagrams, etc., necessary for the Systems Manual.

E. Trade Subcontractors – Specific Irrigation Systems Requirements

1. In addition to the general Trade Subcontractor responsibilities outlined above, the Irrigation Systems Trade Subcontractor responsibilities during commissioning shall include, but are not limited to:

   a. Submit an Irrigation System Pressure / Leak Test Plan for all applicable irrigation systems, for review by the CxA, at least 4 weeks in advance of conducting any required tests. The Test Plan shall include the test methods, pressures and durations.

   b. Provide approved submittals, including shop drawings, control drawings (showing all control points and sensors), points list and detailed sequences of operation for each piece of equipment and system to be controlled (inclusive of any local, stand-alone system controls). The system sequence of operation shall fully describe their equipment components and functionality, including setpoints, failure modes and alarm functions. The detailed sequence of operation shall be provided regardless of the completeness and clarity of the sequences in the controls specification and/or drawings. Electronic files are acceptable.

1.9. SUBMITTAL REQUIREMENTS FOR COMMISSIONING

A. Trade Subcontractor Commissioning Forms. The Trade Subcontractors shall submit to the CxA all applicable representative, blank forms and plans for IV, Startup and PFCT tasks for the project (as listed in 1.8 Trade Subcontractor Responsibilities), at least 4 weeks in advance of performing any of these tasks.

1. The draft SRC forms issued by the CxA will list the required IV, Startup and PFCT forms and plans, required for this project. The Trade Subcontractor shall review the draft SRCs
to ensure all applicable, representative IV, Startup and PFCT forms and plans have been submitted for the CxA review.

2. The CxA will review these submitted commissioning forms including whether all project specific requirements are included.

3. The CxA may request additional data, changes and/or additions to these forms to confirm application prior to their use. If the Trade Subcontractor cannot submit sufficient forms, the CxA will provide forms based on the construction documents and specifications, manufacturer installation manuals and procedures, and/or industry standards or guidelines.

B. Training Agenda. The Trade Subcontractors shall develop a Training Agenda for each training session, per the requirements of the contract documents and specifications, and the LEED Enhanced Commissioning requirements, and may include both operations and maintenance (O&M) staff training and occupant training. The Training Agenda shall be included in the comprehensive Training Plan to be submitted by the GC for review by the CxC, Design Professionals, and/or the Owner (see Section 01910, General Commissioning Requirements). The GC and Trade Subcontractors shall coordinate to fully develop the comprehensive Training Plan with input from the Owner.

1. The Training Agenda for each training session shall include the following:
   a. equipment and/or systems covered;
   b. recommended attendees;
   c. proposed location;
   d. estimated duration;
   e. level of instruction to be provided and an outline of the training topics and subjects to be covered;
   f. list of any materials and handouts to be provided (or provided in advance);
   g. company to provide the training and the instructor’s name and qualifications.

PART 2 - PRODUCTS – NOT USED

PART 3 - EXECUTION

3.1. MEETINGS, SCHEDULING AND COORDINATION

A. See Section 01910, General Commissioning Requirements.

3.2. DOCUMENTATION

A. The Trade Subcontractors have specific responsibilities for assisting in the development of equipment check, test and verification procedures and forms, and in performing and documenting commissioning tests, as directed by the CxC and as overseen by the CxA.

B. The Trade Subcontractors shall provide, wherever the Contract Documents require, system checks and testing, test reports, factory test data and reports, checklists, operational verifications and demonstration, etc., whether specified or not in the commissioning sections.
3.3. TEST EQUIPMENT

A. The Trade Subcontractor shall provide all test equipment in sufficient quantities to execute all Pre-Functional and Functional Performance Tests in an expedient fashion.

B. The test equipment shall be of industrial quality and suitable for testing and calibration with accuracy within the tolerance necessary to demonstrate system performance per the Contract Documents.

C. The test equipment shall have calibration certification per equipment manufacturer’s interval level or within one year if not otherwise specified. The calibration tags shall be affixed or certificates readily available for all test equipment.

3.4. SYSTEM READINESS: INSTALLATION VERIFICATION, STARTUP, PRE-FUNCTIONAL CHECKS & TESTS

A. The Trade Subcontractors shall conduct all startup procedures and tests without compromise to human or equipment safety. The GC and Trade Subcontractors shall be responsible for the liability and safety of conducting all startup, checks and tests.

B. The Trade Subcontractors shall clearly identify and list any issues and deficiencies resulting from the IV, Startup and PFCT tasks on the associated forms and immediately notify the CxA. The CxA will additionally document the issues on the Cx Log. Once issues and deficiencies are corrected and verified, the associated forms shall be updated and resubmitted, and any necessary field review, back-checks or re-tests witnessed by the CxA.

C. The CxC and Trade Subcontractors shall provide a minimum 10 days’ notice to the CxA for witnessing equipment Startup and PFCT tasks.

1. The sample rates for the CxA witnessing of irrigation system piping PFCT tasks, will be defined in the Cx Plan.

D. The GC and Trade Subcontractors shall ensure the completion of the SRC forms. Review and approval of the completed SRC forms by the CxA is required prior to conducting the FPTs.

3.5. FUNCTIONAL PERFORMANCE TESTS

A. The Trade Subcontractors shall perform all FPTs per the final FPT forms. The FPTs shall be witnessed by the CxA. The Trade Subcontractors may need to complete off hours or weekend work in order to complete the FPTs.

B. The CxA will document all testing results on the FPT forms.

C. As outlined in the Part 1 general commissioning process, a sampling approach shall be used for the FPTs of identical systems and equipment, as defined in the specification herein and/or the Cx Plan, with the specific systems and equipment selected by the CxA.

D. The Trade Subcontractors shall determine what level of pre-testing is appropriate in order to prepare for the CxA witnessed FPTs.

E. The CxC and Trade Subcontractors shall coordinate all FPTs with the CxA, and provide a minimum of 10 days’ notice prior to conducting each test.
F. The GC and Trade Subcontractors shall have responsibility for the liability and safety of conducting all functional performance tests.

G. The Trade Subcontractor executing the test shall provide all necessary materials, system modifications, etc. to produce the necessary flows, pressures, temperatures, etc. to execute the test according to the test procedures.
   1. The Trade Subcontractors shall provide any necessary control system global or system level commands and setpoint adjustments necessary to conduct the testing as called out in the FPT procedures.

H. At completion of the test, the Trade Subcontractor shall return all affected equipment and systems to their pre-test normal condition.

3.6. COMMISSIONING ISSUES, BACK-CHECKS AND RE-TESTS

A. When Cx issues are identified during testing, the CxA will discuss with the executing Trade Subcontractor and/or CxC and determine whether or not testing can proceed. The CxA may allow immediate correction of minor issues and deficiencies identified during testing. The Cx issue and any identified resolution will be documented on the test form in use in addition to the Cx Log.

B. The CxA will maintain and update the Cx Log, and document the issue resolution process. Copies will be distributed to the GC, Owner, and Trade Subcontractors as appropriate. The Trade Subcontractors shall provide updates and comments regarding issue status and resolution.

C. The Trade Subcontractors shall promptly correct all Cx issues. The responsible party shall correct the issue and inform the CxC and CxA of the resolution and completion date, and update the Cx Log accordingly (in the fields assigned for contractor updates).

D. The CxA will record completion on the Cx Log after a successful witnessed re-test, field review, back-check, verification obtained through appropriate documentation or photographs, or acceptance by the Design Professional or Owner. The CxC shall reschedule any applicable re-testing with the CxA and Trade Subcontractor. The Trade Subcontractor shall retest until achievement of passing performance or Owner acceptance of the noted issue.
   1. Where sampling is used for the PFCTs and FPTs, the results shall be deemed acceptable once all noted issues are resolved and any new sample tests or checks have passed.

E. Additional parties may require input during a dispute regarding a Cx Issue. Regardless of the validity or responsibility of the issue, the CxA will have the final interpretive authority on Cx issues and the Owner will have the final approval authority.

F. The CxA may recommend solutions to Cx issues. However, the GC and Trade Subcontractors ultimately have the burden of responsibility to solve, correct and perform required retests.

G. Back-checks, Verifications and Re-testing:
   1. The CxA will witness one (1) re-test or will perform one (1) field back-check or verification of any Cx issue.
   2. The CxA’s total onsite time for re-test witnessing and field verification or back-check of Cx issues will be limited to no more than 2 work days (full 8-hour work days) for all applicable systems in the commissioning scope.
   3. The Owner may back-charge the GC for any additional fees from the CxA, resulting from any additional re-testing or field back-checks or verifications beyond this allocated total time.
4. The CxC must provide a minimum 48 hours’ notice for scheduling any re-testing, though the CxA will attempt to accommodate a shorter timeframe if feasible.

5. Any required re-testing shall not be considered a justified reason for a claim of delay or for a time extension.

H. For any re-testing required, the CxA will determine if the entire test must be re-tested or if it is acceptable to re-test specific portions of the test that had failed.

3.7. DEFERRED & SEASONAL TESTING

A. Before or during the end of the first year warranty period, the Trade Subcontractor shall complete any seasonal or deferred testing, required per the design specifications and as defined in the Cx Plan. The Trade Subcontractors shall complete tests in the same manner as all other commissioning tests, including CxA witnessing.

B. The CxC and Trade Subcontractor shall coordinate with CxA and Owner and schedule all deferred and seasonal testing.

3.8. TRAINING VERIFICATION

A. The CxC and Trade Subcontractors shall coordinate and schedule the training for the Owner’s facility and operations personnel, and building occupants. The CxC shall ensure that training is completed per the requirements of the contract documents and specifications.

B. Trade Subcontractors responsible for specific equipment and system training shall submit to the CxC, a written training agenda for each training class for the equipment and systems to be commissioned. The GC shall submit a comprehensive Training Plan, including the specific training agendas, to Owner, Design Professionals and CxA for review and approval. See also Section 01910, General Commissioning Requirements.

C. The CxA will review the Training Plans for commissioning verification prior to conducting the actual training.

D. For verification of actual training conducted, the CxC shall submit to CxA ‘attendee signed’ attendance sheets for each training session conducted and a copy of any final training presentations or handout materials.

3.9. COMMISSIONING ACCEPTANCE, CLOSE-OUT AND REPORTING

A. Completion of the main commissioning activities (system readiness checks, functional performance testing, and training) shall be accomplished as a prerequisite for substantial completion. Completion of any re-testing shall be completed prior to final acceptance of commissioning.

B. After completion of the main commissioning activities and following review of the completed commissioning documents, test results and the current Cx Log with the Owner, the Owner will indicate whether they accept completion of the project construction phase commissioning or if not, the requirements for acceptance. Upon Owner acceptance, any remaining open Cx issues will be transferred to the warranty phase Cx Log for tracking resolution and completion as part of the warranty phase commissioning.
C. Upon completion of all commissioning activities, the CxA will prepare and submit to the Owner a Cx Report detailing all completed commissioning activities and documentation. The CxC shall support this effort by providing all GC and Trade Subcontractor commissioning documentation.

D. The CxA will complete a Systems Manual for the systems and equipment commissioned, following the LEED requirements, with assistance provided by the CxC and Trade Subcontractors. The Systems Manual will provide the operating staff the information needed to understand and optimally operate the commissioned systems. It will also include the current facility requirements, a high-level O&M plan, and an ongoing commissioning plan.

3.10. POST-OCCUPANCY WARRANTY PHASE COMMISSIONING

A. The Trade Subcontractors shall execute any defined seasonal or deferred FPTs, witnessed by the CxA.

B. The CxA will report any identified issues and recommendations to the CxC via a Warranty Phase Cx Log for review and resolution by the GC and Trade Subcontractors prior to the end of the warranty period, for any issues or recommendations identified either by the CxA or the Owner. The CxC shall work with the Trade Subcontractors and O&M staff to make corrections and adjustments as required to address the issues and recommendations.

C. Key representatives from the GC and Trade Subcontractors shall attend a near end of warranty commissioning review meeting, to be scheduled with the Owner’s facility staff and the CxA, no later than either 10 months after substation completion or two months prior to the expiration of the first 12-month warranty period of building occupancy.

   1. During this meeting, the operation of the systems will be discussed with the Owner’s staff, the results of any commissioning trend analysis will be reviewed and the warranty phase Cx Log will be reviewed. If needed, a walk-through of the systems with the Owner’s staff will be conducted.

   2. Next steps and actions items for any open Cx issues and recommendations will be discussed and documented via meeting minutes or a field report issued by the CxA. The intent is to resolve any open Cx issues prior to the end of the warranty phase.

D. After correcting noted Warranty Phase Cx issues, the CxC shall notify the CxA, and the CxA will back-check and verify resolution of the Cx issues and recommendations.

E. Issues identified during the warranty period will remain warranty phase Cx issues until satisfactory completion by Trade Subcontractors, even if the warranty period expires during the correction and back-check period.

END OF SECTION
SECTION 321132 - AGGREGATE BASE COURSE

PART 1 - GENERAL

1.1 SECTION INCLUDES

   A. Aggregate base.
   B. Lime stabilization.

1.2 RELATED SECTIONS

   A. Section 312300, Structural Excavation and Fill
   B. Section 321216, Asphalt Paving
   C. Section 320523, Portland Cement Concrete Paving

1.3 RELATED DOCUMENTS

   A. Geotechnical Report.
   B. Caltrans Standard Specifications:
      1. Section 26, Aggregate Bases.
   C. ASTM:
      1. D 1557, Test Method for Laboratory Compaction Characteristics of Soil Using Modified Effort.

1.4 DEFINITIONS

1.5 SUBMITTALS

   A. Follow Submittal procedure outlined in Division 0 – General Conditions and Division 1 – General Requirements.
   B. Submit material certificates signed by the material producer and the Contractor, certifying that that each material item complies with, or exceeds the specified requirements.

1.6 QUALITY ASSURANCE

   A. Conform to these Specifications and Section 19 of Caltrans Standard Specifications.
   B. Finish surface of the prepared subgrade to receive aggregate base, shall be as specified in
Section 31 23 00.

C. Finish surface of material to be stabilized prior to lime treatment shall be as specified in Section 24-1.04 of Caltrans Standard Specifications.

D. Finish surface of the stabilized material after lime treatment shall be as specified in Section 24-1.08 of Caltrans Standard Specifications.

E. Do not project the finish surface of aggregate base above the design subgrade.

F. Finish surface of aggregate base shall be 0 to 0.05-feet.

G. Finish surface of cement treated base shall be as specified in Section 27 of Caltrans Standard Specifications.

H. Percentage of compaction specified shall be the minimum acceptable. The percentage represents the ratio of the dry density of the compacted material to the maximum dry density of the material as determined by the procedure set forth in ASTM Designation D1557.

PART 2 - PRODUCTS

2.1 FILL MATERIAL

A. If fill material is required to restore the previously constructed subgrade to its proper elevation, provide structural fill material specified in Section 31 23 00.

2.2 AGGREGATE BASE

   1. Class 2, 3/4-inch Maximum: Section 26-1.02A.

2.3 LIME STABILIZATION

A. Lime Treat Material per Geotechnical recommendation and field investigation if required.

PART 3 - EXECUTION

3.1 SOIL STERILANT

A. Furnish and apply to areas indicated in accordance with Section 31 23 00.

3.2 AGGREGATE BASE

A. Watering, Spreading & Compacting: Section 26-1.035, 26-1.04 and 26-1.05 of Caltrans Specs
3.3 LIME STABILIZATION

A. Performing the stabilization shall conform with Geotechnical recommendations.

END OF SECTION
SECTION 321312 - SITE CONCRETE

PART 1 - GENERAL

1.1 DESCRIPTION

A. Provide Portland cement concrete site work complete, including the following principal items:
   1. Retaining walls, stairs, seat walls.
   2. Curbs, walks and pavements, including aggregate bases.
   3. Footings for posts and structures.
   4. Integrally colored cast-in-place concrete

B. Related requirements specified elsewhere include:
   1. Section 312300, EXCAVATION & FILL
   2. Section 312305, STRUCTURAL EXCAVATION & FILL
   3. Section 321132, AGGREGATE BASE COURSE
   4. Section 334100, STORM DRAINAGE SYSTEMS

1.2 RELATED DOCUMENTS

A. Soils Reports: “Geotechnical Engineering Investigation Report, C-4016 New Allied Science Building, Contra Costa College, 2600 Mission Bell Drive, San Pablo, California.” Kleinfelder Project No.: 20181569.001A, dated: October 17, 2017, including:
   1. Addendum Letters No. 1 and No 2. Dated March 2 and March 14, respectfully.

B. Reference and Standards
   1. Perform work in accordance with all applicable laws, codes and regulations required by State of California.
   2. Reference to "Standard Specifications" shall mean the current Standard Specifications of the State of California, Business and Transportation Agency, Department of Transportation, CALTRANS.
   3. The American Concrete Institute (ACI): "Manual of Concrete Practice," Parts 1, 2 and 3.
   4. The American Concrete Institute (ACI): “Recommended Practice for Concrete Formwork” (ACI 347R)
   5. The American Concrete Institute (ACI): "Hot Weather Concreting", 305R-99
   6. The American Concrete Institute (ACI): Guide for Concrete Slab construction, 302.1R-07
   10. West Coast Lumber Inspection Bureau's “Standard Grading Rules No. 17” (WCLIB)
   11. Concrete Reinforcing Steel Institute (CRSI): “Manual of Standard Practice” and “Recommended Practice for Placing Reinforcing Bars”.
   13. Americans with Disabilities Act (ADA), Federal ADA/State of California Title 24 Standards.

C. Stipulations

1. Finish Surface Tolerance: 1/4-inch maximum variation in 10 feet.
2. At no point shall paving surface fail to drain.
3. Finish Concrete Surface Slip Resistance: Shall have a minimum slip resistance coefficient of 0.65 on concrete pavement with less than 5% slope and 0.8 on concrete pavement with more than 5% slope.
4. Walls retaining soil that retain 30 inches or more of soil shall include a subsurface drain behind wall per Section 68 of the Standard Specifications and as accepted by the Owner's Representative. Drain line shall be connected to storm drain system as accepted by Owner's Representative.
5. Walls retaining soil that retain 18 inches or more of soil shall receive Dampproofing per Caltrans Standard Specifications, Section 54.
6. Contractor shall pour adjacent slabs in a way that does not impact finish quality or construction (expansion) joint dimensional stability.

D. Testing and Inspection, per Section 014500.

E. Conform to ACI 318, Section 5.13 during hot weather and to ACI 318, Section 5.12 during cold weather.

F. Requirements of ACI 318 shall govern work, materials and equipment related to this Section; specifications herein set minimum results required, and references to procedures are intended to establish minimal guides.

G. The Contractor shall be responsible for quality of concrete in place and shall bear burden of proof that concrete meets minimum requirements. Contractor shall confirm that site soils do not contain elevated levels of sulfate that would require sulfate resistant concrete as outlined in Table 4.3.1 of the ACI 318 Building Code or Table 19B-A-3 of the Uniform Building Code. If the site soils contain elevated levels of sulfate, it is the Contractor's responsibility to request mixes that meet the aforementioned requirements.

H. Placing of concrete by means of pumping will be an acceptable method of placement providing that the Contractor can demonstrate that:

1. Specified concrete strengths will be met.
2. Equipment has a record of satisfactory performance under similar conditions and using a similar mix.
3. Trial batches have been successfully made.

I. Installer Qualifications: Concrete work shall be by firm with 5 years experience with work of similar scope and quality.

J. Formwork Design Criteria: Formwork shall conform to ACI 318, Section 6.1 and CBC Section 1906A.

1. Formwork:
   a. Shall prevent leakage or washing out of cement mortar.
   b. Shall resist spread, shifting, and settling.
   c. Shall reproduce accurately required lines, grades and surfaces within tolerances specified.
2. Safety: The Contractor shall be responsible for adequate strength and safety of all formwork including falsework and shoring.

3. Formwork allowable tolerances: Formwork shall produce concrete within tolerance limits recommended in ACI 318, Section 6.1, unless otherwise noted.

1.3 TESTS

A. The Owner will select a qualified testing laboratory to take samples for testing during the course of the work as considered necessary. Costs for such tests will be paid by the Owner. Contractor shall cooperate in arranging tests and shall be responsible for notifying the designated laboratory in sufficient time to allow taking of samples at time of pour.

B. Should tests show that concrete is below specified strength, Contractor shall remove all such concrete, as directed by the Owner. Full cost of removal of low strength concrete, its replacement with concrete of proper specified strength and testing, shall be borne by Contractor.

1.4 COORDINATION

A. Coordinate items of other trades. Contractor shall be responsible for the proper installation of all accessories embedded in the concrete and for the provision of holes, openings, etc., necessary to the execution of the work of the trades.

1.5 SUBMITTALS, per Section 013300.

A. Samples of all materials under this Division shall be supplied for testing as requested by the Owner.

B. Material certificates in lieu of material laboratory test reports when permitted by Engineer. Material certificates shall be signed by manufacturer and Contractor certifying that each material item complies with or exceeds requirements. Provide certification from admixture manufacturers that chloride content complies with requirements.

C. Submit color additive manufacturer’s color chart and sample chip(s), indicate color additive number and required dosage rate.

D. Submit full-scale mock-up (minimum 4’ by 4’) sample panels of all concrete finishes and color. The samples shall include curing compound if any is to be used, and include an expansion joint and a score joint, as indicated on the Drawings. Approved samples shall be kept at the job site to serve as a prerequisite for all finishes until acceptance of the Work.

E. Submit one pint samples of aggregate for exposed aggregate finished concrete paving in color range as specified.

1.6 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Supply ready mixed concrete throughout. Batch, mix and transport in accordance with ASTM C-94, "Specifications for Ready Mixed Concrete."
B. Mix and deliver concrete in quantities that will permit immediate use only.

C. Indiscriminate addition of water for any reason will be cause for rejection of the load.

1.7 LEED REQUIREMENTS

A. Cast-in-place concrete shall contain a minimum of fly ash by weight as indicated in concrete mix design.

1.8 LEED SUBMITTALS

A. Submit certification in a letter indicating percentages by weight of fly ash content for cast-in-place concrete.

B. Submit product data highlighting percentages by weight of fly ash content for cast-in-place concrete.

C. LEED Requirement for cost information submittal requirements.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

A. Cement and aggregates shall have proven history of successful use with one another. Sources of cement and aggregate shall remain unchanged throughout work.

B. Mixes:
1. Ready-mixed concrete shall meet requirements of ASTM C94.
2. The Contractor shall perform tests or assemble the necessary data indicating conformance with specifications.
3. For each mix, submit data showing that proposed mix will attain the required strength in accordance with requirements of Caltrans Standard Specifications, Section 90.
4. Instruct Laboratory to base mix design on use of materials specified and approved by the Owner's Representative.
5. Mix design shall include compression strength test reports per CBC Section 1905A.6.3.
6. Insure mix designs will produce concrete to strengths specified and of uniform density without segregation.
7. If mix yield exceeds 1-cubic yard, modify mix design to no more than one cubic yard, without changing cement content.
8. Introduction of calcium chloride will not be permitted.
9. Mix design shall be in accordance with CBC Section 1905A.3.

C. Concrete Types (See Drawings for any other miscellaneous items not listed below):

### 2.2 FORMWORK MATERIALS

A. For Smooth Form-finished Concrete: Use Medium Density (or better) Overlaid Concrete Form Exterior (MDO), to provide continuous straight, smooth, exposed surfaces without grain patterns. Furnish in largest practicable sizes to minimize number of joints and to conform to a joint system as approved by Owner’s Representative.

B. Curbs may be formed with approved metal form systems.

C. Form Release Agent: Must not stain or otherwise adversely affect architectural concrete surfaces. “Nox-Crete Form Coating”; Industrial Synthetics Corp.’s “Synthex”; or equal.

D. Form Ties: Burke “Penta-Tie,” or equal, cone and rod type with 1-inch break-back.

### 2.3 REINFORCING MATERIALS

A. New, free of rust, Billet steel bars: Current ASTM designation A615.

B. Bar Reinforcement: ASTM A615.
   1. #3 and smaller: Refer to section 320523
   2. #4 and larger: Grade 60.
   3. Tie wire: #6 minimum, black and annealed.

C. Bar Reinforcement recycled content shall be a minimum of 75% recycled post consumer steel.

D. All reinforcing steel, bolts anchors, sleeves, etc. shall be securely anchored in place before concrete is placed. All reinforcing details, fabrication and installation shall conform to ACI Standard 315, latest edition, except as noted. Stagger all splices where practical and not otherwise detailed. Minimum concrete protection for reinforcement shall be as follows unless otherwise noted:
   1. 3” clearance where concrete is placed against the earth.
   2. 2” clearance where concrete is exposed to earth or weather but placed in forms.

E. Accessories: Metal and plaster spacers, supports, ties, etc. as required for spacing, assembling and supporting reinforcing in place. Legs of accessories to be of type that will rest on forms without embedding into forms. Galvanized metal items where exposed to moisture, or use other approved non-corrodible, non-staining supports.

### 2.4 CONCRETE MATERIALS

A. Portland Cement: ASTM C150, Type II, except if water or soil is high in sulfates use Type V Portland Cement as described above under Quality Assurance. Use one brand of cement throughout project.

</tbody>
</table>
B. Fly Ash: ASTM C618,08A.

C. Aggregates: ASTM C33, materials from established sources with proven history of successful use in producing concrete with minimum shrinkage.

D. Aggregate for seeded aggregate finish paving shall consist of 3/8" smooth, hard, fine-grained clean, river run pea gravel mix aggregate. Submit samples for approval as specified herein.

E. Aggregate for washed exposed aggregate finish paving shall consist of 3/4" by #4 smooth, hard, fine-grained clean, river run aggregate. Submit samples for approval as specified herein.

F. Water: Clear and potable, free from deleterious impurities.

G. Admixtures:
   1. Admixtures are optional; however, a water reducer or plasticizing admixture shall be included in the concrete mix and it must be compatible with color pigments where color pigments are required. Any proposed admixture shall comply with ASTM C494.
   2. Where more than one admixture is proposed, include statement from admixture manufacturer indicating that admixtures proposed for use are compatible, such that desirable effects of each admixture will be realized.
   3. Accelerating admixtures and admixtures containing more than 0.05 percent chloride ions are not permitted. If an accelerator is used, it shall be an non-chloride accelerator.
   4. Liquid admixtures shall be considered part of the total water.
   5. Refer to Color Additives/Pigments herein for color admixtures.

H. Color Additives/Pigments: Insoluble minerals, light fast, at least 95 percent passing #325 sieve complying with ASTM C979: Davis Colors, Los Angeles, CA (800) 356-4848; L.M. Scofield Co., Los Angeles, CA (800) 800-9900; or equal. Color(s) as shown on drawings.

2.5 CONCRETE MIXES

A. Concrete mixes shall be approved and shall be in accordance with Caltrans Standard Specifications Section 90. Unless otherwise noted, mix shall contain not less than 590 pounds of cementitious material per cubic yard (Class "2", 3,000 psi,) Type II Portland cement and a maximum aggregate blend of 1" by #4.

B. Cementitious Material: An intimate blend of type II Portland cement and fly ash. Cementitious material shall include 15% maximum fly ash by weight unless the strength is specified to be achieved on 7 or 14 days.

C. Matching existing colored concrete work: Mixes for matching existing colored paving shall be as required to match specified items on site using specified integral color pigments at required rates per 94 pounds of Portland cement. Submit integrally colored sample(s) per Submittals herein.

D. Lampblack: As supplied by batch plant for plain non-colored concrete work. Concrete for non-colored pavements shall be darkened by the addition of lampblack at the mixer. The proportion of lampblack or other approved colorant shall be that required to properly darken the concrete to reduce glare, and shall be subject to the approval of the Owner's Representative. Provide ¾ pound of lampblack per cubic yard of concrete unless required otherwise.
2.6  SPECIAL AGGREGATE FOR EXPOSED AGGREGATE FINISHES

A. Aggregate for exposed aggregate finished concrete paving shall be hard durable aggregate in a color range as accepted by the Owner’s Representative. Submit sample for approval.

2.7  ANCILLARY MATERIALS

B. Expansion Joint Material
   2. Caulked Expansion Joint: “Sonolastic Sealant Two-Part” as manufactured by Sonneborn-Contech, Building Products Division, Contech, Inc.; or approved equal. Joint caps or bond breaker tape to be as recommended by sealant manufacturer. Color shall match adjacent paving.

C. Dampproofing: Per CALTRANS Standard Specifications, Section 54, or approved equal.

D. Subsurface Drain behind Retaining-Type Walls: All concrete walls that retain 30 inches of soil or more shall include a subsurface drainage system to relieve water pressure in accordance with Section 68 of the CALTRANS Standard Specifications and as shown. If no subsurface drain is shown, provide corrugated polyethylene plastic tubing per 68-1.02K surrounded with an envelope of Class 2 permeable material in conformance to Section 68 “Subsurface Drains” of the Standard Specifications, 3/4 inch maximum without fines and wrapped with filter fabric per 68-1.028. Provide black colored rodent-proof slotted cap over exposed outfalls as accepted by Owner’s Representative.

E. Curing Materials for non-colored Concrete:
   1. Waterproof Paper: ASTM C171, Type 1.1.1.1, regular. Same as Sisalkraft Division of St. Regis Paper Co.’s “Orange Label”, or equivalent.
   3. Curing Compound: ASTM C309. Product: Sealtight 1100 Clear-Series by WR Meadows, Burke Azua Resin Cure by Edocol, or equal that will not discolor concrete or affect bonding of other finishes applied thereafter, and which restricts loss of water to not more than 0.500 grams per sq. centimeter of surface when tested per ASTM C156, “Test Method for Water Retention by Concrete Curing Materials.”

F. Curing Compound for Colored Concrete: Water-base acrylic type, free of permanent color, oil or wax, complying with ASTM C309: “W 1000” by Davis Colors, Los Angeles, CA (800) 356-4848; “Cureseal” semi-gloss by L.M. Scofield Co., Los Angeles, CA (800) 800-9900; or equal.

G. Grout: Premixed high strength non-shrink grout requiring only addition of water at the site. Burke’s “Non-Ferrous, Non-Shrink Grout”; Master Builders “Masterflow 928 Grout”, or equal.

H. Patching Mortar: Mix in proportions by volume of one part cement to two parts fine sand. Provide integrally colored patching mortar as required to match color and finish of colored concrete surfaces.
2.8 PERFORATED DRAIN PIPE

A. Polyvinyl Chloride (PVC) pipe and pipe fittings shall meet extra strength minimum of SDR-35 of the requirements of ASTM Specification D3034.

B. Perforated and non-perforated corrugated polyethylene pipe, 3- to 10-inch diameter, shall meet the requirements of ASTM D883 and ASTM F412, and shall conform to Section 68 of the Standard Specifications.

C. Corrugated polyethylene pipe fittings shall comply with all requirements of AASHTO M-252-85I for 3- to 10-inch diameter pipe. Couplings shall be split or snap-on type for perforated pipe and split couplings with gaskets for non-perforated pipe. Cutting pipe with integral couplings will not be allowed.

D. Corrugated polyethylene pipe and fittings manufactured by Advanced Drainage Systems, Inc., shall be considered the standard to determine compliance to this specification.

E. Inspection Tube Cap: Paint cap one coat chocolate-brown color using Flat, exterior grade latex paint as accepted by Owner's Representative.

2.9 FILTER FABRIC / PERMEABLE LANDSCAPE FABRIC

A. Polyester or polypropylene non-woven filter fabric with uniform fiber distribution by "Terra Bond" #1115, "Mirafi, Inc." #140N, or approved equal.

2.10 PERMEABLE DRAIN ROCK

A. Permeable drain rock used in subsurface drain installations to be Class 2 permeable material in conformance with Section 68 "Subsurface Drains" of the Standard Specifications; gradation to 3/4" maximum size. Submit Sample for approval.

PART 3 - EXECUTION

3.1 GENERAL REQUIREMENTS

A. Install all concrete work true to line and grade as indicated on the drawings.

B. Correct irregularities to the satisfaction of the Owner's Representative.

C. Plain non-colored, exposed concrete shall contain lampblack, approximately 3/4 pound of lampblack per cubic yard, as accepted by Owner's Representative.

D. The intent of the Grading Drawings is to provide positive drainage and to maintain slopes on walkways as required by the Americans with Disabilities act and California Title 24 throughout the project site. Notify the Owner's Representative immediately of any discrepancies between the Drawings and actual field conditions and/or conflicts between the design and Code requirements.
3.2 PREPARATION

A. Examine subgrades and installation conditions. Do not start concrete work until unsatisfactory conditions are corrected.

B. Provide subgrade preparation and the base material installation complete, including clearing, grading, excavation, filling and dewatering. Take every precaution to obtain a subgrade of uniform bearing strength, compacted to a minimum of 95% relative compaction as determined by the ASTM D1557 laboratory test procedure and in Sections 19 and 20 of the Caltrans Standard Specifications.

C. Subgrade shall be kept moist and shall not be allowed to dry out before placement of concrete. Place no material on muddy subgrade. Remove un-compactable material and replace with clean fill and compact as required.

D. Aggregate base, where indicated, shall be placed and compacted in conformance with Caltrans Standard Specifications 26-1.04 and 26-1.05.

E. Obtain approval of subgrade from Owner's Representative prior to placing steel and concrete.

3.3 FORMS

A. Forms shall be constructed in accordance with ACI 318, Section 6.1 and shall be of sufficient strength and sufficiently tight to prevent visible distortion or leakage of mortar and fines.

B. Forms for exposed surfaces shall be constructed to protect intended finish. Deflection of facing material between studs shall not exceed 0.0025 of the span. Facing material and pattern of joints shall be as approved by the Owner’s Representative.

C. For vertical surface of wall footings below grade, clean cut trench may be used in lieu of form if character of soil will permit installation without sluffing and width of concrete is increased at least 1 inch beyond indicated dimension of each face poured against earth.

D. Curb and pavement edge forms shall extend full depth of concrete and shall be coordinated with installation of planting root barriers where required. Curves shall be formed with flexible metal or wood made up of thin laminations. Curve forms shall extend one stake space straight beyond tangent point. Where curbs and pavement are adjacent to areas to receive root barriers, provide smooth uniform edges. Remove any excess concrete as required to allow installation of root barriers without gaps between curbs and/or pavement and barriers.

E. Maintain forms within the following tolerances.
   1. Top of Form: Plus or minus 1/8 inch in 10 feet and no abrupt variations; at required elevation to plus 3/8 inch.
   2. Face of Form: Plus or minus 1/4 inch in 10 feet longitudinal and no abrupt variations; perpendicular to surface plus or minus 1/8 inch.

F. Form Ties: Align form ties as accepted by Owner’s Representative. Obtain approval of form work from Owner's Representative prior to placing concrete.

G. Forms may be reused upon cleaning and coating with parting compound to ensure separation from concrete without damage.
H. After concrete is placed, the following minimum times shall elapse before removal of forms.
   1. Walls: 48 hours.
   2. Footing sides: 24 hours.
   3. Curbs: 1 hour

3.4 REINFORCEMENT

A. All concrete footings, walls, grade-beams shall be steel reinforced unless specifically noted to be “not reinforced.” If no reinforcement is shown, reinforce in same manner as that shown in similar places or as accepted by Owner's Representative.

B. Fabricate and place reinforcement as indicated on the Drawings and in accordance with ACI "Detailing Manual" SP-66. No reinforcement shall be placed prior to distribution of the approved shop drawings.

C. Secure reinforcement in position by suitable supports and by wiring at intersections with tie wire. Supports shall be of sufficient number and strength to resist crushing or displacement under full load. Metal shall not extend to surface of concrete.

D. At time of placing concrete, reinforcing shall be free of excessive rust, mill scale, or other bond reducing matter. Immediately before placing concrete, check and adjust position, support and anchorage.

3.5 CLEANING, PATCHING AND DEFECTIVE WORK

A. Where concrete is under strength, out of line, level or plumb, or shows objectionable cracks, honeycombing, rock pockets, voids, spalling, exposed reinforcement, signs of freezing, mismatched color, or is otherwise defective, and, in the Owner's Representative’s judgment, these defects impair proper strength or appearance of the work, the Owner's Representative will require its removal and replacement at the Contractor's expense.

B. Immediately after stripping and before concrete is thoroughly dry, patch minor defects, form-tie holes, honeycombed areas, etc., with patching mortar colored and textured to match concrete. Remove ledges and bulges.

C. Compact mortar into place and neatly file defective surfaces to produce level, true planes. After initial set, dress surfaces of patches mechanically or manually to obtain same texture as surrounding surfaces.

D. Rock Pockets:
   1. Cut out to full solid surface and form key.
   2. Thoroughly wet before casting mortar.
   3. Where the Owner’s Representative deems rock pocket too large for satisfactory mortar patching as described, cut out defective section to solid surface, and replace.

E. Cleaning
   1. Insure removal of bituminous materials, form release agents, bond breakers, curing compounds, if permitted and other materials employed in work of concreting that would otherwise prevent proper application of sealants, liquid waterproofing, and other delayed finishes and treatments.
2. Where cleaning is required, take care not to damage surrounding surfaces or leave residue from cleaning agents.

3.6 MIXING AND PLACING CONCRETE

A. Conform to applicable requirements set forth in Caltrans Standard Specifications Section 51-1.09 and Section 90.

B. Mixes for integrally colored concrete shall have pigment added early enough to ensure complete dispersal and uniform color, but not less than 15 minutes before placing.

3.7 JOINTS AND GROOVES IN FLAT WORK

A. Plane of joints shall be perpendicular to surface. Where new pavements join existing, joints shall align.

B. Sawn Contraction Joints:
   1. General: Provide where shown. Saw cut straight, true, and uniform, (1/8 -inch wide 1/4-inch-wide) and not less than 1/4 of slab thickness in depth, unless otherwise noted. Cut with a power saw fitted with an abrasive or diamond blade.
   2. Commence saw cutting operations after concrete has cured long enough to resist damage by the saw cutting operations and early enough to avoid random contraction cracks.
   3. Contractor shall coordinate form removal and sequencing of adjacent concrete placement to minimize unnecessary saw cutting of adjacent surfaces.
   4. Contractor shall plan for the use of varying types of saw cutting apparatus to provide acceptable finishes in areas limited in accessibility.
   5. Fill saw cut over-runs and inadvertent saw cutting of adjacent surfaces with cement mortar to match color and finish of sawn pavement.
   6. If the joint pattern is not shown, provide joints not exceeding 6 feet in either direction and located to conform to column centerlines, wall corners, etc. as accepted by Owner’s Representative.

C. Tooled Joints / Score Joints
   1. Form joints in fresh concrete using a jointer to cut the groove so that a smooth, uniform impression is obtained to 1/4 depth of pavement unless shown otherwise.
   2. All joints shall be struck before and after brooming. Tool concrete both sides of joint.
   3. If joint pattern is not shown, provide joints not exceeding 6 feet in either direction and located to conform to column centerlines, wall corners, etc. as accepted by Owner’s Representative.

D. Expansion Joints in Flat Work: Provided at the location and intervals as shown on the drawings, and at all locations where concrete paving abuts buildings, curbs, walls, columns, or other structures, and not more than 16 feet on center. Specified and shown joint material shall be placed with top edge 1/8" below the paved surface, and shall be securely held in place to prevent movement. Joint and other edges shall be formed in the fresh concrete using an edging tool to provide a smooth uniform impression. All edges shall be struck before and after brooming.
E. Sealed Joints: After the curing period, expansion joints shall be carefully cleaned and filled with approved joint sealant to just below adjacent paved surface in such a manner as to avoid spilling on paved surfaces or overflowing from joint.

3.8 JOINTS AND GROOVES IN WALLS

A. Provide control joints (weakened plane) in walls as shown on Drawings, and not to exceed 16 feet on center. Provide control joint both sides of wall opposite one another and connected across the top unless shown otherwise. If joint is omitted on top of wall, add bridging rebars to reduce cracking as accepted by Owner's Representative.

3.9 JOINTS AND FINISH OF STAIRS

A. General: Provide field scoring (control joints) of all exterior stair treads, slabs adjacent to the highest and lowest tread in a run of stairs, and at intermediate landings.

B. Scoring Layout: Provide matching pattern at all locations,

C. Finish: match adjacent paving

D. Stair Nosing Strip: Provide nosing strip as shown on drawings. Install per manufacturer’s recommendations. After installation remove dirt, grease, loose mortar, scale, salts, alkalies, and any other detrimental substances. Nosing Strip to conform to the following requirements

2. Setback from Sides: 2 inches maximum.
3. Overall Width including setback from nosing: 4 inches.

3.10 FINISHING

A. Flatwork and Curbs

1. Surface Finishes
   a. Float Finish (typical preliminary finishing for slabs to receive other finishes): The surface of the slab shall be screeded and all surface water and laitance removed. Floating shall be started as soon as the screeded surface has stiffened sufficiently. Floating shall be performed by hand using a wood float and shall be the minimum necessary to produce a relatively smooth, level, even-textured surface.
   b. Medium Broom Finish: Obtain by drawing a stiff bristled broom across a floated finish for a nonslip surface. Perform brooming while concrete is still wet enough to receive broom marks to match approved sample. Direction of brooming to be perpendicular to direction of work or as otherwise shown on the drawings.
   c. Brush Finish (typical for curbs): After the front form is removed, exposed surface shall be troweled smooth and then given a uniform light texture with fine brush parallel to line of curb, to match approved sample.
   d. Steel Trowel Finish: After surface water disappears and floated surfaces sufficiently hardened, steel trowel and retrowel to smooth surface. After concrete has set enough to ring trowel, retrowel to a smooth uniform finish free of trowel marks or other blemishes. Avoid excessive troweling that produces burnished areas.
e. Exposed Aggregate: Perform in as continuous an operation as possible, utilizing the same work crew to maintain continuity of finish.
   1) Use an surface retarder to expose the aggregate and surrounding matrix surfaces to match sample panel, as follows:
      a) Light Cut: approximately 1/16" depth
      b) Medium Cut: approximately 1/8" to 3/16" depth
      c) Heavy Cut: approximately 1/4" to 5/16" depth

3.11 DAMPPROOFING

A. Mop apply one heavy coat of asphalt dampproofing to soil side of retaining walls and planter walls from top of wall footing to a minus 2 inches below finished soil grade.

3.12 CURING

A. Cure non-colored exposed concrete in accordance with Caltrans Standard Specifications Section 90-7.

B. Cure colored exposed concrete using Curing Compound for Colored Concrete as specified herein.

C. When applying Curing Compound, apply after initial set of fresh concrete when bleed water has evaporated from surface using a "Hudson-type" airless sprayer in accordance with manufacturer’s specifications.

D. Only water or curing compounds which impart no permanent color or gloss shall be used for curing concrete.

3.13 CLEANUP: Per Section 017700.

END OF SECTION
SECTION 321216 - ASPHALT CONCRETE PAVEMENT

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Prime coat.
B. Tack coat.
C. Asphalt concrete paving.
D. Asphalt concrete overlay.
E. Asphalt curbs.
F. Pavement grinding.
G. Adjusting manholes, valves, monument covers and other structures to grade.

1.2 RELATED SECTIONS

A. Section 32 11 32, Aggregate Base.

1.3 RELATED DOCUMENTS

A. ASTM:

B. Caltrans Standard Specifications.
   1. Section 39: Asphalt Concrete.
   2. Section 88: Engineering Fabrics.
   4. Section 93: Liquid Asphalts.
   5. Section 94: Asphaltic Emulsions.
1.4 DEFINITIONS

1.5 QUALITY ASSURANCE
A. Testing Agency: District’s Representative will engage a qualified independent testing agency to perform field inspections and tests and to prepare test reports.
   1. Testing agency will conduct and interpret tests and state in each report whether tested work complies with or deviates from specified requirements.

B. Additional testing, at Contractor’s expense, will be performed to determine compliance of corrected Work with specified requirements.

C. Thickness of Asphalt Concrete: In-place compacted thickness of asphalt courses will be determined according to ASTM D 3549.

D. In-Place Density: Samples of uncompacted paving mixtures and compacted pavement will be secured by testing agency according to ASTM D 979.
   1. Reference maximum theoretical density will be determined by averaging results from 4 samples of hot-mix asphalt-paving mixture delivered daily to site, prepared according to ASTM D 2041, and compacted according to job-mix specifications.
   2. In-place density of compacted pavement may be determined by testing core samples according to ASTM D 1188 or ASTM D 2726.
      a. One core sample may be taken for every 1000 sq. yd. or less of installed pavement, but in no case will fewer than 3 cores be taken.
      b. Field density of in-place compacted pavement may also be determined by nuclear method according to ASTM D 2950 and correlated with ASTM D 1188 or ASTM D 2726.

1.6 SUBMITTALS
A. Follow Submittal procedure outlined in Division 0 – General Conditions and Division 1 – General Requirements.

B. Job-Mix Designs: Certificates signed by manufacturers certifying that each asphalt concrete mix complies with requirements.

C. Material Certificates: Certificates signed by manufacturers certifying that each material complies with requirements.

1.7 PROJECT CONDITIONS
A. Environmental Limitations:
   1. Prime Coat: Minimum surface temperature of 60 deg F at application.
   2. Tack Coat: Minimum surface temperature of 60 deg F at application.
   3. Asphalt Concrete: Minimum atmospheric temperature of 50 deg F at application.
   4. Reinforcing Fabric: Air temperature is 50 deg F and rising and pavement temperature is 40 deg F and rising.
PART 2 - PRODUCTS

2.1 ASPHALT CONCRETE

A. Caltrans Standard Specifications Section 39, Type B.

B. Asphalt Materials:
   3. Tack Coat: Caltrans Standard Specification Section 94, SS1 or SS1h.

F. Sand: ASTM D 1073, Grade No. 2 or 3.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that subgrade is dry and in suitable condition to support paving and imposed loads.

B. Proof-roll subbase using heavy pneumatic-tired rollers to locate areas that are unstable or that require further compaction.

C. Notify District’s Representative in writing of any unsatisfactory conditions. Do not begin paving until these conditions have been satisfactorily corrected.

3.2 PAVEMENT GRINDING

A. Clean existing paving surface of loose or deleterious material immediately before pavement grinding.

B. Grind conforms as indicated.

3.3 SURFACE PREPARATION FOR AGGREGATE BASE MATERIALS

A. General: Immediately before placing asphalt materials remove loose and deleterious material from substrate surfaces and ensure that prepared subgrade is ready to receive paving according to the Caltrans Standard Specification Section 39-4.01.

B. Prime Coat: Apply uniformly over surface of compacted-aggregate base according to the Caltrans Standard Specification Section 39-4.02. Apply enough material to penetrate and seal, but not flood, surface. Allow prime coat to cure for 24 hours minimum.
1. If prime coat is not entirely absorbed within 8 hours after application, spread excess prime coat with hand tools and broadcast sand over surface to blot excess asphalt. Use just enough sand to prevent pickup under traffic. Remove loose sand by sweeping before pavement is placed and after volatiles have evaporated.
2. Protect primed substrate from damage until ready to receive paving.

C. Tack Coat: Apply uniformly to all vertical surfaces against which asphalt concrete is to be placed, including existing surfaces of previously constructed asphalt or portland cement concrete paving and to surfaces abutting or projecting into new asphalt pavement, according to the Caltrans Standard Specification Section 39-4.02.
   1. Allow tack coat to cure undisturbed before paving.
   2. Avoid smearing or staining adjoining surfaces, appurtenances, and surroundings. Remove spillages and clean affected surfaces.

3.4 SURFACE PREPARATION FOR PAVEMENT AT ASPHALT CONCRETE OVERLAYS

A. Pavement Irregularities: Level with asphalt concrete, Type B, No. 4 maximum.

B. Pavement Cracks:
   1. Less than ¼-inch wide: Clean of all dirt by compressed air jet, spray and seal with RS-1 asphaltic emulsion.
   2. Wider than ¼-inch: Clean of all dirt by compressed air jet, spray and seal with RS-1 asphaltic emulsion and skin patch.

C. Clean surface of all material, such as leaves, dirt, sand, gravel, water and vegetation prior to applying binder of paving asphalt to existing surface.

3.5 PAVEMENT REINFORCING FABRIC

A. Protect from exposure to ultraviolet rays until placed.

B. Reject rolls with broken or damaged cores, or factory wrinkled fabric that prevents wrinkle free placement.

C. Place with binder of paving asphalt in accordance with Section 39-4.03 of Caltrans Standard Specifications.

3.6 ASPHALT CONCRETE SPREADING AND COMPACTING EQUIPMENT

A. Spreading Equipment: Caltrans Standard Specification Section 39-5.01.

3.7 ASPHALT CONCRETE PLACEMENT

A. Place, spread and compact asphalt concrete to required grade, cross section, and thickness according to the Caltrans Standard Specification Sections 39-6.01, 39-6.02 and 39-6.03.
B. Promptly correct surface irregularities in paving course behind paver. Use suitable hand tools to remove excess material forming high spots. Fill depressions with hot asphalt to prevent segregation of mix; use suitable hand tools to smooth surface.

3.8 JOINTS

A. Construct joints to ensure continuous bond between adjoining paving sections according to the Caltrans Standard Specification Sections 39-6.01 and 39-6.02.
   1. Construct joints free of depressions with same texture and smoothness as other sections of asphalt course.
   2. Clean contact surfaces and apply tack coat.
   3. Offset longitudinal joints in successive courses a minimum of 6 inches.
   4. Offset transverse joints in successive courses a minimum of 24 inches.
   5. Compact joints as soon as asphalt concrete will bear roller weight without excessive displacement.

3.9 COMPACTION

A. General: Begin compaction as soon as placed hot-mix paving will bear roller weight without excessive displacement. Compact according to the Caltrans Standard Specification Sections 39-6.01 and 39-6.03.

B. Compaction Requirements: Average Density to be 92 percent of reference maximum theoretical density according to ASTM D 2041, but not less than 90 percent nor greater than 96 percent.

C. Finish Rolling: Finish roll paved surfaces to remove roller marks while asphalt is still warm.

D. Edge Shaping: While surface is being compacted and finished, trim edges of pavement to proper alignment. Bevel edges while still hot, with back of rake or smooth iron. Compact thoroughly using tamper or other satisfactory method.

E. Repairs: Remove paved areas that are defective or contaminated with foreign materials and replace with fresh asphalt. Compact by rolling to specified density and surface smoothness.

F. Protection: After final rolling, do not permit vehicular traffic on pavement until it has cooled and hardened. Erect barricades to protect paving from traffic until mixture has cooled enough not to become marked.

3.10 ASPHALT CURBS

A. Construction: Place over compacted surfaces according to Caltrans Standard Specification Section 39-7.01 as specified for dikes. Apply a light tack coat prior to construction, unless pavement surface is still tacky and free of dust.

B. Shape: Place asphalt concrete to curb cross section indicated.

3.11 ADJUSTING MANHOLES, VALVES, MONUMENT COVERS AND OTHER STRUCTURES TO GRADE
A. Remove pavement, using vertical cuts, as needed to remove frame and provide for concrete collar. Do not damage adjacent pavement.
   1. Circular Covers: Cut circle with radius 6 inches larger than cover and concentric with cover.
   2. Rectangular Covers: Cut rectangle 6 inches larger than cover on all sides.

B. Install grade rings or blocking as needed to raise cover to finish grade.

C. Pour concrete collar:
   1. Bottom of Collar: Top of existing collar or 6 inches below top of proposed collar, whichever is at a higher elevation.
   2. Top of Collar: Bottom of existing asphalt pavement.
   3. Apply tack coat to all exposed surfaces.
   4. Fill excavation with asphalt concrete and, while still hot, compact flush with adjacent surface.

3.12 INSTALLATION TOLERANCES

A. Asphalt Pavement:
   1. Course thickness and surface smoothness within the tolerances specified in Caltrans Standard Specification Sections 39-6.01, 39-6.02 and 39-6.03.
   2. Total Thickness: Not less than indicated.

B. Trench Patch:
   1. Compacted surface: Within 0.01 foot of adjacent pavement.
   2. Do not create ponding.

C. Adjust Covers:
   1. Compacted surface: Up to 0.01 foot higher, and no lower, than adjacent pavement.
   2. Do not create ponding.

END OF SECTION
SECTION 323300 - SITE FURNISHINGS

PART 1 - GENERAL

1.1 1.1 DESCRIPTION
A. Furnish and install all site furnishings shown on drawings and specified in accordance with the manufacturer's instructions and as shown on the drawings and as specified.

B. Related requirement specifications elsewhere:
   1. Section 321312, SITE CONCRETE

1.2 REFERENCES
A. Perform work in accordance with all applicable laws, codes and regulations required by the City and the State of California.

B. Manufacturer's Instructions:
   1. Where required in the Specifications that materials, products, processes, equipment or the like to be installed or applied in accordance with manufacturer's instructions, directions or specifications, or words to this effect, it shall be constructed to mean that said application or installation shall be in strict accordance with printed instructions furnished by the manufacturer of the material for use under conditions similar to those at the job site.
   2. All site furnishings shall be anchored or otherwise secured to prevent movement, unless stated otherwise. Provide concrete footings, corrosion resistant clips, etc. as accepted by the Owner's Representative.

C. Reference Standards:

1.3 COORDINATION
A. Coordinate items of other trades. Contractor shall be responsible for the proper installation of all accessories embedded in concrete and for the provision of connections, holes, openings, etc., necessary to the execution of the work of the trades.

1.4 SUBMITTALS: Section 013300
A. All Product cut sheets, sample chips and required leveling spacers.

PART 2 - MATERIALS

2.1 SCULPTURAL SITE ELEMENT
A. Model: FLOR by Landscape Forms, Precast Concrete, Neutral color.
B. Model: MILENIO by Landscape Forms, Precast Concrete, Neutral color.

2.3 TRASH RECEPTACLE, Wabash FR500P 32-gallon, flare-top with side door. Perforated pattern, with LR310 receptacle liner & FT100 flat top lid with 8" diameter opening- inward slope. Freestanding.

2.5 TREE GRATE, 4’x8’ Jamison tree grate by Urban Accessories, 100% recycled grey iron w/ rust conditioner, 12” tree opening, Triangular end pieces to be custom, see plans. ADA compliant.

2.6 TRENCH DRAIN GRATE, 6"X18" 'Terrain' trench grate by Urban Accessories, 100% recycled grey iron with rust conditioner. Triangular end pieces to be custom, see plans. ADA compliant.

2.7 AREA DRAIN GRATE, 8"x8" drain grate by Urban Accessories, 100% recycled aluminum. ADA compliant.

2.8 BIKE RACK, Ultra Play Model 5000SM, Surface mount, Color; Blue

PART 3 - EXECUTION

3.1 GENERAL INSTALLATION

A. Install manufactured items in accordance with the manufacturer's instruction and as shown in the drawings and as specified herein.

B. Perform all work in accordance with all applicable laws, codes and regulations required by State of California

C. Set all work true and square, plumb and level. Remove and replace any wood that splits during or after erection until acceptance. Keep nailing neatly lined up.

D. Fabricate wood in as long pieces as practical unless otherwise indicated. End joints shall occur at supports. Keep all work clean, accurately cut, closely fitted and set to the required lines and levels. Blunt exposed edges by sanding or with plane.

E. Place washer under the head and nut of bolts where same bear on wood, except head of carriage bolt. Drill bolt holes same diameter as bolt.

F. Size bolts to fit flush with nuts. Countersink nuts and bolts as detailed.

G. Hammers with scored faces shall not be used in nailing.

H. Supply all miscellaneous metal units and install as specified herein under the Sections entitled "Miscellaneous Metalwork" and "Galvanizing." Hot-dip galvanize all metal fastenings, angles, etc., after complete fabrication.
I. Galvanized metal that is cut, damaged or modified after fabrication shall be immediately painted with Zinc-rich paint to prevent rusting.

J. Touch up paint any damaged surfaces to match original finish as accepted by Owner's Representative.

K. Set site furniture, level. Provide spacers under furniture to level as specified herein and acceptable to Owner's Representative.

L. Transport, store and handle precast units and manufactured items in a manner to avoid hairline cracks, staining or other damage. Store units free of the ground and protected from mud or rain splashes. Cover units, secure covers firmly, and protect the units from dust, dirt or other staining material.

3.2 SCULPTURAL SITE ELEMENT
   A. Install level and in accordance with the manufacturer's instruction and as shown.

3.3 TABLES & CHAIRS
   A. Install level and in accordance with the manufacturer's instruction and as shown. Surface mount.

3.4 TRASH RECEPTACLES
   A. Install level and in accordance with the manufacturer's instruction and as shown. Provide spacers under receptacles to level as specified and acceptable to Owner's Representative.

3.5 RECYCLING RECEPTACLES
   A. Install level and in accordance with the manufacturer's instruction and as shown. Provide spacers under receptacles to level as specified and acceptable to Owner's Representative.

3.6 TREE GRATES
   A. Install in accordance with the manufacturer's instruction and as shown.

3.7 TRENCH DRAIN GRATE
   A. Install in accordance with the manufacturer's instruction and as shown.

3.8 AREA DRAIN GRATES
   A. Install in accordance with the manufacturer's instruction and as shown.

3.9 BIKE RACKS
   A. Install in accordance with the manufacturer's instruction and as shown. Surface mount.

3.10 CLEANUP, per Section 017700.

END OF SECTION
SECTION 328400 - IRRIGATION

PART 1 - GENERAL

1.1 DESCRIPTION

A. The work in this section consists of furnishing, layout and installing an irrigation system complete, including certification of irrigation system installation as required by the State of California Model Water Ordinance described herein.

B. Related work specified elsewhere includes:

1. Section 312300, EXCAVATION & FILL
2. Section 329000, PLANTING
3. Division 26 - ELECTRICAL (stub-out for controllers).
4. Section 320800, COMMISSIONING OF IRRIGATION SYSTEMS

1.2 CALIFORNIA MODEL WATER EFFICIENT LANDSCAPE ORDINANCE REQUIREMENTS

A. Contractor shall be familiar with and follow the State of California Model Water Ordinance, California Code of Regulations, Title 23 Waters, Division 2, Department of Water Resources, Chapter 2.7. Also, the Contractor is responsible to follow all local water ordinances.

B. Pursuant to the requirements of the California Model Water Efficient Landscape Ordinance, the Contractor shall submit a Certification of Installation to the Local Jurisdiction /water purveyor as described in the construction documents and these specifications. Certification shall at a minimum include the following documents:

PART 1. Project Information Sheet
PART 2. Certification of Installation according to the landscape documentation package.
PART 3. Irrigation Scheduling and Controller Programming
PART 4. Schedule of Landscape and Irrigation
PART 5. Landscape Irrigation Audit Report
PART 6. Soil Management/Analysis Report with verifying implementation, see Planting Specification for analysis requirements.

1.3 QUALITY ASSURANCE

A. Manufacturer's Specifications: Follow manufacturer's current printed specifications and drawings in all cases where the manufacturers of articles used in the Contract furnish directions covering points not specified or shown in the drawings.

B. Ordinances and Regulations: All local, municipal and state laws, codes and regulations governing or relating to all portions of this work are hereby incorporated into and made a part of these Specifications. Anything contained in these Specifications shall not be construed to conflict with any of the above codes, regulations or requirements of the same. However, when these Specifications and Drawings call for or describe materials, workmanship or construction of a better quality, higher standard, or larger size than is required by the above codes and regulations, the provisions of these Specifications and Drawings shall take precedence. Furnish without extra charge additional materials and labor required to comply with above rules and regulations.
C. References, Codes and Standards:
   1. State of California Model Water Efficient Landscape Ordinance
   2. California Environmental Quality Act (CEQA)
   3. Water Use Classification of Landscape Species (WUCOLS).
   6. CAL-OSHA, title 8, Subchapter 4-Construction Safety Orders and Subchapter 7-General Industry Safety Orders.
   8. California Plumbing Code (UPC) published by the Association of Western Plumbing Officials.
   9. NFPA 24, Section 10.4, Depth of Cover.
   10. Underwriters Laboratories (UL): Electrical wiring, controls, motors and devices, UL listed and so labeled.

D. Furnish without extra charge any additional material and labor when required by the compliance with all above mentioned codes and regulations, though the work be not mentioned in these specifications or shown on the drawings.

E. Experience: Assign a full-time employee to the job as supervisor for the duration of the Contract with a certified landscape technician, irrigation certification through CLCA or minimum of four (4) years experience in landscape irrigation installation.

F. Labor Force: Provide a landscape installation and maintenance force thoroughly familiar with, and trained in, the work to be accomplished to perform the task in a competent, efficient manner acceptable to the Owner's Representative.

G. Explanation of Drawings:
   1. Due to the scale of the Drawings, it is not possible to indicate all piping offsets, fittings, sleeves, etc., which may be required. Carefully investigate the conditions affected all of the work and plan accordingly, and furnish all required fittings. Install system in such a manner to avoid conflicts with planting, utilities and architectural features.
   2. Do not install the irrigation system as shown on the Drawings when it is obvious in the field that obstructions, grade differences or discrepancies in arc dimensions exist that might not have been considered in engineering. Bring such obstruction or differences to the attention of the Owner's Representative. Notify and coordinate irrigation Work with applicable contractors for location and installation of piping and sleeves through or under walls, pavement and structures. In the event this notification is not given, the Contractor shall assume full responsibility for any revision necessary.

H. Trench Interference with Tree Root Systems:
   1. Prior to trenching, layout main and lateral line locations within Drip Line of trees and review locations with Owner's Representative. Relocate any lines that may interfere with existing root systems to avoid or reduce damage to root systems as accepted by Owner's Representative.
   2. Mechanical Trenching is not allowed within dripline of existing trees to be protected except as approved by Landscape Architect

I. Coordinate plant locations with emitter locations.
1. Adjust plant locations in relation to the subsurface emitters as required to ensure that the plant roots receive the proper amount of water in order for it to thrive.
2. Coordinate planting and irrigation and provide hand watering of emitter irrigated and drip irrigated areas as required to maintain moist root zones until end of plant establishment period.

1.4 PROTECTION OF EXISTING STRUCTURES AND UTILITIES

A. The Drawings show, if applicable, existing above and below grade structures and utilities that are known to the Owner. Locate known existing installations before proceeding with construction operations that may cause damage to such installations. Existing installations shall be kept in service where possible and damage to them shall be repaired with no adjustment of Contract Sum. Verify with Owner if As Built drawings are available.

B. If other structures or utilities are encountered, request Owner's Representative to provide direction on how to proceed with the Work. If a structure or utility is damaged, take appropriate action to ensure the safety of persons and property.

C. Verify location of existing irrigation systems to be removed and/or replaced. Maintain any existing systems as required by the Drawings and Specifications, including temporary retention of systems necessary to maintain existing on site and adjacent planting.

1.5 SUBMITTALS, in accordance with Section 013300.

A. Materials List:
   1. Submit required copies of the cut sheets and a complete list of materials proposed for installation, along with any proposed substitutions clearly identified and obtain the Owner Representative's written approval thereof before proceeding. Use only accepted materials and items of equipment.
   2. List all materials by manufacturer's name and model number.
   3. Submit to Local Water Purveyor with copy to the Owner Certification of Installation as required by the State of California Model Water Ordinance.

B. Substitutions:
   1. If the Contractor desires to substitute a product, he shall list each item and note it as a "substitution" and provide the following information:
      a. Descriptive information describing its similarities to the specified product.
   2. If the product is approved and, in the opinion of the Owner's Representative, the substituted product does not perform as well as the specified product, the Contractor shall replace it with the specified product at no additional cost to the Owner.

C. Operations and Maintenance Manuals:
   1. Prior to the final acceptance of the irrigation system, furnish three (3) individually bound Operation and Maintenance Manuals to the Owner's Representative for use by the Owner. The manuals shall contain complete enlarged drawings, diagrams and spare parts lists of all equipment installed showing manufacturer's name and address. In addition, each Service Manual shall contain the following:
      a. Index sheet indicating the Contractor's name, address and phone number.
      b. Copy of the Landscape Irrigation Audit
c. Copy of the 12-month irrigation schedule and estimate of annual water consumption
d. Copies of equipment warranties and certificates.
e. List of equipment with names, addresses and telephone numbers of all local manufacturer representatives.
f. Complete operating and maintenance instructions in sufficient detail to permit operating personnel to understand, operate and maintain all equipment.
g. Parts list of all equipment such as controllers, valves, solenoids and heads.

D. Record Drawings:
1. Dimension the location of the following items from two (2) permanent points of reference such as building corners, sidewalks, road intersections, etc.:
   a. Connection to existing water lines/meter.
   b. Connection to electrical power.
   c. Gate valves.
   d. Routing of sprinkler pressure lines (a dimension at least every 100 feet and as required to identify all changes in direction and location).
   e. Remote control valves.
   f. Routing of control valves.
   g. Quick coupling valves.
   h. All sleeve locations.
   i. Routing of all control wiring.
   j. Include all invert elevations below 12”.
2. Deliver a reproducible record drawing to the Architect within seven (7) working days before the date of final review. Delivery of the record drawings shall not relieve the Contractor of the responsibility of furnishing required information in the future.

E. Controller Plan:
1. Provide one Irrigation Diagram plan in each controller housing. The plan shall show the area controlled by each valve in different colors and for orientation, any major permanent structure such as buildings and roads.
2. Charts to be waterproof and hermetically sealed between two pieces of transparent 10 mil thick plastic and installed in each controller on the door as accepted by the Owner's Representative no later than the time of the coverage test of the irrigation system.

F. Maintenance Material - supply the following tools to the Owner:
1. Three (3) sets of specialized tools required for removing, disassembling and adjusting each type of sprinkler, valve or other equipment supplied on this project.
2. Two (2) keys for each type of equipment enclosure.
3. Two (2) keys for each type of automatic controller.
4. Two (2) keys for each type of valve (including square type key for valves larger than 2")
5. Two (2) quick-coupler keys and matching hose swivels for each type of quick-coupling valve installed.
6. All lock keys shall be keyed alike.

1.6 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Furnish and deliver materials in manufacturer's packaging, bearing original legible labeling.

B. The Contractor is cautioned to exercise care in handling, loading, unloading, and storing PVC pipe and fittings. All PVC pipe shall be transported in a vehicle which allows the length of the pipe to lie flat so as not to subject it to undue bending or concentrated external load at any
point. Any section of pipe that has been dented, cracked, or otherwise damaged shall be discarded and, if installed, shall be replaced with new piping.

1.7 SEQUENCING AND SCHEDULING

A. Acceptance: Do not install main line trenching prior to acceptance by Owner's Representative of rough grades completed under another Section.

B. Coordination: Coordinate with the work of other sections to insure the following sequence of events:
   1. Sleeves and Conduits: Installation of all sleeves and conduits to be located under paving and through walls prior to placement of those materials.
   2. Bubbler Heads: Install after placement of tree, but prior to backfill with planter soil mix.
   3. On-Structure Equipment: Install piping and risers after waterproofing is accepted.
   4. Sprinkler Head in Pots: Install riser and seal the penetration of the pot prior to backfill of pot with drainage materials and planter soil mix.
   5. Coordinate work schedule with Owner to avoid disruption of landscape maintenance of existing landscaping.
   6. Install piping prior to soil preparation (planting soil amendment installation).

1.8 WARRANTY, per Section 017836.

A. In addition to manufacturer's guarantees and warranties, work shall be warranted for one (1) year from date of final acceptance against defects in material, equipment and workmanship. Warranty shall also cover repair of damage to any part of the premises resulting from leaks or other defects in materials, equipment and workmanship to the satisfaction of the Owner.

B. Include a copy of the warranty form in the Operation and Maintenance Manual.

1.9 OPERATION

A. Routine: Inspect and adjust all spray heads and control valves including raising or lowering of spray head heights to accommodate plant growth and weather conditions.

B. Controller: Inspect regularly for power interruption and reset clock as required. Adjust station timing to accommodate changes in plant growth and weather conditions.

C. System Failure: Perform all repairs within one (1) operating period. Replacements to match removed products and materials in all respects. Report promptly all damage not resulting from Contractor's operations. Repair all damage caused by Contractor at no expense to Owner.

D. Climate Change: Set and program automatic controllers in response to seasonal requirements and requirements of newly planted materials.
PART 2 - PRODUCTS

2.1 PIPE

A. Pressure Main Line Pipe and Fittings: All PVC fittings shall bear the manufacturer's trademark name, material designation, size, applicable I.P.S. schedule and NSF seal of approval.

B. All main line pipe shall be solvent welded and shall be schedule 40 unless shown otherwise on the Drawings.
   1. PVC Pressure Rated Pipe: ASTM D2241 NSF approved Type I, Grade I, solvent welded PVC with an appropriate standard dimension ratio (S.D.R.).
   2. PVC Scheduled Pipe: ASTM D1785 NSF approved, Type I, Grade I, solvent welded PVC.
   4. Solvent Cement and Primer for PVC solvent-weld pipe and fittings: Type and installation methods prescribed by the manufacturer.
   5. Connections between Main Lines and RCVs: Schedule 80 PVC (threaded both ends) nipples and fittings unless required otherwise by local jurisdiction.
   6. Valves 2-inch and larger shall be flanged only.
   7. Copper pipe shall be Type K or Red Brass where threaded joints are required and Type L otherwise.

C. All lateral line pipe shall be solvent welded and shall be schedule 40 unless shown otherwise on the Drawings.

2.2 CONDUITS & SLEEVES

A. Sleeving shall be Schedule 40 PVC pipe sleeves and a minimum of two times the aggregate diameter of all pipes contained within the sleeve. Provide vertical sweep for all electrical conduit on each side of hardscape and terminate ends at 12" minimum depth and 12" from hardscape surface.

2.3 BACKFLOW PREVENTION DEVICE & ENCLOSURE, existing as shown on drawings.

2.4 CONTROLLERS(S):

A. Pedestal-mounted irrigation controller, as shown on drawings, and with the following minimum requirements.

B. Shall be weather – based and be compatible with rain shut off sensor.

C. Shall be user-friendly. The controller must have a minimum 20-character readout display describing actions or options, or a full visible panel of buttons, dials, or switches that control all different functions separately.

D. Shall have the ability to start a programmed sequence of valves a minimum of 5 times a day per program.

E. Shall have ability to easily and quickly change watering schedules due to change in weather.
F. Provide portable hand-held remote device compatible with controller and capable of operating all control valves.

A. Provide rain shut off device as manufactured by Control System manufacturer capable of shutting off all control valves. Locate in a location exposed to rain and hardwire to controller.

2.5 CONTROLLER GROUND

A. Provide each pedestal controller with its own ground rod. Separate the ground rods by a minimum of eight feet. The ground rod shall be an eight foot long by 5/8” diameter U.L. approved copper clad rod or as recommended by controller manufacturer. Install no more than 6” of the ground rod above finish grade. Connect #8 gauge wire with a U.L. approved ground rod clamp to rod and back to ground screw at base of controller with appropriate connector. Make this wire as short as possible, avoiding any kinks or bending. Install within pedestal housing base unless otherwise noted.

B. Provide each irrigation controller with its own independent low voltage common ground wire.

2.6 CONTROLLER ENCLOSURES

A. Verify correct equipment to fit the specified equipment, "Strong Box" available from John Deere, (800) 347-4272.

2.7 MASTER CONTROL VALVE

A. Master control valve shall be a 24 VAC, industrial type, solenoid control valve, Griswold 2000 series or equal. Valve shall be equipped with spring loaded packless diaphragm, cast iron body and bronze trim. The valve shall be of the normally open type and shall be equipped with four-prong (cross) flow control. Valve shall be slow closing without chatter settings or adjustment. Valve shall have a mechanical self-purging internal control system with tapered, serrated, scrubbing rod through diaphragm for positive, variable port opening and cleaning. No solenoid port screens. Valve solenoid shall be corrosion-proof, molded in epoxy to form one integral unit with no connection shunts and shall be 24 VAC, 3 watt maximum.

2.8 FLOW SENSORS

A. Compatible with controller and as recommended by controller manufacturer.

2.9 ISOLATION VALVE:

A. Valves 3 inches and smaller: 125 lb. WSP bronze gate valve with screw-in bonnet, non-rising stem and solid wedge disc, NIBCO T-113 K, or approved equal. Valves shall be line size.

B. Valves larger than 2”: shall have square nut stem and o-ring connections for key operation.
2.10 QUICK COUPLER VALVES:
A. Quick coupler valves shall be as listed on the Drawings with 10" diameter black box and black lid similar to isolation valve box described below.

2.11 BOX FOR ISOLATION & QUICK COUPLER VALVES
A. 10" diameter black plastic, Ametek, Brooks, Christy, Rain Bird with bolt down black lid marked "irrigation," or accepted equal. Avoid locating valve in paved areas. Provide H/20 Loading concrete box with bolt-down concrete lid if valve is located in paved area. Obtain location approval by Owner's Representative.

2.12 REMOTE CONTROL VALVE: As shown on Drawings and with the following minimum requirements:
A. Remote control valves shall be those normally manufactured for irrigation systems and shall have a slow, consistent speed of closure through entire closing operation, including last portion. To ensure this, the effective diaphragm working area/valve seating opening ratio must be a minimum 3 to 1.
B. Shall be mechanically self-cleaning to help prevent diaphragm or solenoid port plugging. To ensure this, the flush rod should be tapered to vary the size of the port opening as the diaphragm raises and lowers, thus allowing trapped material to escape. Rod is to be finished with a serrated surface to help scrub trapped material out. Screens not acceptable.
C. Shall have removable valve seat so valve can be repaired without removal from irrigation line.
D. Shall have ability to operate manually without the use of wrenches or special keys.
E. Shall have one-piece solenoid that attaches directly to valve without shunts or clips that can be lost.
F. Shall have cross top handle to adjust maximum travel of diaphragm to allow "tuning" of valve and closure.

2.13 BOX FOR REMOTE CONTROL VALVE
A. Rectangular black plastic valve box - Ametek, Carson, Christy, Rain Bird or accepted equal with non-hinged bolt down black colored lid marked "irrigation". Box body shall have knock outs. Do not saw cut body. The minimum size box is as shown on Drawings. Increase box size as required to fit. Valve box lids are to indicate the controller letter and station number of valve as accepted by Owner’s Representative. Also refer herein to required polyurethane tag at valve solenoid control wire under Control Wires. Locate the identification in center of the lid. Provide separate box for each valve. Provide H/20 Loading concrete boxes with bolt-down concrete lids for all valves that occur in paved areas.

2.14 CONTROL WIRES
A. Connections between automatic controllers and the solenoid-operated electric control valves shall be made with direct burial copper wire 14- AWG-UF 600 volt (minimum size). Pilot wires
shall be a color other than white, and shall be a different color for each automatic controller with
wires sharing a common trench. Common wires shall be white in color, with a different color
stripe for each controller with wiring sharing the same common trench. No stripe is required if
multiple controller wiring is not present.

B. Size of wire shall conform to the remote control valve manufacturer’s specification for control
wire sizes, but in no case shall the control wire be smaller than #14. Runs over 2,000 lineal feet
shall be #12- AWG-UF 600 volt copper wire.

C. All wire splices are to be made within a valve box, with a copper crimp-type connector, and a "3-
M" #DBY splice kit or Rain Bird “DBTWC25”.

D. Use continuous control wiring between controllers and remote control valves (no splices).

E. Provide polyurethane tag at valve solenoid control wire that shows the controller number and
station number. Also refer to valve box lid identification.

F. Provide a spare control wire in each RCV box for future.

2.15 SWING JOINTS

A. Sprinklers and Bubblers: Use Dura, Lasco, Rain Bird or equal pre-assembled swing joints with
O-rings.

2.16 Quick Coupling Valve: Dura 1-inch 1-A2-1-11-18 pre-assembled swing joint with O-rings and
Dura quick lock to receive stabilizing rod.

2.17 SHRUB & TREE BUBPLERS, as shown on drawings

2.18 DRIP EMMITTER IRRIGATION

A. Drip Manifold:

1. Pressure Regulator: Preset at 30 psi outlet pressure, ¾” female threaded inlet and outlet,
by RainBird, Torro or equal.
2. Emitters: Xeri-Bug (XB Series) by RainBird, Toro EZ Drip Series, or equal.
3. Flexible PVC: ASTM D2287 algae-resistant flexible PVC as recommended by
manufacturer of Drip Emitters.
4. Drip tubing: Conform to A. S. A. E. standards for minimum inside diameter and wall
thickness, Minimum 2% carbon black, Salco ¾” AR Drip PVC flexible drip hose, or equal.
5. ¾” Y-filter, 200 mesh.
6. Toro DL 2000 Air/Vacuum Relief Valves and In-line Spring Check Valves.
7. ¾” manual PVC ball valve with extra 3’ of hose coiled in valve box.
8. Drip system in accordance with “RainBird Xerigation Low-Volume Landscape Irrigation
Design Manual” and as shown on the drawings as required for a complete working
system.
2.19 IN-LINE DRIP IRRIGATION

A. As specified herein and as shown on the drawings and in accordance with manufacturer's recommendations. Provide all miscellaneous valves, filters fittings etc. required for a complete, operable system including the following:
   1. Rain Bird XFD/XFS/XFCV with “Copper Shield” technology. Drip system in accordance with “RainBird Xerigation Low-Volume Landscape Irrigation Design Manual” and as shown on the drawings as required for a complete working system.
   2. Pop-up operation indicator
   3. Air/vacuum relief valves
   4. Flush valves

B. Drip Valve Assembly: Size valve box large enough and deep enough to contain assembly and allow convenient access and easy removal of filter screen. Position filter pointed down, approximately 45 degrees.

C. Pressure regulator: Size regulator in accordance with flow rate. Do not over size. Use factory pre-set regulator at 30 PSI.

2.20 Y-STRAINER / BASKET STRAINER

A. Strainer upstream of remote control valves, Brass, 100 mesh.

2.21 RCV IDENTIFICATION TAGS:

A. Plastic or brass tags with valve number, approximately 2" by 2" with number imprinted, as accepted by Owner.

2.22 MISCELLANEOUS INSTALLATION MATERIALS

A. Solvent Cement and Primers for Solvent-weld Joints: Make and type approved by manufacturer(s) of pipe and fittings. Maintain cement proper consistency throughout use.

B. Pipe and Joint Compound: Permatex: Do not use on sprinkler inlet port.

2.23 MISCELLANEOUS EQUIPMENT/ACCESSORIES

A. Concrete for equipment pads (and thrust blocks if Bell-Type Pipe with O-Rings is required): Poured-in-place Class A concrete per Section 90 of the Caltrans Standard Specifications.

B. Sleeves and Conduits: See Drawings.

C. Key(s) for Quick-Coupling Valves:
   1. Type: Same manufacturer as Quick-Coupling Valve.

2.26 OTHER EQUIPMENT: As shown on Drawings and required for a fully functional irrigation system.
PART 3 - EXECUTION

3.1 EXAMINATION

A. Sleeves and Conduits: Verify that all installed sleeving and conduits are undisturbed and are free of defects or errors introduced by the work of other sections.

B. Water Meter/Water Pressure: Test and verify that existing water pressure is the minimum pressure at maximum system g.p.m. to operate the irrigation system as indicated on the drawings.

C. Stub-outs: Verify that all stub-outs to be provided under another contract are correctly sized, located and installed as noted on Drawings.

D. Notification: Submit written notification to Owner's Representative within ten (10) working days of above inspections describing all acceptable and non-acceptable site conditions.

3.2 CONNECTIONS TO SERVICES

A. Provide and coordinate connection to water meter.

B. Provide and coordinate connection of irrigation controller to electrical power source.

3.3 INSTALLATION

A. Install irrigation system components in accordance with this Section, with the Drawings, with the manufacturer's recommendations, and with established industry standards. The Contractor shall do nothing that may jeopardize any manufacturer warranty.

B. Automatic Controller:
   1. General: Install with lock box cutoff switch per local code and manufacturer's current printed specifications. Provide each controller with its own independent low voltage common ground wire.
   2. Connection to Valves: Connect remote control valves to controller in clockwise sequence to correspond with station setting beginning with Stations 1, 2, 3, etc.
   3. Labeling: Affix controller letter (i.e., "A") on inside of controller cabinet door with minimum of one-inch (1") high permanent letter.
   4. Irrigation Diagram: Affix a non-fading, waterproof copy of irrigation diagram to cabinet door below controller name. Irrigation diagram to be sealed between two plastic sheets, 20 mil. minimum thickness. Use a legible reduced copy of the Record Drawing for the irrigation diagram clearly showing all valves operated by the controller, station, number, valve size, and type of planting irrigated. Color code area operated by each valve.

C. Control Wiring:
   1. General: Install control wires in common trenches with sprinkler mains and laterals wherever possible. Lay to the bottom side of pipe line. Provide looped slack at valves. Snake wires in trench to allow for contraction of wires. Tie wires in bundles at 10 ft. intervals.
2. Extra Length: Provide 30 inches (30") extra control wire at each remote control valve splice to facilitate the removal of the remote control bonnet to finish grade without cutting wires.
3. Spare: Install one unconnected spare control wire running from the controller through each intermediate control valve box.
4. Size: Minimum size of wire is to be determined strictly by the manufacturer's current printed specifications for remote control valves, but not smaller than #14.
5. Detection Wire: Install a bare #12 copper wire or greater on top of the PVC supply line for the purpose of possible future mine detection search. Install the control wires on the bottom of the PVC supply line with electrical tape every ten feet (10').
6. Splicing: Crimp control wire splices at remote control valves. Seal with specified splicing materials. In-line splices will be allowed only on runs exceeding 2500 feet and only in junction boxes.

A. Rain Shutoff Switch:
1. Install switch in area not affected by irrigation or rain shadow. Provide wires in rigid conduit as accepted by Owner's Representative.

B. Excavating and Trenching:
1. Prior to trenching, layout main and lateral line locations within Drip Line of trees and review locations with Owner's Representative. Relocate any lines that may interfere with existing root systems to avoid or reduce damage to root systems as accepted by Owner's Representative.
2. Dig trenches wide enough to allow a minimum of three inches (3") between parallel pipe lines. Provide a minimum cover from finish grade as follows:
   a. 24-inches Deep: Over pipe on pressure side of irrigation control valve, control wires and quick-coupling valves.
   b. 36-inches Deep: Over all pipe and pipe sleeves under roadways, parking lots, entrance to parking lots and Fire-Access Lanes per NFPA 24, Section 10.4.4.
   c. 18-inches Deep: Over pipe on non-pressure side of irrigation control valve.
   d. Direct Burial PVC Piping Under Pavement: Provide a minimum of 4 inches of sand backfill on all sides and 24 inches cover to bottom of paving.
   e. On-Structure: Protect waterproofing with 2-inch layer of planting soil mix or as otherwise detailed.

C. Conduits and Sleeves:
1. Coordination: Provide conduits and sleeves and coordinate installation with other trades.
2. Extent: Install conduits and sleeves where control wires and pipes pass under paving or through walls as shown on Drawings. Extend twelve inches (12") beyond edges of paving and walls and cap ends until ready for use.

D. Pipeline Assembly:
1. Install pipe and fittings in accordance with manufacturer's current printed Specifications.
2. Clean all pipes and fittings of dirt, scale and moisture before assembly.
3. Solvent-welded Joints for PVC Pipes:
   a. Solvents: Use solvents and methods specified by pipe manufacturer.
   b. Curing Period: Minimum of one (1) hour before applying any external stress on the piping and at least 24 hours before placing the joint under water pressure.
4. Threaded Joints for Plastic Pipes:
   a. Use Permatex on all threaded PVC fittings except sprinkler heads and quick coupler valve ACME threads.
b. Joining: Use strap-type friction wrench only. Do not use metal-jawed wrench. Assemble finger tight plus one or two turns.

5. Laying of Pipe:
   a. Bedding On-grade: Remove from trench all rocks or clods. Bed pipe in at least 2 inches of soil excavated from trench. Backfill on all sides of piping to provide a uniform bearing.
   b. Snaking: Snake pipe from side to side of trench bottom to allow for expansion and contraction. Minimum allowance for snaking is one (1) additional foot per 100 ft. of pipe.
   c. Moisture Restrictions: Do not lay PVC pipe when there is water in the trench. Do not assemble PVC pipe unless the pipe is dry.

E. Closing of Pipe and Flushing of Lines:
   1. Capping: Cap or plug all openings as soon as lines have been installed to prevent entrance of materials that would obstruct the pipe. Leave in place until removal is necessary for completion of installation.

F. Detection Wire and Warning Tape:
   a. Install a bare #12 copper wire or greater on top of the PVC supply line for the purpose of possible future mine detection search.

G. Control Valves:
   1. Install in valve boxes where shown on Drawings and group together where practical. Install box flush with finish grade, not necessarily level. If valve occurs in drainage swale, relocate out of drainage swale as approved by Owner's Representative.
   2. Where two or more valves are installed adjacent to each other, provide at least six inches (6") separation. Align boxes in a row, perpendicular with pavement edge.
   3. Permanently mark valve box lid with 2" black valve number and controller letter or with numbered metal tag inside box as approved by Owner's Representative.
   4. Refer to control wiring for required spare wire in each valve box.

H. Install “Y”-Strainer upstream of remote control valves at backflow preventer with two pressure gauges, one upstream and one downstream of each strainer/filter.

I. RCV Identification Tags:
   1. Install in remote control valve box as recommended by manufacturer and as accepted by Owner's Representative.

J. Bubblers:
   1. Coordinate installation with planting contractor to insure timely and proper placement of heads at new planting.

K. In-Line Drip Irrigation
   1. Coordinate plant locations with emitter locations. Refer to QUALITY ASSURANCE herein.
   2. Coordinate hand watering of emitter irrigated and drip irrigated areas. Refer to QUALITY ASSURANCE herein.
   3. Coordinate emitter spacing with planting types and plant spacing as accepted by Landscape Architect. Install emitters at uniform **18 inches** on center maximum and 2 to 4 inches deep, except where emitter spacing and depth is shown otherwise.
4. In Turf in raised (podium) planters and similar sandy soil planting areas, install emitters at uniform 12 inches on center maximum and 3 inches deep, except where emitter spacing and depth is shown otherwise.
5. Adjust spacing on slopes to prevent over watering at base of slopes. Install system in accordance with manufacturer’s recommendations and as shown on the Drawings as required for a complete working system.
6. Provide air/vacuum relief valves at all high points on systems.
7. Provide filter as shown and as recommended by emitter manufacturer.
8. Tape pipe ends during installation and do not allow dirt or debris to enter pipe.
9. Use emitter line with the specified emitter flow rate and emitter spacing. Assemble dripper line to allow water to flow continuously and directly, with no dead ends or dead end loops between control valve and flush valve.
10. Use fittings at sharp bends and do not allow dripper line to kink.
11. Install emitter line around perimeter of planter not more than 3 inches off edge for ground cover and turf, 18 inches maximum for shrub planting.
12. Adjust alternate rows so emitters are spaced in a triangular pattern.
13. Collect water from multiple dripper lines and convey the water to automatic line flush valve.
14. Install flush valve at end(s) of collector laterals so that entire system will flush and be free of dirt and debris.
15. Flush valves shall be open when water is turned on for the first time and after a break in the main or lateral lines. Extend collector lateral as required and locate flush valve at convenient accessible location.
16. Flush the systems weekly through the first month of the maintenance period.
17. Thoroughly saturate soil prior to planting. Provide additional surface watering as required to keep plant root systems moist during planting establishment period.

L. Drip Emitter Irrigation:
1. Install system in accordance with “RainBird Landscape Irrigation Design and Specifications Xerigation Products and Details” or equal and as shown on the Drawings as required for a complete working system.
2. Install Toro DL 2000 Air/Vacuum Relief Valves at high points in system.
3. Install manual PVC ball valve with extra 3’ of hose coiled in valve box at end(s) of collector laterals so that entire system will flush and be free of dirt and debris.
4. Install a continuous PVC irrigation mainline warning tape 12” above the supply line.

3.4 MISCELLANEOUS EQUIPMENT

A. Install miscellaneous equipment with concrete footings, brackets, etc., as required and as recommended by manufacturer.

3.5 FIELD QUALITY CONTROL

A. Testing of Irrigation System:
1. Make hydrostatic tests with risers capped when welded PVC joints have cured at least 24 hours. Center load piping with backfill to prevent pipe from moving under pressure. Keep all couplings and fittings exposed.
2. Install two (2) pressure gauges at opposite ends of main line system. Pump system up to a minimum of 125 psi the day preceding the scheduled test and verify that pressure is holding. Inspect system early following day and immediately notify Owner’s Representative if the test confirmation must be postponed.
3. Apply continuous static water pressure of 125 psi in accordance with Caltrans Standard Specifications Section 20-5.03H, except after a drop in pressure (5 psi maximum), then the pressure must stabilize and remain stable for a one (1) hour minimum period before acceptance of the test.

4. Leaks detected during tests shall be repaired and test repeated until system passes tests at no additional cost to Owner.

B. Irrigation Audit Report with Certificate of Completion

1. Per the requirements of the California Model Water Efficient Landscape Ordinance, the Contractor shall perform an irrigation audit and provide a report with certificate of completion to the local agency that may include, but is not limited to: inspection, system tune-up, system test with distribution uniformity, reporting overspray or run off that causes overland flow, and preparation of an irrigation schedule. Irrigation audits shall be conducted by a CLIA Certified landscape Irrigation Auditor by the Irrigation Association. Operation of the irrigation system outside the normal watering window is allowed for auditing and system maintenance.

C. Adjustment of the System:

1. Flush and adjust all sprinkler heads for optimum performance and to prevent overspray onto walks, roadways and buildings. Adjust the arc and radius as applicable.

2. Include as a part of the work any nozzle changes or arc adjustments necessary due to daytime windy conditions during grass establishment period. After grass has been established and watering can be performed during calm early morning or evening hours, make any required adjustments to nozzles and arcs.

3. Set all sprinkler heads perpendicular to finished grades unless otherwise noted on the drawings.

4. When the landscape sprinkler system is completed and before planting, perform a coverage test in the presence of the Owner's Representative to determine if the water coverage for planting areas is adequate.

5. Test controllers individually in the presence of the Owner's Representative and the Landscape Architect. Demonstrate that all control valves operate electronically. Provide vehicles and radio equipment as necessary to expedite this process.

6. Demonstrate to Owner's Representative that irrigation scheduling programmed into controller is adequate for plant requirements without causing runoff, and that scheduling capacities of controller are utilized.

3.6 IRRIGATION SCHEDULING AND CONTROLLER PROGRAMMING

A. Per the requirements of the California Model Water Efficient Landscape Ordinance All irrigation schedules and programs shall be developed, managed and evaluated to utilize the minimum amount of water required to maintain plant health.

B. Irrigation controller Scheduling and Programming Parameters to be conducted by a CLCA Certified Irrigation manager and submitted to the local agency as part of the Certificate of Completion.

C. Parameters used to set the automatic controller shall be developed for each of the following:

1. Plant establishment period
2. Established landscape period
3. Temporary irrigated area (if applicable)

D. Each irrigation schedule shall consider for each station all of the following that apply:
1. Irrigation interval (days between irrigation)
2. Irrigation run times (hours or minutes per irrigation event to avoid runoff)
3. Number of cycle starts required for each irrigation event to avoid runoff
4. Amount of applied water scheduled to be applied on a monthly basis
5. Application rate setting
6. Root depth setting
7. Plant type setting
8. Soil type
9. Slope factor setting
10. Shade factor setting
11. Irrigation uniformity or efficiency setting

E. Total annual applied water shall be less than or equal to Maximum Applied Water Allowance (MAWA). Actual irrigation schedules shall be regulated by automatic irrigation controllers using current reference evapotranspiration data (CIMIS or soil moisture sensor data).

3.7 BACKFILL AND COMPACTING

A. General: After system is operating and required tests and reviews have been made, backfill excavations and trenches with clean soil, free of debris.

B. Backfill for All Trenches: Regardless of the type of pipe covered, compact to minimum 95% density under pavements and 85% under planted areas.

C. Finishing: Dress off areas to finish grades. Re-dress any areas which subsequently settle.

D. Owner's testing agency will test backfill compaction in areas under paving.

3.8 MAINTENANCE

A. The entire sprinkler irrigation system shall be under full automatic operation for a period of 2 days prior to any planting.

B. The Owner's Representative reserves the right to waive or shorten the operation period.

C. Maintain/repair system for full duration of plant maintenance period.

3.9 REVIEWS PRIOR TO ACCEPTANCE

A. Notify the Owner's Representative in advance for the following reviews, according to the time indicated:
   1. Supply line pressure test and control wire installation - 72 hours.
   2. Coverage and controller test - 72 hours.
   3. Final review - 7 days.

B. No reviews will commence without record drawings, without completing previously noted corrections, or without preparing the system for review.
3.10 FINAL REVIEW AND CLEANUP, per Section 017700.

A. Operate each system in its entirety for the Owner's Representative at time of final review. Any items deemed not acceptable by the Owner's Representative shall be reworked to the complete satisfaction of the Owner's Representative.

B. Provide evidence to the Owner's Representative that the Owner has received all accessories and equipment as required before final review can occur.

C. Final acceptance and start of warranty period will occur no earlier than the end of the plant maintenance period.

D. For time of final review, Contractor shall arrange a meeting with the Owner's maintenance personnel to demonstrate the operation of the irrigation systems automatically in order to verify acceptance and to familiarize the maintenance personnel with the system and recommended programming.

END OF SECTION
PART 1 - GENERAL

1.1 DESCRIPTION

A. Provide planting work and planting maintenance complete as shown on the drawings and as specified including staking and layout of the landscaping, including soil sampling as required by the State of California Model Water Ordinance.

B. Related work specified elsewhere includes:

   1. Section 311200, SOIL STRIPING & STOCKPILING
   2. Section 311001, PLANT PROTECTION
   3. Section 312300, EXCAVATION & FILL
   4. Section 328400, IRRIGATION

1.2 QUALITY ASSURANCE

A. Reference Standards:

   1. All local, municipal and state laws, codes and regulations relating to all portions of this work are to be incorporated as part of these Specifications. These specifications shall not be construed to conflict with any of the above codes, regulations or requirements. The Specifications and Drawings shall take precedence when they call for materials, workmanship or construction of a better quality or higher standard than required by the above mentioned codes and regulations. Furnish without extra charge additional materials and labor required to comply with above rules and regulations.
   2. State of California Model Water Ordinance
   3. Public utility agency having jurisdiction over the project work.
   7. US Composting Council Compost Analysis Program (CAP)
   8. US Composting Council (USCC) Seal of Testing Assurance (STA) program.
   10. Manufacturer's recommendations.

B. Qualifications:

   1. Experience: Assign a full-time employee to the job as foreman for the duration of the Contract who is certified landscape technician, certification through CLCA or minimum of four (4) years experience in landscape installation and maintenance supervision, with experience or training in turf management, entomology, pest control, soils, fertilizers and plant identification
   2. Labor Force: Provide a landscape installation and maintenance force thoroughly familiar with, and trained in, the work necessary to complete the tasks described herein in a competent, efficient manner acceptable to the Owner.

C. Requirement
1. Site Visit: At beginning of work, visit and walk the site with the Owner's Representative to clarify scope of work and understand existing project/site conditions.

2. Supervision: The foreman shall directly supervise the work force at all times and be present during the entire installation. Notify Owner's Representative of all changes in supervision.

3. Identification: Provide proper identification at all times for landscape maintenance firm's vehicles and a labor force uniformly dressed in a manner satisfactory to Owner's Representative.

4. Protect all existing and new plants from construction activities, deer & rodents: Contractor shall be responsible for protection of all planting per Part 3.

D. Plant Material Standards:

1. Quality and Size of Plants: Conform to the State of California Grading Code of Nursery Stock, No. 1 grade. Use only nursery-grown stock which is free from insect pests and diseases.

2. Comply with federal and state laws requiring inspection for plant diseases and infestations. Submit inspection certificates required by law with each shipment of plants, and deliver certificates to the Owner. Obtain clearance from the County Agricultural Commissioner as required by law, before planting plants delivered from outside the County in which planted.

E. Soils & Amendment Testing

1. All soils & amendments to be tested for agricultural suitability by one of the following accredited soil testing laboratory (or approved equal). Components of the test shall include all major nutrients, pH, salinity, boron, sodium, micronutrients, copper, zinc, manganese and iron, adsorption rate, organic content and texture. The laboratory report shall include recommendations for adjusting fertilizer and amendment quantities.

   Waypoint Analytical, Inc.
   1101 South Winchester Blvd, San Jose CA 95128; (408-727-0330)

2. Upon approval of the laboratory's report by the Landscape Architect, the recommendations in the report shall become a part of the Specifications and the soil preparation procedures, quantities of soil amendment, fertilizer and other additives shall be adjusted to conform with the report at no additional cost to the owner. Note that there is a minimum quantity of organic amendment specified elsewhere in this specification section.

3. Significant issues with soil quality will require soil to be retested in the locations identified on Soil Analysis Plan, prior to proceeding with plant installation, to ensure that the recommendations in the report have been followed and the In-Situ Topsoil is agriculturally suitable as described in Part 2.

1.3 DEFINITIONS

A. Subsoil: Soil beneath the level of subgrade; soil beneath the topsoil layers of a naturally occurring soil profile, typified by less than 1 percent organic matter and few soil organisms. Subsoil is defined as either existing site soil located below the topsoil prior to construction activities, or select fill used for rough grading during construction. Subsoil cannot be considered for use as planting soil.
1. Surface Soil: Soil that is present at the top layer of the existing soil profile. In undisturbed areas, surface soil is typically called "topsoil," but in disturbed areas such as urban environments, the surface soil can be subsoil.

2. Topsoil: Top layer of the soil profile consisting of existing native surface topsoil or existing in-place surface soil; the zone where plant roots grow. Its appearance is generally friable, pervious, and black or a darker shade of brown, gray, or red than underlying subsoil; reasonably free of subsoil, clay lumps, gravel, and other objects larger than 2 inches (50 mm) in diameter; and free of weeds, roots, toxic materials, or other non-soil materials.

3. Planting Soil: Approved existing topsoil or imported planting soil, meeting the requirements herein. Subsoil cannot be considered for use as planting soil.

1.4 SUBMITTALS, per Section 013300.

A. The following shall be submitted to the landscape architect for approval prior to the installation of landscape materials and products.

B. Manufacturer’s Technical data sheets for fertilizers, turf, and all other products and materials listed herein.

C. Manufacturer’s technical data sheets for amendments. Reports to be dated no more than 3 months prior to soil preparation.

D. 1-pint samples of imported soils, organic amendments/compost, mulches, and stones.

E. Submit planting soil and organic amendment laboratory reports a minimum of [3] weeks prior to beginning soil prep. See below for required soil analysis reports.

F. Topsoil stripping and stockpiling program. Prepare a written program to systematically demonstrate the ability of personnel to properly follow procedures and handle materials and equipment during the Work. Include dimensioned diagrams for placement and protection of stockpiles.

1. Topsoil Stockpile Quantity Report: Provide a written report documenting the quantity, location and height of all stockpiled soil.

G. Required Soil Analysis Reports. Reports to be dated no more than [3] months prior to soil preparation.

1. Soil Analysis Plan: Contractor to submit annotated plan showing confirmed locations of all required soil tests. Each location is to be identified with a unique label.

2. Soil Analysis Report of Stockpiled Topsoil: Provide soil analysis report for each topsoil stockpile. Soils analysis report to be performed by Waypoint Analytical, a certified soil analysis laboratory, and include agricultural suitability analysis and recommendations for amending the soil. Subsoil will not be approved as planting soil.

3. Existing Planting Soil Analysis: After approval of the Soil Analysis Plan, rough grading, and topsoil placement, contractor to obtain [3] representative samples of in situ topsoil taken from approved site locations at depth of 4" to 6" below finish grade and submit to an accredited soils testing laboratory for "agricultural suitability" analysis, including particle size, infiltration rate, and evaluation of physical and chemical properties of soil and recommendations for adding amendments and fertilizers to the soil.

4. Subsoil Analysis: In addition to the above required soil samples, contractor to obtain one representative sample of any subgrade soil that is to receive a layer of imported planting soil over it. The laboratory report shall include the soil's infiltration rate, total
combined silt and clay content for determining the total allowable combined silt and clay content of the imported planting soil specified herein.

5. **Imported Planting Soil Analysis:** Contractor to submit an “agricultural suitability” analysis report from an accredited soils testing laboratory, including particle size, infiltration rate, and evaluation of physical and chemical properties of soil and recommendations for adding amendments and fertilizers to the soil. Soil to conform to requirements in Part 2.

6. **Amended Planting Soil Analysis:** Significant issues with soil quality will require soil to be retested in the locations identified on Soil Analysis Plan, prior to proceeding with plant installation, to ensure that the recommendations in the report have been followed and the final Planting Soil is agriculturally suitable as described in Part 2.

H. The Contractor is responsible to follow all local water ordinances and make available to the local agency the soil analysis report and verification of its implementation as required.

I. Delivery Receipts upon request by Owner, provide delivery receipts for quantities of soil & amendments delivered to the site.

J. Plant sample of each variety of plant. Samples to be delivered to the site 2 weeks prior to plant installation and stored and maintained separately from entire quantity of delivered plants. Contractor to maintain plants throughout maintenance period. Plants to be reviewed in a single site visit.

K. Representative photos of each plant species. Photos to be of plants to be delivered to site and not a stock photograph.

L. Entire plant quantity delivered to the site. Plants to be reviewed prior to installation during a single site visit.

M. Representative photos of each tree species (unless trees previously tagged at nursery by landscape architect). Photos to be of trees to be delivered to site and not a stock photograph.

1.5 **WARRANTY AND REPLACEMENT**

A. Maintenance Period: See Part 3.

B. Warrant the work against weed growth for a period of four (4) months after application of Pre-Emergence Weed Killer.

C. Warrant all plants to be in a healthy, thriving condition until the end of the maintenance period, and deciduous trees, shrubs and vines beyond that time until active growth is evident.

D. Replace all dead and damaged plants and plants not in a vigorous condition immediately upon discovery and as directed by the Owner’s Representative and at no cost to the owner. Install replacement plants before the final acceptance of the maintenance period in the size specified.

E. Warrant all products, prepared soils and plant material installed and maintained by contractor against defects for a period of one year after final acceptance of the maintenance period.
PART 2 - PRODUCTS

2.1 SUBSOIL

A. **Submit soil analysis report** from an approved soils laboratory for approval by the Landscape Architect. Refer to Part 1 for soil testing requirements.

2.2 EXISTING PLANTING SOIL (ON-GRADE):

A. Existing Planting Soil is defined as on-site topsoil that has been removed and stockpiled for reuse. Satisfactory planting soil shall be free of subsoil, clay, lumps, stones, and other objects over 4" in diameter, and without weeds, roots, and other objectionable material. The soil shall be fertile, friable, natural, productive soil containing a normal amount of humus, and shall be capable of sustaining healthy plant life. Soil shall not be infested with nematodes or with other noxious animal life or toxic substances. Soil shall be obtained from well-drained, arable land, and shall be of an even texture. Soil shall not be taken from areas on which are growing any noxious weeds such as Morning Glory, Equisetum, or Bermuda Grass, etc.

B. If herbicide contamination is suspected then a radish/ryegrass growth trial must be performed. Consult with Landscape Architect prior to decision to test or not.

C. Amended Planting Soils are to conform with the following target levels. Elements are expressed as mg/kg dry soil or mg/l for saturation extract

<table>
<thead>
<tr>
<th>pH value</th>
<th>6.5-7.9,</th>
<th>iron</th>
<th>4-15 mg/kg</th>
</tr>
</thead>
<tbody>
<tr>
<td>lime</td>
<td>none present</td>
<td>manganese</td>
<td>0.6-3.0 mg/kg</td>
</tr>
<tr>
<td>salinity (ECe)</td>
<td>0.5-3 milli-mho/cm</td>
<td>zinc</td>
<td>1-3 mg/kg</td>
</tr>
<tr>
<td>chloride</td>
<td>&lt;150 ppm</td>
<td>copper</td>
<td>0.2-3.0 mg/kg</td>
</tr>
<tr>
<td>nitrate</td>
<td>20-30 ppm</td>
<td>boron</td>
<td>0.2-0.5 mg/kg</td>
</tr>
<tr>
<td>SAR</td>
<td>&lt;3</td>
<td>magnesium</td>
<td>25-100 mg/kg</td>
</tr>
<tr>
<td>phosphorus</td>
<td>8-20 mg/kg</td>
<td>sodium</td>
<td>&lt;200 mg/kg</td>
</tr>
<tr>
<td>potassium</td>
<td>60-180 mg/kg</td>
<td>sulfur</td>
<td>25-100 mg/kg</td>
</tr>
</tbody>
</table>

D. If sufficient on-site surface topsoil is not available, contractor to provide imported planting soil as specified below. Placement of dissimilar soils shall be coordinated with irrigation zones by the contractor to maintain separate valves for dissimilar soils.

E. **Submit soil analysis report** from an approved soils laboratory for approval by the Landscape Architect. Refer to Part 1 for soil testing requirements.

2.3 IMPORTED PLANTING SOIL (ON-GRADE):

A. Imported planting soil shall be screened and shall be free of subsoil, heavy or stiff clay, rocks, gravel, brush, roots, weeds, noxious seeds, sticks, trash, and other deleterious substances.

B. Imported Planting Soils are to conform with the following target levels. Elements are expressed as mg/kg dry soil or mg/l for saturation extract
### pH value

- 6.5-7.9

### lime

- none present

### salinity (ECe)

- 0.5-3 milli-mho/cm

### chloride

- <150 ppm

### nitrate

- 20-30 ppm

### SAR

- <3

### phosphorus

- 8-20 mg/kg

### potassium

- 60-180 mg/kg

### iron

- 4-15 mg/kg

### manganese

- 0.6-3.0 mg/kg

### zinc

- 1-3 mg/kg

### copper

- 0.2-3.0 mg/kg

### boron

- 0.2-0.5 mg/kg

### magnesium

- 25-100 mg/kg

### sodium

- <200 mg/kg

### sulfur

- 25-100 mg/kg

---

C. The silt and clay content of Imported Planting Soil shall not exceed that of the existing soil it is to be placed over. Except where otherwise required, it shall be a "Sandy Loam" as classified in accordance with USDA Standards with a combined total of between 25% to 40% Clay and Silt.

D. **Submit soil analysis report** from an approved soils laboratory for approval by the Landscape Architect. Refer to Part 1 for soil testing requirements.

E. Following approval of the sample, provide a one-half cubic yard sample, which shall be stored at the site for comparison with sample and subsequent loads of soil. The comparison sample shall be protected by a cover until the installation of all soil has been completed and accepted.

---

### 2.4 PLANTING SOIL FOR STORMWATER TREATMENT

A. Planting soil for stormwater treatment shall be used in landscape areas designed for infiltration and the filtration of stormwater runoff before entering the storm drain system as specified below and as shown in drawings.

B. Planting soil mixes for stormwater treatment are available from TMT Enterprises in San Jose, CA, (408-432-9040); American Soil and Stone in Richmond, CA (510-292-3000) and San Rafael, CA (415-456-1381); and Lyngso Garden Materials in Redwood City, CA, (650-364-1730); or approved equal.

C. Planting soil for stormwater treatment shall conform to the following:

1. All material shall be free of trash and debris, expansive clays or any other deleterious materials.
2. Material shall be free of seeds.
3. The mineral component shall be classified as USDA sand or loamy sand and shall conform to the following particle size and characteristics.

<table>
<thead>
<tr>
<th>US Sieve</th>
<th>Size (mm)</th>
<th>Class</th>
<th>% wt. retained</th>
</tr>
</thead>
<tbody>
<tr>
<td>#10</td>
<td>2.0</td>

<td>20-35</td>
</tr>
<tr>
<td>#270</td>
<td>&lt;0.05</td>
<td>Silt &amp; Clay</td>
<td>6-12</td>
</tr>
</tbody>
</table>

Rock ½ inch – 1 inch = 0-5% by volume with none > 1 inch
Organic = 0-3% by weight

4. **Percolation Rate** must fall in the range of 10 inches per hour Initial Rate and 5 inches Sustained Rate as determined by SPL method A06-2, unless otherwise specified by civil engineer.
5. Chemistry Suitability Considerations
   Salinity: Saturation Extract Conductivity (ECe) Less than 3.0 dS/m @ 25° C.
   Sodium: Sodium Adsorption Ratio (SAR) Less than 6.0
   Boron: Saturation Extract Concentration Less than 1.0 ppm
   Reaction: pH of Saturated Paste: 5.5 – 7.8 without high lime content.

   Top 6” should be amended with the approved organic composted yard waste. See Part 3 for amendment procedures.

D. Submit Soil analysis report(s) for approval by the Landscape Architect and Civil Engineer. Refer to Part 1 for soil testing requirements.
   1. Submit soil analysis report (including infiltration rate) for planting soil mix for stormwater treatment from an approved soils laboratory.
   2. Submit subsoil analysis report (including infiltration rate) for subsoils if planting area is designed to allow stormwater to infiltrate into native subsoils.

2.5 ORGANIC AMENDMENT FOR PLANTING SOILS (ON-GRADE):

   A. Ground Redwood or Ground Fir Bark with the following properties:
      
      | Percent Passing | Sieve Designation |
      |-----------------|-------------------|
      | 100             | 9.51 mm 3/8"      |
      | 50-60           | 6.35 mm 1/4"      |
      | 20-40           | 4.76 mm No. 4     |
      | 0-20            | 2.38 mm No. 8 8 mesh |

      Redwood Sawdust
      Dry bulk density, lbs. per cu. yd., 260-280
      Nitrogen stabilized - dry weight basis, min. 0.4%
      Salinity (ECe): 4.0 maximum
      Organic Content: 90% minimum
      Reaction (pH): 4.0 minimum

      Ground Fir and/or Pine Bark
      Dry bulk density, lbs. per cu. yd., Min. 350
      Nitrogen stabilized - dry weight basis, min. 0.5%
      Salinity (ECe): 4.0 maximum
      Organic Content: 90% minimum
      Reaction (pH): 4.0 minimum

   B. Submit sample, product’s technical data sheet, and analysis report from an approved soils laboratory for approval by the Landscape Architect. The analysis report should include compliance to the specifications above and directions for product use.

   C. Contractor may use Composted Yard Waste Amendment in lieu of the above specified Organic Amendment pending approval of product’ technical data sheet.

2.6 COMPOSTED YARD WASTE AMENDMENT FOR PLANTING SOILS (ON-GRADE):
   Courtesy of Soil & Plant Laboratory, Inc. Santa Clara, CA

   A. The above ORGANIC AMENDMENT FOR PLANTING SOILS (ON-GRADE) is the specified organic amendment material. Acceptance of Composted Yard Waste Amendment in lieu of the above specified amendment material will be considered if the in situ planting soil salinity and soil structure is favorable for the inclusion of recycled yard waste organic matter, as approved by the Landscape Architect.
B. Composted yard waste amendment will not be accepted for use in on-structure raised planters and pots.

C. The composted yard waste amendment shall be a mixture of feedstock materials including green material consisting of chipped, shredded, or ground vegetation and mixed food waste, or clean processed recycled wood products. Single source, biosolids (sewage waste) compost will not be acceptable.

D. The addition of the compost shall result in a final ECe of the amended soil of less than 4.0 dS/m @ 25 degrees C. as determined in a saturation extract. Use the following table to determine the maximum allowable Ece (dS/m of saturation extract) of compost at desired use rate and allowable Ece increase.

<table>
<thead>
<tr>
<th>DESIRED USE RATE</th>
<th>MAXIMUM ALLOWABLE Ece INCREASE FROM AMENDMENT</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cu. Yds. Amendment Per 1000 Sq. Ft. for Incorporation to 6&quot; depth</td>
<td>Volume percentage of amendment</td>
</tr>
<tr>
<td>1</td>
<td>5</td>
</tr>
<tr>
<td>2</td>
<td>11</td>
</tr>
<tr>
<td>3</td>
<td>16</td>
</tr>
<tr>
<td>4</td>
<td>22</td>
</tr>
<tr>
<td>5</td>
<td>27</td>
</tr>
<tr>
<td>6</td>
<td>32</td>
</tr>
</tbody>
</table>

Example: Specification calls for 6 cu. Yrds. Compost per 1000 sq. ft. for incorporation to 6" depth, and site soil has an ECe of 2.0. In order to avoid exceeding ECe of 4 in final blend, compost ECe shall be less than 4.5 dS/m.

E. Composted Yard Waste Soil Amendment properties to conform to the following:

1. Gradation:
   - % Passing by weight
   - Sieve Designation
   - 90 1/2"
   - 85-100 9.51 mm 3/8"
   - 50-80 2.38 mm No. 8
   - 0-40 500 micron No. 35

2. Organic Content: Minimum 50% based on dry weight and determined by ash method. Minimum 250 lbs. organic matter per cubic yard of compost.

3. Carbon to nitrogen ratio: Maximum 35:1 if material is claimed to be nitrogen stabilized.

4. pH: 5.5 – 8.0 as determined in saturated paste.

5. Soluble Salts: See B. above.

6. Moisture Content: 35-60%.

7. Contaminants: The compost shall be free of contaminants such as glass, metal and visible plastic. Heavy meals, fecal coliform and Salmonella shall not exceed levels outlined as acceptable in the California integrated waste management regulations.

8. Maturity: Physical characteristics suggestive of maturity include:
   - Color: Dark brown to black.
   - Acceptable Odor: None, soil-like, or musty.
   - Unacceptable Odor: Sour, ammonia or putrid.
d. Particle Characterization: Identifiable wood pieces are acceptable but the balance of the material shall be soil-like without recognizable grass or leaves.

F. **Submit sample, product’s technical data sheet, and analysis report** from an approved soils laboratory for approval by the Landscape Architect. The analysis report should include compliance to the specifications above, directions for product use, and a list of ingredients. It is the Contractor’s responsibility to secure test of the proposed composted yard waste amendment (2 quart sample) and submit to a Soils Laboratory for evaluation and recommendations. The composted yard waste amendment sample shall be a grab sample from the currently available material that has been tested within the last 30 days and shall include the composter’s Compost Technical Data Sheet that includes lab analytical test results and directions for product use along with list of ingredients. Refer to Part 1 for soil testing requirements.

G. Based on the Soils Laboratory evaluation, the addition of composted yard waste amendment shall not be acceptable if it creates a leaching requirement.

2.7 PLANTS

A. Plant the variety, quantity and size indicated on drawings. The total quantities indicated on the drawings are considered approximate and furnished for convenience only. Contractor shall perform plant quantity calculations and provide all plants shown on the drawings.

B. Measure trees and shrubs with branches in normal position. Height and spread dimensions indicated refer to the main body of the plant, and not from branch tip to tip.

C. Take precautions to ensure that the plants will arrive at the site in proper condition for successful growth. Protect plants in transit from windburn and sunburn. Protect and maintain plants on site by proper storage and watering.

D. Install healthy, shapely and well rooted plants with no evidence of having been root-bound, restricted or deformed.

E. Tag plants of the type or name indicated and in accordance with the standard practice recommended by the American Association of Nurserymen.

F. Substitutions will not be permitted, except as follows:

1. If proof is submitted to the Landscape Architect that any plant specified is not obtainable, a proposal will be considered for use of nearest equivalent size or variety with an equitable adjustment of contract price.

2. Substantiate and submit proof of plant availability in writing to the Landscape Architect within 10 days after the effective date of Notice to Proceed.

G. Tree Form:

1. Trees shall have a symmetrical form as typical for the species/cultivar and growth form.

2. Central Leader for Single Trunk Trees: Trees shall have a single, relatively straight central leader and tapered trunk, free of co-dominant stems and vigorous, upright branches that compete with the central leader. Preferably, the central leader should not have been headed; however, in cases where the original leader has been remove, an upright branch at least $\frac{1}{2}$ the diameter of the original leader just below the pruning point shall be present.
3. Potential Main Branches: Braches shall be evenly distributed radially around and appropriately spaced vertically along the trunk, forming a generally symmetrical crown typical for the species.

4. Headed temporary branches should be distributed around and along the trunk as noted above and shall be no greater than 3/8” diameter, and no greater than ½ diameter of the trunk at point of attachment.

H. Tree Trunk

1. Trunk diameter and taper shall be sufficient so that the tree will remain vertical without the support of a nursery stake.

2. Trunk shall be free of wounds (except properly-made pruning cuts), sunburned areas, conks (fungal fruiting-bodies), wood cracks, bleeding areas, signs of boring insects, galls, cankers and/or lesions.

3. Tree trunk diameter at 6” above the soil surface shall be within the diameter range shown for each container size below, except where shown otherwise:

<table>
<thead>
<tr>
<th>Container</th>
<th>Trunk Diameter</th>
<th>Soil level from Container Top</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 gallon</td>
<td>0.5” to 0.75”</td>
<td>1.25 to 2”</td>
</tr>
<tr>
<td>15 gallon</td>
<td>0.75” to 1.0”</td>
<td>1.75 to 2.75”</td>
</tr>
<tr>
<td>24” Box</td>
<td>1.5” to 2.5”</td>
<td>2.25 to 3”</td>
</tr>
<tr>
<td>36” Box</td>
<td>&gt;2.5”</td>
<td>2.25 to 3”</td>
</tr>
<tr>
<td>60” Box</td>
<td>&gt;2.5”</td>
<td>3-6”</td>
</tr>
</tbody>
</table>

4. Tree trunks shall be undamaged and uncut with all old abrasions and cuts completely callused over. Do not prune plants prior to delivery.

I. Tree Roots

1. Trunk root collar (root crown) and large roots shall be free of circling and/or kinked roots. Contractor may be required to remove soil near the root collar in order to verify that circling and/or kinked roots are not present.

2. The tree shall be well rooted in the container. When the trunk is lifted the trunk and root system shall move as one and the rootball shall remain intact.

3. The top-most roots or root collar shall be within 1” above or below the soil surface. The soil level in the container shall be within the limits shown in above table.

4. The rootball periphery shall be free of large circling and bottom-matted roots.

5. On grafted or budded trees, there shall be no suckers from the root stock.

2.8 FERTILIZERS

A. General Landscape Fertilizers

Commercial fertilizer, pelleted or granular form, conform to the requirements of Chapter 7, Article 2, of the Agricultural Code of the State of California for fertilizing materials as follows:

**Type A:**
6% Nitrogen, 20% Phosphorus Acid and 20% Potash, (6-20-20)

**Type B:**
21 gram planting tablets 20% Nitrogen, 10% Phosphoric Acid and 5% Potash (20-10-5) available from Agriform or 10gm BestPacks packets 20% Nitrogen, 10% Phosphoric Acid and 5% Potash (20-10-5) available from Best Fertilizer Co.

**Type C (Maintenance Fertilizer)**
Complete fertilizer 21% Nitrogen, 7% Phosphoric Acid and 14% Potash (21-7-14).
If commercial fertilizer having the above analysis is not obtainable, other similar commercial fertilizer may be used providing it meets the approval of the Landscape Architect.

B. **Hydroseed Fertilizer**

Hydroseed fertilizer to be used in the slurry shall be commercial fertilizers conforming to the requirements of the California Food and Agricultural Code, shall have a guaranteed analysis for nitrogen, phosphorus and potassium of 7-2-1. Products specified as slow release shall have been tested and demonstrate a nearly linear curve.

2.9 **IRON SULFATE:** Dry form.

2.10 **EROSION CONTROL NETTING**

A. New, with a uniform, open plain-weave, flame-retardant mesh. The mesh shall be [natural brown-tan] and made from unbleached single jute yarn. The yarn shall be of loosely twisted construction and shall not vary in thickness by more than one-half its normal diameter. Furnish jute mesh in rolled strips to meet the following requirements:

- **Width:** 48 inches, with a tolerance of one-inch wider or narrower.
- **Not less than 78 warp ends per width.**
- **Not less than 41 weft ends per yard.**

2.11 **PERFORATED DRAIN PIPE**

A. Polyvinyl Chloride (PVC) pipe and pipe fittings shall meet extra strength minimum of SDR-35 of the requirements of ASTM Specification D3034.

B. Perforated and non-perforated corrugated polyethylene pipe, 3- to 10-inch diameter, shall meet the requirements of ASTM D883 and ASTM F412, and shall conform to Section 68 of the Standard Specifications.

C. Corrugated polyethylene pipe fittings shall comply with all requirements of AASHTO M-252-85I for 3- to 10-inch diameter pipe. Couplings shall be split or snap-on type for perforated pipe and split couplings with gaskets for non-perforated pipe. Cutting pipe with integral couplings will not be allowed.

D. Corrugated polyethylene pipe and fittings manufactured by Advanced Drainage Systems, Inc., shall be considered the standard to determine compliance to this specification.

E. Inspection Tube Cap: Paint cap one coat chocolate-brown color using Flat, exterior grade latex paint as accepted by Owner's Representative.

2.12 **FILTER FABRIC / PERMEABLE LANDSCAPE FABRIC**

A. Polyester or polypropylene non-woven filter fabric with uniform fiber distribution by "Terra Bond" #1115, "Mirafi, Inc." #140N, or approved equal.

2.13 **PERMEABLE DRAIN ROCK**

A. Permeable drain rock used in subsurface drain installations to be Class 2 permeable material in conformance with Section 68 "Subsurface Drains" of the Standard Specifications; gradation to 3/4" maximum size. Submit Sample for approval.
2.14 PRE-EMERGENCE WEED KILLER
   A. Clean non-staining as recommended by a licensed pest control specialist.

2.15 TREE STAKES
   A. Lodge pole pine logs, clean, smooth, un-treated.
   B. Unless otherwise shown on drawings, provide two-inch (2") diameter by eight feet (8') long for trees less than 8' high and 1" caliper.
   C. Unless otherwise shown on drawings, provide three-inch (3") diameter by eight to ten feet (8' - 10') long for trees greater than 8' high and 1" caliper.

2.16 TREE TIES
   A. Unless otherwise shown on drawings, provide rubber strap, 24-inch minimum length without sharp edges adjacent to trunk, V.I.T. cinch-tie, Dublin, CA, (818)882-9530, or approved equal.
   B. Black corded rubber tree ties w/ clips by greensleeves.com
   C. Biodegradable VStrap webbing by Treestrap.

2.17 MULCH
   A. Organic Mulch:
      1. Small Fir Bark, Forest floor bark mulch by American Soil and Stone, or approved equal
   B. Rock Mulch:
      1. Hard, durable smooth, river washed stone, 3/4-inch to 1-inch diameter in brown color range, Lin Creek or equal.
   C. Submit samples of rock mulch for approval by Landscape Architect until acceptable to Owner, at no extra cost.

2.18 STONES
   A. Smooth 2"-8" tan river pebbles, Lin Creek or equal.
   B. Stones to be installed around Drainage Structures to prevent mulch from migrating into stormdrain, and where shown in drawings

PART 3 - EXECUTION

3.1 PLANT PROTECTION AND REPLACEMENT
   A. Inspect and protect all existing and new plants and trees against damage from construction activities, erosion, trespass, insects, rodents, deer, disease, etc. and provide proper safeguards, including trapping of rodent and applying protective sprays and fencing to
discourage deer browsing. Maintain and keep all temporary barriers erected to prevent trespass.

B. Repair all damaged planted areas. Replace plants and re-seed or re-sod turf immediately upon discovery of damage or loss.

3.2 SOIL STRIPPING & STOCKPILING,
A. Refer to Section 311000, SITE CLEARING (soil stripping)

3.3 LIME TREATED SOIL
A. If site work includes Lime Treatment of the subsoil, the Contractor shall remove full depth of treated soil beyond 12” from structure(s) and replace with approved planting soil.

B. Following removal of lime treated material, scarify subgrade to a minimum depth of 6 inches and test for drainage.

C. Test subgrade in all planting areas for drainage by flooding with minimum 4 inch depth of water puddle and verify complete absorption of standing water within two hours. If standing water is still present after two hours, provide perforated pipe and drain rock “French Drain” system in bottom of non-draining planters and connect to storm drainage system, as accepted by Owner’s Representative prior to backfilling with approved planting soil.

3.4 GENERAL PREPARATION OF PLANTING SOIL
A. Submit soil analysis report of amended soils from an approved soils laboratory for approval by the Landscape Architect. Refer to Part 1 for soil testing requirements.

B. All planting soils to be amended as specified in soil laboratory analysis report(s).

C. Provide a minimum of [12"] depth of amended planting soil in all planting areas, or more where shown or specified otherwise. Install soil in maximum [12"] lifts. Compact each lift prior to installing subsequent lifts.

D. Amended subsoil is not an acceptable planting soil.

E. Thoroughly wet down the planting areas to settle the soil and confirm irrigation coverage and operation. Allow soil to dry so as to be workable as described herein.

F. After the rototill work, float areas to a smooth, uniform grade as indicated on the drawings. Slope all planting areas to drain. Roll, scarify, rake and level as necessary to obtain true, even planting surfaces. Remove rocks, sticks and debris 1 inch and larger in size in turf areas and 2 inches or larger in shrub and ground cover areas. Secure approval of the grade by the Landscape Architect before any planting.

G. Prior to planting, soil shall be loose and friable to a minimum depth of [12"] with a relative maximum compaction of 85%. Rip and scarify any overly compacted and re- compacted planting areas (in two directions full depth of compacted soil) prior to planting.

H. Water settling, puddling, and jetting of soil and backfill materials as a compaction method is not acceptable.
I. Prior to planting, soil shall be moist, but not so moist that it sticks to a hand shovel. Do not work planting soil in a wet or muddy condition or dump or spread in areas where subgrade is not in proper condition.

J. Provide planting soil as a final lift in all planting areas within and adjacent to paved areas and other construction where native site soil has been covered by engineered fill and/or base rock. Unless otherwise shown or specified, finish grade in planting islands shall be crowned with a minimum 2% pitch to drain.

K. Finish Grade: Hold finish grade and/or mulch surface in planting areas 1/2-inch below adjacent pavement surfaces, tops of curbs, manholes, etc. The subgrade of the mulch in mulched planting areas shall be a minus 2 inches at a distance of 12 to 18 inch from the edge of pavement. Drag finish grade to a smooth, even surface. Grade to form all swales and berms. Pitch grade with uniform slope to catch basins, streets, curb, etc., to ensure uniform surface drainage. Areas requiring grading include adjacent transition areas that shall be uniformly sloped between finish elevations. Slope surface away from walls so water will not stand against walls or buildings. Control surface water to avoid damage to adjoining properties or to finished work on the site. Take required remedial measures to prevent erosion of freshly graded areas.

L. Planting operations shall be performed only during periods when beneficial results can be obtained. When excessive moisture or other unsatisfactory conditions prevail, the work shall be stopped until conditions are satisfactory.

3.5 PREPARATION OF IMPORTED PLANTING SOIL

A. Provide a minimum of [12"] depth of imported planting soil in all planting areas, or more where shown or specified otherwise. Install soil in maximum [12"] lifts. Compact each lift prior to installing subsequent lifts.

B. Uniformly distribute and spread Subsoil or select fill in planting areas to achieve rough grading and compact to a maximum of 85% relative compaction.

C. Except within tree driplines, rip all planting areas in two directions full depth to a minimum of [12"] into undisturbed native subsoil prior to backfilling. Scarification of any planting area which cannot be accomplished with a tractor shall be accomplished by an alternative method approved by the Owner’s Representative to the specified depth to ensure proper percolation/drainage.

D. Thoroughly water-settle subsoil to required subgrade prior to installing Top Soil.

E. Prior to placing planting soil secure the Owner’s Representatives acceptance of the planting areas subgrade condition. Test depth of loose soil with hand shovel in presence of Owner’s Representative in several locations as directed.

F. After acceptance of the planting areas subgrade condition, uniformly distribute and spread planting soil backfill over scarified subgrade in planting areas as specified.

G. Mix and amend soil with required fertilizers, nutrients, etc. per specifications herein and recommendations given in soils reports.
3.6 PREPARATION OF IN-SITU PLANTING SOIL

A. In-Situ Planting Soil is defined as topsoil left in its original place and undisturbed during construction activities which is to receive new planting.

B. Amended subsoil is not an acceptable planting soil.

C. Contractor to provide soil report for any in-situ planting soil proposed for reuse. If in-situ planting soil is determined to be an acceptable planting soil, contractor to provide credit to owner for reduced quantity of imported planting soil.

D. Except within tree driplines, rip all planting areas in two directions full depth to a minimum of [12"] into undisturbed native subsoil prior to amending. Scarification of any planting area which cannot be accomplished with a tractor shall be accomplished by an alternative method approved by the Owner's Representative to the specified depth to ensure proper percolation/drainage.

E. Inspect planting areas and remove all base rock and other foreign material. Verify placement of planting soil within dripline of trees with Owner's Representative.

A. Test depth of loose soil with hand shovel in presence of Owner’s Representative in several locations as directed.

B. After acceptance of the planting condition, uniformly mix and amend soil with required fertilizers, nutrients, etc. per specifications herein and recommendations given in soils reports.

C. In the case of a contradiction between the quantity of organic amendment required by the soils laboratory analysis and the specified quantity below, the greater of the two quantities shall take precedence. Spread organic amendment, iron and Type A fertilizer evenly over installed and rough graded on-site topsoil in all planting areas including turf, ground cover and shrub areas at the following rates:
   a. Organic Amendment: 6 cubic yards per 1,000 square feet
   b. Fertilizer: Type A (6-20-20) at 20 lbs. per 1,000 square feet.
   c. Iron Sulfate: 10 lbs. per 1,000 square feet

2. Rototill above additives into soil [8-12"] inches deep. Keep iron sulfate off pavement and other surfaces to prevent rust staining. Correct all rust damage to work.

D. Final planting soil shall have a pH range of 6.5 to 7.5.

3.7 SOIL PREPARATION FOR STORMWATER TREATMENT PLANTING AREAS

A. Earthwork, rough grading, and drainage materials shall be complete and approved prior to installation of planting soil.

B. Do any necessary finish grading in addition to that performed in accordance with earthwork to bring subgrades after final compaction to required grades and sections as indicated.

C. Install the approved specified soil mix for infiltration planting areas as shown in Drawings. Soil depth to be 18” minimum typical and 24” minimum for planting areas with trees, unless otherwise shown on drawings.

D. After placement of the mineral component, the top 6” should be blended with the approved compost for stormwater treatment planting areas. If bulk blended, proportions should be 1
part compost to 4 parts of the above mineral component. If blended in place, this is equivalent
to 4 ½ cubic yards or 1,000 square feet for blending to 6-inch depth

E. If organic content of the mineral component is less than 0.6% weight, then it should be blended
with compost in volume proportions of 5% compost to 95% mineral.

F. Finish Grade: Provide a smooth, even surface. Sideslopes of stormwater planting areas (eg.
bioswales, basins, etc) not to exceed 3:1 in any direction. Finish grade of flow through planters
to be as shown in drawings.

3.8 WEED GERMINATION

A. Work shall be done under the supervision of a person licensed by the State of California as a
pest control applicator and holding a qualified applicator license or a Qualified Applicator
Certificate.

B. Following soil preparation and fine grading of planting areas, irrigate the planting areas to
germinate any weed seeds for a minimum period of 21 days. Maintain the soil in a damp
condition for a minimum depth of 4 inches. Following approval of the weed germination by the
Owner’s Representative, spray kill the weeds using a short lived systemic weed killer that will
not affect subsequent planting. Confirm the weed kill and allow the soil to dry out to optimum
degree for planting prior to planting.

3.9 PRE-EMERGENCE WEED KILLER

A. Work shall be done under the supervision of a person licensed by the State of California as a
pest control applicator and holding a qualified applicator license or a Qualified Applicator
Certificate.

B. Apply pre-emergence weed killer in all areas to receive ground cover planting. Obtain
approval of the finish grades prior to applying weed killer and coordinate planting and watering
with the pest control specialist prior to planting. Take care to keep weed killer off areas to be
seeded.

3.10 EROSION CONTROL NETTING

A. Verify finished grades and provide Jute Mesh and single grind Redwood bark mulch on all
slopes 3:1 and steeper as accepted by the Owner’s Representative. Install jute mesh loosely
up and down the slope in accordance with manufacturer's specifications and as follows. Fit the
soil surface contour and hold in place with 12-inch long, 11-gauge (minimum) steel wire
staples driven vertically into the soil at 18- to 24-inch spacing. Jute mesh strips shall overlap
along all edges at least 6 inches. Ends of side strips shall be buried into the soil at least 6
inches. Drive staples along edges to securely anchor mesh to ground.

3.11 TREE AND SHRUB PLANTING

A. Mark tree and shrub locations on site using stakes, gypsum or similar approved means and
secure location approval by the Landscape Architect before plant holes are dug. Adjust
location as required prior to planting.

B. Review location of plants in relationship to irrigation heads and adjust location(s) that interfere
with the function of the spray heads. Adjust locations as required to ensure that the plant roots
receive the proper amount of water in order for the plants to thrive.
A. Square Tree Pits
   1. Drilled tree pits shall be modified to a square pattern with pit walls scarified to promote root penetration.

B. Excavate tree, shrub and vine pits as follows:

<table>
<thead>
<tr>
<th></th>
<th>Width</th>
<th>Depth</th>
</tr>
</thead>
<tbody>
<tr>
<td>Boxed Trees</td>
<td>Box + 24&quot;</td>
<td>Box depth</td>
</tr>
<tr>
<td>Canned Trees (15 gc)</td>
<td>Can + 18&quot;</td>
<td>Can depth</td>
</tr>
<tr>
<td>Canned Shrubs/Vines (1-5 gc)</td>
<td>Can + 12&quot;</td>
<td>Can depth</td>
</tr>
</tbody>
</table>

C. Test drainage of plant beds and tree pits by filling with water (minimum 6"). The retention of water in planting beds and plant pits for more than two (2) hours shall be brought to the attention of the Landscape Architect. If rock, underground construction work, tree roots, poor drainage, or other obstructions are encountered in the excavation of plant pits, alternate locations may be selected by Landscape Architect.

D. Break and loosen the sides and bottom of tree pits to ensure root penetration and water test hole for drainage as required above.

E. Excavate plant hole or tree pit keeping excavated planting soil layer on the surface when backfilling around the plant. Carefully set plants as detailed without damaging the rootball. Superficially cut edge roots vertically on three sides. Remove bottom of plant boxes before planting. Remove sides of boxes after positioning the plant and partially backfilling.

F. Set plants in backfill with top of the rootball 1 inch above finished grade of adjacent soil. Backfill remainder of hole and soak thoroughly by jetting with a hose and pipe section. Water backfill until saturated the full depth of the hole.

G. Backfill plant holes with mix as specified, free from rocks, clods or lumpy material. Backfill native soil free of soil amendments under rootball and foot tamp to prevent settlement. Backfill remainder of the hole with soil mix and place plant tablets or packets (Type B fertilizer) 3 inches below finish grade and 1/2-inch from roots at the following rates:

<table>
<thead>
<tr>
<th>Plant Type</th>
<th>Tablets or Packet</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 gallon can plant</td>
<td>1 tablet or packet</td>
</tr>
<tr>
<td>5 gallon can plant</td>
<td>3 tablets or packet</td>
</tr>
<tr>
<td>15 gallon can plant</td>
<td>6 tablets or packet</td>
</tr>
<tr>
<td>24-inch box plant</td>
<td>6 tablets or packet</td>
</tr>
<tr>
<td>36-inch box plant</td>
<td>8 tablets or packet</td>
</tr>
</tbody>
</table>

H. Except for acid loving plants (Azaleas, Rhododendrons, Ferns, Camellias, etc.), use a soil mix of 2 parts soil from the hole, and 1 part amendment with iron added at the following rates:

<table>
<thead>
<tr>
<th>Plant Type</th>
<th>Amendment</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 gallon can plants</td>
<td>iron, 1/4 cup</td>
</tr>
<tr>
<td>5 gallon can plants</td>
<td>iron, 1/3 cup</td>
</tr>
<tr>
<td>15 gallon can plants</td>
<td>iron, 1/2 cup</td>
</tr>
<tr>
<td>24&quot; box and larger</td>
<td>iron, 1 cup</td>
</tr>
</tbody>
</table>

For acid loving plants (Azaleas, Rhododendrons, Ferns, Camellias, etc.), mix 1 part soil from the hole and 1 part amendment to use a backfill around the plants.

Mix the iron, amendment and soil thoroughly for use in the top 8 inches of backfill around plants. For acid loving plants, mixture to be 1/2 soil from the hole and 1/2 amendment.
I. Remove any soil from top of plant rootballs and secure Landscape Architect's approval of rootball height prior to mulching.

J. After approval of rootball height, install mulch as required below.

K. Stake and/or guy trees as detailed. Drive stake(s) until solid (at least 12" beyond bottom of rootball) and remove excess stake protruding above top tree tie to prevent rubbing against branches. Avoid driving stakes through rootball. If subgrade does not accept stakes to a stable degree, delete stakes and guy the trees as specified herein and as detailed. Locate tree ties to avoid contact with tree branches. Locate top tie at tree flex point.

L. Build watering basin berms around trees and shrubs to drain through rootball. Water backfill until saturated the full depth of the hole.

3.12 GROUND COVER PLANTING

A. Plant in neat, straight, parallel and staggered rows as indicated on plan. Plant first row one-half required ground cover spacing behind adjacent curbs, structures, or other plant bed limits. Plant ground cover to edge of water basins of adjacent trees and shrubs.

3.13 MULCH:

A. Except where rock mulch is required, mulch all tree, shrub and ground cover areas with organic mulch to a 3-inch depth, except mulch to 2-inch depth where planting with ground cover plants from flats.

B. Hold bark mulch away from base (trunk) of plant 4" or as directed by the Landscape Architect.

C. Individual trees and/or shrubs planted in non-irrigated areas shall, at minimum, receive bark mulch over their watering basin and berm.

D. Install rock mulch to depth as detailed, minimum 2-inches for full coverage of soil surface, whichever is greater.

3.14 WATERING:

A. Water all trees, shrubs and ground cover immediately after planting. Apply water to all plants as often and in sufficient amount as conditions may require to keep the plants in a healthy vigorous growing condition until completion of the Contract. Provide supplemental hand watering of trees and shrubs, as required, to maintain a moist root zones throughout plant establishment period.

3.15 PRE-MAINTENANCE PERIOD REVIEW AND APPROVAL OF PLANTING

A. Maintain plants from time of delivery to site until final acceptance of landscape installation.

B. Receive approval of the installed planting prior to commencement of planting establishment maintenance period. Notify the Landscape Architect or Owner’s Representative a minimum of seven (7) days prior to requested review. Before the review, complete the following:

1. Complete all construction work.
2. Present all planted areas neat and clean with all weeds removed and all plants installed and appearing healthy.
3. Plumb all trees and tree and shrub supports.
3.16 PLANTING ESTABLISHMENT MAINTENANCE:

A. General Requirements:

1. **Maintenance Period:** The planting establishment maintenance period required shall be **120 calendar days** after all planting and irrigation is complete and as approved by Owner’s representative. A longer period may be required if the plant material is not acceptably maintained during the maintenance period. The start of the maintenance period to be confirmed by Owner’s representative. Contractor to notify landscape architect of start and end dates of maintenance period. The maintenance period may be suspended at any time upon written notice to the Contractor that the landscaping is not being acceptably maintained, and the day count suspended until the landscape is brought up to acceptable standards as determined by the Owner Representative.

2. Planting establishment maintenance immediately follows, coincides with, and is continuous with the planting operations, and continues after all planting is complete and accepted; or longer where necessary to establish acceptable stands of thriving plants.

3. Protect all areas against damage, including erosion, trespass, insects, rodents, disease, etc. and provide proper safeguards. Maintain and keep all temporary barriers erected to prevent trespass.

4. Keep all walks and paved areas clean. Keep the site clear of debris resulting from construction or maintenance activities.

5. Repair all damaged planted areas, and replace plants and resod turf immediately upon discovery of damage or loss.

6. Check sprinkler systems at each watering; adjust coverage and clean heads immediately. Adjust timing of sprinkler controller to prevent flooding.

7. Maintain adequate moisture depth in soil to ensure vigorous growth. Check rootball of trees and shrubs independent of surrounding soils and hand water as required.

8. Keep contract areas free from weeds by cultivating, hoeing or hand pulling. Use of chemical weed killers will not relieve the Contractor of the responsibility of keeping areas free of weeds at all times.

B. Tree and Plant Maintenance:

1. Maintain during the entire establishment period by regular watering, cultivating, weeding, repair of stakes and ties, and spraying for insect pests. Prune when requested by the Landscape Architect.

2. Keep watering basins in good condition and weed-free at all times.

3. Replace all damaged, unhealthy or dead trees, shrubs, grasses, vines and ground covers with new stock immediately; size as indicated on the drawings.

C. Fertilizing:

1. Upon approval and after submitting fertilizer delivery tags, maintenance fertilization shall begin 30 days after planting is complete. Fertilize all ground cover areas by broad-casting Type C (21-7-14) fertilizer at the rate of 5 lbs. per 1,000 square feet evenly throughout. Reapply every forty-five (45) days until acceptable.

2. During the winter, for quick turf greening effect, calcium nitrate (15.5-0-0) may be applied at the rate of 6 lbs. per 1,000 square feet.

3. Early spring and fall substitute a complete fertilizer such as 15-15-15 applied at the rate of 6 lbs. per 1,000 square feet, to help insure continuing adequate phosphorus and potassium.
4. Apply ammonium sulfate fertilizer as necessary to maintain vigorous, green grass between fertilizations mentioned above.

5. Observe plant's color, and if a soil pH imbalance is suspected, take soil samples and obtain laboratory analysis for confirmation. Take necessary action recommended in laboratory analysis such as top dressing with soil sulfur, leaching soil, etc.

3.17 FINAL PLANTING REVIEW AND ACCEPTANCE

A. At the conclusion of the Maintenance Period, schedule a final review with the Owner, the Owner's maintenance person, and/or the Landscape Architect. On such date, all project improvements and all corrective work shall have been completed. If all project improvements and corrective work are not completed, continue the planting establishment maintenance period at no additional cost to the Owner until all work has been completed. This condition will be waived by the Owner under such circumstances wherein the Owner has granted an extension of time to permit the completion of a particular portion of the work beyond the time of completion set forth in the Agreement.

B. Submit written notice requesting review at least 10 days before the anticipated review.

C. Prior to review, weed and restore all planted areas, mow and edge turf, plumb trees and tree supports, clear the site of all debris and present in a neat, orderly manner.

END OF SECTION
SECTION 329451 – MODULAR SUSPENDED PAVEMENT SYSTEM

PART 1 - GENERAL

1.1 DESCRIPTION

A. Section Includes:
   1. Furnishing and installing Modular Suspended Pavement System, including, but not limited to: geotextile, geogrids, aggregates, sub base material, backfill, drainage system, root barrier, concrete retainers and installation of planting soil.

B. Related work specified elsewhere includes:
   1. Section 32 11 32 AGGREGATE BASE COURSE
   2. Section 32 84 00 IRRIGATION
   3. Section 32 90 00 PLANTING
   4. Section 32 94 56 PLANTING SOIL FOR MODULAR SUSPENDED PAVEMENT SYSTEM

1.2 DEFINITIONS

A. Aggregate Sub Base (below Cell frame): Aggregate material between the bottom of the Cell frame and the compacted subgrade below. Designed to distribute loads from the frame to the subgrade, including subgrade drainage as shown.

B. Aggregate Base Course (above Cell deck): Aggregate material between the paving and the top of the Cell deck designed to distribute loads across the top of the deck.

C. Backfill: The earth used to replace or the act of replacing earth in an excavation beside the Cell frames to the excavation extents.

D. Bridging Slab: Bridging slabs are to be used in locations where spacing larger than 3 inches (75 mm) is necessary between Cell frames.

E. Compost: Organic material subjected to composting processes

F. Finish Grade: Elevation of finished surface of planting soil or paving.

G. Geogrid: Net-shaped synthetic polymer-coated fibers that provide a stabilizing force within soil structure as the fill interlocks with the grid.

H. Geotextile: A geosynthetic fabric, applied to either the soil surface or between materials, providing filtration, separation, or stabilization properties.

I. Inspection Riser for Drainage: Vertical, perforated pipe installed at tree openings to allow access for visual inspection of water levels at base of Modular Suspended Pavement system.

J. Inspection Riser for Soil: Vertical pipe installed as shown to allow access for visual inspection of soils moisture within the Modular Suspended Pavement system. Inspection riser to occur in each tree cutout as accepted by Owner's Representative.

K. Irrigation: as required within the soil of the Modular Suspended Pavement system.

L. Planting Soil: as required by Specification, 32 91 13, PLANTING SOIL PREPARATION.

M. Root Barrier: Plastic root diversion device.
N. Root package (rootball): The earthen package containing the root system of the tree as shipped from the nursery.

O. Silva Cells (Modular Suspended Pavement System): Plastic structural cellular system with posts, beams and decks designed to be filled with planting soil for tree rooting and support of vehicle loaded pavements.

P. Subgrade: Surface or elevation of subsoil remaining after completing excavation, or top surface of a fill or backfill.

Q. Strongback: Modified Silva Cell frame designed to be attached to top of Silva Cells for stability while installing planting soil and backfill.

R. Subsoil: All soil beneath the topsoil layer of the soil profile, and typified by the lack of organic matter and soil organisms.

S. Zip Tie: A tensioning device or tool used to tie similar or different materials together with a specific degree of tension.

1.3 SUBMITTALS

A. Upon Thirty (30) days prior to start of installation of items in this section, the Contractor shall provide submittals required in this section to the Owner's Representative for review and approval.

1. Schedule of work and coordination with other trades
2. Installer qualifications, including name and work experience of field supervisor.

B. Product Data: For each type of product, submit manufacturer's product literature with technical data sufficient to demonstrate that the product meets these specifications, including but not limited to:

1. Modular Suspended Pavement System,
2. Anchoring Spikes,
3. Solid and perforated drain lines,
4. Inspection risers and caps,
5. Geogrid,
6. Geotextile,
7. Aggregate sub base,
8. Aggregate base course,
9. Backfill Materials,
10. Root barrier,
11. Manufacturer's product warranty.
12. For bulk materials, including soils and aggregates, include analysis as required by Specifications.

C. Testing of mock up results

1. Compaction testing log

D. Modular Suspended Pavement System manufacturer's letter of review and approval of the project, plans, details and specifications for compliance with product installation requirements.

E. Modular Suspended Pavement System Mock Up:

1. Prior to the installation, construct a mock up of the complete installation at the site. The installation of the mock up shall be in the presence of the Owner's Representative and the Modular Suspended Pavement System Representative.
2. The mock up shall be a minimum of 100 square feet in area and include the complete system installation with sub base compaction, drainage installation, base course aggregate and geotextile
as required, geogrids, backfill, planting soil with compaction, decks, top geotextile and all necessary accessories.

3. The mock up area may remain as part of the installed work at the end of the project provided that it remains in good condition and meets all the conditions of the specifications.

F. Compaction testing results: Submit results of all compaction testing required by the specifications including the bulk density test of the mock up and installed soil to the Owner's Representative for approval.

G. Qualification Data: Submit documentation of the qualifications of the Modular Suspended Pavement System installer sufficient to demonstrate that the installer meets the requirements of paragraph "Quality Assurance".

1.4 SEQUENCING AND SCHEDULING

A. General: Prior to the start of Work, prepare a detailed schedule of the work for coordination with other trades.

B. Schedule all utility installations prior to beginning work in this section.

C. Where possible, schedule the installation of Modular Suspended Pavement Systems after the area is no longer required for use by other trades and work. Protect installed Modular Suspended Pavement Systems from damage in the event that work must occur over, through, or adjacent to the completed Modular Suspended Pavement Systems.

1.5 QUALITY ASSURANCE

A. Reference Standards:

1. Ordinances and Regulations: All local, municipal and state laws, codes and regulations governing or relating to all portions of this work are hereby incorporated into and made a part of these Specifications. Anything contained in these Specifications shall not be construed to conflict with any of the above codes, regulations or requirements of the same. However, when these Specifications and Drawings call for or describe materials, workmanship or construction of a better quality, higher standard than is required by the above mentioned codes and regulations, the provisions of these Specifications and Drawings shall take precedence. Furnish without extra charge additional materials and labor required to comply with above rules and regulations.

B. Coordination:

1. A minimum of two weeks prior to beginning construction of the Modular Suspended Pavement System Mock Up, notify and coordinate with the Owner and the Modular Suspended Pavement System Manufacturer, observation of the excavation, subgrade preparation, installation of the cell frame, backfilling, etc.

C. Installer Qualifications: Modular Suspended Pavement Systems and related products shall be installed by a qualified installer whose work has resulted in successful installation of planting soils and planter drainage systems, underground piping, chambers and vault structures.

1. Submit list of completed projects of similar scope and scale to the Owner's Representative, demonstrating capabilities and experience.

2. The installer and the field supervisor shall have a minimum of five years successful experience with construction of similar scope in dense urban areas.

3. Installer's Field Supervision: Installer is required to maintain an experienced full-time supervisor on Project site when work is in progress. This person shall be identified during the Pre-installation Conference, with appropriate contact information provided, as necessary. The same supervisor shall be utilized throughout the Project, unless a substitution is submitted to and approved in writing by the Owner's Representative.
1.6 LAYOUT AND ELEVATION CONTROL
   A. Provide layout and elevation control during installation of Modular Suspended Pavement Systems. Utilize grade stakes, benchmarks, surveying equipment and other means and methods to assure that layout and elevations conform to the layout and elevations indicated on the plans.

1.7 PERMITS AND CODE COMPLIANCE
   A. Comply with applicable requirements of the laws, codes, ordinances and regulations of Federal, State and Municipal authorities having jurisdiction. Obtain necessary permits/approvals from all such authorities.

1.8 DELIVERY, STORAGE, AND HANDLING
   A. Packaged Materials: Deliver packaged materials in original, unopened containers showing weight, certified analysis, name and address of manufacturer, and indication of conformance with state and federal laws, if applicable. Protect materials from deterioration during delivery and while on the project site.
   B. Bulk Materials:
      1. Do not deliver or place backfill, soils and soil amendments in frozen, wet, or muddy conditions.
      2. Provide protection including tarps, plastic and or matting between all bulk materials and any finished surfaces sufficient to protect the finish material.
   C. Provide erosion-control measures to prevent erosion or displacement of bulk materials and discharge of soil-bearing water runoff or airborne dust to adjacent properties, water conveyance systems, and walkways. Provide additional sediment control to retain excavated material, backfill, soil amendments and planting mix within the project limits as needed.
   D. Modular Suspended Pavement Systems: Protect Modular Suspended Pavement Systems from damage during delivery, storage and handling.
      1. Store under tarp to protect from sunlight when time from delivery to installation exceeds one week. Storage should occur on smooth surfaces, free from dirt, mud and debris
      2. Handling is to be performed with equipment appropriate to the size (height) of Cells and site conditions, and may include, hand, handcart, forklifts, extension lifts, or small cranes, with care given to minimize damage to Modular Suspended Pavement System frames, decks and adjacent Modular Suspended Pavement Systems.

1.9 PROJECT CONDITIONS
   A. Verification of Existing Conditions and Protection of New or Existing Improvements: Before proceeding with work in this section, the Installer shall carefully check and verify all dimensions, quantities, and grade elevations, and inform the Owner's Representative immediately of any discrepancies.
      1. Carefully examine the civil, record, and survey drawings to become familiar with the existing underground conditions before digging. Verify the location of all aboveground and underground utility lines, infrastructure, other improvements, and existing trees, shrubs, and plants to remain including their root system, and take proper precautions as necessary to avoid damage to such improvements and plants.
      2. In the event of conflict between existing and new improvements notify the Owner's Representative in writing and obtain written confirmation of any changes to the work prior to proceeding.
      3. When new or previously existing utility lines are encountered during the course of excavation, notify the Owner's Representative in writing and make recommendations as to remedial action. Proceed with work in that area only upon approval of appropriate remedial action. Coordinate all work with the appropriate utility contractors, utility company or responsible public works agency.
B. Weather Limitations: Do not proceed with work when subgrades, soils and planting soils are in a wet, muddy or frozen condition.

C. Protect partially completed Modular Suspended Pavement System installation against damage from other construction traffic with highly visible construction tape, fencing, or other means until construction is complete. Prevent all non-installation related construction traffic over the completed Modular Suspended Pavement System installation; allowing only loads less than the design loads.

1.10 PROTECTION

A. Protect open excavations and partially completed Modular Suspended Pavement System installation from access and damage when work is in progress, and following completion with highly visible construction tape, fencing, or other means until all construction is complete.

1.11 WARRANTY

A. Modular Suspended Pavement System manufacturer's product warranty shall apply. Submit manufacturer's product warranty.

1.12 PROJECT WORK

A. Coordinate installation with all other work that may impact the completion of the work.

1.13 PRECONSTRUCTION MEETING

A. Prior to the start of the installation of Modular Suspended Pavement Systems, meet at the site with the Owner's Representative, general contractor and the Modular Suspended Pavement Systems installer to review installation layout, procedures, means and methods.

PART 2 - PRODUCTS

2.1 MODULAR SUSPENDED PAVEMENT SYSTEMS

B. Fiberglass-reinforced polypropylene structures including frames and decks designed to support sidewalk loads and designed to be filled with soil for the purpose of growing tree roots, and rainwater filtering, detention and retention.

C. Silva Cell Frames: 400 mm x 600 mm x 1200 mm (16 inches x 24 inches x 48 inches).

D. Silva Cell Deck: 5 cm x 600 mm x 1200 mm (2 inches x 24 inches x 48 inches). Deck to include manufactured installed galvanized steel tubes.

E. Silva Cell Strongback: 400 mm x 600 mm x 150 mm (24 inches x 48 inches x 6 inches) modified Modular Suspended Pavement System Frame units designed to stiffen and align the frames as planting soil and backfill material is placed. Strongbacks are to be removed prior to placing decks. They are to be reused as the work progresses.

F. Silva Cell Deck Screws: Manufacturer's supplied stainless steel screws to attach decks to frames.

2.2 ANCHORING SPIKES

A. 10" (250 mm) long X 19/64" (8 mm) diameter, spiral, galvanized timber spikes. Utilize 4 spikes in each frame on the first layer of Silva Cells to anchor the frames to the aggregate sub base.
2.3 SOLID AND PERFORATED DRAIN LINES
   A. Any solid or perforated drain lines to be specified...

2.4 INSPECTION RISER FOR DRAINAGE (where applicable):
   A. Rigid, PVC schedule 40 pipe, 4” diameter.
   B. Cap: Cast Iron solid threaded cleanout designed to fit standard PVC schedule 40 pipe-fittings with concrete collar set flush in pavement surface as accepted by Owner's Representative.
      1. Products meeting this specification: Zurn Z 1440, Cast Iron Adjustable Cleanout, Zurn, 1801 Pittsburgh Avenue, Erie, PA 16502, 1-877-ZURN-NOW. http://www.zurn.com/

2.5 INSPECTION RISER FOR SOIL (where applicable):
   A. Rigid, PVC schedule 40 pipe, 6” diameter.
   B. Cap: Cast Iron solid threaded cleanout designed to fit standard PVC schedule 40 pipe-fittings.
      1. Products meeting this specification: Zurn Z 1440, Cast Iron Adjustable Cleanout, Zurn, 1801 Pittsburgh Avenue, Erie, PA 16502, 1-877-ZURN-NOW. http://www.zurn.com/

2.6 INSPECTION RISER FOR SOIL LOCATED IN TREE WELL
   A. Rigid, Perforated PVC schedule 40 pipe, 4” diameter.
   B. Cap: PVC solid threaded cleanout designed to fit standard PVC schedule 40 pipe-fittings. Cap painted color to match Granite Pavers as accepted by Owner’s Representative.

2.7 GEOGRID
   A. Geogrid shall be woven polyester fabric with PVC coating, Uni-axial or biaxial geogrid, inert to biological degradation, resistant to naturally occurring chemicals, alkalis, acids.
      1. Tensile strength at ultimate: 1850 lbs/ft (27.0 kN/m) minimum by ASTM D6637 test method
      2. Creep reduced strength: 1000 lbs/ft (14.6 kN/m) minimum by ASTM D5262 test method
      3. Long term allowable design load: 950 lbs/ft (13.9 kN/m) minimum by GRI GG-4 test method
      4. Grid aperture size (MD): 0.8 inch (20 mm) minimum
      5. Grid aperture size (CD): 1.28 inch (32 mm) maximum
      6. Roll size: 6’ (1.8m) width is preferred, up to 18’ (5.4m)
   B. Products meeting this specification:

2.8 GEOTEXTILE
   A. Geotextile shall be nonwoven polypropylene fibers, inert to biological degradation and resistant of naturally occurring chemicals, alkalis and acids.
      1. Grab tensile strength: 200 lbs (900 N) minimum (ASTM D 4632 test method)
      2. Elongation: 50% maximum (ASTM D 4632 test method)
      3. Trapezoid tear strength: 80 lbs (350 N) minimum (ASTM D 4533 test method)
      4. Mullen burst strength: 350 psi (2400 kPa) minimum (ASTM D 3786 test method)
      5. Puncture strength: 110 lbs (490 N) minimum (ASTM D 4833 test method)
6. CBR puncture strength: 500 lbs (2225 N) minimum (ASTM D 6241 test method)
7. Apparent opening size: 80 sieve (0.18mm) maximum (ASTM D 4751 test method)
8. Flow rate: 95 gal/min/ft² (3870 l/min/m²) minimum (ASTM D 4491 test method)
9. UV Resistance (at 500 hours): 70% strength retained

B. Products meeting this specification:
      (Distributed by Geosynthetic Systems in Ontario)
   2. Geotex 801 as manufactured by Propex Geosynthetics, Chattanooga, TN,
      http://www.geotextile.com (Distributed by Nilex in Canada)

2.9  AGGREGATE SUB BASE (Drain Rock) BELOW CELL FRAME
   A. Aggregate subbase below Modular Suspended Pavement System frame to provide Modular
      Suspended Pavement System support and subsurface drainage: 3/4" X 1/4" clean, hard, durable
      virgin crushed rock meeting Caltrans Section 68 Submit Sample along with material analysis for
      approval.

2.10  CONCRETE BASE COURSE FOR NON-POROUS PAVEMENT (ABOVE CELL DECK)
   A. Refer to project's SECTION 3214 40, SAND & MORTAR-SET PAVING

2.11  SETTING BED FOR UNIT PAVERS (ABOVE CELL DECK)
   A. Refer to project SECTION 3214 40, SAND & MORTAR-SET PAVING Specifications for setting bed
      material requirements.

2.12  BACKFILL MATERIAL (ADJACENT TO MODULAR SUSPENDED PAVEMENT SYSTEMS):
   A. Clean, compactable, coarse grained fill soil meeting the requirements of the Unified Soil Classification
      system for soil type GW, GP, GC with less than 30% fines, SW, and SC with less than 30% fines.
      Backfill material shall be free of organic material, trash and other debris, and shall be free of toxic
      material injurious to plant growth.
   B. Submit supplier certificate for material meeting this specification.

2.13  PLANTING SOIL: (See Specification Section 32 91 13 PLANTING SOIL PREPARATION for Modular
      Suspended Pavement Systems)

2.14  ROOT BARRIER
   A. Root Barrier shall be DeepRoot; Tree Root Barriers; UB 18-2, manufactured by DeepRoot Partners,
      L.P. (Deep Root); 530 Washington Street, San Francisco, CA 94111; 415.781.9700; 800.458.7668; fax
   B. Material: Black, injection molded panels, 0.080"(2.03mm) wall thickness in modules 24" (61cm) long by
      18" (46cm) deep; manufactured with a minimum 50% post-consumer recycled polypropylene plastic
      with UV inhibitors; recyclable. Integrated zipper joining system providing for instant assembly by sliding
      one panel into another.

PART 3 - EXECUTION

3.1  LAYOUT APPROVAL
   A. Prior to the start of work, layout and stake the limits of excavation and horizontal and vertical control
      points sufficient to install the Modular Suspended Pavement Systems and required drainage features in
      the correct locations.
### 3.2 EXCAVATION

A. Excavate to the depths and shapes indicated on the drawings. The base of excavation shall be smooth soil, level, and free of lumps or debris.

B. Do not over-excavate existing soil beside or under the limits of excavation required for the installation. If soil is over-excavated, install compactable fill material in lifts not more than 8 inches (200 mm) deep and compact to the required density.

C. Confirm that the depth of the excavation is accurate to accommodate the depths and thickness of materials required throughout the extent of the excavation.

D. Confirm that the width and length of the excavation is a minimum of 6 inches (150 mm), in all directions, beyond the edges of the Modular Suspended Pavement Systems.

### 3.3 SUBGRADE COMPACTION

A. Check compaction of the subgrade below the Modular Suspended Pavement Systems and confirm that the subgrade soil is compacted to a minimum of 95% of maximum dry density at optimum moisture content in accordance with ASTM D 698 Standard Proctor Method.

B. Proof compact the subgrade with a minimum of three passes of a suitable vibrating compacting machine or apply other compaction forces as needed to achieve the required subgrade compaction rate.

C. Apply additional compaction forces at optimum water levels.

### 3.4 INSTALLATION OF GEOTEXTILE OVER SUBGRADE

A. Where indicated on drawings, install geotextile over compacted subgrade.

B. Removal of the geotextile as a standard component of the Modular Suspended Pavement System system must be determined by professional civil or geotechnical engineer.

C. Install the geotextile with a minimum joint overlap of 18 inches (450 mm) between sections of material. Ensure geotextile is laid flat with no folds or creases.

### 3.5 INSTALLATION OF INSPECTION RISERS FOR DRAINAGE

A. Cut PVC pipe to fit vertically to finish surface.

B. Manually perforate riser. Pipe should be rigid at level of pavement section, and perforated through level of Modular Suspended Pavement System system.

C. Wrap pipe in geotextile and secure with zip ties. Brace riser for the remainder of installation to secure its location and elevation.

D. Install caps on top of each riser flush with grade. PVC caps shall be painted chocolate brown color using exterior grade paint.

### 3.6 INSTALLATION OF Aggregate SUB BASE BELOW MODULAR SUSPENDED PAVEMENT SYSTEM FRAME

A. Install aggregate sub base and subbase drainage system to the depths indicated on the drawings, under the first layer of Modular Suspended Pavement System frames. Sub base aggregate shall extend a minimum of 6 inches (150mm) beyond the edge of the Cell frames.

B. Compact aggregate sub base layer to a minimum of 95% of maximum dry density at optimum moisture content in accordance with ASTM D 698 Standard Proctor Method. Compact the subgrade with a
minimum of three passes of a suitable vibrating compacting machine or apply other compaction forces as needed to achieve the required subgrade compaction rate.

C. The maximum slope on the surface of the sub base shall be 5%. Where proposed grades on finished paving are greater than 5%, the Cells shall be stepped to maintain proper relationships to the finished grade.

D. The grade and elevations of the base under the Modular Suspended Pavement Systems shall be approved by the Owner's Representative prior to proceeding with the installation of the Modular Suspended Pavement Systems.

E. Note that the Modular Suspended Pavement System does not fully meet H-20 loading until the final paving is installed. No equipment shall be used on top of the Cell system until paving installation has been completed.

3.7 INSTALLATION OF MODULAR SUSPENDED PAVEMENT SYSTEMS, PLANTING SOIL, GEOGRID, AND BACKFILL

A. Identify the outline layout of the structure and the edges of paving around tree planting areas on the floor of the excavation, using spray paint or chalk line.

B. Lay out the first layer of Modular Suspended Pavement System frames on the sub base. Verify that the layout is consistent with the required locations and dimensions of paving edges to be constructed over the Modular Suspended Pavement Systems. Coordinate with drainage of sub base.

C. Check each Modular Suspended Pavement System frame unit for damage prior to placing in the excavation. Any cracked or chipped unit shall be rejected.

D. Place frames no less than 1 inch (25 mm) and no more than 3 inches (75 mm) apart at base. In the event that spacing between Cells exceeds 3 inches (75 mm), bridging slab details and methods shall be used to span these gaps.

E. Install Modular Suspended Pavement System frames around, over, or under existing or proposed utility lines as indicated on plans.

F. Where any two adjacent Modular Suspended Pavement System frames must be installed at different elevations, the upper frame shall be supported by aggregate sub base with a maximum slope of 1:1. This may require installation of aggregate sub base within the adjacent lower Cell frame. No two frames shall differ in elevation by more than 15 inches (375 mm).

G. Assure that each frame sits solidly on the surface of the sub base. Frames shall not rock or bend over any stone or other obstruction protruding above the surface of the sub base material. Frames shall not bend into dips in the sub base material. The maximum tolerance for deviations in the plane of the sub base material under the bottom of the horizontal beams of each Modular Suspended Pavement System frame shall be 1/4 inch (6 mm) in 4 feet (1200 mm).

H. Adjust sub base material including larger pieces of aggregate under each frame to provide a solid base of support.

1. Anchor each Modular Suspended Pavement System into sub base with four-10 inch (250 mm) spikes, driven through the molded holes in the Cell frame base. The purpose of the anchoring system is to maintain cell spacing and layout during the installation of planting soil and backfill.

2. For applications where cells are installed over waterproofed structures, develop a spacing system consistent with requirements of the waterproofing system. Do not use anchoring nails that will come within 6” or less of any waterproofing material.

I. Install the second layer of Modular Suspended Pavement System frames on top of the first layer. Comply with manufacturer’s requirements to correctly register and connect the Cell frames together.
J. Register each frame on top of the lower frame post. Rotate each frame registration arrow in the opposite direction from the frame below to assure that connector tabs firmly connect. Each frame shall be solidly seated on the one below.

K. Build layers as stacks of frames set one directly over the other. Do not set any frame half on one Cell frame below and half on an adjacent frame.

L. Install Strongbacks on top of the Modular Suspended Pavement System frames prior to installing planting soil and backfill.
   1. Strongbacks are required only during the installation and compaction of the planting soil and backfill.
   2. Strongbacks should be moved as the work progresses across the installation.
   3. Strongbacks shall be removed prior to the installation of Modular Suspended Pavement System decks.

M. Install planting soil, geogrid and backfill as indicated on the drawings. The process of installation requires that these three materials be installed and compacted together in several alternating operations to achieve correct compaction relationships within the system.

N. Where required, place the geogrid curtain along the outside of the limit of the Modular Suspended Pavement System frames.
   1. Geogrid curtains are required between the edge of the Modular Suspended Pavement Systems and any soils to be compacted to support paving beyond the area of Modular Suspended Pavement Systems. Do not place geogrid curtains between the edge of the Cells and any planting area adjacent to the Cells.
   2. Pre-cut the geogrid to allow for 6 inches (150 mm) minimum under lapping below backfill, and 12 inches (300 mm) minimum overlapping top of Modular Suspended Pavement System stack.
   3. Where Modular Suspended Pavement System layout causes a change direction in the plane of the geogrid, slice the top and bottom flaps of the material so that it lies flat on the top of the cell deck and aggregate base course along both planes.
   4. Provide a minimum of 300 mm (12 inch) overlaps between different sheets of geogrid.
   5. Place the geogrid in the space between the Modular Suspended Pavement System frames and the sides of the excavation. Attach the geogrid to the Modular Suspended Pavement System frames using 3/16 inch x 14-inch (5x350 mm) zip ties. Attach with zip ties at every cell and at Cell Deck.

O. Install no more than two layers of Modular Suspended Pavement System frames before beginning to install planting soil and backfill. Compact the planting soil within the Modular Suspended Pavement System frames and the backfill material outside the frames in alternating lifts until the desired elevations and density is achieved in both planting soil and backfill.

P. Install and compact backfill material in the space between the Modular Suspended Pavement Systems and the sides of the excavation in lifts that do not exceed 8 inches (200 mm).
   1. Compact backfill to 95% of maximum dry density using a powered mechanical compactor. Use a pneumatic compacting tool or narrow foot jumping jack compactor for spaces less than 12 inches (300 mm) wide and a 12-inch wide jumping jack compactor or larger equipment in wider spaces.
   2. Maintain the geogrid curtain between the Modular Suspended Pavement Systems frames and the backfill material.
   3. Install backfill in alternating lifts with the planting soil inside the Modular Suspended Pavement Systems.

Q. Fill the first layer or layers of frames with planting soil, specified in Section 32 94 56 Planting Soil for Modular Suspended Pavement Systems.
1. Bring planting soil to the site using equipment and methods that do not overly mix and further damage soil peds within the soil mix. Soil mixes shall not be blown or pumped into the Cells using soil blowing equipment.

2. Install in lifts that do not exceed 16 inches (400 mm). Lightly compact the soil inside the frames at each lift to remove air pockets and settle the soil within the frames.

3. Do not compact greater than 80% of maximum dry density. Check the soil compaction with a penetrometer or densiometer to achieve similar compaction levels provided in the mock up.

4. If the planting soil becomes overly compacted, remove the soil and reinstall. Use hand tools or other equipment that does not damage the Modular Suspended Pavement System frames.

5. Do not walk directly on horizontal beams of the frames.

6. Work soil under the horizontal frame beams of the second level of Cell frames and between columns eliminating air pockets and voids. Fill each frame such that there is a minimum of 10 inches (250 mm) of soil over the top of horizontal frame beams before beginning compaction.

7. The top 1-2 inches (25-50 mm) of each frame post should remain exposed above the soil to allow the placement of the next frame or deck.

R. After the first two layers of Modular Suspended Pavement System frames have been installed, filled with planting soil and backfilled, proceed to install the third layer, if required, of Modular Suspended Pavement Systems frames. Comply with manufacturer’s requirements to correctly register and connect the Cell frames together.

S. Remove the strongbacks. Sweep any soil from tops before adding the next layer of frames.

T. Register each frame on top of the lower frame post. Rotate each frame registration arrow in the opposite direction from the frame below to assure that connector tabs firmly connect. Each frame shall be solidly seated on the one below.

U. Build layers as stacks of frames set one directly over the other. Do not set any frame half on one Cell frame below and half on an adjacent frame.

V. Install Strongbacks on top of third layer of Modular Suspended Pavement Systems.

W. Continue to install and compact the specified planting soil within the Modular Suspended Pavement System frames and the backfill material outside the frames in alternating lifts until the desired elevations and density is achieved in both soils.

X. Obtain final approval by the Owner's Representative of soil installation prior to installation of the Modular Suspended Pavement System deck.

Y. Remove Strongbacks after planting soil and backfill has been compacted to the top of the entire set of Modular Suspended Pavement Systems.

Z. Install 3 inches (75 mm) of compost, or leave 1-inch (25 mm) air space, below Modular Suspended Pavement System Deck as indicated on the drawings.

3.8 IRRIGATION SYSTEM INSTALLATION

A. Install irrigation as shown and per project specifications. Irrigation shall be installed within the entire soil system, under both pavement and metal grate systems.

3.9 MODULAR SUSPENDED PAVEMENT SYSTEM DECK INSTALLATION

A. Install the Modular Suspended Pavement System Decks over the top of each frame stack. Clean dirt from the tops of the Modular Suspended Pavement System frame columns. Register the deck and make connections as recommended by the manufacturer to secure the deck to the top of the Modular Suspended Pavement System Frame. Secure each deck at the four corners with screw fasteners as recommended by the manufacturer. Assure that each deck is seated firmly on the frame top with all connectors attached.
B. Install and compact remaining backfill material such that the soil outside the limits of the Modular Suspended Pavement Systems is flush with the top of the installed deck.

3.10 INSTALLATION OF GEOTEXTILE, GEOGRID, INSPECTION RISER FOR SOIL, AND AGGREGATE OVER THE DECK

A. Overlap geogrid from the sides of the Modular Suspended Pavement Systems over the top of the Modular Suspended Pavement System Decks, with minimum of 12 inches (300mm) overlap.

B. Place geotextile over the top of the deck and where indicated on the drawings, extending beyond the outside edge of the excavation by at least 18 inches (450 mm). Any joints must be overlapped by a minimum of 18 inches (450 mm).

C. Install inspection risers for soil above geotextile as indicated on drawings.
   1. Cut PVC pipe to fit vertically from Modular Suspended Pavement System deck to finish surface.
   2. Align riser with slots in Modular Suspended Pavement System deck or as shown.
   3. Wrap pipe in geotextile and secure with zip ties. Cut geotextile to overlap deck minimum 12".
   4. Cut geotextile inside the pipe to allow access. Do not cut or otherwise damage Modular Suspended Pavement System deck.
   5. Install painted caps on top of each riser flush with final paving surface.

D. Install the aggregate base course (including aggregate setting bed if installing unit pavers) over the geotextile immediately after completing the installation of the fabrics and inspection risers. Work the aggregate from one side of the deck to the other to assure that the fabric and aggregate conforms to the cell deck contours. Do not apply aggregate in several positions at the same time.
   1. Aggregate base course shall be a minimum of 4 inches (100mm) thick under pored in place concrete paving.
   2. Aggregate base course shall be a minimum of 12 inches (300mm) thick under unit pavers, asphalt paving, or porous paving.

E. Load the aggregate from equipment that is outside the limits of the excavated area. Work over material already in place.

F. For large or confined areas, where aggregate cannot easily be placed from the edges of the excavated area, obtain approval for the installation procedure and types of equipment to be used in the installation from the Modular Suspended Pavement System manufacturer.

G. Compact aggregate base course(s) in lifts not to exceed 6" in depth, to 95% of maximum dry density. Utilize a roller or plate compactor with a maximum weight of 1000 pounds. Make sufficient passes with the compacting equipment to attain the required compaction.

3.11 INSTALLATION OF PAVING ABOVE THE MODULAR SUSPENDED PAVEMENT SYSTEM

A. Place paving material over Modular Suspended Pavement System per project specifications. Take care when placing paving or other backfill on top of Modular Suspended Pavement System not to damage the system components.

B. Turn down edge of all concrete paving to Cell deck along the edges of all planting areas to retain the aggregate base course.

3.12 INSTALLATION OF BRIDGING SLABS (WHERE APPLICABLE)

A. Bridging slabs are to be used in locations where spacing larger than 3 inches (75 mm) is necessary between Modular Suspended Pavement System frames.

B. Replace aggregate base course material with a minimum 4 inch (100 mm) concrete slab beneath paving. The paving shall extend beyond the gap between Cells at a minimum of 24 inches (610 mm).
C. If spacing (gap) between Cells is larger than 12 inches (300 mm), the concrete slab must be increased to 6 inch (150 mm) thickness. If spacing (gap) between Cells is larger than 18 inches (450 mm), steel reinforcing shall be added to the slab. Reinforcing is to be designed by the project structural engineer. In no case shall the space between Cells be greater than 30 inches (750 mm).

3.13 INSTALLATION OF ROOT BARRIERS
   A. Install root barrier in accord with manufacturer's reviewed installation instructions.

3.14 INSTALLATION OF PLANTING SOIL WITHIN THE TREE PLANTING AREA
   A. Prior to planting trees, install additional planting soil, to the depths indicated, within the tree opening adjacent to paving supported by Modular Suspended Pavement Systems.
   B. Remove all rubble, debris, dust and silt from the top of the planting soil that may have accumulated after the initial installation of the planting soil within the Modular Suspended Pavement Systems.
   C. Assure that the planting soil under the tree root ball is compacted for the entire soil depth to 85-90% to prevent settlement of the root ball.
   D. The planting soil within the tree opening shall be similar in texture to the soil in the adjacent Modular Suspended Pavement Systems.

3.15 REPAIR OF CUT GEOTEXTILE
   A. In the event that any geotextile over subgrades or the Modular Suspended Pavement System decks must be cut during or after installation, repair the seam with a second piece of geotextile that overlaps the edges of the cut by a minimum of 12-inches in all directions prior to adding aggregate material.

3.16 PROTECTION
   A. Ensure that all construction traffic is kept away from the limits of the Modular Suspended Pavement Systems until the final surface materials are in place. No vehicles shall drive directly on the Modular Suspended Pavement System deck or aggregate base course.
   B. Provide fencing and other barriers to keep vehicles from entering into the area with Modular Suspended Pavement System supported pavement.
   C. Maintain a minimum of 4 inches (100 mm) of aggregate base course over the geotextile material during construction.
   D. When vehicle must cross Modular Suspended Pavement Systems that does not have final paving surfaces installed, use construction mats designed to distribute vehicle loads to levels that would be expected at the deck surface once final paving has been installed. Use only low impact track vehicles with a maximum surface pressure under the vehicle of 4 pounds per square inch, on top of the mats over Modular Suspended Pavement Systems prior to the installation of final paving.

3.17 CLEAN UP
   A. Perform cleanup during the installation of work and upon completion of the work. Maintain the site free of soil and sediment, free of trash and debris. Remove from site all excess soil materials, debris, and equipment. Repair any damage to adjacent materials and surfaces resulting from installation of this work.

END OF SECTION
SECTION 329456 - PLANTING SOIL FOR MODULAR SUSPENDED PAVEMENT SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Labor, materials, tools, supplies, equipment, facilities, transportation and services necessary for, and incidental to performing all operations in connection with furnishing, and delivery of planting soil and/or the modification of existing site soil for use as planting soil within the Silva Cell system.

B. The scope of Work in this Section includes, but is not limited to, the following:
   1. Locate, purchase, deliver and install imported planting soil and soil amendments.
   2. Harvest and stockpile existing site soils suitable for planting soil.
   3. Modify existing stockpiled site soil.

C. Related Requirements:
   1. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 01 Specifications, apply to Work of this Section.
   2. Section 01 33 00 – Submittal Procedures: For administrative and procedural requirement processing of submittals during the construction phase.
   3. Section 01 77 00 – Closeout Procedures: For administration and procedural requirements for completion of the Work.
   4. Section 32 90 00 Planting
   5. Section 32 94 51 Modular Suspended Paving System

1.2 PRICE AND PAYMENT PROCEDURES

D. Unit Prices: Provide unit prices for the following:
   1. Soil Unit Price 1: Remove existing site soil scheduled or otherwise shown for reuse in Silva Cells, and substitute unscreened planting soil specified in Section 32 94 56 - Planting Soil for Silva Cells, including removal of existing site soil determined unsuitable for reuse, and installation of new materials.

1.3 REFERENCES

E. Definitions:
   1. COMPACTION: The density of soil measured as oven dry weight divided by volume.
   2. EXISTING SOIL: Mineral soil existing at the locations of proposed planting of area designated for the installation of Silva Cells after the majority of the construction within and around the planting or Silva Cell site is completed and just prior to the start of Work to excavate the soil.
   3. PED: Clump or clod of soil held together by a combination of clay, organic matter, and fungal hyphae, retaining the original structure of the harvested soil.
   4. SCREENED SOIL: Soil that has been processed through a metal screen to remove or break apart soil peds (clumps/clods), roots, rocks and debris and remove larger physical items in the soil not permitted by the specification.
   5. SILVA CELLS: Structural paving support system defined in Section 32 94 51 Silva Cells.
   6. SUBGRADE: Surface or elevation of subsoil remaining after completing excavation, or
top surface of fill or backfill, before placing planting soil.

1.4 Submittals

G. Action Submittals: Submit in accordance with Section 01 33 00

A. Action Submittals: Submit for review and acceptance not less than 45 days prior to start of
   installation of materials and products specified in this Section.

1. Product Data: For each type of product, submit manufacturer's product literature
   with technical data sufficient to demonstrate that the product meets these
   specifications.
   a. For each compost product submit the manufactures certification that the
      compost meets the requirements for US Compost Council STA/TMECC criteria
      for “Compost as a Landscape Backfill Mix Component” and other requirements
      of the Specification.
   b. For coarse sand product submit the following analysis by a recognized
      laboratory:
      1) pH
      2) Manufactures Fines Modulus Index
      3) Particle size distribution (percent passing the following sieve sizes):
         3/8 inch  (9.5 mm)
         No 4    (4.75 mm)
         No 8    (2.36 mm)
         No 16   (1.18 mm)
         No 30   (0.60 mm)
         No 50   (0.30 mm)
         No 100  (0.15 mm)
         No 200  (0.075 mm)

2. Test and Evaluation Reports:
   a. Include analysis of bulk materials including soils and aggregates, by a recognized
      laboratory that demonstrates that the materials meet the Specification requirements.
   b. Submit required soil test analysis report for each sample of imported topsoil, existing
      site soil, and planting soil mixes from an approved soil-testing laboratory as follows:
      1) Do not submit planting soil mixes, for testing until all topsoil, compost, and coarse
         sand have been approved.
      2) If tests fail to meet the Specifications, obtain other sources of material, retest and
         resubmit until accepted by the Owner's representative.
3) All testing shall be performed following the requirements of *Methods of Soil Analysis*, The Soil Science Society of America.

4) Provide a particle size analysis (percent dry weight) and USDA soil texture analysis. Soil testing of planting soil mixes shall also include USDA gradation distribution of gravel, coarse sand, medium sand, and fine sand in addition to silt and clay. Reports of particle size distribution shall use USDA size nomenclature and analysis protocols.

5) Provide the following other soil properties:
   a.) pH and buffer pH.
   b.) Percent organic content by oven dried weight.
   c.) Nutrient levels by parts per million including: phosphorus, potassium, magnesium, manganese, iron, zinc and calcium. Nutrient test shall include the testing laboratory recommendations for supplemental additions to the soil for optimum growth of the plantings specified.
   d.) Soluble salt by electrical conductivity of a 1:2 soil water sample measured in Milliohm per cm.

6) All soil testing will be at the expense of the Contractor.

3. Samples:
   a. Each sample shall be double bagged packaged in two plastic zip loc style bags. Each bag shall be clearly marked with the project name, date, contractors name and telephone number, and product name.
   b. Samples of all existing site soil, topsoil, coarse sand and, compost and planting soil mixes shall be submitted at the same time as the particle size and physical analysis of that material.
   c. Samples of the existing site soil that are under existing pavement to be removed may be submitted as soon as possible after the paving is removed.
   d. Samples will be reviewed for appearance only.
   e. Provide samples for the following products.
      1) One-gallon (3.79-liter) sample of each type of existing site soil prior to adding amendments.
      2) One-gallon (3.79-liter) sample of imported topsoil.
      3) One-gallon (3.79-liter) sample of compost.
      4) One-gallon (3.79-liter) sample of coarse sand.
      5) One-gallon (3.79-liter) sample of unscreened planting soil mix.
      6) One-gallon (3.79-liter) sample of screened planting soil mix.

4. Qualification Statements:
   a. Soil supplier:
      1) Submit documentation of the qualifications of the planting soil supplier and their field supervisor, sufficient to demonstrate that both meet the requirements specified in Article 1.05 QUALITY ASSURANCE.
      2) Submit list of completed projects of similar scope and scale demonstrating capabilities and experience.

1.5 QUALITY ASSURANCE

B. Supplier: Soil mixes shall be supplied by a firm that specializes in the production of mixes of planting soils and have at least 5 years experience in providing soil mixes soils to projects of similar size and scope to this Work.

C. Soil Testing Laboratory Qualifications: The testing laboratory shall specialize in agricultural soil testing and be a member of the Soil Science Society of America's, North American Proficiency Testing Program (NAPT). Testing results for soil particle size shall be reported using USDA sizes for sand, silt, and clay.
1.6  DELIVERY, STORAGE, AND HANDLING

D. Weather: Do not mix or deliver soil when frozen or muddy.
E. Protect soil and soil stockpiles, from wind, rain and washing that can erode soil or separate fines and coarse material, and contamination by chemicals, dust and debris that may be detrimental to plants or soil drainage. Confine delivered materials to neat piles in areas coordinated with the site supervisor. Cover stockpiles with plastic sheeting or fabric at the end of each Workday.
F. All manufactured packaged products and material shall be delivered to the site in unopened containers and stored in a dry enclosed space suitable for the material and meeting all environmental regulations.
   1. Biological and chemical additives shall be protected from extreme humidity, cold, or heat. All products shall be freshly manufactured and dated for the year in which the products are to be used. Chemical amendments shall have original labels intact and legible, stating the guaranteed chemical analysis.

PART 2  - PRODUCTS

2.01  EXISTING SITE SOIL

A. Existing site soil: Soil at the site that is of a texture and chemical composition that can support roots provided that compost and or fertilizer is added and the soil compaction loosened.
B. Existing site soil shall meet the following criteria:
   1. Soil objects larger than 1/4 inch (6.24 mm) in diameter: Existing site soil shall contain less than 5 percent total volume of the combination of all objects 1 to 8 inches (25 mm – 200 mm) in their largest dimension including clumps/clods of heavy clay, sandy clay or silty clay subsoil, debris, refuse, roots, stones, sticks, brush, and or litter. The soil shall contain less than 8 percent by volume total of the above objects 1/4 inch (6.24 mm) to 1 inch (25 mm) in diameter. Remove objects larger than 8 inches (200 mm) in its longest dimension.
   2. Seedlings that germinated from seeds in the soil shall be removed within one month of germination whether during the period the soil is being stored or after installation including during the plant warranty period.
   3. The Owner’s Representative shall verify that the soil in the designated areas is suitable at the beginning of planting bed preparation Work. The decisions to specify the use of existing site soils is based on assumptions made during the design phase about the quality of soil which may have been covered by paving at that time or where construction activity earlier in the Project may have altered this soil.
      a. Areas and depths to which existing site soil can be harvested for use in the Silva Cells is indicated on the soil plan.
   4. Soil testing results and soil observation notes that describe the preconstruction soil conditions in the existing soil areas are included as an appendix to this Specification:
C. If the Owner’s Representative determines the soil to be unacceptable or the Work of this Project has damaged areas designated for use as existing site soil to the point where the soil is no longer suitable to support the plants specified, the Owner’s Representative may require modification of the damaged soil up to and including removal and replacement with soil of equal quality to the soil that existed prior to construction.
   1. Examples of damage include further compaction, contamination, grading, creation of hardpan or drainage problems, or lack of previously assumed O, A and or B-horizon soils.
   2. Do not begin Work on additional modifications or soil replacement until changes, if any, to the Contract price are approved.
D. Protect existing soil from contamination, and degradation during the construction process.
E. Excavation and storage of existing site soil:
   1. Remove existing plants, roots, stumps, paving, and non-soil debris from the surface layers of the soil.
   2. Excavate the soil over the areas and depths indicated on the plan or as directed by the Owner’s Representative. Utilize techniques and equipment that retains peds (clumps/clods) of soil.
   3. During the excavation process, soils in the approved areas and depths of different color and texture should be loosely mixed to create a more uniform single soil while still retaining soil peds (clumps/clods). The Owner's Representative may request that soils encountered that are not in accordance with the soil assumptions not be included in the mixing process. Such soils should be removed from the site or may be used as fill soils if approved by the Owner’s Representative.
   4. Do not screen the soil unless approved in advance by the Owner’s Representative. Encountered volumes of soil that do not meet the requirement for soil objects larger than 1/4 inch (6.24 mm) in diameter should be segregated during the excavation process and removed from the site. If approved, soil may be screened through a 2-inch (50 mm) square or larger opening in order to allow the soil to meet the requirements. Isolated large objects shall be removed from the soil by hand.
   5. Stockpile the soil in locations approved in advance by the General Contractor.

F. Amending existing site soil:
   1. Amendments for existing site soil should be calculated for a composite mix of all soils to be used.
   2. Add compost to existing site soil, up to 20 percent by moist volume to bring soil organic matter to a minimum of 3 percent by dry weight.
      a. Each 10 percent moist volume of added compost is assumed to raise the percent dry weight soil organic matter by 1.5 percent.
      b. Spread compost over the stockpile in amounts that achieve the required organic matter content. As soil is being scooped from the pile to bring to the Silva Cells, mix the compost loosely into the soil with the loader bucket. Add additional compost to the stockpile as the Work progresses to achieve even compost distribution within the mix.
      c. Do not over mix the soil. Maintain as many large soil peds (clumps/clods) as possible in the mix.
   3. Add fertilizer of the types and quantity recommended by the soil test at the time of mixing.

G. Submittal Requirements: Provide a one-gallon (3.79-liter) sample of each type of existing site soil prior to adding amendments with testing data that includes recommendations for compost volumes and chemical additives for the types of plants to be grown. Samples and test samples shall represent the composite mixing of the available soils. Samples and testing data shall be submitted at the same time.

2.02 IMPORTED TOPSOIL

A. Imported topsoil: Fertile, friable soil loam topsoil suitable for the germination of seeds and the support of vegetative growth meeting the following criteria:
   1. Soil texture: USDA loam, sandy clay loam or sandy loam with clay content between 15 and 35 percent; a combined clay/silt content of no more than 60 percent; and sand between 35 and 65 percent.
   2. Except where noted, imported topsoil shall NOT have been screened and shall retain soil peds (clumps/clods) larger than 2 inches (50 mm) in diameter throughout the stockpile after harvesting.
      a. Light screening through a 2-inch (50 mm) square or larger opening will be permissible in soils with clay content of 20 percent or greater if required to break up large peds (clumps/clods) or remove coarse roots and stones.
      b. Retained soil peds (clumps/clods) shall be the same color on the inside as is visible on
the outside surface of the ped.

3. Soil objects larger than 1/4 inch (6.24 mm) in diameter: Imported topsoil shall contain less than 5 percent total volume of the combination of all objects 1 to 8 inch (25 mm to 200 mm) in their largest dimension including clumps/clods of heavy clay, sandy clay or silty clay subsoil, debris, refuse, roots, stones, sticks, brush, and or litter. The soil shall contain less than 8 percent by volume total of the above objects 1/4 inch to 1 inch (6.24 mm to 25 mm) in diameter. Remove all objects larger than 8 inch (200 mm) in its longest dimension.
   a. Meet the above requirement by utilizing acceptable soils sources rather than soil screening.

4. Imported topsoil may be a harvested soil from fields or development sites or purchased from suppliers who collect and process soil. The organic content and particle size distribution shall be the result of natural soil formation. Manufactured soils where sand, composted organic material or other additives have been added to the soil to meet the requirements of imported topsoil shall not be acceptable.

5. pH value shall be between 5.5 and 7.5.
7. Soluble Salt Level: Less than 2 mmho/cm.
8. Soil nutrient chemistry suitable for growing the plants specified or after modification.
9. Germinating seedlings from seeds in the soil shall be removed within one month of germination whether during the period the soil is being stored or after installation, including during the warranty period of the plants.

B. Stockpiled existing topsoil at the site meeting the above criteria may be acceptable.
C. Submittal Requirements: Provide a one-gallon (3.79-liter) sample from each imported topsoil source with required soil testing results. The sample shall be a mixture of the random samples taken around the source stockpile or field. The soil sample shall be delivered with soil peds (clumps/clods) intact that represent the size and quantity of expected peds (clumps/clods) in the final delivered soil. The sample shall represent the expected amount of objects larger than 1/4 inch (6.24 mm).

2.03 COARSE SAND

A. Clean, washed, natural sand, free of toxic materials.
1. Coarse concrete sand, ASTM C33 Fine Aggregate, with a Fines Modulus Index of 2.8 and 3.2.
2. Coarse sand, free of limestone, shale and slate particles. Manufactured Sand shall not be permitted.
3. pH shall be lower than 7.4.
4. Provide coarse sand with the following particle size distribution:

<table>
<thead>
<tr>
<th>Sieve</th>
<th>Percent passing</th>
</tr>
</thead>
<tbody>
<tr>
<td>3/8 inch (9.5 mm)</td>
<td>100</td>
</tr>
<tr>
<td>No 4 (4.75 mm)</td>
<td>95 to100</td>
</tr>
<tr>
<td>No 8 (2.36 mm)</td>
<td>80 to100</td>
</tr>
<tr>
<td>No 16 (1.18 mm)</td>
<td>50 to 85</td>
</tr>
<tr>
<td>No 30 (0.60 mm)</td>
<td>25 to 60</td>
</tr>
<tr>
<td>No 50 (0.30 mm)</td>
<td>10 to 30</td>
</tr>
<tr>
<td>No 100 (0.15 mm)</td>
<td>2 to 10</td>
</tr>
<tr>
<td>No 200 (0.75 mm)</td>
<td>2 to 5</td>
</tr>
</tbody>
</table>

B. Submittal Requirements: Provide a one-gallon (3.79-liter) sample with manufacturer's literature and material certification that the product meets the requirements.
2.04 FERTILIZER

A. If noted by the soil test recommendations, add slow-release, organic fertilizer based on soil test and plant requirements.
B. Fertilizers should NOT be added to Bio-retention soils.
C. Submittal Requirements: Provide manufacturer’s literature that the product meets the requirements.

2.05 BIOLOGICAL AMENDMENTS

A. Amendments such as Mycorrhizal additives, compost tea or other products intended to change the soil biology.

2.06 Unscreened Planting soil Mix

A. A mixture of imported topsoil, coarse sand, and compost to make a new soil that meets the Project goals for the indicated planting area.
   1. The approximate mix ratio of imported topsoil, coarse sand and compost shall be:
      
      | Mix component     | Percent by moist volume |
      |-------------------|------------------------|
      | Imported topsoil unscreened | 50 to 60 percent |
      | Coarse sand       | 30 to 40 percent       |
      | Compost           | 10 percent             |

   2. Final Tested Soil Organic Matter (OM): 2.75 to 4 percent (by dry weight loss ash burn).

B. Mix the coarse sand and compost together first and then add to the topsoil. Mix with a loader bucket to loosely incorporate the topsoil into the coarse sand/compost Mix. DO NOT OVER MIX. Do not mix with a soil-blending machine. Do not screen the soil. Peds (clumps/clods) of Soil, and loosely mixed Compost and coarse sand will be permitted in the overall mix.
C. At the time of soil installation, add fertilizer or biological amendments, if required, to the planting soil mix at rates recommended by the testing results for the plants to be grown.
D. Submittal Requirements: Provide a one-gallon (3.79-liter) sample with testing data that includes recommendations for chemical additives for the types of plants to be grown. Samples and testing data shall be submitted at the same time. The sample shall be a mixture of the random samples taken around the source stockpile or field. The sample shall be delivered with soil peds (clumps/clods) intact that represent the size and quantity of expected peds (clumps/clods) in the final delivered soil mix.

2.07 screened Planting soil Mix

A. A mixture of imported topsoil, coarse sand, and compost mixed off site to make a new soil that meets the Project goals for the indicated planting area.

   1. A mix of imported topsoil, coarse sand and compost. The approximate Mix ratio shall be:
      
      | Mix component     | Percent by moist volume |
      |-------------------|------------------------|
      | Imported topsoil screened | 40 to 45 percent |
      | Coarse Sand       | 40 to 50 percent       |
      | Compost           | 10 to 15 percent       |

   2. Final Tested Organic Matter: 3 to 4.5 percent (by dry weight loss ash burn).

   3. Final mix shall be thoroughly screened, mixed and blended.

B. At the time of soil installation, add fertilizer or biological amendments, if required, to the planting
soil mix at rates recommended by the testing results for the plants to be grown.

C. Submittal Requirements: Provide a one-gallon (3.79-liter) sample with testing data that includes recommendations for chemical additives for the types of plants to be grown. Samples and testing data shall be submitted at the same time. The sample shall be a mixture of the random samples taken around the source stockpile or field.

PART 3 - EXECUTION

3.01 INSTALLATION OF PLANTING SOIL IN SILVA CELLS

A. Refer to Section 329451 - Silva Cells

END OF SECTION
Submittal Checklist for Reference Only

Provide submittals required to the Owner’s Representative for review and approval. The Submittal process may take up to 2 months prior to installation of the Silva Cell system and should be executed as soon as possible after the Contract is awarded. Testing will be at the expense of the Contractor.

SOIL COMPONENT SUBMITTALS – SUBMITTED PRIOR TO SOIL MIXING

- **EXISTING SITE SOIL**
  - Lab analysis for physical and chemical composition
  - One-gallon (3.79-liter) sample

- **IMPORTED TOPSOIL**
  - Lab analysis for physical and chemical composition
  - One-gallon (3.79-liter) sample

- **COMPOST**
  - Manufacturer’s literature
  - Certificate of compliance with US Composting Council STA/TMECC requirements
  - One-gallon (3.79-liter) sample

- **COARSE SAND**
  - Manufacturer’s literature
  - Lab analysis for physical and chemical composition
  - Manufactures Fines Modulus Index
  - One-gallon (3.79-liter) sample

- **FERTILIZER**
  - Manufacturer’s literature

SOIL MIX SUBMITTALS

- **UNSCREENED PLANTING SOIL MIX**
  - Lab analysis for physical and chemical composition
  - One-gallon (3.79-liter) sample

- **SCREENED PLANTING SOIL MIX**
  - Lab analysis for physical and chemical composition
  - One-gallon (3.79-liter) sample
SECTION 330413 - COMMON SUBMITTAL REQUIREMENTS FOR UTILITIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Supplementary administrative and procedural requirements for submitting Shop Drawings, Product Data, Samples, and other submittals specific to the work of this Division.

B. Related Requirements:
   1. Division 01 submittal requirements.

1.3 DEFINITIONS

A. Contractor: Refers to an entity in direct Contract with the Owner to furnish and/or perform any portion of the Work of the Contract.
   1. Contractor shall review and approve Product Submittals prior to forwarding them to the Architect.

B. Product Submittals: In general, Product Submittals show characteristics of the proposed construction in one of the following forms:
   1. Shop Drawings.
   2. Product Data.
   3. Samples.

C. Action Submittals: Written and graphic information and physical samples that require Architect/Engineer's responsive action. Action submittals are those submittals indicated in individual Specification Sections as "action submittals."

D. Sustainable Design Submittals: Submittals required by Section 01813 "Sustainable Design Requirements." Submit documentation for products and materials contributing to achievement of LEED rating indicated. Sustainable Design Submittals are in addition to other submittal requirements.

E. Informational Submittals: Written and graphic information and physical samples that do not require Architect/Engineer's responsive action. Submittals may be rejected for not complying with requirements. Informational submittals are those submittals indicated in individual Specification Sections as "informational submittals."

F. Submittal Review Sheet: Specific form required to accompany each submittal. Obtain Submittal Review Sheet from the SmithGroup Project Manager.
1.4 SUBMITTAL ADMINISTRATIVE REQUIREMENTS

A. Requirements specified for submittals are intended to provide efficient handling, while permitting review responsibilities to be carried out.

B. Avoidable Resubmittals: The first two reviews of each specified submittal will be processed without cost to the Contractor. After the second review, the Owner may charge the Contractor for the cost of such additional processing, unless the processing results from approved Change Orders causing revisions to previously approved submittals.

C. Coordination: Coordinate preparation and processing of submittals with performance of construction activities.
   1. Coordinate each submittal with fabrication, purchasing, testing, delivery, other submittals, and related activities that require sequential activity.
   2. Submit all submittal items required for each Specification Section concurrently unless partial submittals for portions of the Work are indicated on approved submittal schedule.
   3. Submit action submittals and informational submittals required by the same Specification Section as separate packages under separate transmittals.
   4. Coordinate transmittal of different types of submittals for related parts of the Work so processing will not be delayed because of need to review submittals concurrently for coordination.
      a. Architect and Engineer reserve the right to withhold action on a submittal requiring coordination with other submittals until related submittals are received.

D. Processing Time: Allow time for submittal review, including time for resubmittals, as follows. Time for review shall commence on Architect's receipt of submittal. No extension of the Contract Time will be authorized because of failure to transmit submittals enough in advance of the Work to permit processing, including resubmittals.
   1. Refer to Section 01330 for quantity of days allowed for review.
   2. When a large volume of submittal materials is scheduled, additional review time may be required. Similarly, a particular submittal may require review completion in less than the agreed normal time. Due to variations in submittal volume and processing needs, agreed review time is not intended to apply to extreme conditions.

E. Maintain at the Project Site ready access to the latest reviewed Shop Drawings and Product Data, and one set of samples.

PART 2 - PRODUCTS

2.1 SUSTAINABLE DESIGN REQUIREMENTS

A. The District requires the Contractor to implement practices and procedures to meet the project's environmental performance goals. The Contractor shall ensure that the minimum requirements related to these goals, as defined in Section 01813 "Sustainable Design Requirements" are implemented to the fullest extent possible. Specific materials and systems have been selected to this end. Substitutions, or other changes to the work proposed by the Contractor or their Subcontractors, shall not be allowed if such changes compromise the aforementioned environmental goals and LEED certification.
PART 3 - EXECUTION

3.1 CONTRACTOR’S REVIEW

A. Project Closeout and Maintenance Material Submittals: See requirements in Division 01.

B. Be responsible for quantities, weights, and dimensions to be confirmed and correlated at the site; for information that pertains solely to the fabrication processes and to the means, methods, techniques, sequences, and procedures of construction; and for coordination of the work of every trade, supplier, and subcontractor.

C. Be responsible for each submittal to be in conformance with information given and the design intent expressed in the Contract Documents.

D. Provide with each submittal specific written notice of any variation from the requirements of the Contract Documents by causing a specific notation to be made on the Submittal Review Sheet and Submittal Transmittal. Changes to the approved construction documents are subject to DSA review and approval, submitted by the Architect as a CCD per DSA IR A-6.

3.2 ARCHITECT/ENGINEER’S AND GENERAL CONTRACTOR’S ACTION

A. General: Architect will not review submittals that do not include the Submittal Review Sheet.

B. Action Submittals: Architect’s staff and consultants will review the submittal, and mark the Submittal Review Sheet with an action code. The code meanings are described below.

C. Additional codes may be provided within comments or as an electronic submittal review stamp and shall be used in help indicating return of partial submittals.

E. Review Code meanings are as follows:
   1. Action Codes Permitting Use:
      a. When an action code permitting use is assigned to a submittal, it does not authorize work that does not comply with the requirements of the Contract Documents. Acceptance of the Work will depend on compliance.
      b. Code AP - Approved: The Work covered by the submittal item may proceed, provided it complies with Contract Document requirements.
      c. Code AN - Approved as Noted: The Work covered by the submittal item may proceed, provided it complies with the Architect’s notations and Contract Document requirements.
3.3 SUBMITTAL TRANSMITTAL REQUIREMENTS

A. Submittal Transmittal shall be a PDF file in electronic format. It is recommended, to expedite the submittal review, the electronic form be emailed for review to the Architect as early as possible.

1. Submittal Numbering: See below.
2. Contact Information: Full Name, Phone Number and Email Address.

B. Submittal Definition

1. Each submittal consists of items from only ONE Specifications section.

2. Action Code Prohibiting Use:
   a. Action Code REJ - Not Approved: The Work covered by the submittal item, including purchasing, fabrication, delivery, and other activity, shall not proceed. Revise the submittal item or prepare a new item in accordance with the Architect's notations. Resubmit the corrected or new item without delay; do not permit submittal items marked "Not Approved" to be used. Work incorporating such items will be rejected.

3. Action Code for Items Not Required:
   a. Action Code X - Not Requested by Contract Documents: The submittal item is not called for by the Contract Documents and is being returned unreviewed by the Architect except to the extent necessary to determine its status.

F. Informational Submittals: For Architect's information only. Architect will review each submittal and will not return it, or will return it if it does not comply with requirements. Architect will forward each submittal to appropriate party.

1. Action Code for Information Only:
   a. Action Code INF - Information Only: The submittal item is not called for a return with a reviewed action code by the Contract Documents and is being returned un-reviewed by the Architect except to the extent necessary to determine its status.

G. Partial submittals prepared for a portion of the Work will be reviewed when use of partial submittals has received prior approval from Architect.

H. Incomplete submittals are not acceptable, will be considered non-responsive, and will be returned without review.

I. Architect will return without review or discard submittals received from sources other than the Contractor.

J. Submittals not required by the Contract Documents may be returned by the Architect without action.

1. Do not submit Material Safety Data Sheets. They will be returned without review or discarded.
2. Complete Submittal: If ALL the items required by the Specifications section are listed on one Submittal Form (including continuation sheet), it is a complete submittal.

3. Partial Submittals: If it is necessary to divide the required items of a given Specifications section into two or more submittals to meet schedule or handling requirements, the separate submittals are partial submittals. All partial submittals have the same submittal number, and are differentiated by sequential P-numbers (see below).

4. All items in each submittal, whether complete or partial, will be processed together: Individual items will not be ‘broken out’ for special handling. Arrange submittals accordingly.

C. Submittal Numbering

1. Number submittals as described below to assist tracking.
2. Number each submittal in the format nnnnnn-nn.
   a. The 6-digit number is the number of the section that requires the submittal. For example, 044200.
   b. The 2-digit number is based on the numerical sequence of submittals from that section. In other words, for each section, the first submittal is 01, the second is 02, and so on. The 2-digit number does not change for partial or re-submittals, so that the submittal can be tracked.
   c. P-Number for Partial Submittals: Number each partial submittal in the pee space, beginning with P1, and increasing by one for each partial submittal of that submittal. If the submittal is a complete submittal, leave the P space blank.
   d. R-Number for Re-submittals: Number each re-submittal in the arr space, beginning with R1, and increasing by one for each re-submittal of that submittal. Do not include an R-Number for the initial submittal.
   e. Examples:

3.4 SUBMITTAL REVIEW SHEET REQUIREMENTS

A. Provide Submittal Review Sheet in PDF format. Submit as the page after the Submittal Transmittal.

B. When attached, the Submittal Review Sheet shall not obscure information contained in the submittal.

C. Do not edit any of the information contained within the Submittal Review Sheet except as follows:
   1. Submittal Number: See Submittal Numbering in Submittal Transmittal Requirements paragraph.

D. The Contractor shall submit the PDF file in a manner that will allow editing of the Submittal Review Sheet fields by SmithGroup and its consultants.

END OF SECTION
SECTION 331166 - WATER DISTRIBUTION SYSTEM

PART 1 - GENERAL

1.1 SECTION INCLUDES

A. Site water distribution system for irrigation water, domestic water and fire protection service up to 5 feet of any on-site commercial building being served.

B. Irrigation water, domestic water and fire protection water transmission or distribution system within a roadway or street right-of-way.

C. Protective coating or wrap for metallic pipe, fittings, restraining devices, and appurtenances.

1.2 RELATED SECTIONS

A. Section 312333, Utility Trenching and Backfilling.

1.3 RELATED DOCUMENTS

A. ASTM:
2. B 88: Specifications for Seamless Copper Water Tube.
3. D 1785: Specifications for Poly(Vinyl Chloride) (PVC) Plastic Pipe, Schedules 40, 80, and 120.

B. AWWA:
3. C110: Ductile-Iron and Gray-Iron Fittings, 3 In. Through 48 In. (76 mm Through 1,219 mm) for Water.
9. C200: Steel Water Pipe-6 In. (150 mm) and larger.
12. C207: Steel Pipe Flanges for Waterworks Service-Sizes 4 In. Through 144 In. (100 mm Through 3,600 mm).
19. C219: Bolted, Sleeve-type Couplings for Plain-End Pipe.
24. C507: Ball Valves 6 In. Through 8 In. (150 mm Through 1,200 mm).
25. C508: Swing-check Valves for Waterworks Service, 2 In. (50mm) Through 24 In. (600 mm) NPS.
27. C510: Double Check Valve Backflow-Prevention Assembly.
28. C511: Reduced-Pressure Principle Backflow-Prevention Assembly.
33. C606: Grooved and Shouldered Joints.
34. C651: Disinfecting Water Mains.
36. C900: Polyvinyl Chloride (PVC) Pressure Pipe and Fittings, 4 In. Through 12 In. (100mm Through 300mm) for Water Distribution.
37. C901: Polyethylene (PE) Pressure Pipe and Tubing, ½ In. (13mm) Through 3 In. (76mm) for Water Service.
38. C905: Polyvinyl Chloride (PVC) Pressure Pipe and Fabricated Fittings, 14 In. Through 48 In. (350 mm Through 1,200 mm) for Water Transmission and Distribution.
39. C906: Polyethylene (PE) Pressure Pipe and Fittings, 4 In. (100 mm) through 63 In (1,575 mm), for Water Distribution and Transmission.
40. C907: Polyvinyl Chloride (PVC) Pressure Fittings for Water – 4 In. through 8 In. (100 mm Through 200 mm).
44. M41: Ductile-Iron Pipe and Fittings.

1.4 DEFINITIONS

A. AASHTO: American Association of State Highway and Transportation Officials.
C. AWWA: American Waterworks Association
D. DI: Ductile iron.
E. DIP: Ductile iron pipe.
F. FM: Factory Mutual.
H. NSF: National Sanitation Foundation.
J. PE: Polyethylene.
K. PVC: Polyvinyl Chloride.
L. UL: Underwriters Laboratory.

1.5 SYSTEM PERFORMANCE REQUIREMENTS

A. Minimum Internal Pressures
   2. Test Pressure: 200-psi.

B. External Load: Earth load indicated by depth of cover plus AASHTO H20 live load unless indicated otherwise.

1.6 SUBMITTALS

A. Follow Submittal procedure outlined in Division 0 – General Conditions and Division 1 – General Requirements.

B. Product Data: For the following:
   1. Piping materials and fittings.
   2. Pipe couplings.
   3. Flexible pipe fittings.
   4. Restrained pipe fittings.
   5. High deflection fittings/ball joints.
   7. Flexible expansion joints.
   8. Gate valves.
  10. Check valves.
  11. Air and vacuum relief valves.
  13. Pressure reducing valves.
  14. Pressure sustaining valves.
  15. Ball valves.
  16. Fire hydrants.
  17. Post indicator valves.
  18. Fire department connections.
  20. Precast valve boxes and box covers.

C. Shop drawings: Include plans, elevations, details and attachments.
   1. Precast and cast in-place vaults and covers.
   2. Wiring diagrams for alarm devices.

D. Field test reports: Indicate and interpret test results for compliance with the Project requirements.
1.7 QUALITY ASSURANCE

A. Comply with requirements of utility supplying water. Do not operate existing valves or tap existing piping without written permission and/or presence of utility company representative.

B. Comply with the following requirements and standards:

C. Provide listing/approval stamp, label, or other marking on piping and specialties made to a specified standard.

1.8 MATERIAL DELIVERY, STORAGE AND HANDLING

A. Preparation for Transport: Prepare valves, including fire hydrants, according to the following:
1. Ensure that valves are dry and internally protected against rust and corrosion.
2. Protect valves against damage to threaded ends and flange faces.

B. Deliver piping with factory-applied end-caps. Maintain end-caps through shipping, storage and handling to prevent pipe end damage and to prevent entrance of dirt, debris and moisture.

C. Handling: Use slings to handle valves and fire hydrants whose size requires handling by crane or lift. Rig valves to avoid damage to exposed parts. Do not use handwheels or stems as lifting or rigging points.

D. During Storage: Use precautions for valves, including fire hydrants according to the following.
1. Do not remove end protectors, unless necessary for inspection, then reinstall for storage.
2. Protection from Weather: Store indoors and maintain temperature higher than ambient dew-point temperature. Store indoors and maintain temperature higher than ambient dew point temperature. Support off the ground or pavement in watertight enclosures when outdoor storage is necessary.

E. Do not store plastic pipe and fittings in direct sunlight.

F. Protect pipe, fittings, flanges, seals and specialties from moisture, dirt and damage.

G. Protect linings and coatings from damage.

H. Handle precast boxes, vaults and other precast structures according to manufacturer's written instructions.

I. Protect imported bedding and backfill material from contamination by other materials.

1.9 COORDINATION

A. Coordinate connection to existing water mains with water utility supplying water.
B. Coordinate piping materials, sizes, entry locations, and pressure requirements with building domestic water distribution piping and fire protection piping.

1.10 HAZARDOUS MATERIAL – ASBESTOS CONCRETE PIPE AND ASBESTOS CONTAINING MATERIAL

A. Asbestos cement pipe (ACP) exists within the project area and replacement of existing ACP is anticipated but shall be abandoned in place unless otherwise noted in the plans. The contractor shall make every attempt to protect all asbestos containing items during the execution of this contract. However, there will be instances where ACP or asbestos containing material will need to be removed, handled, cut, disturbed, or disposed of and the contractor shall comply with all local, state and federal regulations regarding construction activities near asbestos containing materials.

PART 2 - PRODUCTS

2.1 LARGE SIZE SERVICE AND DISTRIBUTION PIPES

A. PVC Pipe: Sizes 4-inch through 48-inch.
   1. Pipe:
      a. 4-inch through 12-inch: AWWA C900.
      b. 14-inch through 48-inch: AWWA C905.
   2. Fittings: DI
   3. Unrestrained Joints:
   4. Restrained Joints:
      a. Push-On Bell and Spigot Joint: Harness assembly as manufactured by Ebaa Iron (Eastland, Tx) (Tel. 800-433-1716) or approved equal.
      b. Plain End PVC to DI Mechanical Joint: Ebaa Iron (Eastland, Tx) (Tel. 800-433-1716) or approved equal.
   5. Steel or Ductile Iron Couplings:
      a. Plain End Pipe to Plain End Pipe: Ductile iron or steel bolted couplings, manufacturer's shop coating with low alloy steel bolts and nuts. Steel couplings to conform to AWWA C219. Smith-Blair, Inc, (Texarkana, AR) (Tel. 501-773-5127), Dresser (Bradford, PA) (Tel.-814-368-3131) or approved equal.
      b. Plain End Pipe to DI or Steel Flanged Pipe: Ductile iron or steel bolted flanged coupling adapters, manufacturer's shop coating with low alloy steel bolts and nuts. Steel flanged couplings to conform to AWWA C219. Smith-Blair, Inc, (Texarkana, AR) (Tel. 501-773-5127), Dresser (Bradford, PA) (Tel.-814-368-3131) or approved equal.
   6. PVC Couplings
      a. Unrestrained Plain End to Plain End Pipe: AWWA C900, as manufactured by CertainTeed (Valley Forge, PA) (Tel. 610 341-6820) or approved equal.
      b. Restrained Plain End to Plain End Pipe: AWWA C900, “Certa-Lock” as manufactured by CertainTeed (Valley Forge, PA) (Tel. 610 341-6820) or approved equal.

2.2 CORROSION PROTECTION

A. All ductile iron fittings shall be protected against corrosion with the installation of corrosion protection wrapping.
B. POLY-WRAP AND PolyETHYLENE ADHESIVE TAPE

1. Poly-wrap shall be continuous tubing formed from 8-mil (0.2-mm) thick virgin polyethylene, in accordance with AWWAC105. Minimum polyethylene tube size shall be as follows:

<table>
<thead>
<tr>
<th>PIPE SIZE POLY-WRAP FLAT TUBE WIDTH</th>
</tr>
</thead>
<tbody>
<tr>
<td>4 to 8 inches (100 to 200 mm)</td>
</tr>
<tr>
<td>(100 through 200mm)</td>
</tr>
<tr>
<td>21&quot; (530mm)</td>
</tr>
<tr>
<td>10&quot; through 12&quot;</td>
</tr>
<tr>
<td>(250 through 300mm)</td>
</tr>
<tr>
<td>29&quot; (735mm)</td>
</tr>
<tr>
<td>14&quot; through 16&quot;</td>
</tr>
<tr>
<td>(350 through 400mm)</td>
</tr>
<tr>
<td>37&quot; (940mm)</td>
</tr>
</tbody>
</table>

2. Adhesive tape shall be a general-purpose polyethylene adhesive tape, 2-inches (50-mm) wide and at least 8 mil (0.2mm) thick.

2.3 HIGH DEFLECTION FITTINGS/BALL JOINTS

A. Plain End Pipe: Xtra Flex Restrained Joint High Deflection Fittings, 4-inch through 24-inch, U. S. Pipe, (Birmingham, AL) (Tel. 205-254-7442) or approved equal.

B. Mechanical or Flanged Joint: Flex 900, 4-inch through 12-inch, Ebaa Iron Sales, (Eastland, TX) (Tel. 800-433-1716) or approved equal.

2.4 EXPANSION JOINTS

A. TR Flex Joints: TR Flex Telescoping Sleeve, 4-inch through 64 inch, U. S. Pipe, (Birmingham, AL) (Tel. 205-254-7442).

B. Mechanical or Flanged Joint: Ex-Tend 200, 4-inch through 36-inch, EBAA Iron Sales, (Eastland, TX) (Tel. 800-433-1716) or approved equal.

2.5 FLEXIBLE EXPANSION JOINTS

A. Plain End to Plain End Pipe: “Xtra Flex,” sizes 4-inch through 24-inch, U. S. Pipe, (Birmingham AL) (Tel. 205-254-7442) or approved equal.

B. Flanged or mechanical Joint: “Flex-Tend,” sizes 3-inch through 48-inch, Ebaa Iron (Eastland TX) (Tel. 800-433-1716) or approved equal.

C. Flanged Joint: Starflex, Series 500, Star Pipe Products, (Tel. 800-999-3009) or approved equal.
2.6 SERVICE LINE VALVES AND FITTINGS

A. General: AWWA C-800

B. Includes service lines, ½ inch through 2 inch, from main to meter valve, including corporation stops and curb stops.

2.7 GATE VALVES

A. Provide on lines 10-inch and smaller.

B. Valves, 3-Inch through 20-Inch: AWWA C509, resilient-seated, non-rising stem, gray or ductile-iron body and bonnet, with bronze or gray or ductile-iron gate, bronze stem and square stem operating nut unless noted otherwise. All bolts, nuts and washers, except operating nut, shall be stainless steel. Stem operating nut to be 2-inches square and open counter-clockwise. Stem extensions shall be installed to bring the stem operating nut to within 2-feet of finish grade where the depth from finish grade to the stem operating nut exceeds 4-feet. Equip valves in pump stations and other interior or vault installations with hand-wheels. Provide protective epoxy interior and exterior coating according to AWWA C550 and manufacturer’s recommendations.

C. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Project include, but are not limited to, the following:
   1. Mueller Company (Decatur, IL) (Tel. 800-423-1323).
   3. Clow

D. Valve Box and Cover: 9-inch minimum diameter PCC box with extensions of length required for depth of bury of valve, and cast iron or ductile iron cover with lettering “WATER”. Both the box and the cover shall be rated for AASHTO H20 loading.

2.8 AIR RELEASE, AIR/VACUUM AND COMBINATION AIR VALVES

A. AWWA C512, specific type of valve, size, details and valve box as indicated.

B. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Project include, but are not limited to, the following:
   1. Apco Valves, Valve and Primer Corporation (Schaumburg, IL) (Tel. 708-529-9000).
   2. Crispin.

2.9 BLOW-OFF VALVES

A. Blow-off valve assemblies, details and boxes as indicated.

2.10 SWING CHECK VALVES

A. Valves 2-Inch through 24-Inch: AWWA C508, details as indicated.

B. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Project include, but are not limited to, the following:
1. Mueller Company (Decatur, IL) (Tel. 800-423-1323).

2.11 BALL VALVES

A. Valves 6-Inch through 48-Inch: AWWA C507, details as indicated.

B. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Project include, but are not limited to, the following:

2.12 PRESSURE-REGULATING VALVES

A. Valve: Automatic, pilot-operated, cast-iron body with interior coating according to AWWA C550. 250-psi Working-pressure, bronze pressure-reducing pilot valve and tubing, and means for discharge pressure adjustment. Details as indicated.

B. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Project include, but are not limited to, the following:
   1. Cla-Val Company (Newport Beach, CA) (Tel. 714-548-2201).
   2. Bermad (Porterville, CA) (Tel. 209-781-6630).
   3. Ames Company (Woodland, CA) (Tel. 916-666-2493).

2.13 FLOW-REGULATING VALVES

A. Valve: Automatic, pilot-operated, cast-iron body with interior coating according to AWWA C550. 250-psi working-pressure, bronze pressure-reducing pilot valve and tubing, and means for flow adjustment. Details as indicated.

B. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Project include, but are not limited to, the following:
   1. Cla-Val Company (Newport Beach, CA) (Tel. 714-548-2201).
   2. Bermad (Porterville, CA) (Tel. 209-781-6630).
   3. Ames Company (Woodland, CA) (Tel. 916-666-2493).

2.14 SERVICE CONNECTIONS AND WATER METERS

A. Service connections and water meter details and boxes per current Contra Costa Water District standard details.

2.15 FIRE HYDRANTS

A. Wet Barrel: AWWA C503, details as indicated.

B. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Project include, but are not limited to, the following:
   1. Clow (800 Series) Model 860
   2. Clow (Ranger) Model 960
   3. Jones Model J-3760
C. Available Paint Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Project include, but are not limited to, the following:
   1. Kelly Moore – Kel Guard Enamel “Sunburst/Safety Yellow” No 1700-63
   2. Sherman Williams – Metalex “Safety Yellow” No.B42Y37

2.16 REDUCED PRESSURE ASSEMBLY BACKFLOW PREVENTER – IRRIGATION AND DOMESTIC

A. Provide as indicated and as required by State or local agency.

B. General: AWWA C511, with OS gate valve on inlet and outlet, and strainer on inlet. Include test cocks and pressure-differential relief valve with ASME A112.1.2 air gap fitting located between 2 positive-seating check valves for continuous-pressure application.

C. Body:
   1. 2-Inch and Smaller: Bronze with threaded ends.
   2. 2-1/2-Inch and Larger: Bronze, cast iron steel, or stainless steel with flanged ends.

D. Interior Lining: AWWA C550, epoxy coating for cast iron or steel bodies.

E. Interior Components: Corrosion-resistant materials.

F. Manufacturer shall be approved by Contra Costa Water District, Materials List Attached.

2.17 DOUBLE DETECTOR CHECK BACKFLOW PREVENTER – FIRE

A. FM approved or UL listed, with OS&Y gate valve on inlet and outlet, and strainer on inlet. Include two positive-seating check valves and test cocks, and bypass with displacement-type water meter, valves, and double-check backflow preventer, for continuous pressure application.

B. Manufacturer shall be approved by Contra Costa Water District. Materials List Attached.

2.18 POST INDICATOR VALVE

A. General: UL 789, FM approved, vertical-type, cast-iron body with operating wrench extension rod, and adjustable cast-iron barrel of length required for depth of bury of valve.

B. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Project include, but are not limited to, the following:
   1. Mueller Co. (Decatur, IL) (Tel. 800-423-1323).
   2. Clow Corporation (Oskaloosa, IA).

2.19 FIRE DEPARTMENT CONNECTION

A. Exposed, Freestanding Fire Department Connection: UL 405, cast brass body with threaded inlets according to NFPA 1963 and matching local fire department hose threads and threaded bottom outlet. Include lugged caps, gaskets and chains; lugged swivel connections and drop clapper for each hose-connection inlet; 18-inch high brass sleeve; and round escutcheon plate. Six 2-1/2-inch 4-way connections.
2.20 UNDERGROUND VAULTS/PITS

A. General: Portland cement concrete, precast or cast-in-place as indicated.

B. Portland Cement Concrete and Reinforcing Steel: Section 32 05 23.

C. Access Openings: As indicated.

D. External Load: Earth load plus AASHTO H20 live load if located in traffic area.

2.21 TRACER WIRE

A. General: Minimum #12 AWG stranded copper wire with blue THW, THWN, or THHN rated insulation.

2.22 WARNING TAPE

A. General: Non-detectable 3-inch warning tape made of solid blue film with continuously printed black-letter message reading “CAUTION—WATER LINE BURIED BELOW.”

2.23 PCC THRUST BLOCKS

A. Portland Cement Concrete and Reinforcing Steel: Section 32 05 23.

PART 3 - EXECUTION

3.1 PIPE INSTALLATION

A. General: Install pipe, fittings, and appurtenances utilizing best practices, manufacturer’s instructions, and in accordance with the following:
   1. PVC pipe: AWWA M23 and AWWA C605.

B. Pipe Depth and Trench Configuration: Conform to elevations, profiles and typical trench section(s) indicated.

C. Excavation, Bedding, Backfill, and Compaction: Section 31 23 33.

D. Handling: Carefully handle during loading, hauling, unloading and placing operations to avoid breakage or damage. Use strap type slings for lifting and placing; no chains or hooks will be permitted. Comply with manufacturer’s recommendations.

E. Laying: Before lowering pipe into the trench, remove all stakes, debris, loose rock and other hard materials from the bottom of the trench. Lay accurately in conformance with lines and grades indicated. Lay pipe on a bed of bedding material specified and prepared by handwork, dug true to grade. Furnish firm bearing for pipe throughout its entire length with bell holes provided at the ends of each pipe length of sufficient size to permit making up the particular type of joint being used. Adjust pipe to line and grade by scraping away or filling and tamping material under the body of the pipe for the entire pipe length and not by blocking or wedging. After final positioning, hold pipe in place in trench with backfill material placed equally on both sides of the
pipe at as many locations as required to hold the pipe section in place.

F. Curved Alignment: When necessary to conform to the alignment specifically indicated, lay pipe on a curved alignment by means of asymmetrical closure of joints or bending of the pipe barrel. If necessary, use shorter than the standard lengths of pipe to achieve curvature specified. Do not exceed the recommendations of the pipe manufacture for deflections at the joints or pipe bending.

G. Closure: Close open ends of pipes and appurtenance openings at the end of each days work or when work is not in progress.

3.2 CONNECTING TO EXISTING MAINS

A. Pressure Tap Connections: Perform in accordance with the requirements of the owner of the system being tapped. Maintain a positive pressure flow from the main being tapped to the tapping device to flush plastic chips, metal ribbons, etc. into the tapping devise and not into the pipe being tapped.

B. Other Connections: As indicated and in accordance with the requirements of the owner of the line being connected to.

3.3 ANCHORAGE INSTALLATION

A. Mechanically Restrained Joints: Install where indicated for lengths indicated in accordance with manufacturer’s instructions.

B. PCC Thrust Blocks: Install where required and as indicated. Bearing area indicated is to be against undisturbed earth. Allow a minimum of 24-hours curing time before introducing water into the pipeline and allow a minimum of 7-days curing time before pressure testing.

3.4 HIGH DEFLECTION FITTINGS/BALL JOINTS, EXPANSION JOINTS, AND FLEXIBLE EXPANSION JOINTS

A. Install as indicated and in accordance with the manufacturers recommendations.

3.5 VALVE INSTALLATION

A. Install all valves in accordance with the manufacturer’s instructions and the following:

1. General:
   a. Gate Valves: Appendix A of AWWA C509.

2. Joints:
   b. Valves on Steel Pipe: As indicated for buried locations. Flanged-end valves for installation in vaults/pits.

3.6 SERVICE CONNECTIONS INSTALLATION
A. Install as indicated and in accordance with the requirements of the owner of the system.

3.7 WATER METER INSTALLATION
A. Installed by Contra Costa Water District. Contractor shall coordinate installation.

3.8 FIRE HYDRANT INSTALLATION
A. Install as indicated and in accordance with the requirements of the owner of the system and the fire department.

3.9 REDUCED-PRESSURE PRINCIPLE ASSEMBLY BACKFLOW PREVENTER INSTALLATION
A. Install as indicated and in accordance with the requirements of the owner of the system and the local health department requirements.

3.10 DOUBLE CHECK DETECTOR ASSEMBLY INSTALLATION
A. Install as indicated and in accordance with the requirements of the owner of the system and the fire department.

3.11 POST INDICATOR VALVE INSTALLATION
A. Install as indicated and in accordance with the requirements of the owner of the system and the fire department.

3.12 FIRE DEPARTMENT CONNECTION INSTALLATION
A. Install as indicated and in accordance with the requirements of the owner of the system and the fire department.

3.13 UNDERGROUND VAULT/PIT INSTALLATION
A. Install as indicated.
B. Excavation and Backfill: Section 31 23 33.

3.14 TRACER WIRE INSTALLATION
A. Place and secure to top of pipe and fittings at about 3-foot intervals with 6" length of 1" wide filament tape, Scotch brand No. 898 or equal.
B. Form a mechanically and electrically continuous line throughout the pipeline, extending to the nearest valve or other pipeline appurtenance designated by the owner of the system or the Owner’s Representative. Extend the wire up the outside of the valve box/riser and cut a hole
that is 8-inches from the top, extend a 12-inch wire lead to the inside of the box. At other pipeline appurtenances, designated by the owner of the system or the Owner’s Representative, terminate the 12-inch wire lead inside the enclosure.

C. Splice wire with a splicing device consisting of and electro-tin plated seamless copper sleeve conductor. Install as recommended by the manufacturer. Wrap splices and damaged insulation with electrician’s tape.

3.15 WARNING TAPE INSTALLATION

A. Install tape approximately 1-foot above and along the centerline of the pipe.

B. Where tape is not continuous, lap tape ends a minimum of 2-feet.

3.16 PLASTIC PROTECTIVE WRAPPING FOR DUCTILE IRON PIPING

A. Cover underground ductile iron piping, including connecting galvanized steel spools, fittings, and like items with a loose, polyethylene plastic-film wrap to provide a continuous barrier between the pipe and the surrounding backfill.
   1. Wrap in accordance with AWWA-C105.
   2. Wrapping isolates the pipe surfaces from contact with corrosive environments, and is not intended to provide complete sealing or to prevent ground water intrusion.

B. Cut poly-wrap tube to a length approximately 2-feet (600-mm) longer than the length of the pipe section.
   1. Slip the poly-wrap around the pipe, centering it to provide a 1-foot (300-mm) overlap of each adjacent pipe section and bunching it accordion fashion until it clears the pipe ends.
   2. Lower the pipe into the trench and make-up the pipe joint with the preceding section of pipe. Make a shallow bell hole at joints to facilitate installation of the poly-wrap.

C. After completing the joint, make the overlap.
   1. Pull the bunched-up poly-wrap from the preceding length of pipe, slip it over the end of the new length of pipe, and secure it in place with two circumferential turns of tape plus enough overlap to assure firm adhesion.
   2. Slip the end of the poly-wrap from the new pipe section over the end of the first wrap until it overlaps the joint at the end of the preceding length of pipe.
   3. Tape it in place using three circumferential turns of tape. Take up the slack width to make a snug, but not tight, fit along the barrel of the pipe, securing the fold as necessary with adhesive tape at approximately 3-foot (900-mm) centers.

D. Repair any rips, punctures, or other damage to the poly-wrap with short length of poly-wrap tube cut open, wrapped around the pipe, and secured with tape.

E. Wrap the next section of pipe in the same manner.

F. Cover bends, reducers, and offsets with poly-wrap in the same manner as the pipe.

G. Wrap valves and other odd-shaped pieces, that cannot practically be wrapped in a tube, with a flat sheet obtained by splitting open a length of poly-wrap tube.
   1. Pass the flat sheet under the valve and bring it up around the body of the stem.
   2. Make the seams by bringing the edges together, folding over twice, and taping down. Slack width and overlaps at joints shall be handled as described above.
3. Tape poly-wrap securely in place at valve stem and other penetrations.

H. Where poly-wrapped pipe joins a pipe that is not poly-wrapped, extend the poly-wrap tube to cover the unwrapped pipe a distance of 2 feet (600-mm), unless shown otherwise on the drawings. Secure the end with at least three circumferential turns of tape.

3.17 HYDROSTATIC PRESSURE AND LEAKAGE TEST

A. General:
1. Provide all necessary materials and equipment, including water.
2. Backfill all trenches sufficient to hold pipe firmly in position.
3. Allow time for thrust blocks to cure prior to testing.
4. Flush all pipes prior to testing to remove all foreign material.
5. Perform pressure and leakage test concurrently.
6. Test pressure: See Subsection titled “System Performance Requirements.”
7. Apply test pressure by means of a pump connected to the pipe.
8. Base test pressure on the elevation of the lowest point in the line.
9. Fill each closed valve section or bulk-headed section slowly. Expel air from section being tested by means of permanent air vents installed at high points or by means of temporary corporation cocks installed at such points. Remove and plug the temporary corporation cocks at the conclusion of the test.
10. Allow water to stand in the pipe for 24 hours before test pressure is applied.
11. Allow the system to stabilize at the test pressure before conducting the leakage test.
12. Do not operate valves in either the opening or closing direction at differential pressures above the valves rated pressure.
13. Maintain test pressure as specified for type of pipe being tested.
14. Pressure Test: Examine any exposed pipe, fittings, valves, hydrants and joints during the test, if no leaks are observed the section of line has passed the pressure test. If leaks are observed, repair any damaged or defective pipe, fittings, valves, or hydrants, and repeat the pressure test.
15. Leakage Test: Perform as specified hereafter for the type of pipe being installed.

B. DIP Leakage Test: Perform in accordance with AWWA C600. Selected requirements of AWWA C600 are repeated as follows:
1. Maintain the test pressure, +/- 5 psi, for a minimum of two hours.
2. No piping will be accepted if the leakage is greater than that determined by the following formula:

\[ L = \frac{S \times D \times P^{1/2}}{133,200} \]

- \( L \) = Allowable leakage, gallons per hour.
- \( S \) = Length of pipe tested, feet.
- \( D \) = Nominal diameter of pipe, inches.
- \( P \) = Average test pressure during the leakage test, pounds per square inch (gauge).

C. PE Pipe Leakage Test: [The following leakage test for PE water pipe was taken from the Phillips Petroleum Company (Richardson, TX) (Tel. 800 527 0662) catalog for “Driscopipe.”]
1. Apply the test pressure and allow the pipe to stand, without makeup pressure, for sufficient time to allow for diametric expansion or pipe stretching to stabilize, approximately
two to three hours.

2. After the above stabilization has occurred, return the section being tested to the test pressure. Hold the test pressure for one to three hours. If the pressure in the test section drops, and it is determined the drop may be the result of expansion resulting from increasing temperature, a limited amount of additional water may be added to bring the pressure back to the test pressure. Allowable amounts of make-up water, to compensate for expansion due to increasing temperature, are as shown in the following table. Make-up water is only allowed during this final test period and not during the initial stabilization described in the previous paragraph. If the additional water added is less than the allowable shown in the table and there are no visual leaks or significant pressure drops, the tested section passes the test.

D. PVC Pipe Leakage Test: Perform in accordance with AWWA M23. Selected requirements of AWWA M23 are repeated as follows:

1. Maintain the test pressure, +/- 5 psi, for a minimum of two hours.
2. No piping will be accepted if the leakage is greater than that determined by the following formula:

\[ L = \frac{(N \times D \times P^{1/2})}{7,400} \]

L = Allowable leakage, gallons per hour.
N = Number of joints in the length of the pipeline tested.
D = Nominal diameter of pipe, inches.
P = Average test pressure during the leakage test, pounds per square inch (gauge).

E. Cement Mortar Lined and Coated Steel Pipe Leakage Test: Perform in accordance with AWWA M11. Selected requirements of AWWA M11 are repeated as follows:

1. Maintain the test pressure, +/- 5 psi, for a minimum of two hours.
2. There shall be no significant leakage for pipe with welded joints or mechanical couplings.
3. For pipe joined with O-ring rubber gaskets, a leakage of 25 gallons per inch of diameter
per mile per 24-hours is allowed.

3.18 DISINFECTION

A. All New Pipelines shall be disinfected in accordance with one of the three methods specified in AWWA C651 and the following:
   1. Disinfect after pressure and leakage test have been performed and accepted.
   2. The method used shall be at the Contractor's option, unless specified by the owner of the water system.
   3. Engage the services of a commercial testing laboratory, approved by the owner of the water system, to perform the bacteriological tests specified in Section 5.1 of AWWA C651. Direct the testing laboratory to send the original report of the bacteriological testing to the owner of the water system. Should the laboratory report show that any sample taken was not acceptable, repeat the sterilization process shall until a satisfactory sterilization is accomplished.
   4. Lawfully dispose of the chlorinated water.

END OF SECTION
SECTION 334100 - STORM DRAINAGE SYSTEM

PART 1 - GENERAL

1.1 SUMMARY
   A. Provide and install all appurtenances as necessary to complete the storm drainage system, as shown on the plans, including piping and joints, flexible joints, manholes, catch basins, drain inlets, and area drains.

1.2 RELATED SECTIONS
   A. Section 31 23 33, Utility Trenching and Backfill

1.3 RELATED DOCUMENTS:
   A. AASHTO:
      1. M 199: Precast Reinforced Concrete Manhole Sections.
   B. ASTM:
      1. A615/A615M: Deformed and Billet-Steel Bars for Concrete Reinforcement.
      2. C 443: Joints for Circular Concrete Sewer and Culvert Pipe, Using Rubber Gaskets.
      6. D 1785: Poly (Vinyl Chloride) (PVC) Plastic Pipe, Schedules 40, 80, and 120.
     10. F 477: Elastomeric Seals (Gaskets) for Joining Plastic Pipe.
   C. AWWA:
      3. C110: Ductile-Iron and Gray-Iron Fittings, 3 In. Through 48 In. (76 mm Through 1,219 mm) for Water.
D. Caltrans Standard Specifications
   1. Section 52 Reinforcement
   2. Section 65 Reinforced Concrete Pipe

1.4 REGULATORY REQUIREMENTS:
   A. City of San Pablo, Standard Specifications and Details.
   B. Contra Costa County Flood Control District, Standard Specifications and Details.

1.5 Definitions
   A. AASHTO: American Association of State Highway and Transportation Officials.
   D. HDPE: High-density polyethylene.
   E. NPS: Nominal pipe size.
   F. PVC: Polyvinyl chloride.
   G. RCP: Reinforced concrete pipe.

1.6 SUBMITTALS
   A. Submittal procedure shall be as outlined in Division 1 – General Requirements.
   B. Product Data Shop Drawings, etc. for the following:
      1. Piping materials and fittings.
      2. Special pipe couplings.
      4. Plastic area drains.
      5. Cleanout plugs or caps.
      6. Precast manholes
      7. Precast concrete catch basins, inlets, curb inlets, junction structures and area drains, including frames and grates.
      8. Precast clean out boxes and box covers.
   C. Design Mix Reports and Calculations: For each class of cast in place concrete.
   D. Field Test Reports: Indicate and interpret test results for compliance with performance.

1.7 DELIVERY, STORAGE AND HANDLING
   A. Do not store plastic structures, pipe and fittings in direct sunlight.
B. Protect pipe, fittings, and seals from dirt and damage.

C. Handle precast concrete pipe, manholes and other precast structures according to manufacturer’s written instructions.

D. Protect imported bedding and backfill material from contamination by other materials.

PART 2 - PRODUCTS

2.1 PIPING MATERIALS FOR GRAVITY FLOW

A. PVC Pipe and Fittings: Pipes 12” and smaller in diameter shall be SDR 26 PVC conforming to ASTM D3034 using elastomeric gasket joint in a bell and spigot assembly system or as shown on plans. Minimum 2 feet cover, maximum 15 feet cover.

1. Fittings: Shall conform to ASTM F 1336.

B. Reinforced Concrete Pipe: Pipes greater than 12” in diameter shall be Class III, Type II Portland Cement conforming to ASTM C76 and C150 or as shown on plans.

C. HDPE Pipe and Fittings: (As alternate to PVC only) pipes can be HDPE (High Density Polyethylene Pipe) DR-11 (160 psi), conforming to ASTM F714 and AASHTO designation M-294.

D. Manholes

1. General:
   a. Size, shape, configuration, depth, etc. of manhole and frame and cover shall be as indicated.

2. Portland Cement Concrete and Reinforcing:
   a. Poured-in-Place Portion: Section 03 30 00 – Portland Cement Concrete.
   b. Precast Portion:
      1) Pre-cast Concrete manhole conforming to ASTM C478 and shall be Type II modified cement with a minimum compressive strength of 4,000 psi at 28 days. Iron Castings for manhole covers and frames shall conform to ASTM A48, Class 25
      2) ASTM C 478. Rate for AASHTO H20 loading in traffic areas.

3. Frames and Covers: As indicated and in accordance with Caltrans Standard Specification Section 75-1.02.

4. Steps: Manufacture from deformed, ½-inch steel reinforcement rod complying with ASTM A 615/A 615M and encased in polypropylene complying with ASTM D 4101. Include pattern designed to prevent lateral slippage off step.

   a. Acceptable manufacturers include:
      1) Hanson Concrete Products, (Milpitas, CA) (Tel 408-262-1091)
      2) Or approved equal.

E. Concrete Trench Drains

1. Modular system of concrete channel sections, grates, and appurtenances; designed so
grates fit into channel recesses without rocking or rattling. Include number of units required to form total length required.

2. Include the following components:
   a. Channel Sections: Interlocking-joint, precast modular units with end caps. Inside width as indicated with deep, rounded bottom, with built in slope or flat invert as indicated and outlets in number, sizes, and locations indicated. Include extension sections necessary for required depth.
   b. Frame and Grate: Ductile iron as indicated. Where drain is located in traffic areas, rate for AASHTO H20 loading.

3. Locking Mechanism: Manufacturer’s standard device for securing grates to channel sections.

4. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Project include, but are not limited to, the following:
   a. “Polydrain” by ABT Inc. (Troutman, NC) (Tel 704-528-9806).
   b. “ACO Drain” by ACO Polymer Products Inc. (Chardon, OH) (Tel. 800-543-4764).
   c. Or approved equal.

F. Cleanouts
   1. Piping: Same as storm drain line if possible.
   2. Top Plug or Cap: Same material as piping if possible. Plug or cap to be secure but removable, threaded or non-threaded.
   3. Box Size: As required to provide access and allow easy removal and reinstallation of plug or cap.
   4. Box Types:
      b. Traffic Areas: Portland cement concrete box and box cover or steel or cast iron cover, heavy duty, both box and cover to be rated for AASHTO H20 loading.
   6. Available Manufacturers: Subject to compliance with requirements, box manufacturers offering products that may be incorporated into the Project include, but are not limited to, the following:
      a. Associated Concrete Products, Inc. (Santa Ana, California) (Tel. 714-557-7470).
      b. Brooks Products Inc. (El Monte, California) (Tel. 818-443-3017).
      c. Christy Concrete Products, Inc. (Fremont, California) (Tel. 800-486-7070).

G. Area drains shall only be used on 6 inch in diameter or smaller storm drain lines.
   1. Area drains shall be polyvinyl chloride.
   2. Grates shall be brass and comply with accessibility requirements.
   3. Rate for AASHTO H20 loading in traffic areas.

H. Catch Basins shall be pre-cast or cast-in-place with 3,000 psi concrete and 1-1/2 inch max aggregate size.

I. Frames, Grates and Covers for Catch Basins: Caltrans Standard Specification Section 75-1.02, 75-1.03 and 75-1.05.
   1. Galvanize steel frames, grates and covers.
   2. Grates and covers shall be non-rocking.
   3. Rate for AASHTO H20 loading in traffic areas.
2.2 Special Pipe Couplings
   1. Gravity Piping: ASTM C 1173. Rubber or elastomeric sleeve and band assembly fabricated to match outside diameters of pipes to be joined.

2.3 Joint sealant for precast structures and manholes
      1. Use to seal around pipes at connections to structures and manholes. Also use to seal joints between precast sections of structures and manholes.
   B. Gaskets: Preformed flexible rubber or plastic gasket.
      2. Plastic Gaskets: Federal Specification SS-S-00210 (GSA-FSS), Type I, Rope Form; or alternate standard which may exist.

PART 3 - EXECUTION

3.1 GRAVITY PIPE INSTALLATION
   A. Construct all storm drainage utilities to the extent required by new construction and as indicated. Use methods required to complete the Work within limitations of governing regulations.
   B. Install pipe, fittings, and appurtenances utilizing best practices, manufacturer’s instructions, and in accordance with Section 6 and 7 of ASTM D 2321 for plastic pipe, Caltrans Standard Specification Section 65-1.07 for reinforced concrete pipe, and chapter 11.3.3 of AWWA M41 for cast iron and ductile iron pipe.
   C. Pipe Depth and Trench Configuration: Conform to typical trench section(s) indicated.
   D. Excavation, Bedding, Backfill, and Compaction: Section 31 23 33 – Utility Trenching and Backfill
   E. Handling: Carefully handle during loading, hauling, unloading and placing operations to avoid breakage or damage. Use strap type slings for lifting and placing; no chains or hooks will be permitted. Comply with manufacturer’s recommendations.
   F. Laying: Before lowering pipe into the trench, remove all stakes, debris, loose rock and other hard materials from the bottom of the trench. Lay accurately in conformance with lines and grades indicated. Start laying the pipeline at the low end and proceed upstream. Lay bell and spigot pipe with the bell end facing upstream. Lay pipe on a bed prepared by handwork, dug true to grade. Furnish firm bearing for pipe throughout its entire length with bell holes provided at the ends of each pipe length of sufficient size to permit making up the particular type of joint being used. Adjust pipe to line and grade by scraping away or filling and tamping material under the body of the pipe for the entire pipe length and not by blocking or wedging. After final positioning, hold pipe in place in trench with backfill material placed equally on both sides of the pipe at as many locations as required to hold the pipe section in place.
   G. Curved Alignment: When necessary to conform to the alignment specifically indicated, lay pipe on a curved alignment by means of asymmetrical closure of joints or bending of the pipe barrel.
Use shorter lengths of pipe than the standard length if necessary to achieve curvature specified. Do not exceed the recommendations of the pipe manufacture for deflections at the joints or pipe bending.

H. Closure: Close open ends of pipes and appurtenance openings at the end of each days work or when work is not in progress.

3.2 SPECIAL PIPE COUPLINGS

A. General: Use where required to join piping and no other appropriate method is specified. Do not use instead of specified joining methods.

B. Installation: Manufacturer’s instructions.

3.3 CLEANOUT INSTALLATION

A. General: Install as indicated.

3.4 INSTALLATION OF CURB INLETS, CATCH BASINS, DROP INLETS, JUNCTION STRUCTURES, AREA DRAINS, ETC. AND MANHOLES

A. Excavation, Bedding, Backfill, and Compaction: Section 31 23 33 – Utility Trenching and Backfill

B. Poured in Place Structures: Install as indicated and Caltrans Standard Specification Section 51.
   1. Shape bottoms to convey flows as indicated.

C. Precast Structures: Install as indicated.
   1. Seal all joints and pipe entrances and exits.
   2. Place concrete in bottom and shape to convey flows as indicated.

3.5 CONCRETE TRENCH DRAIN INSTALLATION

A. Excavation, Bedding, Backfill, and Compaction: Section 31 23 33 – Utility Trenching and Backfill

B. Install: As indicated and in accordance with the manufacturer’s instructions.

C. Valve shall be installed in accordance with manufacturer’s written Installation and Operation Manual and approved submittals.

3.6 TRENCHING AND EXCAVATION

A. Existing PCC or AC Areas: Cut PCC or AC to full depth at a minimum distance of 12-inches beyond the edge of the trench.

B. Excavate by hand or machine. For gravity systems begin excavation at the outlet end and proceed upstream. Excavate sides of the trench parallel and equal distant from the centerline of
the pipe. Hand trim excavation. Remove loose matter.

C. Excavation Depth for Bedding: Minimum of 4-inches below bottom of pipe or as otherwise allowed or required by the District’s Representative, except that bedding is not required for nominal pipe diameters of 2-inches or less.

D. Excavation Width at Springline of Pipe:
   1. Up to a nominal pipe diameter of 24-inches: Minimum of twice the outside pipe diameter, or as otherwise allowed or required by the District.
   2. Nominal pipe diameter of 30-inches through 36-inches: Minimum of the outside pipe diameter plus 2-feet, or as otherwise allowed or required by the District.
   3. Nominal pipe diameter of 42-inches through 60-inches: Minimum of the outside pipe diameter plus 3-feet, or as otherwise allowed or required by the District.

E. Over-Excavations: Backfill trenches that have been excavated below bedding design subgrade, with approved bedding material.

F. Comply with the District limitations on the amount of trench that is opened or partially opened at any one time. Do not leave trenches open overnight without the approval of the District.

G. Where forming is required, excavate only as much material as necessary to permit placing and removal of forms.

H. Bottoms of trenches will be subject to testing by District. Correct deficiencies as directed by the District.

I. Grade bottom of trench to provide uniform thickness of bedding material and to provide uniform bearing and support for pipe along entire length. Remove stones to avoid point bearing.

3.7 BACKFILLING

A. Backfill per Section 31 23 33: Utility Trenching and Backfill.

3.8 CLEANUP

A. Upon completion of utility earthwork all lines, manholes catch basins, inlets, water meter boxes and other structures shall be thoroughly cleaned of dirt, rubbish, debris and obstructions of any kind to the satisfaction of the District.

3.9 TESTING

A. General: Test new piping systems, and parts of existing systems that have been altered, extended, or repaired, for leaks and defects.
   1. Do not enclose, cover, or put into service before inspection and approval.
   2. Test completed piping systems according to authorities having jurisdiction.
   3. Schedule tests and inspections by authorities having jurisdiction with at least 24 hours advance notice.
   4. Submit separate reports for each test.
   5. Where authorities having jurisdiction do not have published procedures, perform tests in accordance with latest edition of the Uniform Plumbing Code (UPC) Section 1109.0,
Testing.
6.Leaks and loss in test pressure constitute defects that must be repaired.
7.Replace leaking piping using new materials, and repeat testing until leakage is within allowances specified.

B. Storm Drain Pipe:
1. Storm drain pipe, shall be hydrostatically joint tested, (air test is not to be used), in the field for water-tightness in accordance with ASTM Standard C 1103.
2. Perform test after pipe is bedded but prior to any backfill.
3. Testing may be done by manufacturing pipe with double gasket joints, or by utilizing a joint tester. Contractor shall obtain the District’s Representative’s approval of details of the Contractor’s selected method prior to performing the testing.
4. Inspect all joints for leakage.
5. If the pressure holds, or drops less than 1psi in 5 seconds, the joint is acceptable.
6. After backfill of storm drain, the Contractor shall video inspect the pipeline. The video shall be supplied to the District for review.

3.10 DISPOSAL
A. Lawfully dispose of all unsuitable and excess or surplus material off-site at no cost to the District.

3.11 CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL
A. Construction Waste shall be managed in accordance with provisions of Standard Construction Waste Management and Disposal Practices. Documentation shall be submitted to satisfy the requirements of that section.

END OF SECTION
